[*History of* SCOTLAND *continued from the preceding Volume.*]

land. JAMES could never forgive Henry for the loss of this brave officer. He sent to demand satisfaction; but all the answer he received was, that Barton and his crews were lawless pirates, and that what had been done against them ought never to have been resented amongst sovereign princes. James asserted, that Barton was no pirate, because he bore his commission; and that he ought to have been convicted of piratical acts before he was treated as being guilty of them. Henry intimated to James, that he was willing to accommodate the affair by way of negotiation; but James
60 thought himself affronted by the proposal.

s re- Various negotiations took place concerning this and
to in- other affairs till the year 1513; when James, though
Eng- he had for some time before been fully resolved upon a war with England, thought it highly necessary that it should have the sanction of his parliament, which he assembled for that purpose. The young nobility were not only inspired with the sentiments of James, but had been won over by the French; and the majority of them, as well as of the clergy (which was somewhat extraordinary, as James was, in effect, to fight against the pope and his allies), were keen for a war with England. The old counsellors, on the other hand, who saw the flourishing state of Scotland, arising from a long peace and their commerce, which was protected by a fleet, dreaded the ruinous consequences of the war. The queen naturally headed this party; and she was joined by the earl of Angus and the wisest part of the nobility. Their arguments made no impression upon James, who had received a present from Louis of four ships laden with wine and flour, and two ships of war completely equipped, one of them carrying 34 pieces of brass ordnance. He promised to the French queen, upon his honour, that he would take the field against the English; and she had sent him a fresh letter, gently reproaching him for want of gallantry, and for not being so good as his word. In short, the reasonings of the wisest and best part of the nobility were overruled, and the expedition against
I England was resolved on.

ots The earl of Hume, who was chamberlain of Scot-
d. land, was, at this juncture, at the head of 7000 or 8000 men, with whom he committed prodigious devastations on the English borders. Henry's queen, Scotla
Catharine of Spain, whom he had left regent of his dominions, issued a commission of array, directed to Sir Thomas Lovel, knight of the garter, for assembling the militia of the counties of Nottingham, Derby, Warwick, Leicester, Stafford, Rutland, Northampton, and Lincoln. The management of the war, however, was chiefly committed to the earl of Surry, who assembled the militia of Chester, Lancaster, Northumberland, Westmorland, Cumberland, and the bishopric of Durham. The earl of Hume had by this time laid great part of Northumberland waste; and his men were returning home laden with booty. The earl of Surry, resolving to intercept them, ordered Sir William Bulmer to form an ambush with 1000 archers, at a place called *Broomhouse*, which was extremely convenient for that purpose, as the Scots were obliged to pass that way. As the latter expected nothing of that kind, Bulmer executed his orders with great success. The archers assaulted the Scots all at once, and made so good use of their arrows, that their main body was put to flight, 500 were killed, and 400 taken, with the Lord Hume's standard, which he left on the field of battle; the greatest part of the plunder being recovered at the same time. The commonalty of Scotland termed this expedition of the Lord Hume's the *Ill Road*. 362

James was more exasperated than ever by this de- The que
feat, and continued his preparations for invading Eng- endeavo
land with additional vigour. His queen did all that to dissua
became a wife and prudent wife to divert him from his James fr
fatal purpose. She endeavoured to work upon his his desig
superstition, by recounting to him her ominous dreams and boding apprehensions. James treating these as mere illusions and fictions of the brain, she had recourse to other arts. While James was waiting at Linlithgow for the arrival of his army from the north and the Highlands, he assisted one afternoon at the vespers in the church of St Michael. Being placed in one of the canons seats, a venerable comely man, of about 52 A phan-
years of age, entered, dressed in a long garment of an tom appe
azure colour, and girded round with a towel or roll to him.
of linen, his forehead bald, and his yellow locks hanging down his shoulders; in short, he was dressed and

formed to appear like St Andrew, the apoſtle of Scotland, as he is repreſented in painting and ſculpture. The church being crowded, this perſonage, with ſome difficulty, made his way to the king's ſeat; and leaning over it, he ſpoke to the following purpoſe: "Sir (ſaid he), I am ſent hither to entreat you for this time to delay your expedition, and to proceed no farther in your intended journey: for if you do, you ſhall not proſper in your enterpriſe, nor any of your followers. I am further charged to warn you, if ye be ſo refractory as to go forward, not to uſe the acquaintance, company, or counſel of women, as ye tender your honour, life, and eſtate." After delivering thoſe words, he retired through the crowd, and was no more ſeen, though, when the ſervice was ended, James earneſtly inquired after him.

That this ſcene was acted, ſeems to be paſt diſpute; for Sir David Lindſay, who was then a young man, and preſent in the church, reported it both to Buchanan and Lindſay the hiſtorian. It is, however, equally certain, that the whole was a contrivance of the queen, to whoſe other afflictions the ſtings of jealouſy were now added. In one of the Scotch inroads into England, one Heron, the proprietor of the caſtle of Ford, had been taken priſoner, and ſent to Scotland; where he was detained on a charge of murder, of which he ſeems to have been innocent. The Engliſh hiſtorians mention this as having paſſed after James entered England: but from the latter part of the ſuppoſed phantom's ſpeech, it is probable that it happened before; and that Heron's wife and beautiful daughter had been for ſome time ſoliciting James for his deliverance. Be that as it may, it is too probable that James was ſmitten with the charms of the daughter; and that her mother, who was a moſt artful woman, knew how to avail herſelf of the conqueſt. Pretending that ſhe had intereſt enough to procure the releaſe of the lord Johnſton and Alexander Home, who were priſoners in England, ſhe was permitted by James to keep a conſtant correſpondence with the earl of Surry, to whom ſhe is ſaid to have betrayed all James's ſecrets and meaſures. The rendezvous of James's army was at the Burrow-moor, to which James repaired; and having given orders for the march of his artillery, he lodged at the abbey of Holyroodhouſe. While he was there, another attempt was made to divert him from his purpoſe of invading England: but James, deaf to all the ſolicitations and inventions of his queen, muſtered his army; and on the 22d of Auguſt he paſſed the Tweed, encamping that night near the banks of the Twiſſel. On his arrival at Twiſſelhaugh on the 14th, he called an aſſembly of his lords together, and made a declaration, that the heirs of all ſuch as ſhould die in the army, or be killed by the enemy during his ſtay in England, ſhould have their wards, relief, and marriages of the king; who, upon that account, diſpenſed with their age. This is ſaid to have been the criſis of that prince's fate. Abandoned to his paſſion for his Engliſh miſtreſs, ſhe prevailed with him, at her mother's inſtigation, to trifle away his time for ſome days; during which interval, the junction of the Engliſh army was formed. The earl of Surry, the Engliſh general, was then at Pomfret: but ordered the landholders of the neighbouring counties to certify to him in writing what number of men each could furniſh, charging them to be ready at an hour's warning; and he laid his plan ſo, as not to bring his army into the field till James had advanced ſo far into England as to render it very difficult for him to retire without a general battle. This precaution aſſiſted the Lady Ford (as ſhe is called) in perſuading James that there was no danger in the delay, becauſe the Engliſh had not the face of an army in the field. Scotla

In the mean time, the earl of Surry ordered the governors of Berwick and Norham, the two ſtrongeſt places on the frontiers of England, to prepare for a vigorous reſiſtance in caſe they were attacked; and directed them to certify how long they could hold out, in hopes, that if they made a reſolute defence, James would march on, and leave them in his rear. The governor of Norham's anſwer was, that his caſtle was ſo well provided, as to leave him no doubt, in caſe of a ſiege, to be able to defend it till King Henry ſhould return from abroad, and relieve it in perſon. James, however, beſieged it on the 25th of Auguſt, and battered it ſo furiouſly, that he took it by capitulation the ſixth day after. James then proceeded to the caſtle of Etal belonging to the family of Manners (now duke of Rutland); which he took and demoliſhed likewiſe, as he alſo did Wark, and arrived before the caſtle of Ford. The Scotch army is generally allowed to have conſiſted of at leaſt 50,000 men when it paſſed the Tweed. At this time it was encamped on the heights of Cheviot, in the heart of a country naturally barren, and now deſolate through the precautions taken by the Engliſh general. Being obliged to extend their quarters for the benefit of ſubſiſtence, the mercenary part of them had acquired a conſiderable plunder, with which, as uſual, they retired to their own country, as many more did for want of ſubſiſtence. The earl of Surry knew their ſituation, and ordered the rendezvous of his army, firſt at Newcaſtle, and then near Norham, having certain intelligence of the vaſt deſertions daily happening in the Scotch army, which had reduced it greatly. The wetneſs of the ſeaſon rendered his march, eſpecially that of the artillery, extremely difficult; but being joined by ſeveral perſons of diſtinction, he marched on the 3d of September to Alnwick, where he was reinforced by 5000 hardy veteran troops, ſent from the Engliſh army on the continent, under the command of his ſon the lord admiral of England; ſo that the Engliſh authors admit his army to have conſiſted of 26,000 men, all completely armed and provided for the field. James having, in the manifeſto which he diſperſed on his entering England, given the death of Barton as one of the cauſes of his invaſion, the lord admiral had prevailed with Henry to ſend him upon this ſervice; and he informed James by a letter, that he intended to juſtify the death of that pirate in the front of the Engliſh army. 365 The Sco take the caſtles o Norham Etal, an Wark.

By this time the army of James was, by deſertion and other cauſes, reduced to leſs than half its numbers; but the chief misfortune attending it was his own conduct. His indolence and inactivity, joined to the ſcandalous examples of his amours, at ſuch a ſeaſon, had diſguſted ſeveral of his greateſt men and beſt friends; and ſome of them more than ſuſpected a correſpondence between the Engliſh lady and the earl of Surry. James was deaf to all their remonſtrances; and the earl of Angus declared, that he was reſolved to return home, as he foreſaw that the ruin of the army was inevitable 366 James d guits fe ral of hi nobility

through

Scotland. through the obſtinacy of James. He accordingly withdrew to Scotland, but left behind him his two ſons. The lord Hume and the earl of Huntley were likewiſe diſcontented. The former had brought his men into the field; but, according to ſome Scotch hiſtorians, with a deſign rather to betray than to ſerve James: but Huntley, though he diſliked his maſter's conduct, remained firmly attached to his perſon.

The defection or backwardneſs of thoſe great men ſeemed to make no impreſſion upon James. He had choſen a ſtrong camp in the neighbourhood of Ford, on the ſide of a mountain called Flodden hill; and he was ſeparated from the Engliſh army by the river Till. This advantageous ſituation put the earl of Surry under great difficulties; for it rendered the Scotch army inacceſſible, as it was fortified by artillery, and was now well ſupplied with proviſions by the change of its ſituation. The earl drew up a manifeſto, with which he charged Rouge Croix herald, who was attended by a trumpet. It contained ſome propoſals for an exchange of priſoners, which ſeems to have been calculated to give the lady Ford the more credit with James; but concluded with reproaches for his perfidious invaſion of England, and a defiance to James to fight him in a general battle. The herald was farther charged with a verbal commiſſion to acquaint James, that the earl of Surry had iſſued orders that no quarter ſhould be given to any of the Scotch army but the king himſelf.

367 camps an advantageous ſituation.

A council of war was called on this occaſion; in which the earl of Huntley and others made ſtrong remonſtrances againſt a general engagement. They ſhowed how fatal it muſt be to Scotland, ſhould it prove unſucceſsful; and that the wiſeſt courſe James could follow was to return home, where, if he was purſued by the enemy, he could fight to great advantage. The earl of Huntley, however, added, that his opinion ſhould be determined by that of the king and council; and that he was equally ready to ſhare in his majeſty's danger as his glory.

368 Huntley and the other noblemen were oppoſed by the French ambaſſador, who repreſented a retreat as diſgraceful to the nobility of Scotland and the arms of James; and uſed many romantic arguments of the ſame kind, which but too well ſuited with the king's diſpoſition. According to Drummond, the council were of opinion, that the king ſhould immediately beſiege Berwick; but be that as it will, the majority of them were certainly of opinion, that it was beneath the dignity of James to fight the earl of Surry at that nobleman's requiſition, and that James could loſe no honour by returning home. Patrick Lord Lindſay of Byres, mentioned on a former occaſion, and who was preſident of the council, expreſſed himſelf ſo ſtrongly on that head, that James, in a paſſion, is ſaid by the hiſtorian Lindſay to have ſworn, that if ever he lived to return to Scotland, he would hang that nobleman at his own gate. He ordered Rouge Croix to be called in; and after treating him with great politeneſs, he ſent a meſſage to the earl of Surry by one of his own heralds (Iſlay), importing that he would give the Engliſh battle on the Friday following; and that had he received ſuch a meſſage from the earl even in his own caſtle of Edinburgh, he would have left that, and all other buſineſs to have fought him. With this meſſage, a ſmall manifeſto, in vindication of James's conduct, was ſent by the ſame herald. Scotl

The earl of Surry, who was then ſo infirm that he was carried about in a ſedan or chariot, had foreſeen that James would return an anſwer by one of his own heralds; but, unwilling that he ſhould obtain any knowledge of the ſituation of the Engliſh camp, he ordered proper perſons to receive him at two miles diſtance, where ſoon after he attended himſelf in perſon. Iſlay executed his commiſſion without paying much reſpect to the perſon of the Engliſh general; who diſmiſſed him, after beſtowing great compliments upon the honour and courage of James. The earl then ordered his army to march in line of battle towards Woollerhaugh. There he was joined by Rouge Croix, herald, who gave him an account of the ſtrong ſituation of the Scottiſh camp; but the advanced poſts of the Engliſh army were then within three miles of their enemies, and the earl of Surry found his difficulties daily increaſing. The roads were broken up, the ſwelling of the rivers cut him off from the neceſſary communications for ſupplying his army, and nothing but a battle could ſave him either from being diſbanded or deſtroyed.

James ſeems to have ſo far regarded the advice of his wiſeſt counſellors, as not to abandon his ſtrong ſituation. They endeavoured to perſuade him, that it was a ſufficient guard to his honour, if he did not decline the battle on the day appointed; and that his engagement did not bind him to fight upon diſadvantageous ground. The Scots, at the ſame time, knew of their enemy's diſtreſſes; and, as Drummond elegantly expreſſes it, they remonſtrated to their king, that he lacked nothing but patience to be victorious. The Scots thus lying on the defenſive, the earl of Surry again ſent Rouge Croix to inform James that he was ready to give him battle. James was ſenſibly nettled at this tacit imputation upon his honour, and perhaps was inwardly vexed for having followed the wiſe advice of his noblemen. It is certain, from the beſt authorities, that he neglected the neceſſary precautions for guarding the paſſages of the Till, which the Engliſh croſſed, partly at a place where it was fordable, and partly at a bridge. We are told, not without a great appearance of probability, that while the Engliſh were paſſing the bridge, Borthwick, maſter of the Scotch artillery, fell upon his knees, and begged permiſſion from James to point his cannon againſt the bridge; but that James anſwered him in a paſſion, that it muſt be at the peril of his (Borthwick's) head, and that he was reſolved to ſee all his enemies that day on the plain before him in a body. The earl of Surry, after paſſing the Till, took poſſeſſion of Braxton, which lay to the right of the Scotch camp; and by that ſituation he cut off the communication of his enemies with the Tweed, and commanded the Till below Eton caſtle. The Scotch generals ſaw themſelves now in danger of being reduced to the ſame ſtraits in which their enemies had been involved two days before, and their country open to an invaſion of the Engliſh army. James had ſecret intelligence that this was far from being the intention of the Engliſh general; and imagining that the latter's intention was to take poſſeſſion of a ſtrong camp upon a hill between him and the Tweed, which would give the Engliſh a farther command of the country, he reſolved to be be-

His dent duct

land. forehand with the earl, and gave orders for making large fires of green wood, that the ſmoke might cover his march along the height, to take advantage of that eminence. But while this ſtratagem concealed his march from the Engliſh, their movements were concealed from him: for when he came to the brow of the height over which he had marched, he found the enemy drawn up in order of battle on the plain, but ſo cloſe to the height where he was, that his artillery, on which his great dependence was, muſt overſhoot them.

o unt of ttle of en. A battle was now not only unavoidable, but the only means of ſaving the Scotch army, which was probably far from being a diſagreeable circumſtance to James. His perſon was ſo dear to his troops, that many of them dreſſed themſelves as nearly as they could in the ſame coats of armour and with the ſame diſtinctions that James wore that day. His generals had earneſtly deſired him to retire to a place of ſafety, where his perſon would be ſecure in all events: but he obſtinately refuſed to follow their advice; and on the ninth of September, early in the morning, diſpoſitions were ordered for the line of battle. The command of the van was allotted to the earl of Huntley; the earls of Lenox and Argyll commanded the Highlanders under James, who, ſome ſay, ſerved only as a volunteer; and the earls of Crawford and Montroſe led the body of reſerve. The earl of Surry gave the command of his van to his ſon, the lord admiral; his right wing was commanded by his other ſon, Sir Edward Howard; and his left by Sir Marmaduke Conſtable. The rear was commanded by the earl himſelf, Lord Dacres, and Sir Edward Stanley. Under thoſe leaders ſerved the flower of all the nobility and gentry then in England. Other writers give different accounts of the diſpoſition of the Engliſh army, but they may be reconciled by the different forms into which the battle was thrown before it was decided. The Lord Hume is mentioned as ſerving under the earls of Crawford and Montroſe, and Hepburn earl of Bothwel was in the rear.

The firſt motion of the Engliſh army was by the lord-admiral, who ſuddenly wheeled to the right, and ſeized a paſs at Milford, where he planted his artillery ſo as to command the moſt ſloping part of the aſcent where the Scots were drawn up; and it did great execution. The Scots had not foreſeen this manœuvre; and it put them into ſuch diſorder, that the earl of Huntley found it neceſſary to attack the lord-admiral; which he did with ſo much fury, that he drove him from his poſt; and the conſequence muſt have been fatal to the Engliſh, had not his precipitate retreat been covered by ſome ſquadrons of horſe under the lord Dacres, which gave the lord-admiral an opportunity of rallying and new forming his men. The earl of Surry now found it neceſſary to advance to the front, ſo that the Engliſh army formed one continued line, which galled the Scots with perpetual diſcharges of their artillery and bows. The Highlanders, as uſual, impatient to come to a cloſe fight, and to ſhare in the honour of the day, which they now thought their own, ruſhed down the declivity with their broadſwords, but without order or diſcipline, and before the reſt of the army, particularly the diviſion under Lord Hume, advanced to ſupport them. Their impetuoſity, however, made a conſiderable impreſſion upon the main battle of the Engliſh; and the king bringing up the earl of Bothwel's reſerve, the battle became general and doubtful: but by this time the lord-admiral, having again formed his men, came to the aſſiſtance of his father, and charged the diviſion under the earls of Crawford and Montroſe, who were marching up to ſupport the Highlanders, among whom the king and his attendants were now fighting on foot: while Stanley, making a circuit round the hill, attacked the Highlanders in the rear. Crawford and Montroſe, not being ſeconded, according to the Scotch hiſtorians, by the Humes, were routed; and thus all that part of the Scotch army which was engaged under their king, was completely ſurrounded by the diviſion of the Engliſh under Surry, Stanley, and the lord-admiral. In this terrible ſituation, James acted with a coolneſs not common to his temper. He drew up his men in a circular form, and their valour more than once opened the ranks of the Engliſh, or obliged them to ſtand aloof, and again have recourſe to their bows and artillery. The chief of the Scotch nobility made freſh attempts to prevail with James to make his eſcape while it was practicable; but he obſtinately continued the fight; and thereby became acceſſory to his own ruin, and that of his troops, whom the Engliſh would gladly have ſuffered to retreat. He ſaw the earls of Montroſe, Crawford, Argyll, and Lenox, fall by his ſide, with the braveſt of his men lying dead on the ſpot; and darkneſs now coming on, he himſelf was killed by an unknown hand. The Engliſh were ignorant of the victory they had gained: and had actually retreated from the field of battle, with a deſign of renewing it next morning.

Scot

The ſ defa and t king

This diſaſter was evidently owing to the romantic diſpoſition of the king himſelf, and to the want of diſcipline among many of his ſoldiers; though ſome writers have aſcribed it to the treachery of Lord Hume. Many of James's domeſtics knew and mourned over his body; and it appeared that he had received two mortal wounds, one through the trunk with an arrow, and the other on the head with a ball. His coat of armour was preſented to Queen Catharine, who informed her huſband, then in France, of the victory over the Scots. The loſs on both ſides, in this engagement, is far from being aſcertained; though Polydore Virgil, who lived at the time, mentions the loſs of the Engliſh at 5000, and that of the Scots at 10,000.

3 The dowa ſumes gover ment.

After the death of King James IV. the adminiſtration devolved on the queen-dowager; but ſhe being big with a poſthumous child, and unable to bear the weight of public buſineſs, accepted of Beaton archbiſhop of Glaſgow and chancellor of Scotland, with the earls of Huntley, Angus, and Arran, to aſſiſt her in the affairs of government. Soon after her huſband's death ſhe had wrote an affecting letter to her brother the king of England, informing him of her pregnancy, ſetting forth the deplorable ſtate of the kingdom, with her own condition, and imploring his friendſhip and protection for herſelf and her infant ſon. This letter ſeems never to have been communicated by Henry to his council; but he anſwered it, and informed his ſiſter, that if the Scots would have peace, they ſhould have peace, and war if they choſe it. "He added (according to Drummond), that her huſband had fallen by his own indiſcreet raſhneſs, and fooliſh kindneſs to France; that he regretted his death as his ally, and ſhould be willing to prohibit all hoſtility againſt the country of Scotland

during the minority of her ſon. For a remedy of preſent evils, one year's truce and a day longer was yielded unto; in which time he had leiſure to proſecute his deſigns againſt France, without fear of being diſturbed or diverted by the incurſions and inroads of the Scots upon his borders,"

Thus far Drummond: but though Henry might grant this time to his ſiſter's entreaty, yet it certainly did not become a national meaſure: for it appears by a letter dated two years after, from the Scots council to the king of France, publiſhed by Rymer, that the Scots never had deſired a truce. So far from that, the French influence, joined to a deſire of revenge, remained ſo ſtrong in the kingdom, that after the meeting of the parliament, ſome of the members were ſo violent as to propoſe a renewal of the war. This motion was indeed overruled by the more moderate part of the aſſembly: but they could not be brought to make any advances towards Henry for a peace; and every day was now big with public calamity, which ſeems to have gathered ſtrength while the queen was in childbed. The archbiſhopric of St Andrew's being vacant, it was offered by univerſal conſent to Elphinſton biſhop of Aberdeen; but being now old and infirm, he declined it. Three competitors for that high dignity then appeared. The firſt was Gawin Douglas, who was then abbot of Aberbrothic, to which he was preſented by the queen upon her recovery (having been brought to bed of a ſon) the very day before her marriage with his nephew the earl of Angus: and upon the death of Biſhop Elphinſton in November following, ſhe preſented him likewiſe to the archbiſhopric of St Andrew's. The ſecond competitor was John Hepburn, prior of St Andrew's; a bold, avaricious, reſtleſs, but ſhrewd and ſenſible prieſt. By his office he had received the rents of the ſee during its vacancy; and having prevailed with the canons, on pretence of ancient privileges, to elect him archbiſhop, without regard to the nomination either of the queen or pope, he drove Douglas's ſervants from the caſtle of St Andrew's, of which they had taken poſſeſſion. The third and moſt powerful competitor was Forman biſhop of Moray in Scotland, and archbiſhop of Bourges in France, a dignity to which he had been raiſed for his public ſervices. He had in his intereſt not only the duke of Albany (ſon to the traitor duke) firſt prince of the blood, but alſo the court of Rome itſelf; and having received the pope's bull and nomination to the dignity, he was conſidered by the Scotch clergy in general, and by the principal tenants and dependants upon the ſee, as the legal archbiſhop.

The preference given to Forman diſcouraged Douglas from purſuing his pretenſions; but Hepburn, being ſupported by the clan of his own name and by the Humes, made ſo formidable a head againſt his rivals, that none could be found daring enough to publiſh the papal bull in favour of Forman. The friends of the latter, however, having intimated to the earl of Hume, that his credit at the court of Rome could eaſily procure the rich abbey of Coldingham for his younger brother, the earl put himſelf at the head of his followers, and, notwithſtanding all the oppoſition given by the Hepburns, he proclaimed the pope's bull over the croſs of Edinburgh. This daring action plainly proved that the earl of Hume had more power than the queen regent herſelf; but Hepburn's reſolution, and the greatneſs of his friends, obliged Forman to agree to a compromiſe. Hepburn was advanced to the ſee of Moray, without accounting for the revenues of the archbiſhopric, which he had received during its vacancy; and he gave Forman a preſent of three thouſand crowns, to be divided among his friends and followers. Scotl

In April 1514, the poſthumous ſon, of whom the queen had been delivered in Stirling caſtle, was by the biſhop of Caithneſs baptized Alexander. On the 6th of Auguſt this year ſhe was married to the earl of Angus; than which nothing could be accounted more impolitic. She had neither conſulted her brother nor the ſtates of Scotland in the match; and by her having accepted of a huſband, ſhe in fact reſigned all claim to the regency under the late king's will. The Douglaſſes did not diſpute her having diveſted herſelf of the regency: but they affirmed, that the ſtates might lawfully reinſtate her in it; and that the peace of the kingdom required it, as it was the only meaſure that could preſerve the happy tranquillity which then ſubſiſted between Scotland and England. The earl of Hume put himſelf at the head of the oppoſition to this propoſal. He knew that he had enemies, and he dreaded that the further aggrandizement of Angus muſt weaken his intereſt on the borders. He was joined by a number of the young nobility, who, though otherwiſe divided, united againſt Angus. In ſhort, the general opinion was, that the Douglaſſes were already too great; and that, ſhould the queen be reinſtated in the regency, they muſt be abſolute within the kingdom, and engroſs all places of power and profit. It was added by the earl of Hume, that he had, out of reſpect to the late king's memory, ſubmitted to the queen's government; and that, now ſhe had made a voluntary abdication of it by her marriage, it ought not to be renewed. 37 The q dowag marri the ea Augu

After ſome deliberations the duke of Albany was choſen regent. He was a man poſſeſſed of all the qualities requiſite for a good governor; nor did he deceive the expectations of the public. On his arrival at Glaſgow, he took upon him the titles of earl of March, Marr, Garioch, lord of Annandale, and of the iſle of Man, regent and protector of the kingdom of Scotland. On his arrival at Edinburgh he was received in form by the three eſtates of the kingdom, and the queen had met him at ſome diſtance from the town. The parliament then reſumed its ſeſſion, and the three eſtates took an oath of obedience, till the king, then an infant of four years old, ſhould arrive at the years of maturity. 37 The d of All choſen gent.

The firſt thing at which the regent aimed, was the conciliating the differences amongſt the various contending families in the kingdom; at the ſame time that he ſuppreſſed ſome daring robbers, one of whom is ſaid to have had no fewer than 800 attendants in his infamous profeſſion. So great was his love of good order and decency, that he puniſhed the lord Drummond with the loſs of his eſtate for having ſtruck Lyon king at arms, whoſe perſon, as the firſt herald in Scotland, ought to have been held ſacred. Nay, it was at the earneſt ſolicitation of Lyon himſelf, and many of the chief nobility, that a greater puniſhment was not inflicted. However, the forfeiture was afterwards

remitted;

remitted; but not before Drummond had, upon his knees, acknowledged his offence, and ſubmitted himſelf before Lyon.

The regent had not been long in office before he took into favour Hepburn the prior of St Andrew's, whom he conſulted for information concerning the ſtate of Scotland. Hepburn acquainted him with all the feuds and animoſities which raged among the great families of Scotland, their ferocious character, and barbarous behaviour to their enemies. He repreſented the civil power as too weak to curb theſe potent chieftans; and gave it as his opinion that the regent's adminiſtration ought to be ſupported by foreign arms, meaning thoſe of France.

Hepburn is ſaid alſo to have gained an aſcendency over the regent by means of large ſums of money laid out among his domeſtics, by a fawning and plauſible addreſs, and by well directed flatteries; and he employed this aſcendency to deſtroy thoſe who were obnoxious to himſelf. The earl of Hume, as being the firſt ſubject in rank and authority, became obnoxious to the regent through the inſinuations of Hepburn; and as that nobleman had frequent occaſion to be at court in virtue of his office of chamberlain, he ſoon perceived that neither he nor his friends were welcome gueſts there. Alarmed for his own ſafety, he reſolved to form a party alongſt with the queen-mother and her new huſband againſt the regent. This was by no means a difficult talk; for the queen naturally imagined that her new huſband ought to have had ſome ſhare in the government; and the earl of Angus readily concurred in the ſcheme. In the mean time, the regent was making a progreſs through Scotland, while bloody feuds were raging among the nobles: but before any remedy could be applied to theſe diſorders, he was informed of the ſchemes laid by the queen-mother and her party; and that ſhe had reſolved to fly into England with her two infants. On this he inſtantly returned to Edinburgh; and, as no time was to be loſt, ſet out at midnight that very night, and ſurpriſed the caſtle of Stirling, where he found the queen-mother and her two infants.

The regent, after this bold ſtep, took care to ſhow that the care of the royal infants was his chief ſtudy. As he himſelf was nearly allied to the crown, in order to remove all ſuſpicions and calumnies on that account, he committed the care of the king and his brother to three noblemen of the moſt unexceptionable characters in the kingdom, but of whom we now know the name only of one, viz. the earl of Lenox. They were appointed to attend the princes by turns; to whom alſo a guard, conſiſting partly of French and partly of Scots, was aſſigned; and the queen-mother was left at liberty to reſide where ſhe pleaſed.

The earl of Hume, finding his ſchemes thus abortive, retired to his own eſtate; from whence he was ſoon after drawn, and obliged to fly into England, by the earls of Arran and Lenox. The queen-mother retired to a monaſtery at Coldſtream; and meſſengers were deſpatched to the court of England, to know how Henry would have his ſiſter diſpoſed of. He ordered the lord Dacres, his warden of the marches, to attend her to Harbottle caſtle in Northumberland; and here ſhe was delivered of her daugher the Lady Mary Douglaſs, mother to Henry Lord Darnly, father to James I. of England. The regent deſpatched ambaſſadors to Henry, in order to vindicate his own conduct. He likewiſe ſent to aſſure the queen that ſhe had nothing to fear in Scotland; and to invite her to return thither, where ſhe ſhould at all times be admitted to ſee her children. This offer, however, ſhe declined; and ſet out for London, where ſhe was affectionately received and entertained by her brother. But in the mean time many diſorders were committed throughout the kingdom by the party of the queen-mother; though, by the interpoſition of Archbiſhop Forman, they were at preſent terminated without bloodſhed, and ſome of the principal offenders were perſuaded to return to their duty. Among theſe was the earl of Angus himſelf, the queen's huſband; which when King Henry heard, he exclaimed, "That the earl, by deſerting his wife, had acted *like a Scot*." Lord Hume refuſed to ſurrender himſelf, or to accept of the regent's terms; and was of conſequence declared a traitor, and his eſtate confiſcated. All this time he had been infeſting the borders at the head of a lawleſs banditti; and now he began to commit ſuch devaſtations, that the regent found it neceſſary to march againſt him at the head of 1000 diſciplined troops. Hume being obliged to lay down his arms, was ſent priſoner to Edinburgh caſtle; where the regent very unaccountably committed him to the charge of his brother-in-law the earl of Arran. Hume eaſily found means to gain over this near relation to his own party; and both of them, in the month of October 1515, eſcaped to the borders, where they ſoon renewed hoſtilities. Both the earls were now proclaimed traitors, but Hume was allowed fifteen days to ſurrender himſelf. This ſhort interval the regent employed in quaſhing the rebellion, for which purpoſe the parliament had allowed him 15,000 men. He beſieged the caſtle of Hamilton, the earl of Arran's chief ſeat, which was in no condition of defence: but he was prevailed upon by Arran's mother, daughter to James II. and aunt to the regent himſelf, to forbear further hoſtilities, and even to pardon her ſon, provided he ſhould return to his duty. Arran accordingly ſubmitted; but the public tranquillity was not by that means reſtored. An aſſociation, at the head of which was the earl of Moray, the king's natural brother, had been formed againſt the earl of Huntley. That nobleman was too well attended, to fear any danger by day; but his enemies found means to introduce ſome armed troops in the nighttime into Edinburgh. On this a fierce ſkirmiſh enſued, in which ſome were killed on both ſides; but farther bloodſhed was prevented by the regent, who confined all the lords in priſon till he had brought about a general reconciliation. One Hay, who had been very active in ſtirring up the quarrels, was baniſhed to France; and only the earl of Hume now continued in arms.

In 1516 died the young duke of Rothſay: an event which brought the regent one degree nearer the crown, ſo that he was declared heir in caſe of the demiſe of young James. Negotiations were then entered into about prolonging the truce which at that time ſubſiſted with England; but Henry inſiſting upon a removal of the regent from his place, they were for the preſent dropped. Finding, however, that he could neither prevail on the parliament as a body to diſmiſs the regent, nor form a party of any conſequence againſt him, he,

he at laſt conſented to a prolongation of the truce for a year.

In 1517, the affairs of the regent requiring his preſence in France, he reſolved, before his departure, to remove the earl of Hume, who, as we have ſeen, alone continued to diſturb the public tranquillity. Under pretence of ſettling ſome differences which ſtill remained with England, he called a convention of the nobility and ſent ſpecial letters to the earl of Hume and his brother to attend, on account of their great knowledge in Engliſh affairs. Both of them imprudently obeyed the ſummons, and were ſeized and executed as ſoon as they arrived at Edinburgh. But whatever occaſion there might be for this ſeverity, it loſt the affections of the people to ſuch a degree, that the regent could ſcarce get the place filled up which Lord Hume had poſſeſſed. That of lord warden of the marches he at laſt gave to his French favourite La Beaute, called by hiſtorians Sir Anthony D'Arcy. The poſt of lord chamberlain was given to Lord Fleming. Soon after this, the regent levied an army, on pretence of repreſſing ſome diſturbances on the borders. Theſe being ſpeedily quelled, he ſeized on his return upon the earl of Lenox, and forced him to deliver up his caſtle of Dunbarton; not chooſing to leave it, during his intended abſence in France, in the cuſtody of a nobleman of ſuſpected fidelity; and from ſimilar motives, he afterwards took him along with him on his departure for the continent. He then procured himſelf to be nominated ambaſſador to France, in which character he left the kingdom; having committed the government to the archbiſhops of St Andrew's and Glaſgow, the earls of Arran, Angus, Huntley, and Argyll, with the warden D'Arcy, on whom was his chief dependence.

On the departure of the regent, the queen-mother left the Engliſh court; and arrived with a noble retinue at Berwick, on purpoſe to viſit her ſon. Here ſhe was received by her huſband; for whom ſhe had contracted an invincible averſion, either on account of his infidelities to her bed, or becauſe he had deſerted her in the manner already related. However, ſhe ſuppreſſed her reſentment for the preſent, and accompanied him to Edinburgh. Here, in conſequence of the propoſals made by the regent, ſhe demanded acceſs to her ſon; but was refuſed by D'Arcy. Lord Erſkine, however, who was one of thoſe to whom the care of the young king was committed, conveyed him to the caſtle of Craigmillar (where D'Arcy had no juriſdiction), on pretence that the plague was in Edinburgh; and there the queen was admitted; but this gave ſuch offence to D'Arcy, that Lord Erſkine was obliged to carry back the king to the caſtle of Edinburgh, where all further acceſs was denied to his mother. In ſhort, the behaviour of this favourite was on all occaſions ſo haughty and violent, that he rendered himſelf univerſally odious; and was at laſt murdered, with all his attendants, in his way to Dunſe, where he propoſed to hold a court of juſtice.—His death was very little regretted; yet his murderers were proſecuted with the utmoſt ſeverity, and ſeveral perſons of diſtinction declared rebels on that account.

Meanwhile, the regent was treated with high marks of diſtinction in France. The king ſhowed him the greateſt reſpect, promiſed to aſſiſt in eſtabliſhing his authority in Scotland, and ſolemnly confirmed the ancient league between the two kingdoms. Soon after, the earl of Lenox arrived from France, with aſſurances of protection and aſſiſtance from the king, who was highly pleaſed at the zeal of the governors in puniſhing D'Arcy's murderers; and 500 ſoldiers arrived with him, to reinforce the garriſons, eſpecially that of Dunbar.

All this time the queen-mother continued at Edinburgh, employing herſelf in attempts to procure a divorce from her huſband, under pretence of his having been previouſly contracted to another. The affairs of the kingdom again began to fall into confuſion, and many murders and commotions happened in different parts of the country. The earl of Arran had the chief direction in the ſtate; but the earl of Angus, notwithſtanding the difference with his wife, had ſtill great intereſt, and waited every opportunity to oppoſe him. This emulation produced an encounter at Edinburgh; in which victory declared for Angus, and 72 of the routed party were killed. This ſkirmiſh was fought on the 30th of April 1519, and has been known in Scots hiſtory by the name of *Cleanſe the Cauſeway*.

On the 19th of November 1521, the regent returned from France. He found the kingdom in great diſorder. The earl of Angus domineered in the field, but his antagoniſts outvoted his party in the parliament. The queen-mother, who had fixed her affections on a third huſband, hated all parties almoſt equally; but joined the duke of Albany, in hopes of his depriving the other two of their power. This happened according to her expectation; and ſhe was with the regent when he made a kind of triumphal entry into Edinburgh, attended by a number of perſons of the firſt rank.—The earl of Angus was now ſummoned to appear as a criminal, but his wife interceded for him, not out of any remains of affection, but becauſe he gave her no oppoſition in the proceſs of divorce which was depending between them. In the mean time, Henry VIII. of England, perceiving that the Scots were entirely devoted to the French intereſt, ſent a letter full of accuſations againſt the regent, and threats againſt the whole nation, if they did not renounce that alliance. No regard being paid to theſe requiſitions, Lord Dacres was ordered to proclaim upon the borders, that the Scots muſt ſtand to their peril if they did not fall in with his meaſures by the firſt of March 1522. This producing no effect, Henry ſeized the effects of all the Scots reſiding in England, and baniſhed them his dominions, after marking them, according to Biſhop Leſley, with a croſs, to diſtinguiſh them from his other ſubjects. A war was the unavoidable conſequence of theſe proceedings; and, on the 30th of April, the earl of Shrewſbury, Henry's ſteward of the houſehold, and knight of the garter, was appointed commander in chief of the army that was to act againſt the Scots; and, in the mean time, Lord Dacres made an inroad as far as Kelſo, plundering and burning wherever he came.

The regent ordered his army to rendezvous at Roſlin; but the Scots, remembering the diſaſter at Flodden, ſhowed an extreme averſion to the war, and even told the regent to his face, that though they would defend themſelves in caſe they were attacked, they would not engage in a French quarrel. The regent remonſtrated,

land. ſtrated, but without effect; and as the malecontents continued obſtinate, he was in danger of being left by himſelf, when the queen-mother interpoſed, and prevailed upon Lord Dacres to agree to a conference, the event of which was a renewal of the negotiations for peace.

389 regent to ce for ance. The regent perceiving, by the diſgrace of this expedition that he had loſt his former popularity, determined to revenge himſelf; and therefore told thoſe whom he could truſt, that he was about to return to France, from whence he ſhould bring ſuch a force by ſea and land, as ſhould render it unneceſſary for him to aſk leave of the Scots any more to invade England. Accordingly he embarked for France on the 25th of October, but publicly gave out that he would return the enſuing Auguſt.

On the regent's arrival in France, he made a demand of 10,000 foot, and 5000 horſe for carrying on the war againſt England; but the ſituation of King Francis did not then allow him to ſpare ſo many at once, though he was daily ſending over ſhips with men, ammunition and money, for the French garriſons in 390 Eng- reſolve tercept Scotland. At laſt it was publicly known in England that the regent was about to return with a ſtrong fleet, and 4000 of the beſt troops in France; upon which Henry determined, if poſſible, to intercept him. Sir William Fitz-Williams, with 36 large ſhips, was ordered to block up the French ſquadron in the harbour of Finhead; Sir Anthony Poyntz cruiſed with another in the Weſtern ſeas, as Sir Chriſtopher Dow and Sir Henry Shireburn did in the northern with a third ſquadron. The duke of Albany, being unable to cope with Fitz-Williams, was obliged to ſet out from another port with 12 ſhips, having ſome troops on board. They fell in with Fitz-Williams's ſquadron; two of their ſhips were ſunk, and the reſt driven back to Dieppe. Fitz-Williams then made a deſcent at Treport, where he burnt 18 French ſhips, and returned to his ſtation off Finhead. By this time the French had given the duke ſuch a reinforcement as made him an overmatch for the Engliſh admiral, had the men been equally good; but the regent had no dependence upon 391 utwits n, and s in land. French ſailors when put in competition with the Engliſh. Inſtead of coming to an engagement, therefore, as ſoon as Fitz-Williams appeared, he diſembarked his ſoldiers, as if he had intended to delay his expedition for that year; but a ſtorm ſoon ariſing, which obliged the Engliſh fleet to return to the Downs, the regent took that opportunity of reimbarking his men, and ſailing by the weſtern coaſts arrived ſafe in Scotland.

392 l deva- ons of Eng- All this time the earl of Surry had been carrying on the moſt cruel and deſtructive war againſt Scotland; inſomuch that, according to Cardinal Wolſey, "there was left neither houſe, fortreſs, village, tree, cattle, corn, nor other ſuccour for man," in the counties of Tweeddale and March. The regent's return did not immediately put a ſtop to theſe devaſtations; for the inteſtine diviſions in Scotland prevented him from taking the field. His party was weakened by his long abſence, and the queen-mother had been very active in ſtrengthening the Engliſh intereſt. A parliament was called in 1523, where it was debated, Whether peace or war with England ſhould be reſolved on? and the determinations of this parliament were evidently on the worſt ſide of the queſtion. Henry was at this time ſo well diſpoſed to cultivate a friendſhip with Scotland, that he offered to James his eldeſt ſiſter Mary in marriage; but the Scots animated by the appearance of their French auxiliaries, and corrupted by their gold, rejected all terms and reſolved upon war. However when the army was aſſembled, and had advanced to the borders, he found the ſame difficulty he had formerly experienced; for they flatly refuſed to enter England. With greatly difficulty he prevailed upon part of the army to paſs the Tweed; but not meeting with ſucceſs, he was obliged to return to Scotland, which at this time was divided into four factions. One of theſe was headed by the regent, another by the queen, a third by the earl of Arran, and a fourth by the earl of Angus, who had lived as an exile under Henry's protection. Had it been poſſible for the earl of Angus and his wife to have been reconciled to each other, it would have been much for the intereſt of the kingdom; but all the art even of Cardinal Wolſey could 39 The du of Alb reſigns office o gent. not effect this. At laſt the duke of Albany, finding all parties united againſt him, reſigned his office of regent of Scotland. On the 14th of March that year he went on board one of his own ſhips for France, from whence he never returned to Scotland. He did not indeed make a formal abdication of his government: ſo far from that, he requeſted the nobility, whom he convened for that purpoſe, to enter into no alliance with England during his abſence, which he ſaid would continue no longer than the firſt of September following; to make no alteration in the government; and to keep the king at Stirling.

The nobility, who were impatient for the abſence of the regent, readily promiſed whatever he required, but without any intention of performing it: nor, indeed, was it in their power to comply; for it had been previouſly determined that James himſelf ſhould now take the adminiſtration into his own hands. According to Buchanan, the regent had no ſooner returned to France than Scotland relapſed into all the miſeries of anarchy. The queen-dowager had the management of public affairs, but her power was limited. The earl of Arran, apprehending danger from the Engliſh, entered into the views of the French party. The queen-mother's diſlike to her huſband continued as great as ever, which prevented an union among thoſe who were in the Engliſh intereſt; and Wolſey took that opportunity of reſtoring the earl of Angus to all his importance in Scotland.—The queen-mother, therefore, had no other way left to keep herſelf in power, but to bring James himſelf into action. On the 29th of July, therefore, he removed from Stirling to the abbey of Holyroodhouſe: where he took upon himſelf the exerciſe of government, by convoking the nobility, and obliging them to ſwear allegiance to his perſon a ſecond time. The truce with England was now prolonged, and the queen's party carried all before them. On the very day on which the laſt truce was ſigned with England, the earl of Angus entered Scotland. He had been invited from his exile in France into England, where he was careſſed by Henry, who diſregarded all his ſiſter's entreaties to ſend him back to France, and now reſolved to ſupport him in Scotland. Yet though his declared intention in ſending the earl to Scotland was, that the latter might balance the French party there, the king enjoined him to ſue, in the moſt humble manner, for a reconciliation with

Scotla 39 Henry fers pe which rejecte 39 James upon h fell the verum 39 The ca Angus turns t Scotla

with his wife, and to co-operate with the earl of Arran, who now acted as prime minister, as long as he should oppose the French party. On his return, however, he found himself excluded from all share in the government, but soon found means to form a strong party in opposition to Arran. In the mean time, ambassadors were sent to the court of England, in order to treat of a perpetual peace between the two nations. At the same time a match was proposed between the young king of Scotland and Henry's daughter. This had originally been a scheme of Henry himself; but the emperor Charles V. had resolved to outbid him, by offering James a princess of his own family, with an immense treasure. The ambassadors arrived at London on the 19th of December, and found Henry very much disposed both to the peace and to the match. Commissioners were appointed to treat of both; but they were instructed to demand by way of preliminary, that the Scots should absolutely renounce their league with France, and that James should be sent for education to England till he should be of proper age for marriage. The Scottish commissioners declared, that they had no instructions on these points: but one of them, the earl of Cassilis, offered to return to Scotland, and bring a definitive answer from the three states; and in the mean time the truce was prolonged to the 15th of May 1525.

On his arrival at Edinburgh, he found the earl of Angus the leading man in parliament, by whose influence it was determined that the Scots should renounce their league with France, and substitute in place of it a similar league with England; and that the king should be brought up at the English court till he was of an age proper for marriage: but at the same time they required of Henry to break off all engagements with Charles V. who was the bitter enemy of Francis, and at that time detained him prisoner. To this the English monarch returned but a cold answer, being then engaged in a number of treaties with the emperor, among which was one concerning the marriage of the princess Mary with his imperial majesty himself, however, before Cassilis returned, a truce of two years and a half was concluded between England and Scotland.

But now the queen mother, though she had always been a warm advocate for an alliance between the two nations, yet disliked the means of bringing it about.—She saw her husband's party increasing every day in power; so that now she had no other resource than in keeping possession of the king's person, whom she removed to the castle of Edinburgh. Being now under the necessity of convening a parliament, it was resolved to hold it within the castle; which, being an unconstitutional measure, gave a great handle to the earl of Arran and his party to complain of the innovation. They began with remonstrances; but finding them ineffectual, they formed a blockade of the castle with 2000 men, and cut off all communication of the town by means of trenches. As no provisions could thus be got into the castle, the queen ordered some of the cannon to be turned against the town, in order to force the citizens to put an end to the blockade. Several shot were fired: but when all things appeared ready for a civil war, matters were compromised, though in such an imperfect manner as left very little room to hope for perfect tranquillity. It was agreed, that the king should remove out of the castle of Edinburgh to the palace of Holyroodhouse; from whence he should repair with all possible magnificence to his parliament, in the house where it was commonly held; and there a finishing hand was to be put to all differences. This agreement was signed on the 25th of February 1526. The parliament accordingly met, and the king's marriage with the princess of England was confirmed; but no mention was made of the king's being sent for his education into that country; on the contrary, he was committed to the care of eight lords of parliament. These were to have the custody of the king's person, every one his month successively, and the whole to stand for the government of the state; yet with this limitation, "that the king, by their counsel, should not ordain or determine any thing in great affairs to which the queen, as princess and dowager, did not give her consent." This partition of power, by giving the queen a negative in all public matters, soon threw every thing into confusion. The earl of Angus, by leading the king to various scenes of pleasure and dissipation, so gained the ascendency over him, that he became in a manner totally guided by him. The queen-mother, perceiving that she could not have access to her son, without at the same time being in company with her husband, whom she had retired suddenly with her consent to Stirling. Thus the king was left under the sole tuition of the earl of Angus, who made a very bad use of his power, engrossing into his own hands, or those of his friends, all the places of honour or profit. The archbishop of St Andrew's, having now joined the king's party, advised her to make a formal demand upon her husband, that the order of government which had been settled last parliament should take place, and that under a penalty he should set the king at liberty. To this the earl answered by a kind of manifesto drawn up by his brother; in which he declared, that "the earl of Angus having been so highly favoured by his good uncle the king of England, and that James himself being under great obligations to him, neither the queen nor the other lords need be in any pain about him, as he chose to spend his time with the earl of Angus rather than with any lord in the kingdom." James himself, however, had discernment sufficient to perceive, that, notwithstanding all the fair pretences of the earl of Angus, he was in fact no better than his prisoner; and resolved to attempt the recovery of his liberty. The earls of Argyle and Arran had for some time retired from court, where they had no share in the administration, and were living on their own estates; but the earl of Lennox dissembled his sentiments so well, that he was neither suspected by the earl of Angus, nor any of the Douglas family, who were his partizans. The king being gained upon by his insinuating behaviour, opened his mind to him, and requested his assistance against his treacherous keepers. At the same time he sent letters to his mother, and the heads of her party, by some of his domestics whom Lennox had pointed out, entreating them to remove him from the earl, and not suffer him any longer to remain under his imperious jurisdiction; adding, that if this could not be done by any other means, they should use force of arms.

On receiving this letter, the queen and her party assembled their forces at Stirling, and without loss of time began their march for Edinburgh. Angus, on the other hand, prepared to give them a warm reception,

tland.

tion, but at the ſame time to carry along with him the king. This reſolution being made known to the queen-mother, ſhe was ſo much concerned for the ſafety of her ſon, that the whole party diſbanded themſelves; and thus the authority of the earl of Angus ſeemed to be more eſtabliſhed than ever. Nothing, indeed, was now wanting to render him deſpotic but the poſſeſſion of the great ſeal, which the archbiſhop of St Andrew's had carried with him to Dunfermline. As no deed of any conſequence could be executed without this, he prevailed upon the king to demand it by a ſpecial meſſage; in conſequence of which, the archbiſhop was obliged to give it up. About this time the divorce which had been ſo long in agitation between the queen-mother and the earl of Angus actually took place; which, no doubt, increaſed the diſlike of James to his confinement, while the imprudence of Angus gave every day freſh matter of diſguſt. As Angus knew that he had no firm ſupport but in the attachment of his followers to his perſon, he ſuffered them to rob and plunder the eſtates of his opponents without mercy. Theſe, again, did not fail to make repriſals; ſo that, towards the end of the year 1526, there was ſcarcely any appearance of civil government in Scotland. Thus the court became almoſt totally deſerted; every nobleman being obliged to go home to defend his own eſtate. Even Angus himſelf ſhared in the common calamity, and hence was frequently obliged to leave the king to the cuſtody of Lenox. To this nobleman the king now made the moſt grievous complaints, and charged him to contrive ſome plan for his eſcape. Lenox accordingly recommended to him the baron of Buccleugh, who was very powerful in the ſouthern parts, and a violent enemy to Angus and the whole family of Douglas. To him he gave orders to foment the diſorders in the ſouthern parts to ſuch a degree as to require the king's perſonal preſence to compoſe them. Buccleugh was then to attack the party, and take the king by force from the Douglaſſes. This ſcheme was put in execution, but Buccleugh had the misfortune to be defeated; ſo that the attempt proved abortive, and James found himſelf in a worſe ſituation than ever. After this attempt, however as the earl of Angus could not but know that Lenox had been acceſſory to it, the former behaved towards him with ſuch viſible indifference, that Lenox openly declared againſt him, and adviſed the king to form a friendſhip with the archbiſhop of St Andrew's, in order to effect his liberty. This was accordingly done; but the intereſt of the archbiſhop and Lenox was overbalanced by that of Arran and the Hamilton family, whom the earl of Angus now drew over to his party. However, the earl of Lenox, having received powers from the king for that purpoſe, ſuddenly retired from court; and publiſhed a manifeſto, inviting all loyal ſubjects to aſſiſt him in delivering the king from confinement. In conſequence of this he was ſoon joined by a numerous army, with whom he advanced towards Edinburgh. Angus did not fail to aſſemble his adherents; and ſent orders to the inhabitants of Edinburgh to take the field, with the king at their head. The citizens immediately put themſelves under arms; but James, pretending to be indiſpoſed, Sir George Douglas, brother to the earl of Angus, made him the following ſpeech: "Sir, rather than our enemies ſhould take you from us, we will lay hold of your perſon; and ſhould you be torn in pieces in the ſtruggle, we will carry off part of your body." Upon this ſpeech, which James never forgot, he mounted his horſe and ſet forward to Linlithgow, but with a very ſlow pace; inſomuch that Sir George Douglas, afraid of not coming in time to ſuccour his brother, made uſe of many indecent expreſſions and actions to puſh James on to the field of battle. Three expreſſes arrived from the earl of Angus; the firſt informing his brother that he was about to engage with a ſuperior army; the ſecond that Angus was engaged with a diviſion of Lenox's army, commanded by the earl of Glencairn; and that Lenox himſelf was engaged with the Hamiltons. The third informed him that Lenox, if not actually defeated, was on the point of being ſo. Upon receiving this laſt news, James haſtened to the field of battle, that he might ſave Lenox, and put an end to the bloodſhed.—But he came too late: for the royal party was already defeated with great ſlaughter; and Lenox himſelf, after being wounded and taken priſoner, was murdered by Sir James Hamilton.

On the night of the battle, the king was removed to Linlithgow; and though he was under the greateſt grief for the fate of Lenox, the behaviour of the Douglaſſes ſtruck him with ſuch terror that he diſſembled his ſentiments. The earl of Angus led his victorious troops into Fife, in hopes of ſurpriſing the queen and the archbiſhop of St Andrew's. The queen, on the news of his approach, fled, with her new huſband Henry Stuart, brother to Lord Evandale, to Edinburgh, and both were admitted into the caſtle. The archbiſhop fled to the mountains, where he was obliged to keep cattle as a ſhepherd. Angus after having plundered the caſtle of St Andrew's and the abbey of Dunfermline, returned in triumph to Edinburgh, where he prepared to beſiege the caſtle; but the queen, hearing that her ſon was among the number of the beſiegers, ordered the gates of the caſtle to be thrown open, and ſurrendered herſelf and her huſband priſoners to James, who was adviſed to confine them to the caſtle. After theſe repeated ſucceſſes, the earl of Angus eſtabliſhed a kind of court of juſtice, in which he proſecuted thoſe who had oppoſed him, among whom was the earl of Caſſilis. He was offered by Sir James Hamilton, natural ſon to the earl of Arran, the ſame who had murdered Lenox, an indemnity if he would own himſelf a vaſſal of that houſe; but this condition was rejected. Being called to his trial, and accuſed of having taken arms againſt the king, a gentleman of his name and family, who was his advocate, denied the charge, and offered to produce a letter under James's own hand, deſiring him to aſſiſt in delivering him from his gaolers. This ſtriking evidence confounded the proſecutor ſo much, that the earl was acquitted; but on his return home he was way-laid and murdered by one Hugh Campbell, at the inſtigation of Sir James Hamilton.

During theſe tranſactions in the ſouth, many of the Highland clans were perpetrating the moſt horrid ſcenes of rapine and murder, which in ſome places reigned alſo in the Lowlands. The ſtate of the borders was little better than that of the Highlands; but it engaged the attention of Angus more, as he had great intereſt in theſe parts. Marching therefore, againſt the banditti which infeſted theſe parts, he ſoon reduced them to reaſon. His power ſeemed now to be firmly eſtabliſhed, inſomuch

land.

insomuch that the archbishop of St Andrew's began to treat with Sir George Douglas, to whom he offered lucrative leases and other emoluments if he would intercede with the regent, as Angus was called, in his favour. This was readily agreed to; and the archbishop was allowed to return in safety to his palace about the same time that Angus returned from his expedition against the borderers. Nothing was then seen at court but festivities of every kind, in which the queen-mother, who was now relieved from her confinement, took part: and she was afterwards suffered to depart to the castle of Stirling; which Angus, not attending to its value, had neglected to secure. In the mean time the archbishop invited the Douglasses to spend some days with him at his castle; which they accordingly did, and carried the king along with them. Here James dissembled so well, and seemed to be so enamoured of his new way of life, that Angus thought there could be no danger in leaving him in the hands of his friends till he should return to Lothian to settle some public as well as private affairs. Having taken leave of the king, he left him in the custody of his uncle Archibald, his brother Sir George, and one James Douglas of Parkhead, who was captain of the guards that watched his majesty on pretence of doing him honour. The earl was no sooner gone than the archbishop sent an invitation to Sir George Douglas, desiring him to come to St Andrew's, and there put the last hand to the leases, and finish the bargains that had been spoken of between them. This was so plausible, that he immediately set out for St Andrew's; while his uncle the treasurer went to Dundee, where he had an amour. James thinking this to be the best opportunity that ever presented to him for an escape, resolved to avail himself of it at all events; and found means, by a private message, to apprise his mother of his design. It was then the season for hunting and diversion, which James often followed in the park of Falkland; and calling for his forrester, he told him, that as the weather was fine, he intended to kill a stag next morning, ordering him at the same time to summon all the gentlemen in the neighbourhood to attend him with their best dogs. He then called for his chief domestics, and commanded them to get his supper early, because he intended to be in the field by day-break; and he talked with the captain of his guard of nothing but the excellent sport he expected next morning. In the mean time, he had engaged two young men, the one a page of his own, the other John Hart, a helper about his stables, to attend him in his flight, and to provide him with the dress of a groom for a disguise. Having formally taken leave of his attendants, charging them to be ready early in the morning, and being left alone, he stole softly out of his bed-chamber, went to the stable unperceived by the guards, dressed himself in his disguise; and he and his companions mounting the three best horses there, galloped to Stirling castle; into which, by the queen's appointment, he was admitted soon after day-break. He commanded all the gates to be secured; and the queen having previously prepared every thing for a vigorous defence, orders were given that none should be admitted into the castle without the king's permission.

About an hour after the king escaped from Falkland, Sir George Douglas returned; and being assured that his majesty was asleep, he went to bed. It appears that James had been seen and known in his flight; for in the morning the bailiff of Abernethy came post-haste to inform Sir George that the king had passed Stirling bridge. They had, however, some glimmering hope that the king might be gone to Bambrigh: but that surmise was soon found to be false; and an express was despatched, informing Angus of all that had happened. The earl quickly repaired to Falkland, where he and his friends came to a resolution of going to Stirling, and demanding access to the king.

James by this time had issued letters to the earls of Huntley, Argyll, Athol, Glencairn, Menteith, Rothes, and Eglinton; the lords Graham, Levingston, Lindsay, Sinclair, Ruthven, Drummond, Evandale, Maxwell, and Semple. Before all of them could arrive at Stirling, the earl of Angus and his friends were upon their journey to the same place; but were stopped by a herald at arms, commanding them on their allegiance not to approach within six miles of the king's residence. This order having sufficiently intimated what they were to expect, the earl deliberated with his party how to proceed. Some of them were for marching on and taking the castle by surprise: but that was found to be impracticable, especially as they had no artillery. The earl and his brother therefore resolved to make a show of submission to the king's order; and they accordingly went to Linlithgow. By this time all the nobility already mentioned, and many others, had assembled at Stirling; and James, calling them to council, inveighed against the tyranny of the Douglasses with an acrimony that sufficiently discovered what pain it must have given him when he was obliged to bear it in silence. He concluded his speech with these words: "Therefore I desire, my lords, that I may be satisfied of the said earl, his kin, and friends. For I vow that Scotland shall not hold us both, while I be revenged on him and his."

The result of the council's deliberation was, that a proclamation should be made, renewing the order for the Douglasses not to approach the court, and divesting the earl of Angus and his brother of all their public employments. In the mean time, such was the moderation of the assembly, that by their advice James ordered the earl to retire to the north of the Spey till his pleasure should be known; but his brother was commanded to surrender himself a prisoner in the castle of Edinburgh, to take his trial in a very full parliament (all the members being summoned to attend), to be held in that city next September. The earl and his brother considered their compliance with those conditions as a prelude to their destruction; and resolved to justify their treasons by still greater excesses, in surprising the town of Edinburgh, and holding it against the king and parliament, before the latter could assemble. Historians have not done that justice to the proceedings of the royal party on this occasion which they deserve. The management of the king's escape, his reception into Stirling, the fortifying that castle, and the ready obedience of his great nobility, some of whom attended him with their followers before they received any summonses for that purpose, are proofs of wise and spirited deliberations. Their conduct at this time was equally consistent with the same plan of foresight.

It was naturally to be supposed that the Douglasses, who remained assembled in a numerous body, would

make the attempt already mentioned; but the royalists had the precaution to deſpatch the Lord Maxwell and the baron of Lochinvar, with a body of troops, to take poſſeſſion of the town, till James could arrive with 2000 forces to their relief. Maxwell and Lochinvar made ſuch deſpatch, that they were in poſſeſſion of the town when the Douglaſſes appeared before it, and repulſed them; while a moſt terrible ſtorm had ſcattered the troops under James before he could come to their aſſiſtance, ſo effectually, that, being left almoſt without attendants, his perſon might have been taken by the ſmalleſt party of the enemy. Upon the retreat of the Douglaſſes from Edinburgh, the parliament met; and none of them appearing in purſuance of their ſummons, the earl of Angus, his brother Sir George Douglas, his uncle Archibald Douglas, and Alexander Drummond of Carnock, with ſome of their chief dependents, were indicted and forfeited for the following offences: "The aſſembling of the king's lieges, with intention to have aſſailed his perſon; the detaining of the king againſt his will and pleaſure, and contrary to the articles agreed upon, for the ſpace of two years and more; all which time the king was in fear and danger of his life.' We know of no advocate for the earl and his friends but one Banantyne, who had the courage to plead their cauſe againſt thoſe heinous charges; and ſo exaſperated were both the king and parliament againſt them, that the former ſwore he never would forgive them, and the latter that they never would intercede for their pardon. Thus it was not deemed ſufficient ſimply to declare their reſolutions; but the ſolemnity of oaths was added with an intention to diſcourage the king of England from continuing the vigorous applications he was every day making, by letters and otherwiſe, for the pardon of Angus; and to ſhut out all hopes of that kind, James created his mother's third huſband (to whom ſhe had been married for ſome time) Lord Methven, and gave him the direction of his artillery.

The diſgrace and forfeiture of the Douglaſſes having created many vacancies in the ſtate, Gavin Dunbar, archbiſhop of Glaſgow, and tutor to the king, was nominated lord chancellor, though but indifferently qualified for a poſt that ought to have been filled by an able ſtateſman; and Robert Carncroſs, a perſon (ſays Buchanan) more eminent for wealth than virtue, was made treaſurer: but this laſt was ſoon after diſplaced, being ſuſpected of favouring the Douglaſſes; and Robert Barton, one of the king's favourites, was appointed to ſucceed him. The Douglaſſes ſtill kept their arms; and being joined by a great number of outlaws and robbers in the ſouth, they ravaged all the lands of their enemies, carrying their devaſtations to the very gates of Edinburgh. A commiſſion of lieutenancy was offered to the earl of Bothwell to act againſt thoſe rebels: but he declining it, it was accepted by the earl of Argyll and Lord Hume, who did great ſervice in protecting the country from the outlaws. Several villages, however, in the neighbourhood of Edinburgh, were burnt; and all the proviſions the Douglaſſes could find were carried off to their caſtle of Tantallon, which now ſerved as their head-quarters, and was threatened with a ſiege.

It is remarkable, that the caſtle of Dunbar remained ſtill in the hands of the duke of Albany's garriſon, who recognized no maſter but him. The place was well ſtored with artillery of all kinds; and lying in the neighbourhood of Tantallon, it was eaſy to tranſport them to the ſiege: but James thought he had no right to make uſe of them without the conſent of one Maurice, governor of the caſtle. Having ſummoned, by proclamation, the inhabitants of Fife, Angus, Strathern, Stirlingſhire, Lothian, Merſe, and Teviotdale, to be ready to compear at Edinburgh on the 10th of December, with 40 days victuals, to aſſiſt in the ſiege; he ſent three noblemen to borrow artillery from Maurice, and to remain as pledges for the ſafe redelivery of the ſame; and the ſeveral pieces required were accordingly ſent him. This delicacy is the more remarkable, as we are told that the duke of Albany had given orders that every thing in his caſtle ſhould be at the king's ſervice. However unanimous the parliament might appear againſt the Douglaſſes, yet James was but ill-ſeconded in this attempt. The unfortunate, if ſeverely proceeded againſt, generally find friends; and the enemies of the Douglaſſes had impolitically rendered it treaſonable for any perſon to ſhelter or protect the earl of Angus, his kinſmen, or followers. This proceeding, in a country where the Douglaſſes had ſo many connexions, carried with it an appearance of cruelty and a thirſt of revenge, eſpecially as James had choſen ſuch a ſeaſon of the year for carrying on the ſiege. In ſhort, after battering the place for ſome days, and loſing one Falconer, his chief engineer, the king was obliged to abandon his enterpriſe, or rather to turn the ſiege into a blockade, with no great credit to his firſt eſſay in the field. Some hiſtorians intimate, that Angus found means to corrupt the other engineers; but we find, that before this time, a negotiation was going forward between James and the king of England; the nature of which proves that the former was now rendered more placable towards the Douglaſſes, and was the true reaſon why the ſiege was ſuſpended.

The truce between Scotland and England was now near expiring; and Henry, under that pretence, gave a commiſſion to the prior of Durham, Thomas Magnus, Sir Anthony Ughtred captain of the town and caſtle of Berwick, William Frankelyn chancellor of Durham, and Sir Thomas Tempeſt. James ſeems to have been in no haſte to enter upon this negotiation, becauſe he underſtood that the Engliſh commiſſioners were privately inſtructed to inſiſt upon the Douglaſſes being reſtored to their eſtates and dignities. England was at that time the principal ally of Francis againſt the emperor; and this gave a handle for Francis to interpoſe ſo far in favour of the Douglaſſes, that he brought James to conſent to a preliminary negotiation for their obtaining at leaſt a ſecure retreat in England. This was at laſt complied with.

James being now delivered from all dread of the Douglaſſes, and under no controul from any party, ſhowed excellent diſpoſitions for government. Finding that the borderers were by no means pleaſed with the late treaty, and that they were renewing their depredations, he reſolved to ſtrike at the root of an evil which had ſo long proved diſgraceful and dangerous to his anceſtors, by giving no quarter to the chiefs of theſe robbers, whoſe principal reſidence was in Liddeſdale. This was the more neceſſary, as their daring attempts had exaſperated the Engliſh ſo much, that they had actually burnt a town in Teviotdale; and they had killed one Robert

Kerr.

nd. Kerr, a man of ſome conſequence. Two of the chiefs of the Scotch borderers were Cockburn of Kenderlaw, and Adam Scot, commonly called *king of the thieves*. Both of them were barons; and had been ſo inured to the practice, that they thought there was no crime in robbing: they therefore appeared publicly in Edinburgh; where James ordered them to be apprehended, tried, and hanged. He next proceeded with great firmneſs againſt many noblemen and principal gentlemen, who were only ſuſpected of being diſaffected to the late peace. All of them had behaved with great loyalty, and ſome of them had done him the moſt important ſervices. Of this number were the earl of Hume, the lord Maxwell, with the barons of Buccleugh, Farniherſt, Polwart, Johnſton, and Mark Kerr. Though we know nothing particularly of what was laid to the charge of thoſe noblemen and gentlemen, yet ſo zealous was James for the impartial adminiſtration of juſtice, that he ordered them all, with many other chief gentlemen of the borders, to be ſent to priſon; where they lay till they entered into recognizances themſelves, and found bail for their good behaviour.

Of all the party of the Douglaſſes, none of any note excepting Alexander Drummond of Carnock was ſuffered to return home, at the earneſt requeſt of the ambaſſadors and the treaſurer Barton. This lenity was of very little conſequence; for James having appointed the earl of Murray to be ſole warden of the Scotch marches, with power to treat with the earl of Northumberland, their conferences had broken off on account of freſh violences happening every day; and ſome information he had received from them, had prevailed with James to impriſon the noblemen and gentlemen we have already mentioned. He now reſolved to attempt in perſon what his predeceſſors and he had ſo often failed in by their deputies. As he was known to be violently addicted to hunting, he ſummoned his nobility, even on the north of the Forth, to attend him with their horſes and dogs; which they did in ſuch numbers, that his hunting retinue conſiſted of above 8000 perſons, two-thirds of whom were well armed. This preparation gave no ſuſpicion to the borderers, as great hunting matches in thoſe days commonly conſiſted of ſome thouſands; and James having ſet out upon his diverſion, is ſaid to have killed 540 deer. Among the other gentlemen who had been ſummoned to attend him, was John Armſtrong of Gilnockhall. He was the head of a numerous clan, who lived with great pomp and ſplendour upon the contributions under which they laid the Engliſh on the borders. He was himſelf always attended by twenty-ſix gentlemen on horſeback, well mounted and armed, as his body guards. Having received the king's invitation, he was fond of diſplaying his magnificence to his ſovereign; and attiring himſelf and his guard more pompouſly than uſual, they preſented themſelves before James, from whom they expected ſome particular mark of diſtinction for their ſervices againſt the Engliſh, and for the remarkable protection they had always given to their countrymen the Scots. On their firſt appearance, James, not knowing who he was, returned Armſtrong's ſalute, imagining him to be ſome great nobleman; but upon hearing his name, he ordered him and his followers to be immediately apprehended, and ſentenced them to be hanged upon the ſpot. It is ſaid that James, turning to his attendants, aſked them, pointing to Armſtrong, "What does that knave want that a king ſhould have, but a crown and a ſword of honour?" Armſtrong begged hard for his life; and offered to ſerve the king in the field with forty horſemen, beſides making him large preſents of jewels and money, with many other tempting offers. Finding the king inexorable, "Fool that I am (ſaid he) to look for warm water under ice, by aſking grace of a graceleſs face;" and then he and his followers ſubmitted to their fate. Thoſe and ſome other executions of the ſame kind reſtored peace to the borders. Scotl

HITHERTO we have conſidered only the civil tranſactions of Scotland; but henceforth religion will claim a conſiderable ſhare of the hiſtorian's attention. The opinions of Luther had been propagated in Britain ſoon after his preaching in 1517. They had for ſome years inſenſibly gained ground; and, at the time the contentions began between James and his nobility, were become formidable to the eſtabliſhed religion. We have ſeen how James eſcaped from the hands of his nobles by means of the archbiſhop of St Andrew's. To the clergy, therefore, he was naturally favourable; and as they of neceſſity oppoſed the Reformation, James became a zealous perſecutor of the reformed. On the other hand, the nobility having already oppoſed the king and clergy in civil affairs, did ſo likewiſe in thoſe of religion. The clergy finding themſelves unequal in argument, had recourſe to more violent methods. Rigorous inquiſitions were made after heretics, and fires were everywhere prepared for them. 42 Accou the R natio 4 Why favou the c

The firſt perſon who was called upon to ſuffer for the reformed religion was Patrick Hamilton, abbot of Ferne. At an early period of life he had been appointed to this abbacy; and having imbibed a favourable idea of the doctrines of Luther, he had travelled into Germany, where, becoming acquainted with the moſt eminent reformers, he was fully confirmed in their opinions. Upon his return to Scotland, he ventured to expoſe the corruptions of the church, and to inſiſt on the advantages of the tenets which he had embraced. A conduct ſo bold, and the avidity with which his diſcourſes were received by the people, gave an alarm to the clergy. Under the pretence of a religious and friendly conference, he was ſeduced to St Andrew's by Alexander Campbell, a Dominican friar, who was inſtructed to remonſtrate with him on the ſubject of the Reformation. The converſations they held only ſerved to eſtabliſh the abbot more firmly in his ſentiments, and to inflame his zeal to propagate them. The archbiſhop of St Andrew's, the archbiſhop of Glaſgow, and other dignitaries of the church, conſtituting a court, called him to appear before them. 4 Mart dem trick milto

The abbot neither loſt his courage nor renounced his opinions. He was convicted accordingly of heretical pravity, delivered over to the ſecular arm, and executed in the year 1527 (N). This reformer had not attained the

(N) His tenets were of the following import, and are enumerated in the ſentence pronounced againſt him. "Man

and. the 24th year of his age. His youth, his virtue, his magnanimity, and his ſufferings, all operated in his favour with the people. To Alexander Campbell, who inſulted him at the ſtake, he objected his treachery, and cited him to anſwer for his behaviour before the judgement-ſeat of Chriſt. And this perſecutor, a few days after, being ſeized with a frenzy, and dying in that condition, it was believed with the greater ſincerity and confidence, that Mr Hamilton was an innocent man and a true martyr.

3 ge- ndig- A deed ſo affecting, from its novelty and in its circumſtances, excited throughout the kingdom an univerſal curioſity and indignation. Minute and particular inquiries were made into the tenets of Mr Hamilton. Converts to the new opinions were multiplying in every quarter, and a partiality to them began to prevail even among the Romiſh clergy themſelves. Alexander Seton, the king's confeſſor, took the liberty to inveigh againſt the errors and abuſes of Popery; to neglect, in his diſcourſes, all mention of purgatory, and pilgrimages, and ſaints; and to recommend the doctrines of the reformed. What he taught was impugned; and his boldneſs riſing with contradiction, he defended warmly his opinions, and even ventured to affirm, that in Scotland there were no true and faithful biſhops, if a judgement of men in this ſtation is to be formed from the virtues which St Paul has required of them. A ſarcaſm ſo juſt, and ſo daring, inflamed the whole body of the prelacy with reſentment. They ſtudied to compaſs his deſtruction: and, as Mr Seton had given offence to the king, whom he had exhorted to a greater purity of life, they flattered themſelves with the hope of conducting him to the ſtake; but, being apprehenſive of danger, he made his eſcape into England.

4 For- rut; In 1533, Henry Forreſt, a Benedictine friar, who diſcovered a propenſity to the reformed doctrines, was not ſo fortunate. After having been impriſoned for ſome time in the tower of St Andrew's, he was brought to his trial, condemned, and led out to the flames. He had ſaid, that Mr Hamilton was a pious man, and a martyr; and that the tenets for which he ſuffered might be vindicated. This guilt was aggravated by the diſcovery that Friar Forreſt was in poſſeſſion of a New Teſtament in the Engliſh language; for the prieſts eſteemed a careful attention to the Scriptures to be an infallible ſymptom of hereſy. A cruelty ſo repugnant to the common ſenſe and feelings of mankind, while it pleaſed the inſolent pride of the eccleſiaſtics, was deſtroying their importance, and exciting a general diſpoſition in the people to adopt in the fulleſt latitude the principles and ſentiments of the reformed.

The following year, James Beaton archbiſhop of St Andrew's, though remarkable for prudence and moderation, was overawed by his nephew and coadjutor David Beaton, and by the clergy. In his own perſon, or by commiſſion granted by him, perſecutions were carried on with violence. Many were driven into baniſhment, and many were forced to acknowledge what they did not believe. The more ſtrenuous and reſolute were delivered over to puniſhment. Among theſe were two private gentlemen, Norman Gourlay and David Straton. They were tried at Holyroodhouſe before the biſhop of Roſs; and refuſing to recant, were condemned. King James, who was preſent, appeared exceedingly ſolicitous that they ſhould recant their opinions; and David Straton, upon being adjudged to the fire, having begged for his mercy, was about to receive it, when the prieſts proudly pronounced, that the grace of the ſovereign could not be extended to a criminal whom their law and determination had doomed to ſuffer. Scotla 425 as alſo Gourla and Str ton;

A few years after, the biſhops having aſſembled at Edinburgh, two Dominician friars, Killor and Beverage, with Sir Duncan Sympſon a prieſt, Robert Forreſter a gentleman of Stirling, and Thomas Forreſt vicar of Dolour in Perthſhire, were condemned to be conſumed in the ſame fire. 426 with ſe ral oth

At Glaſgow, a ſimilar ſcene was acted in 1539: Hieronymus Ruſſel a gray-friar, and a young gentleman of the name of Kennedy, were accuſed of hereſy before the biſhop of that ſee. Ruſſel, when brought to the ſtake, diſplayed a deliberate demeanour, reaſoned gravely with his accuſers, and was only anſwered with reproaches. Mr Kennedy, who was not yet 18 years of age, ſeemed diſpoſed to diſavow his opinions, and to ſink under the weight of a cruel affliction; but the exhortation and example of Ruſſel awakening his courage, his mind aſſumed a firmneſs and conſtancy, his countenance became cheerful, and he exclaimed with a joyful voice, "Now, I defy thee, Death; I praiſe my God, I am ready."

427 Promot of Card Beaton.

James Beaton, the archbiſhop of St Andrew's, having died about this time, the ambition of David Beaton, his coadjutor, was gratified in the fulleſt manner. He had before been created a cardinal of the Roman church, and he was now advanced into the poſſeſſion of the primacy of Scotland. No Scottiſh eccleſiaſtic had been ever inveſted with greater authority; and the reformers had every thing to fear from ſo formidable an enemy. The natural violence of his temper had fixed itſelf in an overbearing inſolence, from the ſucceſs which had attended him. His youth had been paſſed in ſcenes of policy and intrigue, which, while they communicated to him addreſs and the knowledge of men, corrupted altogether the ſimplicity and candour of his mind. He was dark, deſigning, and artificial. No principles of juſtice were any bar to his ſchemes; nor did his heart open to any impreſſions of pity. His ruling paſſion was an inordinate love of power; and the ſupport of his conſequence depending alone upon the church of Rome, he was animated to maintain its ſuperſtitions with the warmeſt zeal. He ſeemed to take a delight in perfidiouſneſs and diſſimulation: he had no religion; and he was ſtained with an inhuman cruelty, and 428 His cha ter.

"Man hath no free-will. Man is in ſin ſo long as he liveth. Children, incontinent after their baptiſme, are ſinners. All Chriſtians, that be worthie to be called Chriſtians, do know that they are in grace. No man is juſtified by works, but by faith only. Good works make not a good man, but a good man doth make good works. And faith, hope, and charity, are ſo knit, that he that hath the one hath the reſt; and he that wanteth the one of them wanteſt the reſt." *Keith, Hiſt. of the Church and State of Scotland, Appendix*, p. 3.

land. and the moſt open profligacy of manners. In connection with theſe defects, he poſſeſſed a perſevering obſtinacy in purſuing his meaſures, the ability to perceive and to practiſe all the arts which were neceſſary to advance them, and the allurements of oſtentation and prodigality.

He was ſcarcely inveſted in the primacy, when he exhibited an example of his taſte for magnificence, and of his averſion to the reformed. He proceeded to St Andrew's with an uncommon pomp and parade. The earls of Huntley, Arran, Mariſchal, and Montroſe, with the lords Fleming, Lindſey, Erſkine, and Seton, honoured him with their attendance; and there appeared in his train, Gavin archbiſhop of Glaſgow and lord high chancellor, four biſhops, ſix abbots, a great many private gentlemen, and a vaſt multitude of the inferior clergy. In the cathedral church of St Andrew's, from a throne erected by his command, he harangued concerning the ſtate of religion and the church, to this company, and to a crowd of other auditors. He lamented the increaſe of heretics: he inſiſted upon their audacity and contempt of order; he ſaid, that even in the court of the ſovereign too much attention was ſhown to them; and he urged the ſtrong neceſſity of acting againſt them with the greateſt rigour. He informed this aſſembly, that he had cited Sir John Borthwick to appear before it, for maintaining tenets of faith hoſtile to the church, and for diſperſing heretical books; and he deſired that he might be aſſiſted in bringing him to juſtice. The articles of accuſation (o) were accordingly read againſt him; but he neither appeared in his own perſon, nor by any agent or deputy. He was found, notwithſtanding, to be guilty; and the cardinal, with a ſolemnity calculated to ſtrike with awe and terror, pronounced ſentence againſt him. His goods and eſtate were confiſcated; a painted repreſentation of him was burned publicly, in teſtimony of the malediction of the church, and as a memorial of his obſtinacy and condemnation. It was ordained, that in the event of his being apprehended, he ſhould ſuffer as a heretic, without hope of grace or mercy. All Chriſtians, whether men or women, and of whatever degree or condition, were prohibited from affording him any harbour or ſuſ-

29 ohn wick ached.

tenance. It was declared, that every office of humanity, comfort, and ſolacement, extended to him, ſhould be conſidered as criminal, and be puniſhed with confiſcations and forfeitures. Sec

Sir John Borthwick having been appriſed of his danger, fled into England; where he was kindly received by Henry VIII. who employed him in negotiations with the Proteſtant princes of Germany. Cardinal Beaton perceived with concern that this act of ſeverity did not terrify the people. New defections from the church were announced to him. Andrew Cunningham ſon to the maſter of Glencairn, James Hamilton brother to Patrick Hamilton the martyr, and the celebrated George Buchanan the hiſtorian, were impriſoned upon ſuſpicions of hereſy; and, if they had not found means to eſcape, muſt have died at the ſtake. In this declining condition of Popery, the cardinal held many mournful conſultations with the biſhops. All their intrigues and wiſdom were employed to deviſe methods to ſupport themſelves. The project of an inquiſitorial court was conceived, and exhibited a diſtant view of the extirpation of heretics. To erect this tribunal, they allured James V. with the hopes of the confiſcations and ſpoils, which might enrich him, from the perſecution and puniſhment of the reformed. He yielded himſelf to their ſolicitations, and gave them the ſanction of his authority. He f to E land.

A formal commiſſion was granted, conſtituting a court of inquiry after heretics, and nominating for its preſident Sir James Hamilton of Fennard, natural brother to the earl of Arran. The officious aſſiduity of this man, his ambition, and his thirſt of blood, were acceptable in a high degree to the clergy; and to this bad eminence their recommendation had promoted him. Upon the ſlighteſt ſuſpicion he was allowed to call any perſon before him, to ſcrutinize into his creed, and to abſolve or to condemn him. A tribunal ſo dreadful could not have found a director more ſuited to it. He was in haſte to fill the priſons of the kingdom with culprits, and was marking down in liſts the names of all thoſe to whom hereſy was imputed by popular report, and whom the arts of malicious men had repreſented as the objects of correction and puniſhment. But, while he was brood- Sir J Ham appo a kin inqu

ing.

(o) They are preſerved by Archbiſhop Spotiſwood, and diſplay great liberality of mind, in a period when philoſophy may be ſaid to have been unknown in Scotland. They are thus detailed by this judicious writer:—

1. "That he held the pope to have no greater authority over Chriſtians than any other biſhop or prelate had.

2. "That indulgences and pardons granted by the pope were of no force nor effect, but deviſed to abuſe people, and deceive poor ignorant ſouls.

3. "That biſhops, prieſts, and other clergymen, may lawfully marry.

4. "That the hereſies, commonly called *hereſies of England*, and their new liturgy, were commendable, and to be embraced of all Chriſtians.

5. "That the people of Scotland are blinded by their clergy, and profeſſed not the true faith.

6. "That churchmen ought not to enjoy temporalties.

7. "That the king ought to convert the rents of the church into other pious uſes.

8. "That the church of Scotland ought to be governed after the manner of the Engliſh.

9. "That the canons and decrees of the church were of no force, as being contrary to the law of God.

10. "That the orders of the friars and monks ſhould be aboliſhed, as had been done in England.

11. "That he did openly call the pope *ſimoniac*, for that he ſold ſpiritual things.

12. "That he did read heretical books, and the New Teſtament in Engliſh, and ſome other treatiſes written by Melancthon, Oecolampadius, and Eraſmus, which he gave likewiſe unto others.

13. "The laſt and greateſt point was, that he refuſed to acknowledge the authority of the Roman ſee, or be ſubject thereunto." *Hiſt. of the Church*, p. 70.

land. ing over miſchief, and multiplying in fancy the triumphs of his wickedneſs, an unexpected turn of affairs preſented himſelf in the light of a criminal, and conducted him to the ſcaffold.

432 jects rum of rick milton's cher. The brother of Mr Hamilton, the martyr, to avoid perſecution, had been obliged to go into baniſhment; but, by the intercеſſion of his friends, he was permitted to return for a ſhort time to his own country, that he might regulate the affairs of his family. He was connected with Sir James Hamilton; and, truſting to the ties of blood, ventured to prolong his ſtay beyond the period allotted to him. This treſpaſs was trivial. Sir James Hamilton, being willing to give a ſignal example of ſeverity, and by this means to ingratiate himſelf the more with the prieſthood, took the reſolution to make his own relation the firſt victim of his power. Mr Hamilton, attentive to his perſonal ſecurity, and not unacquainted with the moſt private machinations of this inquiſitor, deſpatched his ſon to the

433 whom s accu- of trea- king, who was about to paſs the Forth in a barge, and entreated him to provide for his ſafety, as Sir James Hamilton had conſpired with the houſe of Douglas to aſſaſſinate him. James V. being at variance with the houſe of Douglas, had reaſons of ſuſpicion, and was diſpoſed to believe every thing that is moſt flagitious of Sir James Hamilton. He inſtructed the young gentleman to go with expedition to Edinburgh, and to open the matter to the privy council; and that he might be treated with the greater reſpect, he furniſhed him with the ring which he was accuſtomed to lend to them upon thoſe important occaſions which required their addreſs and activity. Sir James Hamilton was apprehended and impriſoned. An accuſation of having deviſed and attempted the king's death at different times, was preferred againſt him. His defence appeared to be weak and unſatisfactory. A jury,

434 ndemn- and exe- ed. which conſiſted of men of rank and character, pronounced him guilty; and, being condemned to ſuffer the death of a traitor, he loſt his head, and the quarters of his body were expoſed upon the gates of the city of Edinburgh. The clergy, who could not prevent his trial and execution, regretted his death, but did not think of appointing a ſucceſſor to him in their court of inquiſition.

In other reſpects, however, James ſhowed great concern for the welfare of his people. Being diſſatisfied with the ordinary adminiſtration of juſtice, he had recourſe to the parliament of Paris for a model of the like inſtitution in Scotland. Great objections lay to juries in civil matters, and to ambulatory courts of ju-

435 nes re- ates the rts of tice. ſtice. The authority of the heritable juriſdictions was almoſt excluſive of all law; for though the king might preſide in them, yet he ſeldom did; and appeals before the council were diſagreeable and expenſive. The inſtitution of lords of the articles threw too much weight into their ſcale, as no buſineſs could be tranſacted in parliament but what they allowed of and prepared; and it was always in the power of the crown to direct them as the king pleaſed. The true ſource of the public grievances in matters of property, lay in the diſregard ſhown to the excellent acts which had paſſed during the reigns of the three firſt James's, and which had not been ſufficiently ſupported in the late reigns. The evil had gathered ſtrength during the minority of James V.; and he reſolved to eſtabliſh a ſtanding jury for all matters of law and equity (for, properly ſpeaking, the court of ſeſſion in Scotland is no other), with a preſident, who was to be the mouth of the aſſembly. On the 13th of May, this year, as we find by a curious manuſcript in the Britiſh muſeum, the lords of the articles laid before the parliament the propoſition for inſtituting this court, in the following words: "Item, anent (concerning) the ſecond artickel concerning the order of juſtice; becauſe our ſovereign lord is maiſt deſirous to have an permanent order of juſtice for the univerſal of all his liege; and therefore tendis to inſtitute an college of cunning and wiſe men for doing and adminiſtration of juſtice in all civil actions: and therefore thinke to be choſen certain perſons maiſt convenient and qualified yair (there), to the number of fifteen perſons, half ſpiritual, half temporal, with an preſident."

In the year 1533, hoſtilities were recommenced with England; but after ſome ſlight incurſions on both ſides, a truce again took place. The moſt remarkable tranſactions of theſe years, however, next to the religious perſecutions already mentioned, were the negotiations for the king's marriage. Indeed, there is ſcarce any monarch mentioned in hiſtory who ſeems to have had a greater variety of choices, or who was more difficult to be pleaſed. The ſituation of affairs on the continent of Europe, had rendered Scotland a kingdom of great conſequence, as holding the balance between France, England, and the emperor of Germany; and each of the rival powers endeavoured to gain the favour of James, by giving him a wife.—In 1534, King Francis offered him his daughter; and the match was ſtrongly recommended by the duke of Albany, who was ſtill living in France, and ſerved James with great fidelity. The ſame year the Imperial ambaſſador arrived in Scotland, and preſented, in the name of his maſter, the order of the Golden Fleece to James, who had already been inveſted with that of St Michael by Francis. At the ſame time, he offered him his choice of three princeſſes; Mary of Auſtria, the emperor's ſiſter, and widow of Lewis king of Hungary; Mary of Portugal, the daughter of his ſiſter Eleonora of Auſtria; or Mary of England, the daughter of Catharine and Henry. Another condition, however, was annexed to this propoſal, viz. that, to ſuppreſs the hereſies of the time, a council ſhould be held for obviating the calamities which threatened the Chriſtian religion. Thoſe propoſals would have met with a more ready acceptance from James, had not his clergy, at this time, been diſguſted with Charles, for allowing too great a latitude to the Proteſtants of Germany. James, in his anſwer, returned the emperor his acknowledgments in the moſt polite terms, for the ſplendid alliances he had offered him. He touched the propoſal of the council as being a meaſure rather to be wiſhed for than hoped, becauſe it ought to be free and holy, and upon the model of the firſt councils; its members conſiſting of the moſt charitable, quiet, and diſintereſted part of the clergy. He ſaid, that if ſuch a council could be obtained, he would willingly ſend eccleſiaſtics to it; but if not, that every prince ought to reform the errors of doctrine, and the faults of the clergy, within his own dominions. He bewailed the obſtinate conduct of his uncle in his divorce and marriage; and offered his beſt offices for effecting a reconciliation between him and the emperor, wiſhing

wiſhing that all the princes of Chriſtendom would unite their arms againſt their common enemy the Turks. He hinted, very juſtly, that his Imperial majeſty had offered more than he could perform, becauſe his couſin, Mary of England, was not at his diſpoſal. The ambaſſador replied, that his maſter, if perſuaſions failed, would compel Henry by force of arms to reſign her. James anſwered this ridiculous declaration by obſerving, that the emperor then would be guilty of a breach of all laws both divine and human; that it would be impolitic to give a preference to any of the three princeſſes, all of them being ſo illuſtrious and deſerving; but, to ſhow how much he valued an alliance with his Imperial majeſty, he would become a ſuppliant to that prince for his niece, daughter to Chriſtiern king of Denmark, to become his bride. The ambaſſador's anſwer to this unexpected requeſt was, that ſhe was already betrothed to the count palatine, and that before that time the marriage was probably conſummated.

But whether the Imperial ambaſſador had any right to offer the Engliſh princeſs or not, it is agreed by moſt hiſtorians, that he was offered either Mary or Elizabeth by their father Henry himſelf. To Mary of Bourbon, the daughter of the duke of Vendoſme, he is ſaid to have been contracted; but for ſome reaſon or other all theſe matches were broken off; and the king at laſt went to France, where he married Magdalen the eldeſt daughter of Francis. The nuptials were celebrated at Paris in the year 1537, with great magnificence; and among other things ſerved up by way of deſſert at the marriage feaſt, were a number of covered cups filled with pieces of gold and gold duſt, the native product of Scotland, which James diſtributed among the gueſts. This gold was found in the mines of Crawford-moor, which were then worked by the Germans. In the beginning of May, the royal pair embarked for Leith, under convoy of four large ſhips of war, and landed on the 28th of the ſame month. The joy of the Scots was inexpreſſible, but it was of ſhort continuance; for the young queen died of a fever on the 22d of July the ſame year.

King James did not long remain a widower; for the ſame year he ſent Beaton abbot of Arbroath, to treat of his ſecond marriage with a French lady, Mary of Guiſe, ducheſs-dowager of Longueville. In this he was rivalled by his uncle Henry VIII. but not before James had been contracted to her. But this was nothing to Henry; for he not only inſiſted upon having this lady for his wife, but threw out ſome menaces againſt Francis, becauſe he would not comply with this unjuſtifiable requeſt. In January 1538, ſhe was married to James, and eſcorted to Scotland by the admiral of France with a conſiderable ſquadron; both James and Francis being ſuſpicious that Henry would make ſome attempt to intercept the royal bride. But nothing of this kind happened, and ſhe landed ſafely at Fifeneſs; from whence ſhe was conducted to the king at St Andrew's.

But while James appeared thus to be giving himſelf up to the pleaſures of love, he was in other reſpects ſhowing himſelf a bloody tyrant. Some differences ſubſiſted between the families of Gordon and Forbes in the north. The heir of the houſe laſt mentioned had been educated in a looſe diſſipated manner, and kept company with a worthleſs fellow named Strahan. Having refuſed this favourite ſomething he had aſked, the latter attached himſelf to Gordon earl of Huntley, who, it is ſaid, aſſiſted him in forming a charge of treaſon againſt Forbes. He was accuſed of intending to reſtore the Douglaſſes to their forfeited eſtates and honours; which improbable ſtory being ſupported by ſome venal evidences, the unhappy young man was condemned and executed as a traitor. The king could not but ſee the injuſtice of this execution; and, in order to make ſome amends for it, baniſhed Strahan the kingdom. The following execution, which happened a few days after, was much more inhuman, inſomuch that it would have ſtained the annals even of the moſt deſpotic tyrants. The earl of Angus, finding that he could not regain the favour of the king, had recourſe to the method uſual in thoſe days, viz. the committing of depredations on the borders. This crime was ſufficient with James to occaſion the death of his innocent ſiſter, the dowager-lady of Glamis. She had been courted by one Lyon, whom ſhe had rejected in favour of a gentleman of the name of *Campbell*. Lyon, exaſperated at his repulſe, found means of admittance to James, whom he filled with the greateſt terrors on account of the practices of the family of Angus; and at laſt charged the lady, her huſband, and an old prieſt, with a deſign of poiſoning the king in order to reſtore Angus. The parties were all remarkable for the quiet and innocent lives they led; and even this circumſtance was by their diabolical accuſer turned to their prejudice, by repreſenting it as the effect of cunning or caution. In this reign an accuſation of treaſon was always followed by condemnation. However, the evidence againſt the lady appeared ſo abſurd and contradictory, that ſome of the judges were for dropping the proſecution, and others for recommending her caſe to the king; but the majority prevailed to have it determined by a jury, who brought her in guilty; and ſhe was condemned to be burnt alive in the Caſtlehill of Edinburgh. The defence ſhe made would have done honour to the ableſt orator, and undeniably proved her innocence; but tho' it was reported to James, it was ſo far from mitigating her ſentence, that it was aggravated by her huſband being obliged to behold her execution. The unhappy huſband himſelf endeavoured to make his way over the caſtle wall of Edinburgh; but the rope proving too ſhort, he was daſhed in pieces: and Lord Glamis her ſon, though but a child, was impriſoned during the remainder of this reign. The old prieſt, though put to the torture, confeſſed nothing, and was freed. Lyon, like the other accuſer already mentioned, was baniſhed the kingdom.

Whether theſe and other cruelties had affected the king's conſcience, or whether his brain had been touched by the diſtractions of the different parties, is unknown: but it is certain, that, in the year 1540, he began to live retired: his palace appeared like the cloiſtered retreat of monks; his ſleep was haunted by the moſt frightful dreams, which he conſtrued into apparitions; and the body of Sir James Hamilton, whoſe execution has already been mentioned, ſeemed continually preſent to his eyes. Perhaps the loſs of his two ſons, who died on the ſame day that Sir James was executed, might have contributed to bring this man more remark-

ably to his remembrance. No doubt, it added to the gloom of his mind; and he now saw his court abandoned by almoſt all his nobility.

At laſt James was in ſome degree rouſed from his inaction, by the preparations made againſt him by his uncle Henry VIII. of England. Some differences had already taken place; to accommodate which, Henry had deſired a conference with James at York. But this the latter, by the advice of his parliament, had declined. The conſequence was a rupture between the two courts, and the Engliſh had taken 20 of the Scots trading veſſels. Henry threatened to revive the antiquated claim of the Engliſh ſuperiority over Scotland, and had given orders for a formidable invaſion of the Scotch borders. He complained that James had uſurped his title of Defender of the Faith, to which he had added the word Chriſtian, implying that Henry was an infidel: but the kings of Scotland had, ſome time before, been complimented by the papal ſee with that title. James, on the other hand, threw his eyes towards Ireland, the north part of which was actually peopled with inhabitants who owned no ſovereign but the king of Scotland, and who offered to ſerve James againſt the Engliſh; ſome of their chiefs having actually repaired to Scotland, and done homage to James. Henry had, about this time, declared himſelf king of Ireland, of which he was before only ſtyled the *lord*; and James roundly aſſerted, that he had a preferable claim to at leaſt one half of that iſland, which had been peopled by the ſubjects of Scotland. Though the Scotch hiſtorians of this reign take very little notice of this incident, yet James appears to have been very tenacious of his title; and that there was a vaſt intercourſe carried on between the ſubjects of Scotland and the northern Iriſh, who unanimouſly acknowledged James for their natural ſovereign. Indeed, this was the only ground of quarrel that the king, with the leaſt ſhadow of juſtice, could allege againſt Henry.

His parliament being met, many public-ſpirited acts were paſſed; and before the aſſembly was diſſolved, the members renewed the acts againſt leaſing-making; by which is meant the miſrepreſenting of the king to his nobles, or the nobles to their king: and James, to diſmiſs them in good humour, paſſed an act of free grace for all crimes committed in his minority; the earl of Angus, and Sir George and Sir Archibald Douglas, being excepted.

Henry, after cutting off the head of his wife Catharine Howard, married and divorced the princeſs Anne of Cleves, and found himſelf either deſerted or diſtruſted by all the princes on the continent, Proteſtant as well as Roman Catholic. James and his clergy relied greatly on this public odium incurred by Henry; but the emperor having again quarrelled with Francis, left Henry, whoſe dominions they had threatened jointly to invade, at liberty to continue his preparations againſt the Scots. He firſt ordered his fleet, then the moſt formidable of any in the world to make freſh deſcents upon Scotland. At the ſame time, he appointed a very conſiderable army to rendezvous upon the borders, under the command of Sir Robert Bowes, one of his wardens, the earl of Angus, and his two brothers Sir George and Sir Archibald Douglas. James was every day expecting ſupplies of money, arms, and other neceſſaries from France; but theſe not arriving, he reaſſembled his parliament on the 14th of March, which gratified him in all his demands. Many excellent regulations were made for the internal government, peace, and ſecurity of the kingdom, and againſt the exportation of money inſtead of merchandiſe. Acts were paſſed for fortifying and embelliſhing the town of Edinburgh, and for better ſupplying the ſubjects with wine and all the other neceſſaries of life. The royal revenue was increaſed by many additional eſtates; and the laſt hand was put to one of the beſt plans for a national militia that perhaps ever appeared. As yet, excepting in the diſappointment which Henry met with from his nephew in not meeting him at York, he had no grounds for commencing hoſtilities. But it is here proper to obſerve, that the queen-mother was then dead; and conſequently the connexion between James and Henry was weakened. Whatever her private character might have been, ſhe was certainly a happy inſtrument of preventing bloodſhed between the two kingdoms. She was buried with royal honours at Perth.

James, to all appearance, was at this time in a moſt deſirable ſituation. His domain, by forfeitures and otherwiſe, far exceeded that of any of his predeceſſors. He could command the purſes of his clergy; he had large ſums of ready money in his exchequer; his forts were well ſtored and fortified; and he was now daily receiving remittances of money, arms, and ammunition from France. All this ſhow of happineſs was only in appearance; for the affections of his nobility, and the wiſer part of his ſubjects, were now alienated from him more than ever, by the exceſſive attachment he ſhowed to bigotry and perſecution.

He had nominated the earl of Huntley to command his army on the borders, conſiſting of 10,000 men; and his lieutenant general was Sir Walter Lindſay of Torphichen, who had ſeen a great deal of foreign ſervice, and was eſteemed an excellent officer. Huntley acquitted himſelf admirably well in his commiſſion; and was ſo well ſerved by his ſpies, as to have certain intelligence that the Engliſh intended to ſurpriſe and burn Jedburgh and Kelſo. The Engliſh army under Sir Robert Bowes and the Douglaſſes, with other northern Engliſhmen, continued ſtill upon the borders; and one of the reſolutions the Scotch nobility and gentry had come to, was, not to attack them on their own ground, nor to act offenſively, unleſs their enemies invaded Scotland. Huntley being informed that the Engliſh had advanced, on the 24th of Auguſt, to a place called *Haldanrig*, and that they had deſtroyed great part of the Scotch and debateable lands, reſolved to engage them: and the Engliſh were aſtoniſhed, when at day-break, they ſaw the Scotch army drawn up in order of battle. Neither party could now retreat without fighting; and Torphichen, who led the van, conſiſting of 2000 of the beſt troops of Scotland, charged the Engliſh ſo furiouſly, that Huntley gained a complete and an eaſy victory. Above 200 of the Engliſh were killed, and 600 taken priſoners; among whom were their general Sir Robert Bowes, Sir William Mowbray, and about 60 of the moſt diſtinguiſhed northern barons; the earl of Angus eſcaping by the ſwiftneſs of his horſe. The loſs of the Scots was inconſiderable.

In the meanwhile, the duke of Norfolk having raiſed

ished
y——

fed a great army, had orders to march northwards, and to diſperſe a manifeſto, complaining of James for having diſappointed him of the interview at York, and reviving the ridiculous claim of his own and his anceſtors ſuperiority over the kingdom of Scotland. It was plain, from the words of this manifeſto, that Henry was ſtill placable towards James; and that he would eaſily have dropt that claim, if his nephew would have made any perſonal advances towards a reconciliation.

The condition of James was now deplorable. The few faithful counſellors he had about him, ſuch as Kirkaldy of Grange, who was then lord treaſurer, plainly intimated, that he could have no dependence upon his
54 nobles, as he was devoted to the clergy; and James
raction ſometimes, in a fit of diſtraction, would draw his dagmes. ger upon the cardinal and other eccleſiaſtics when they came to him with freſh propoſitions of murder and proſcriptions, and drive them out of his preſence. But he had no conſtancy of mind; and he certainly put into his pocket a bloody ſcroll that had been brought him by his prieſts, beginning with the earl of Arran, the firſt ſubject of the kingdom. In one of his cooler moments, he appointed the lord Erſkine, and ſome others of his nobility, to make a freſh attempt to gain time; and Henry even condeſcended to order the duke of Norfolk (who was then advanced as far as York), the lord privy ſeal, the biſhop of Durham, and others, to treat with him. The conferences were ſhort and unſucceſsful. The duke bitterly complained, that the Scots ſought only to amuſe him till the ſeaſon for action was over. In ſhort, he conſidered both them and Learmouth, who was ordered to attend him, as ſo
455 many ſpies, and treated them accordingly. It was the
duke 21ſt of October before he entered the eaſt borders of
Norfolk Scotrs Scot- land. According to the Scotch hiſtorians, his ar with a my conſiſted of 40,000 men; but the Engliſh have fixidable ed it at 20,000.
y.

James affected to complain of this invaſion as being unprovoked; but he loſt no time in preparing to repel the danger. The ſituation of his nobility, who were preſſed by a foreign invaſion on the one hand, and domeſtic tyrants on the other, induced them to hold frequent conſultations; and in one of them, they reſolved to renew the ſcene that had been acted at Lawder bridge under James III. by hanging all his grandſon's
456 evil counſellors. The Scots hiſtorians ſay, that this
ſpiracy reſolution was not executed, becauſe the nobility could
nſt not agree about the victims that were to be ſacrificed;
es's fa- and that the king, who was encamped with his army
rites. at Falla moor, having intelligence of their conſultation, removed haſtily to Edinburgh; from which he ſent orders for his army to advance, and give battle to the duke of Norfolk, who appears as yet not to have entered the Scotch borders. The anſwer of the nobility was, that they were determined not to attack the duke upon Engliſh ground; but that if he invaded Scotland, they knew their duty. The earl of Huntley, who commanded the van of the Scottiſh army, conſiſting of 10,000 men, was of the ſame opinion: but no ſooner did Norfolk paſs the Tweed, than he haraſſed the Engliſh army, cut off their foraging parties, and diſtreſſed them in ſuch a manner, that the duke agreed once more to a conference for peace; which was managed, on the part of the Scots, by the biſhop of Orkney and Sir James Learmouth; but nothing was concluded. The Engliſh general, finding it now impoſſible on many accounts to proſecute his invaſion, repaſſed the Tweed; and was haraſſed in his march by the earl of Huntley, who deſiſted from the purſuit the moment his enemies gained Engliſh ground.

James, whoſe army at this time amounted to above 30,000 men, continued ſtill at Edinburgh, from which he ſent frequent meſſages to order his nobility and generals to follow the duke of Norfolk into England; but theſe were diſregarded. James was flattered, that now he had it in his power to be revenged for all the indignities that had been offered by England to Scotland. In this he was encouraged by the French ambaſſador, and the high opinion he had of his own troops. About the beginning of November, he came to a reſolution of reaſſembling his army, which was diſbanded upon the duke of Norfolk's retreat. This project appeared ſo feaſible and ſo promiſing, that ſeveral of the nobility are ſaid to have fallen in with it, particularly the lord Maxwell, the earls of Arran, Caſſilis, and Glencairn, with the lords Fleming, Somerville, and Erſkine: others repreſented, but in vain, that the arms of Scotland had already gained ſufficient honour, by obliging the powerful army of the Engliſh, with their moſt experienced general at their head, to make a ſhameful retreat before a handful; that the force of Scotland was inferior to that of England; and that an honourable peace was ſtill practicable. It was ſaid, in reply to thoſe conſiderations, that the ſtate of the quarrel was now greatly altered; that Henry had in his manifeſto declared his intention to enſlave their country; that he treated the nobility as his vaſſals; that the duke of Norfolk had been guilty of burning the dwellings of the defenceleſs inhabitants, by laying above 20 villages and towns in aſhes; and that no Scotchman, who was not corrupted by Henry's gold, would oppoſe the king's will. The laſt, perhaps, was the chief but argument that prevailed on the lord Maxwell, a noble- con man of great honour and courage, to agree to carry the inv war into England by Solway, provided he was at the Eng head of 10,000 men. It was at laſt agreed that the earl of Arran and the cardinal ſhould openly raiſe men, as if they intended to enter the eaſt marches, where they were to make only a feint, while the lord Maxwell was to make the real attempt upon the weſt. Private letters were everywhere circulated to raiſe the men who were to ſerve under the lord Maxwell; among whom were the earls of Caſſilis and Glencairn, the lords Fleming, Somerville, Erſkine, and many other perſons of great conſideration. James, who never was ſuſpected of want of courage, probably would have put himſelf at the head of this expedition, had he not been diſſuaded from it by his prieſts and minions, who reminded him of the conſultations at Falla moor, and the other treaſonable practices of the nobility. They added, that moſt of them being corrupted by the Engliſh gold, he could not be too much on his guard. He was at laſt perſuaded to repair to the caſtle of Lochmaben or Carlaverock, and there to wait the iſſue of the inroad.

It was probably at this place that James was prevailed on to come to the fatal reſolution of appointing one Oliver Sinclair, a ſon of the houſe of Roſlin, and a favourite minion at court, to command the army in chief; and his commiſſion was made out accordingly.

On the 23d of November, the Scots began their march at midnight; and having paſſed the Elk, all the adjacent villages were ſeen in flames by the break of day. Sir Thomas Wharton, the Engliſh warden of thoſe marches, the baſtard Dacres, and Muſgrave, haſtily raiſed a few troops, the whole not exceeding 500 men, and drew them up upon an advantageous ground; when Sinclair, ordering the royal banner to be diſplayed, and being mounted on the ſhoulders of two tall men, produced and read his commiſſion. It is impoſſible to imagine the conſternation into which the Scots were thrown upon this occaſion; and their leaders ſetting the example, the whole army declared (according to the Scotch authors), that they would rather ſurrender themſelves priſoners to the Engliſh, than ſubmit to be commanded by ſuch a general. In an inſtant, all order in the Scotch army was broken down; horſe and foot, ſoldiers and ſcullions, noblemen and peaſants, were intermingled. It was eaſy for the Engliſh general to perceive this confuſion, and perhaps to gueſs at its cauſe. A hundred of his light horſe happened to advance: they met no reſiſtance: the nobles were the firſt who ſurrendered themſelves priſoners; and the reſt of the Engliſh advancing, they obtained a bloodleſs victory; for even the women and the boys made priſoners of Scotch ſoldiers, and few or none were killed. The Lord Herbert relates the circumſtances of this ſhameful affair with ſome immaterial differences; but agrees with the Scotch authorities upon the whole. He mentions, however, no more than 800 common ſoldiers having been made priſoners. The chief of the priſoners were the earls of Caſſilis and Glencairn, the lords Maxwell, Fleming, Somerville, Oliphant, and Gray, with above 200 gentlemen beſides.

James was then at Carlaverock, which is about 12 miles diſtant from the place of action, depreſſed in his ſpirits, and anxious about the event of the expedition, which is to this day called the *Raid of Solway moſs*. When the news came to his ears, and that the earl of Arran and the cardinal were returned to Edinburgh, he was ſeized with an additional dejection of mind, which brought him to his grave. In ſuch a ſituation every cruel action of his former life wounded his conſcience; and he at laſt ſunk into a ſullen melancholy, which admitted of no conſolation. From Carlaverock he removed to Falkland; and was ſometimes heard to expreſs himſelf as if he thought that the whole body of his nobility were in a conſpiracy againſt his perſon and dignity. The preſence of the few attendants who were admitted into his chamber, and who were the wicked inſtruments of his miſconduct, ſeemed to aggravate his ſufferings, and he either could not or would not take any ſuſtenance. His death being now inevitable, Beaton approached his bedſide with a paper, to which he is ſaid to have directed the king's hand, pretending that it was his laſt will. On the 18th of December, while James was in this deplorable ſtate, a meſſenger came from Linlithgow, with an account that the queen was brought to bed of a daughter; and the laſt words he was diſtinctly heard to ſay, were, "It will end as it began: the crown came by a woman, and it will go with one; many miſeries approach this poor kingdom. King Henry will either maſter it by arms, or win it by marriage." He then turned his face to the wall, and in broken ejaculations pronounced the word *Solway moſs*, and ſome faint expreſſions alluding to the diſgrace he ſuffered. In this ſtate he languiſhed for ſome days; for it is certain he did not ſurvive the 13th.

James V. was ſucceeded by his infant daughter Mary, whoſe birth we have already mentioned. James had taken no ſteps for the ſecurity of his kingdom, ſo that ambitious men had now another opportunity of throwing the public affairs into confuſion. The ſituation of Scotland indeed at this time was very critical. Many of the nobility were priſoners in England, and thoſe who remained at home were factious and turbulent. The nation was diſpirited by an unſucceſsful war. Commotions were daily excited on account of religion, and Henry VIII. had formed a deſign of adding Scotland to his other dominions. By a teſtamentary deed which Cardinal Beaton had forged in the name of his ſovereign, he was appointed tutor to the queen and governor of the realm, and three of the principal nobility were named to act as his counſellors in the adminiſtration. The nobility and the people, however, calling in queſtion the authenticity of this deed, which he could not eſtabliſh, the cardinal was degraded from the dignity he had aſſumed; and the eſtates of the kingdom advanced into the regency James Hamilton, earl of Arran, whom they judged to be entitled to this diſtinction, as the ſecond perſon of the kingdom, and the neareſt heir, after Mary, to the crown.

The diſgrace of Cardinal Beaton might have proved the deſtruction of his party, if the earl of Arran had been endowed with vigour of mind and ability. But his views were circumſcribed; and he did not compenſate for this defect by any firmneſs of purpoſe. He was too indolent to gain partiſans, and too irreſolute to fix them. Slight difficulties filled him with embarraſſment, and great ones overpowered him. His enemies applying themſelves to the timidity of his diſpoſition, betrayed him into weakneſſes; and the eſteem which his gentleneſs had procured him in private life, was loſt in the contempt attending his public conduct, which was feeble, fluctuating, and inconſiſtent.

The attachment which the regent was known to profeſs for the reformed religion, drew to him the love of the people; his high birth, and the mildneſs of his virtues, conciliated their reſpect; and from the circumſtance, that his name was at the head of the roll of heretics which the clergy had preſented to the late king, a ſentiment of tenderneſs was mingled with his popularity. His conduct correſponded at firſt, with the impreſſions entertained in his favour. Thomas Guillaume and John Rough, two celebrated preachers, were invited to live in his houſe; and he permitted them to declaim openly againſt the errors of the church of Rome. They attacked and expoſed the ſupremacy of the pope, the worſhip of images, and the invocation of ſaints. Cardinal Beaton and the prelates were exceedingly provoked, and indefatigably active to defend the eſtabliſhed doctrines.

This public ſanction afforded to the Reformation was of little conſequence, however, when compared with a meaſure which was ſoon after adopted by Robert Lord Maxwell. He propoſed, that the liberty of reading the ſcriptures in the vulgar tongue ſhould be permitted to the people; and that, for the future, no heretical guilt

ſhould

land. should be inferred against any perſon for having them in his poſſeſſion, or for making uſe of them. The regent and the three eſtates acknowledged the propriety of this propoſal. Gavin Dunbar archbiſhop of Glaſgow, and chancellor of Scotland, proteſted, indeed, for himſelf and for the church, that no act on this ſubject ſhould paſs and be effectual, till a provincial council of all the clergy of the kingdom ſhould conſider and determine, whether there was a neceſſity that the people ſhould conſult and ſtudy the Scriptures in the vulgar tongue. But his proteſtation being diſregarded, the bill of the lord Maxwell was carried into a law, and the regent made it generally known by a proclamation.

From this period copies of the Bible were imported in great numbers from England; and men, allured by an appeal ſo flattering to their reaſon, were proud to recover from the ſupine ignorance in which they had been kept by an artful prieſthood. To read became a common accompliſhment: and books were multiplied in every quarter, which diſcloſed the pride, the tyranny, and the abſurdities of the Romiſh church and ſuperſtitions.

69 yVIII. ofes to the doms e mar- of Ed- VI. Mary. The death of James V. proved very favourable to the ambitious deſigns of Henry. He now propoſed an union of the two kingdoms by the marriage of his ſon Edward VI. with Mary the young queen of Scotland. To promote this, he releaſed the noblemen who had been taken priſoners at Solway, after having engaged them on oath, not only to concur in promoting the alliance, but to endeavour to procure him the charge and cuſtody of the young queen, with the government of her kingdom, and the poſſeſſion of her caſtles. The earl of Angus and his brother, who had been fifteen years in exile, accompanied them to Scotland, and brought letters from Henry recommending them to the reſtitution of their honours and eſtates. The regent was inclined to favour the demands of perſons of ſuch eminent ſtation; but though the ſtates were inclined to the marriage, they refuſed to permit the removal of the queen into England, and treated with contempt the idea of giving the government of Scotland and the care of the caſtles to the king of England. Sir Ralph Sadler, the Engliſh ambaſſador, exerted all his endeavours to induce the regent to comply with the requiſitions of his maſter; but all his intrigues were unſucceſsful; and Henry perceiving that he muſt depart from ſuch extravagant conditions, at laſt authorized the commiſſioners to conſent to treaties of amity and marriage, on the moſt favourable terms that could be procured. In conſequence of theſe powers given to the commiſſioners, it was agreed that a firm peace and alliance ſhould take place between the two nations, and that they ſhould mutually defend and protect one another in caſe of an invaſion. The queen was to remain within her own dominions till ſhe was ten years of age; and Henry was not to claim any ſhare in the government. Six nobles, or their apparent heirs, were to be ſurrendered to him in ſecurity for the conveyance of the young queen into England, and for her marriage with Prince Edward, as ſoon as ſhe was ten years of age. It was alſo ſtipulated, that though the queen ſhould have iſſue by Edward, Scotland ſhould retain not only its name, but its laws and liberties.

70 le. from of his ofals. These conditions, however advantageous to Scotland, yet did not give entire ſatisfaction. Cardinal Beaton, who had been impriſoned on pretence of treaſonable ſchemes, and was now releaſed from his confinement by the influence of the queen-dowager, took all opportunities of exclaiming againſt the alliance, as tending to deſtroy the independency of the kingdom. He pointed out to the churchmen the dangers which aroſe from the prevalence of hereſy, and urged them to unanimity and zeal. Awakening all their fears and ſelfiſhneſs, they granted him a large ſum of money with which he might gain partizans; the friars were inſtructed to preach againſt the treaties with England; and fanatical men were inſtructed to diſplay their rage in offering indignities to Sir Ralph Sadler.

171 regent ofed by dinal on, Cardinal Beaton was not the only antagoniſt the regent had to deal with. The earls of Argyll, Huntley, Bothwel, and Murray, concurred in the oppoſition; and having collected ſome troops, and poſſeſſed themſelves of the queen's perſon, they aſſumed all the authority. They were joined by the earl of Lenox, who was made to hope that he might eſpouſe the queen-dowager and obtain the regency. He was alſo inclined to oppoſe the earl of Arran, from an ancient quarrel which had ſubſiſted between their two families; and from a claim he had to ſuperſede him, not only in the enjoyment of his perſonal eſtates, but in the ſucceſſion to the crown. The regent, alarmed at ſuch a powerful combination againſt him, inclined to attend to ſome advances which were made him by the queen-dowager and cardinal. To refuſe to confirm the treaties, after he had brought them to a concluſion, was, however, a ſtep ſo repugnant to probity, that he could not be prevailed upon to adopt it. He therefore, in a ſolemn manner, ratified them in the abbey church of Holyroodhouſe, and commanded the great ſeal of Scotland to be appended to them. The ſame day he went to St Andrew's, and iſſued a mandate to the cardinal, requiring him to return to his allegiance. To this the prelate refuſed to pay any attention, or to move from his caſtle; upon which the regent denounced him a rebel, and threatened to compel him to ſubmiſſion by military force. But in a few days after, the puſillanimous regent meeting with Beaton, forſook the intereſt of Henry VIII. and embraced that of the queen-dowager and of France. Being in haſte alſo to reconcile himſelf to the church of Rome, he renounced publicly, at Stirling, the opinions of the reformed, and received abſolution from the hands of the cardinal.

By this mean-ſpirited conduct the regent expoſed himſelf to univerſal contempt, while Cardinal Beaton uſurped the whole authority. The earl of Lenox, finding that he had no hopes of ſucceſs in his ſuit to the queen-dowager, engaged in negotiations with Henry, to place himſelf at the head of the Scottiſh lords who were in the Engliſh intereſt, and to aſſert the cauſe of the Reformation. The conſequence of all this was a rupture with England. Henry not only delayed to ratify the treaties on his part, but ordered all the Scottiſh ſhips in the harbours of England to be taken and confiſcated. This violent proceeding inflamed the national diſguſts againſt the Engliſh alliance; and the party of the cardinal and queen-dowager thus obtained an increaſe of popularity. Henry himſelf, however, was ſo much accuſtomed to acts of outrage and violence, that he ſeemed to think the ſtep he had juſt now taken a matter of no moment; and therefore he demanded

manded that the hoſtages, in terms of the treaty of marriage, ſhould ſtill be delivered up to him. But the cardinal and regent informed his ambaſſador, Sir Ralph Sadler, that from their own authority they could not command any of the nobles to be committed to him as hoſtages; and that the offenſive ſtrain of behaviour aſſumed by the Engliſh monarch might have altered the ſentiments of the Scottiſh parliament with regard to a meaſure of ſuch importance. After much altercation, the conferences were broken off; and as the lords who were releaſed from captivity had promiſed to return priſoners to England, it now remained with them to fulfil their promiſe. None of them, however, had the courage to do ſo, excepting the earl of Caſſilis; and Henry, being ſtruck with his punctilious ſenſe of honour, diſmiſſed him loaded with preſents.

Cardinal Beaton being thus in poſſeſſion of power, took meaſures to ſecure it. The ſolemnity of the coronation of the young queen was celebrated at Stirling. A council was choſen to direct and aſſiſt the regent in the greater affairs of ſtate, at the head of which was the queen-dowager. John Hamilton, the abbot of Paiſley, who had acquired an aſcendency over the regent, was alſo promoted to the privy ſeal, and made treaſurer of the kingdom; and Cardinal Beaton, upon the requeſt of the regent and the three eſtates, accepted the office of the lord high chancellor.

After the flatteries and the hopes with which the earl of Lenox had been amuſed, the cardinal had reaſon to dread the utmoſt warmth of his reſentment. He had therefore written to Francis I. giving a detail of the critical ſituation of affairs in Scotland, and entreating him to recal to France the earl of Lenox, who was now intereſted to oppoſe the influence and operations of the queen-dowager. But the indignation with which the treachery of the cardinal had inflamed the earl of Lenox, precipitated him into immediate action, and defeated the intention of this artifice. In the hoſtile ſituation of his mind towards Scotland, an opportunity of commencing hoſtility had preſented itſelf. Five ſhips had arrived in the Clyde from France, loaded with warlike ſtores, and having on board the patriarch of Venice, Peter Contareni, legate from Paul III. with La Broſſe, and James Meſnaige, ambaſſadors from France; and 30,000 crowns, which were to be employed in ſtrengthening the French faction, and to be diſtributed by the queen-dowager and the cardinal. Prevailing with the commanders of theſe veſſels, who conceived him to be the faſt friend of their monarch, he ſecured this money for his own uſe, and depoſited the military ſtores in his caſtle of Dumbarton, under the care of George Stirling the deputy-governor, who at this time was entirely in his intereſts.

By the ſucceſsful application of this wealth, the earl of Lenox called forth the full exertion of his party in levying a formidable army, with which he threatened the deſtruction of the regent and the cardinal, offering them battle in the fields between Leith and Edinburgh. The regent, not being in a condition to accept the challenge of his rival, had recourſe to negotiation. Cardinal Beaton and the earl of Huntley propoſed terms of amity, and exerted themſelves with ſo much addreſs, that the earl of Lenox, loſing the opportunity of chaſtiſing his enemies, conſented to an accommodation, and indulged anew the hope of obtaining the queen-dowager in marriage. His army was diſmiſſed, and he threw himſelf at the feet of his miſtreſs, by whom he was, in appearance, favourably received: but many of his friends were ſeduced from him under different pretences; and at laſt, apprehending his total ruin from ſome ſecret enterpriſe, he fled to Glaſgow, and fortified himſelf in that city. The regent, collecting an army, marched againſt him; and having defeated his friend the earl of Glencairn in a bloody encounter, was able to reduce the place of ſtrength in which he confided. In this ebb of his fortune, the earl of Lenox had no hope but from England. 481 and is obliged to fly.

The revolution produced in the political ſtate of Scotland by the arts of Cardinal Beaton, while it defeated the intrigues of Henry VIII. pointed all its ſtrength againſt the progreſs of the Reformation. After abandoning his old friends, the regent, in connection with the cardinal, was ambitious to undo all the ſervices he had rendered to them. The three eſtates annulled the treaties of amity and marriage, and empowered commiſſioners to conclude an alliance with France. The regent diſcharged the two preachers Guillaume and Rough, whom he had invited to impugn the doctrines of the church. He drove back into England many pious perſons, whoſe zeal had brought them to Scotland, to explain and advance the new opinions. He careſſed with particular reſpect the legate whom the pope had ſent to diſcourage the marriage of the young queen with the prince of Wales, and to promiſe his aſſiſtance againſt the enterpriſes of Henry VIII. He procured an act of parliament to be paſſed for the perſecution of heretics; and, upon the foundation of this authority, the moſt rigorous proceedings were concerted againſt the reformed; when the arms of England, rouſing the apprehenſions of the nation, gave the fulleſt employment to the regent and his counſellors. 482 Alliance with France concluded, and the Proteſtants perſecuted.

In the rage and anguiſh of diſappointed ambition, the earl of Lenox made an offer to aſſiſt the views of the king of England; who, treating him as an ally, engaged, in the event of ſucceſs, to give him in marriage his niece the lady Margaret Douglas, and to inveſt him in the regency of Scotland. To eſtabliſh the Reformation in Scotland, to acquire the ſuperiority over it to Henry VIII. and to effectuate the marriage of the prince of Wales with the queen of Scots, were the great objects of their confederacy. 483 Lenox engages in the Engliſh intereſt.

Henry, though engaged in a war with France, which required all his military force, could not reſiſt the earlieſt opportunity in his power to execute his vengeance againſt Scotland. Edward Seymour earl of Hartford was appointed to command 10,000 men; who were embarked at Tinmouth, aboard a fleet of 200 ſhips, under the direction of Sir John Dudley Lord Liſle. This army was landed without oppoſition near Leith; and the earl of Hartford made it known to Sir Adam Otterburn, the provoſt of Edinburgh, that his commiſſion empowered him to lay the country waſte and deſolate, unleſs the regent ſhould deliver up the young queen to the king of England. It was anſwered, that every extremity of diſtreſs would be endured, before the Scottiſh nation would ſubmit to ſo ignominious a demand. Six thouſand horſe from Berwick, under the lord Evers, now joined the earl of Hartford. Leith and Edinburgh, after a feeble reſiſtance, yielded to the Engliſh commander; who abandoned them to pillage, and 484 An Engliſh army enters Scotland. 485 who commit cruel devaſtations, and then ſuddenly retire.

and then set fire to them. A cruel devastation enfued in the furrounding villages and country, and an immenſe booty was conveyed on board the Engliſh fleet. But, while an extreme terror was every where excited, the earl of Hartford re-embarked a part of his troops, and ordered the remainder to march with expedition to the frontiers of England.

The regent, aſſiſted by Cardinal Beaton and the earls of Huntley, Argyll, Bothwel, and Murray, was active in the mean time, to collect an army, and to provide for the ſecurity of the kingdom. He felt, therefore, the greateſt ſurpriſe on being relieved ſo unexpectedly from the moſt imminent danger; and an expedition, conducted with ſo little diſcernment, did not advance the meaſures of Henry VIII. To accompliſh the marriage of the young queen with the prince of Wales, to poſſeſs himſelf of her perſon, or to achieve a conqueſt over Scotland, were all circumſtances apparently within the reach of the Engliſh commander: and yet, in the moment of victory, he neglected to proſecute his advantages; and having inflamed the animoſities of the Scottiſh nation, by a diſplay of the paſſions and cruelty of his maſter, left them to recover from their diſaſter, and to improve in their reſources.

The earl of Lenox, taking the opportunity of the Engliſh fleet, went to conſult with Henry VIII. upon the deſperate ſtate of his affairs. He renewed his engagements with this monarch; and received in marriage the lady Margaret Douglas, with poſſeſſions in England. Soon after, he arrived in the frith of Clyde, with 18 ſhips and 600 ſoldiers, that he might ſecure the caſtle of Dumbarton, and employ himſelf in plundering and devaſtation. But George Stirling, to whom the caſtle was intruſted, refuſed to ſurrender it; and even obliged him to re-embark his troops. After engaging in a few petty incurſions and ſkirmiſhes, he returned to England.

In 1544, Henry conſented to a truce; and Scotland, after having ſuffered the miſeries of war, was ſubjected to the horrors of perſecution. The regent had procured an act of parliament for the perſecution of the reformed; and the cardinal, to draw to himſelf an additional ſplendour and power, had obtained from the pope the dignity of legate *à latere*. A viſitation of his own dioceſe appeared to him the moſt proper method of commencing the propoſed extirpation of hereſy; and he carried with him in his train the regent, and many perſons of diſtinction, to aſſiſt in his judicatories, and to ſhare in his diſgrace.

In the town of Perth a great many perſons were accuſed and condemned. The moſt trifling offences were regarded as atrocious crimes, and made the ſubjects of proſecution and puniſhment. Robert Lamb was hanged for affirming that the invocation of ſaints had no merit to ſave. William Anderſon, James Reynold, and James Finlayſon, ſuffered the ſame death, for having abuſed an image of St Francis, by putting horns upon his head. James Hunter, having kept their company, was found to be equally guilty, and puniſhed in the ſame manner. Helen Stirke, having refuſed, when in labour, to invoke the aſſiſtance of the Virgin, was drowned in a pool of water. Many of the burgeſſes of Perth, being ſuſpected of hereſy, were ſent into baniſhment; and the Lord Ruthven, the provoſt, was upon the ſame account diſmiſſed from his office.

The cardinal was ſtrenuous in perſecuting hereſy in other parts of his dioceſe. But the diſcontents and clamour attending the executions of men of inferior ſtation were now loſt in the fame of the martyrdom of George Wiſhart; a perſon who, while he was reſpectable by his birth, was highly eminent from the opinion entertained of his capacity and endowments. The hiſtorians of the Proteſtant perſuaſion have ſpoken of this reformer in terms of the higheſt admiration. They extol his learning as extenſive, inſiſt on the extreme candour of his diſpoſition, and aſcribe to him the utmoſt purity of morals. But while the ſtrain of their panegyric is expoſed to ſuſpicion from its exceſs, they have ventured to impute to him the ſpirit of prophecy; ſo that we muſt neceſſarily receive their eulogiums with ſome abatement. It may be ſufficient to affirm, that Mr Wiſhart was the moſt eminent preacher who had hitherto appeared in Scotland. His mind was certainly cultivated by reflection and ſtudy, and he was amply poſſeſſed of thoſe abilities and qualifications which awaken and agitate the paſſions of the people. His miniſtry had been attended with the moſt flattering ſucceſs; and his courage to encounter danger grew with his reputation. The day before he was apprehended, he ſaid to John Knox, who attended him; "I am weary of the world, ſince I perceive that men are weary of God." He had already reconciled himſelf to that terrible death which awaited him. He was found in the houſe of Cockburn of Ormiſton, in Eaſt Lothian; who refuſing to deliver him to the ſervants of the regent, the earl of Bothwel, the ſheriff of the county, required that he ſhould be intruſted to his care, and promiſed that no injury ſhould be done to him. But the authority of the regent and his counſellors obliged the earl to ſurrender his charge. He was conveyed to the cardinal's caſtle at St Andrew's, and his trial was hurried on with precipitation. The cardinal and the clergy proceeding in it without the concurrence of the ſecular power, adjudged him to be burnt alive. In the circumſtances of his execution there appears a deliberate and moſt barbarous cruelty. When led out to the ſtake, he was met by prieſts, who, mocking his condition, called upon him to pray to the Virgin, that ſhe might intercede with her Son for mercy to him. "Forbear to tempt me, my brethren," was his mild reply to them. A black coat of linen was put upon him by one executioner, and bags of powder were faſtened to his body by another. Some pieces of ordnance were pointed to the place of execution. He ſpoke to the ſpectators, entreating them to remember that he was to die for the true goſpel of Chriſt. Fire was communicated to the faggots. From a balcony in a tower of his caſtle, which was hung with tapeſtry, the cardinal and the prelates, reclining upon rich cuſhions, beheld the inhuman ſcene. This inſolent triumph, more than all his afflictions, affected the magnanimity of the ſufferer. He exclaimed, that the enemy, who ſo proudly ſolaced himſelf, would periſh in a few days, and be expoſed ignominiouſly in the place which he now occupied.

Cardinal Beaton took a pleaſure in receiving the congratulations of the clergy upon a deed, which, it was thought, would fill the enemies of the church with terror. But the indignation of the people was more excited than their fears. All ranks of men were diſ-

guſted

gusted with an exercise of power which despised every boundary of moderation and justice. The prediction of Mr Wishart, suggested by the general odium which attended the cardinal, was considered by the disciples of this martyr as the effusion of a prophet; and perhaps gave occasion to the assassination that followed. Their complaints were attended to by Norman Lesly, the eldest son of the earl of Rothes, whom the cardinal had treated with indignity, though he had profited by his services. He consented to be their leader. The cardinal was in his castle at St Andrew's, which he was fortifying after the strongest fashion of that age. The conspirators, at different times, early in the morning, entered into it. The gates were secured; and appointing a guard, that no intimation of their proceedings might go to the cardinal, they dismissed from the castle all his workmen separately, to the number of 100, and all his domestics, who amounted to no fewer than 50 persons. The eldest son of the earl of Arran, whom he kept as an hostage for his father's behaviour, was alone detained by them. The prelate, alarmed with their noise, looked from his window, and was informed that his castle was taken by Norman Lesly. It was in vain that he endeavoured to secure the door of his chamber by bolts and chests. The conspirators brought fire, and were ready to apply it, when, admitting them into his presence, he implored their mercy. Two of them struck him hastily with their swords. But James Melvil, rebuking their passion, told them, that this work and judgment of God, though secret, ought to be done with gravity. He reminded the cardinal, in general terms, of the enormity of his sins, and reproached him in a more particular manner with the death of Mr Wishart. He swore, that no hopes of his riches, no dread of his power, and no hatred to his person, were any motives which actuated him; but that he was moved to accomplish his destruction, by the obstinacy and zeal manifested by him against Christ Jesus and his holy gospel. Waiting for no answer to his harangue, he thrust the cardinal three times through the body with his dagger, on the 29th of May 1546.

The rumour that the castle was taken giving an alarm to the inhabitants of St Andrew's, they came in crowds to gratify their curiosity, and to offer their assistance, according to the sentiments they entertained. The adherents and dependents of the cardinal were clamorous to see him; and the conspirators, carrying his dead body to the very place from which he had beheld the sufferings of Mr Wishart, exposed it to their view.

The truce, in the mean time, which had been concluded with England was frequently interrupted; but no memorable battles were fought. Mutual depredations kept alive the hostile spirit of the two kingdoms; and while the regent was making military preparations, which gave the promise of important events, a treaty of peace was finished between England and France, in which Francis I. took care to comprehend the Scottish nation. In this treaty it was stipulated by Henry, that he was not to wage war against Scotland, unless he should be provoked by new and just causes of hostility.

But the murderers of Cardinal Beaton, apprehensive of their safety, had despatched messengers into England, with applications to Henry for assistance; and being joined by more than 120 of their friends, they took the resolution of keeping the castle, and of defending themselves. Henry, notwithstanding his treaty with France, resolved to embrace this opportunity of augmenting the disturbances of Scotland. He hastened to collect troops; and the regent and his counsellors pressed France for supplies in men and money, and military stores and artillery. Scotla

The high places which the cardinal occupied were filled up immediately upon his death. John Hamilton abbot of Paisley was elected archbishop of St Andrew's, and George earl of Huntley was promoted to be chancellor. By these officers the regent was urged to proceed with vigour against the conspirators; and it was a matter of the greatest anxiety to him to recover his eldest son, whom they detained in custody. The clergy had, in the most solemn manner, pronounced them to be accursed; and agreed to furnish, for four months, a monthly subsidy of 3000l. to defray the expence of reducing them to obedience. The queen-dowager and the French faction were eager, at the same time, to concur in avenging the assassination of a man to whose counsels and services they were so greatly indebted.—And that no dangerous use might be made of the eldest son of the earl of Arran, who, after his father, was the heir of the monarchy, an act of parliament was passed, excluding him from his birthright while he remained in the possession of the enemies of his country, and substituting his brothers in his place, according to their seniority. The dark politics of Henry suggested the necessity of this expedient; and in its meaning and tendency there may be remarked the spirit and greatness of a free people. 49 Proce ings ag the mu derers the car dinal.

A powerful army laid siege to the castle of St Andrew's, and continued their operations during four months; but no success attended the assailants. The fortifications were strong; and a communication with the besieged was open by sea to the king of England, who supplied them with arms and provisions. The garrison received his pay, and the principal conspirators had pensions from him. In return for his generosity, they were engaged to promote the marriage of his son with the young queen; to advance the Reformation: and to keep in custody the eldest son of the regent. Negotiation succeeded to hostility; and as the regent expected assistance from France, and the conspirators had the prospect of support from an English army, both parties were disposed to gain time. A treaty was entered into and transacted, in which the regent engaged to procure from Rome an absolution to the conspirators, and to obtain to them from the three estates an exemption from prosecutions of every kind. Upon the part of the besieged, it was stipulated, that when these conditions were fulfilled, the castle should be surrendered, and the regent's son delivered up to him. In the meantime Henry VIII. died; and a few weeks after Francis I. also paid his debt to nature. But the former, before his death, had recommended the prosecution of the Scottish war; and Henry II. the successor of Francis, was eager to show his attention to the ancient ally of his nation. When the absolution arrived from Rome, the conspirators refused to consider it as valid; and an expression used by the pope, implying an absurdity, furnished an apology for their conduct. They knew that the counsellors of Edward VI. were making vigorous preparations to invade Scotland; they were confident of their present ability to defend themselves, and the 49 Castle St An drew's sieged. 494 Death Henry VIII. a Francis

advocates for the Reformation encouraged them with hopes and with flattery.

The favourers of the Reformation, in the mean time, adopting the intolerant maxims of the Roman Catholics, were highly pleaſed with the aſſaſſination of Beaton; and many of them congratulated the conſpirators upon what they called their godly deed and enterpriſe. John Rough, who had formerly been chaplain to the regent, entered the caſtle and joined them. At this 495 time alſo John Knox began to diſtinguiſh himſelf in an eminent manner, both by his ſucceſs in argument and the unbounded freedom of his diſcourſe; while the Roman clergy, everywhere defeated and aſhamed, implored the aſſiſtance of the regent and his council, who aſſured them that the laws againſt heretics ſhould be put in execution.

ded by
Eng-

The ſame year, 1547, Scotland was invaded by an Engliſh army under the duke of Somerſet, who had been choſen protector of England during the minority of Edward VI. The deſign of this invaſion was to oblige the Scots to comply with the ſcheme of Henry VIII. and conclude a marriage between Edward and the young queen of Scotland. The Engliſh army conſiſted of 18,000 men; beſides which the protector had a fleet of 60 ſail, one half of which were ſhips of war, and the others conſiſted of veſſels laden with proviſions and military ſtores. On the other hand, the regent oppoſed him with an army of 40,000 men. Before the commencement of hoſtilities, however, the duke of Somerſet addreſſed a letter or manifeſto to the government, in which he preſſed the marriage with ſuch powerful arguments, and ſo clearly ſhowed the benefits which would reſult from it to both nations, that the regent and his party, who were averſe to peace, thought proper to ſuppreſs it, and to circulate a report that the Engliſh had come to force away the queen, and to reduce the kingdom to a ſtate of dependence. All hopes of an accommodation being thus removed, the Engliſh army advanced in order to give battle to the Scots. They found the latter poſted in the moſt advantageous ſituation, around the villages of Muſſelburgh, Invereſk, and Monckton; ſo that he could not force them to an action, at the ſame time that he found himſelf in danger of having his communication with his ſhips cut off, which would have totally deprived his army of the means of ſubſiſtence. In this dangerous ſituation he had again recourſe to negotiation, and offered terms ſtill more favourable than before. He now declared himſelf ready to retire into England, and to make ample compenſation for the injuries committed by his army, if the Scottiſh government would promiſe that the queen ſhould not be contracted to a foreign prince, but ſhould be kept at home till ſhe was of age to chooſe a huſband for herſelf, with the conſent of the nobility. Theſe conceſſions increaſed the confidence of the regent ſo much, [illegible] Pinkey, and imploring his aſſiſtance. The regent without taking advantage of the ſtrength of his ſituation, he reſolved to come to a general engagement.—The protector moved towards Pinkey, a gentleman's houſe to the eaſtward of Muſſelburgh; and the regent conceiving that he meant to take refuge in his fleet, changed the ſtrong ground in which he was encamped. He commanded his army to paſs the river Eſk, and to approach the Engliſh forces, which were poſted on the middle of Faſide hill. The earl of Angus led on the van; the main body of the battle marched under the regent; and the earl of Huntley commanded in the rear. It was the regent's intention to ſeize the top of the hill. The Lord Gray, to defeat this purpoſe charged the earl of Angus, at the head of the Engliſh cavalry. They were received upon the points of the Scottiſh ſpears, which were longer than the lances of the Engliſh horſemen, and put to flight. The earl of Warwick, more ſucceſsful with his command of infantry, advanced to the attack. The ordnance from the fleet aſſiſted his operations; and a briſk fire from the Engliſh artillery, which was planted on a riſing ground ſerved ſtill more to intimidate the Scottiſh ſoldiery.—The remaining troops under the protector were moving ſlowly, and in the beſt order, to take a ſhare in the engagement. The earl of Angus was not well ſupported by the regent and the earl of Huntley. A panic ſpread itſelf through the Scottiſh army. It fled in different ways, preſenting a ſcene of the greateſt havock and confuſion. Few periſhed in the fight; but the chaſe continuing in one direction to Edinburgh, and in another to Dalkeith, with the utmoſt fury, a prodigious ſlaughter was made. The loſs of the conquerors did not amount to 500 men; but 10,000 ſoldiers periſhed on the ſide of the vanquiſhed. A multitude of priſoners were taken; and among theſe the earl of Huntley, the lord high chancellor.

Amidſt the conſternation of this deciſive victory, the duke of Somerſet had a full opportunity of effectuating the marriage and union projected by Henry VIII. and on the ſubject of which ſuch fond anxiety was entertained by the Engliſh nation. But the cabals of his enemies threatening his deſtruction at home, he yielded to the neceſſities of his private ambition, and marched back into England. He took precautions, however, to ſecure an entry into Scotland, both by ſea and land. A garriſon of 200 men was placed in the iſle of St Columba in the Forth, and two ſhips of war were left as a guard to it. A garriſon was alſo ſtationed in the caſtle of Broughty, which was ſituated in the mouth of the Tay. When he paſſed through the Merſe and Teviotdale, the leading men of theſe counties repaired to him; and taking an oath of allegiance to King Edward, ſurrendered their places of ſtrength. Some of theſe he demoliſhed, and to others he added new fortifications. Hume caſtle was garriſoned with 200 men, and intruſted to Sir Edward Dudley; and he poſted 300 ſoldiers, with 200 pioneers, in the caſtle of Roxburgh, under the command of Sir Ralph Bulmer.

The only reſource of the regent now was the hope of aſſiſtance from France. The young queen was lodged in the caſtle of Dumbarton, under the care of the lords Erſkine and Livingſtone; and ambaſſadors were ſent to Henry II. of France, acquainting him with the diſaſter

cotland. had aſked permiſſion from the protector to treat of peace, and the earl of Warwick was appointed to wait for them at Berwick; but none were ever ſent on the part of Scotland. It was not long, therefore, before hoſtilities were recommenced by the Engliſh. Lord Gray led an army into Scotland, fortified the town of Haddington, took the caſtles of Yeſter and Dalkeith, laid waſte the Merſe, and the counties of Eaſt and Mid-Lothian. On the other hand, in June 1548, Monſieur de Deſſe, a French officer of great reputation, landed at Leith with 6000 ſoldiers, and a formidable train of artillery.

for arther ceeſſes the nglish.

In the mean time the regent was in diſgrace on account of the diſaſter at Pinkey; and the queen-dowager being diſpoſed to ſuperſede his authority, attempted to improve this circumſtance to her own advantage. As ſhe perceived that her power and intereſt could beſt be ſupported by France, ſhe reſolved to enter into the ſtricteſt alliance with that kingdom. It had been propoſed that the dauphin of France ſhould marry the queen of Scotland; and this propoſal now met with many partizans, the hoſtilities of the Engliſh having loſt a great number of friends to the cauſe of that country. It was reſolved to ſend the queen immediately to France, which would remove the cauſe of the preſent contentions, and her ſubſequent marriage with the dauphin would in the fulleſt manner confirm the friendſhip betwixt the two nations. The French government alſo entered deeply into the ſcheme; and in order to promote it made preſents of great value to many of the Scottiſh nobility. The regent himſelf was gained over by a penſion of 12,000 livres, and the title of duke of Chatelherault. Monſieur de Villegagnon, who commanded four galleys in the harbour of Leith, making a feint as if he intended to proceed inſtantly to France, tacked about to the north, and, ſailing round the iſles, received the queen at Dumbarton; whence he conveyed her to France, and delivered her to her uncles the princes of Lorraine, in the month of July 1548.

502 e queen t to nce.

Theſe tranſactions did not put an end to the military operations. The ſiege of Haddington had been undertaken as ſoon as the French auxiliaries arrived, and was now conducted with vigour. To reinforce the garriſon, 1500 horſe advanced from Berwick; but an ambuſcade being laid for them, they were intercepted, and almoſt totally deſtroyed. Another body of Engliſh troops, however, which amounted only to 300 perſons, was more ſucceſsful. Eluding the vigilance of the Scots and the French, they were able to enter Haddington, and to ſupply the beſieged with ammunition and proviſions. The Lord Seymour, high admiral of England, made a deſcent upon Fife with 1200 men, and ſome pieces of artillery; but was driven back to his ſhips with great ſlaughter by James Stuart, natural brother to the young queen, who oppoſed him at the head of the militia of the county. A ſecond deſcent was made by him at Montroſe; but being equally unſucceſsful there, he was obliged to leave Scotland without performing any important or memorable achievement.

503 e Engmeat h ſeveechecks.

Having collected an army of 17,000 men, and adding to it 3000 German Proteſtants, the protector put it under the direction of the earl of Shrewſbury. U[illegible]ntained not this dignity, and ſoon returned to his own on the approach of the Engliſh, Deſſe, though he [illegible]ntry.

been reinforced with 15,000 Scots, thought it more prudent to retreat than to hazard a deciſive battle. He raiſed the ſiege of Haddington, and marched to Edinburgh. The earl of Shrewſbury did not follow him to force an engagement. Jealouſies had ariſen between the Scots and the French. The inſolence and vanity of the latter, encouraged by their ſuperior ſkill in military arts, had offended the quick and impatient ſpirit of the former. The fretfulneſs of the Scots was augmented by the calamities inſeparable from war; and after the conveyance of the young queen to France, the efficacious and peculiar advantage conferred upon that kingdom by this tranſaction was fully underſtood, and appeared to them to be highly diſgraceful and impolitic. In this ſtate of their humour, Deſſe found not at Edinburgh the reception he expected. The quartering of his ſoldiers produced diſputes, which ended in an inſurrection of the inhabitants. The French fired among the citizens. Several perſons of diſtinction fell, and among theſe were the provoſt of Edinburgh and his ſon. The national diſcontents and inquietudes were driven, by this event, to the moſt dangerous extremity; and Deſſe, who was a man of ability, thought of giving employment to his troops, and of flattering the people by the ſplendour of ſome martial exploit.

Sco

5 Quar betw Scots Fren

The earl of Shrewſbury, after ſupplying Haddington with troops, proviſions, and military ſtores, retired with his army into England. Its garriſon, in the enjoyment of ſecurity, and unſuſpicious of danger, might be ſurpriſed and overpowered. Marching in the night, Deſſe reached this important poſt; and deſtroying a fort of obſervation, prepared to ſtorm the main gates of the city, when the garriſon took the alarm. A French deſerter pointing a double cannon to the thickeſt ranks of the aſſailants, the ſhot was incredibly deſtructive, and threw them into confuſion. In the height of their conſternation, a vigorous ſally was made by the beſieged. Deſſe renewed the aſſault in the morning, and was again diſcomfited. He now turned his arms againſt Broughty caſtle; and, though unable to reduce it, he yet recovered the neighbouring town of Dundee, which had fallen into the poſſeſſion of the enemy. Hume caſtle was retaken by ſtratagem. Deſſe entered Jedburgh, and put its garriſon to the ſword. Encouraged by this ſucceſs he ravaged the Engliſh borders in different incurſions, and obtained ſeveral petty victories. Leith, which from a ſmall village had grown into a town, was fortified by him; and the iſland of Inchkeith, which is nearly oppoſite to that harbour, being occupied by Engliſh troops, he undertook to expel them, and made them priſoners after a briſk encounter.

5 Deſſe Frenc neral ſome vanta

His activity and valour could not, however, compoſe the diſcontents of the Scottiſh nation; and the queen-dowager having written to Henry II. to recal him, he was ſucceeded in his command by Monſieur de Thermes, who was accompanied into Scotland by Monluc biſhop of Valence, a perſon highly eſteemed for his addreſs and ability. This eccleſiaſtic was deſigned to ſupply the loſs of Cardinal Beaton, and to diſcharge the office of lord high chancellor of Scotland. But the jealouſies of the nation increaſing, and the queen-dowager herſelf ſuſpecting his ambition and turbulence, he

De Thermes brought with him from France a reinforcement of 1000 foot, 2000 horſe, and 100 men at arms. He erected a fort at Aberlady, to diſtreſs the garriſon of Haddington, and to intercept its ſupplies of proviſion. At Coldingham he deſtroyed a troop of Spaniards in the Engliſh pay. Faſt-caſtle was regained by ſurpriſe. Diſtractions in the Engliſh court did not permit the protector to act vigorouſly in the war. The earl of Warwick was diverted from marching an army into Scotland. An infectious diſtemper had broke out in the garriſon at Haddington; and an apprehenſion prevailed, that it could not hold out for any length of time againſt the Scots. The earl of Rutland, therefore, with a body of troops, entered the town; and after ſetting fire to it, conducted the garriſon and artillery to Berwick. The regent, in the poſſeſſion of Haddington, was ſolicitous to recover the other places which were yet in the power of the Engliſh. De Thermes laid ſiege to Broughty caſtle, and took it. He then beſieged Lawder; and the garriſon was about to ſurrender at diſcretion, when the news arrived that a peace was concluded between France, England, and Scotland.

By this treaty Henry II. obtained the reſtitution of Boulogne and its dependencies, which had been taken from him by the king of England, and for which he paid 400,000 crowns. No oppoſition was to be given to the marriage of the queen of Scotland with the dauphin: the fortreſſes of Lawder and Douglas were to be reſtored to the Scots, and the Engliſh were to deſtroy the caſtles of Roxburgh and Eyemouth. After the ratification of the articles, the queen-dowager embarked with Leon Strozzi for France, attended by many of the nobility. Having arrived there, ſhe communicated to the king her deſign of aſſuming the government of Scotland, and he promiſed to aſſiſt her to the utmoſt of his power. But the jealouſy which prevailed between the Scots and French rendered the accompliſhment of this deſign very difficult. To remove the regent by an act of power might endanger the ſcheme altogether; but it might be poſſible to perſuade him to reſign his office voluntarily. For this purpoſe intrigues were immediately commenced; and indeed the regent himſelf contributed to promote their ſchemes by his violent perſecution of the reformed. The peace was hardly proclaimed, when he provoked the public reſentment by an action of ſanguinary inſolence. Adam Wallace, a man of ſimple manners, but of great zeal for the Reformation, was accuſed of hereſy, and brought to trial in the church of the Black Friars at Edinburgh. In the preſence of the regent, the earls of Angus, Huntley, Glencairn, and other perſons of diſtinction and rank, he was charged with preaching without any authority of law, with baptizing one of his own children, and with denying the doctrine of purgatory; and it was ſtrenuouſly objected to him, that he accounted prayers to the ſaints and the dead to be an uſeleſs ſuperſtition, that he had pronounced the maſs to be an idolatrous ſervice, and that he had affirmed that the bread and wine in the ſacrament of the altar, after the words of the conſecration, do not change their nature, but continue to be bread and wine. Theſe offences were eſteemed too terrible to admit of any pardon.—The earl of Glencairn alone proteſted againſt his puniſhment. The pious ſufferer bore with reſignation the contumelious inſults of the clergy; and by his courage and patience at the ſtake gave a ſanction to the opinions he had embraced.

Other acts of atrocity and violence ſtained the adminiſtration of the regent. In his own palace, William Crichton, a man of family reputation, was aſſaſſinated by the Lord Semple. No attempt was made to puniſh the murderer. His daughter was the concubine of the archbiſhop of St Andrew's, and her tears and entreaties were more powerful than juſtice. John Melvil, a perſon reſpectable by his birth and his fortune, had written to an Engliſh gentleman, recommending to his care a friend who at that time was a captive in England. This letter contained no improper information in matters of ſtate, and no ſuſpicion of any crime againſt Melvil could be inferred from it. Yet the regent brought him to trial upon a charge of high treaſon; and, for an act of humanity and friendſhip, he was condemned to loſe his head. The eſtate of Melvil, forfeited to his family, was given to David the youngeſt ſon of the regent.

Amidſt the pleaſures and amuſements of the French court, the queen-dowager was not inattentive to the ſcheme of ambition which ſhe had projected. The earls of Huntley and Sutherland, Mariſchal and Caſſilis, with the Lord Maxwell, and other perſons of eminence who had accompanied her to France, were gained over to her intereſts. Robert Carnegie of Kinnaird, David Pauter biſhop of Roſs, and Gavin Hamilton commendator of Kilwinning, being alſo at this time in that kingdom, and having the greateſt weight with the regent, were treated with a moſt punctilious reſpect. Henry declared to them his earneſt wiſh that the queen-dowager might attain the government of Scotland. In caſe the regent ſhould conſent to this meaſure, he expreſſed a firm intention that no detriment ſhould happen to his conſequence and affairs; and he deſired them to inform him, that he had already confirmed his title of *duke of Chatelherault*, had advanced his ſon to be captain of the Scots gendarmes in France, and was ready to tender other marks of favour to his family and relations. Upon this buſineſs, and with this meſſage, Mr Carnegie was deſpatched to Scotland; and a few days after, he was followed by the biſhop of Roſs. The biſhop being a man of eloquence and authority, obtained, though with great difficulty, a promiſe from the regent to reſign his high office; and for this ſervice he received, as a recompenſe, an abbey in Poitou.

The queen-dowager, full of hopes, now prepared to return to Scotland, and in her way thither made uſe of a ſafe conduct obtained from Edward VI. by the king of France. The Engliſh monarch, however, had not yet forgot the beautiful queen of Scotland; and did not fail to urge his ſuperiority of claim to her over the dauphin. The queen-dowager did not ſeriouſly enter upon the buſineſs; only in general terms complained of the hoſtilities committed by the Engliſh; and two days after this converſation, ſhe proceeded towards Scotland, where ſhe was conducted by the earl of Bothwel, Lord Hume, and ſome other noblemen, to Edinburgh, amidſt the acclamations of the people. She had not long been returned to the capital, when the bad conduct of the regent afforded her an opportunity of exerting her influence and addreſs to the advantage of her project. The regent having propoſed a judicial circuit through

the kingdom, under pretence of repreſſing crimes and diſorders, moleſted the people by plunder and rapine. Great fines were levied for offences pretended as well as real; and the Proteſtants in particular ſeemed to be the objects of his diſpleaſure and ſeverity. In his progreſs he was accompanied by the queen-dowager; and as ſhe affected to behave in a manner directly oppoſite, the moſt diſagreeable compariſons were made between her and the regent. The biſhop of Roſs, to whom he had promiſed to reſign his office, did not fail to put him in mind of his engagements; but he had now altered his mind, and wiſhed ſtill to continue in power. His reſolution, however, failed him on the firſt intimation of a parliamentary inquiry into the errors of his adminiſtration. An agreement with the queen-dowager then took place; and it was ſtipulated, that he ſhould ſucceed to the throne upon the death of the queen without iſſue; that his ſon ſhould enjoy the command of the gendarmes; that no inquiry ſhould be made into his expenditure of the royal treaſures; that no inquiry into his government ſhould take place; and that he ſhould enjoy in the moſt ample manner his duchy and his penſion. Theſe articles were ratified at an aſſembly of parliament, and the queen-dowager was formally inveſted with the regency.

Mary of Lorraine, the new regent, though ſhe had with great difficulty attained the ſummit of her wiſhes, ſeemed to be much leſs verſant in the arts of government than of intrigue. She was ſcarcely ſettled in her new office when ſhe rendered herſelf unpopular in two reſpects; one was by her too great attachment to France, and the other by her perſecution of the reformed religion. She was entirely guided by the councils of her brothers the duke of Guiſe and the cardinal of Lorraine; and paid by far too much attention to M. d'Oyſel the French ambaſſador, whom they recommended to her as an able and faithful miniſter. Several high offices were filled with Frenchmen, which excited in the higheſt degree the reſentment of the Scottiſh nobility; and the commonalty were inſtantly prejudiced againſt her by the partiality ſhe ſhowed to the Papiſts. At firſt, however, ſhe enacted many ſalutary laws; and while ſhe made a progreſs herſelf through the ſouthern provinces of the kingdom to hold juſticiary courts, ſhe endeavoured to introduce order and law into the weſtern counties and iſles; firſt by the earl of Huntley, and afterwards by the earls of Argyll and Athol, to whom ſhe granted commiſſions for this purpoſe with effectual powers. In another improvement, which the queen-regent attempted by the advice of her French council, ſhe found herſelf oppoſed by her own people. It was propoſed that the poſſeſſions of every proprietor of land in the kingdom ſhould be valued and entered into regiſters; and that a proportional payment ſhould be made by each. The application of this fund was to maintain a regular and ſtanding body of ſoldiers. This guard or army, it was urged, being at all times in readineſs to march againſt an enemy, would protect effectually the frontiers; and there would no longer be any neceſſity for the nobles to be continually in motion on every rumour of hoſtility or incurſion from Engliſh invaders. No art, however, or argument, could recommend theſe meaſures. A perpetual tax and a ſtanding army were conceived to be the genuine characteriſtics of deſpotiſm. All ranks of men conſidered themſelves inſulted and abuſed; and 300 tenants of the crown aſſembling at Edinburgh, and giving way to their indignation, ſent their remonſtrances to the queen-regent in ſuch ſtrong and expreſſive language, as induced her to abandon the ſcheme. Yet ſtill the attempt which ſhe had made left an impreſſion on the minds of the people. They ſuſpected her to be a ſecret enemy to their government and liberties; and they were convinced that Henry II. was engaging her in refinements and artifices, that he might reduce Scotland to be a province of France.

Scotl

While an alarm about their civil rights was ſpreading itſelf among the people, the Proteſtants were riſing daily in their ſpirit and in their hopes. John Knox (p), whoſe courage had been confirmed by misfortunes, and whoſe talents had improved by exerciſe, was at this time making a progreſs through Scotland. The characteriſtic peculiarities of Popery were the favourite topics of his declamation and cenſure. He treated the maſs, in particular, with the moſt ſovereign contempt, repreſenting it as a remnant of idolatry. Many of the nobility and gentry afforded him countenance and protection. They invited him to preach at their houſes, and they partook with him in the ordinances of religion after the reformed method. Religious ſocieties and aſſemblies were held publicly, in defiance of the Papiſts; and celebrated preachers were courted with aſſiduity and bribes to reſide and officiate in particular diſtricts and towns. The clergy cited him to appear before them at Edinburgh, in the church of the Blackfriars. On the appointed day he preſented himſelf, with a numerous attendance of gentlemen, who were determined to exert themſelves in his behalf. The prieſthood did not chooſe to proceed in his proſecution; and Knox, encouraged by this ſymptom of their fear, took the reſolution to explain and inculcate his doctrines repeatedly and openly in the capital city of Scotland. In 1556, the earl of Glencairn allured the earl Mariſchal to hear the exhortations of this celebrated preacher; and they were ſo much affected with his reaſonings and rhetoric, that they requeſted him to addreſs the queen-regent upon the ſubject of the reformation of religion. In compliance with this requeſt, he wrote a letter in very diſagreeable terms; and the earl of Glencairn delivered it with his own hand, in the expectation that ſome advantage might in this manner be obtained for the reformed. But the queen-regent was no leſs offended with the freedom of the nobleman than the preacher; and, after peruſing the paper, ſhe gave it to James Beaton archbiſhop of Glaſgow, with an expreſſion of diſdain, "Here, my lord, is a paſquil."

51 John encour the rel ers.

51 Write offenſi letter the qu regent

Amidſt theſe occupations, John Knox received an invitation to take the charge of the Engliſh congregation at Geneva; which he accepted. The clergy called upon him, in his abſence, to appear before them, condemned

land.

ed him to death as a heretic, and ordered him to be burned in effigy.

The injurious treatment of John Knox did not in the leaſt obſtruct the progreſs of the Reformation. Deſertions were made from Popery in every town and village; and even many members of the church, both ſecular and regular, were forward to embrace the new principles, and to atone for their paſt miſtakes by the bitterest railleries againſt the corruptions and the folly of the Romiſh faith. The prieſts were treated in all places with ridicule and contempt. The images, crucifixes, and relics, which ſerved to rouſe the decaying fervours of ſuperſtition, were ſtolen from the churches, and trampled under foot. The biſhops implored the aſſiſtance of the queen-regent. Citations were given to the preachers to appear in their defence. They obeyed; but with ſuch a formidable retinue, that it was with difficulty ſhe was permitted to apologize for her conduct. James Chalmers of Gaitgirth, preſſing forward from the crowd, addreſſed himſelf to her: "We vow to God, that the devices of the prelates ſhall not be carried into execution. We are oppreſſed to maintain them in their idleneſs. They ſeek to undo and murder our preachers and us; and we are determined to ſubmit no longer to this wickedneſs." The multitude, applauding his ſpeech, put their hands to their daggers.

A truſty meſſenger was deſpatched to Geneva, inviting John Knox to return to his own country. But in the infancy of their connexion, the Proteſtants being apprehenſive of one another, uncertain in their counſels, or being deſerted by perſons upon whom they had relied, it appeared to them that they had adopted this meaſure without a due preparation; and, by oppoſite deſpatches, Knox was requeſted to delay his journey for ſome time.

To this zealous reformer their unſteadineſs was a matter of ſerious affliction; and in the anſwer he tranſmitted to their letters, he rebuked them with ſeverity: but amidſt this correction, he entreated them not to faint under their purpoſes, from apprehenſions of danger, which, he ſaid, was to ſeparate themſelves from the favour of God, and to provoke his vengeance. To particular perſons he wrote other addreſſes; and to all of them the greateſt attention was paid. In 1557, a formal bond of agreement, which obtained the appellation of *the firſt covenant*, was entered into, and all the more eminent perſons who favoured the Reformation were invited to ſubſcribe it. The earls of Argyll, Glencairn, and Morton, with the Lord Lorn, and John Erſkine of Dun, led the way, by giving it the ſanction of their names. All the ſubſcribers to this deed, renouncing the ſuperſtitions and idolatry of the church of Rome, promiſed to apply continually their whole power and wealth, and even to give up their lives, to forward and eſtabliſh the word of God. They diſtinguiſhed the reformed, by calling them the *Congregation of Chriſt*; and by the opprobrious title of the *Congregation of Satan*, they peculiarized the favourers of Popery.

22 firſt ant.

23 Knox Calvin ed into and.

After the leaders of the Reformation had ſubſcribed the firſt covenant, they addreſſed letters to John Knox, urging in the ſtrongeſt terms his return to Scotland; and that their hopes of his aſſiſtance might not be diſappointed, they ſent an addreſs to John Calvin, the celebrated reformer, begging him to join his commands to their entreaties. The archbiſhop of St Andrew's, who perceived the riſing ſtorm, was in a difficult ſituation. A powerful combination threatened ruin to the church; and he had ſeparated himſelf from the politics of the queen-regent. The zeal of the Roman Catholics pointed out ſtrong meaſures to him; and his diſpoſitions were pacific. The clergy were offended with his remiſſneſs and neglect of duty. The reformers deteſted his looſeneſs of principles, and were ſhocked with the diſſolute depravity of his life and converſation. He reſolved to try the force of addreſs, and did not ſucceed. He then reſolved to be ſevere, and was ſtill more unſucceſsful.

Scotla

52 The ar biſhop St And attemp vain t duce t earl of gyll.

The earl of Argyll was the moſt powerful of the reformed leaders. To allure him from his party, the archbiſhop of St Andrew's employed the agency of Sir David Hamilton. But the kindneſs he affected, and the advices he beſtowed, were no compliment to the underſtanding of this nobleman; and his threats were regarded with ſcorn. The reformers, inſtead of loſing their courage, felt a ſentiment of exultation and triumph; and the earl of Argyll happening to die about this time, he not only maintained the new doctrines in his laſt moments, but entreated his ſon to ſeek for honour in promoting the public preaching of the goſpel of Jeſus Chriſt, and in the utter ruin of ſuperſtition and idolatry.

It was determined by the archbiſhop and the prelates, that this diſappointment ſhould be ſucceeded by furious perſecution of the reformed. Walter Mill, a prieſt, had neglected to officiate at the altar; and having been long under the ſuſpicion of hereſy, was carried to St Andrew's, committed to priſon, and accuſed before the archbiſhop and his ſuffragans. He was in an extreme old age; and he had ſtruggled all his life with poverty. He ſunk not, however, under the hardneſs of his fate. To the articles of his accuſation he replied with ſignal recollection and fortitude. The firmneſs of his mind, in the emaciated ſtate of his body, excited admiration. The inſults of his enemies, and their contempt, ſerved to diſcover his ſuperiority over them. When the clergy declared him a heretic, no temporal judge could be found to condemn him to the fire. He was reſpited to another day; and ſo great ſympathy prevailed for his misfortunes, that it was neceſſary to allure one of the archbiſhop's domeſtics to ſupply the place of the civil power, and to pronounce the ſentence of condemnation. When brought to the ſtake, the reſolution of this ſufferer did not forſake him. He praiſed God, that he had been called to ſeal up the truth with his life; and he conjured the people, as they would eſcape eternal death, not to be overcome by the errors and the artifices of monks and prieſts, abbots and biſhops.

52 Walke Mill e cuted accou religi

The barbarity of this execution affected the reformers with inexpreſſible horror. Subſcriptions for mutual defence were taken. The leaders of the Reformation, diſperſing their emiſſaries to every quarter, encouraged the vehemence of the multitude. The covenant to eſtabliſh a new form of religion extended far and wide. The ſharp point of the ſword, not the calm exertions of inquiry, was to decide the diſputes of theology.

5 Th teſta folve fert right

When the leaders of the Reformation were appriſed of the ardent zeal of the people, and conſidered the great number of ſubſcriptions which had been collected in the different counties of the kingdom, they aſſembled

otland.

527 irion quarenent.

to deliberate concerning the ſteps to be purſued. It was reſolved, accordingly, that a public and common ſupplication of the whole body of the Proteſtants ſhould be preſented to the queen regent; which, after complaining of the injuries they had ſuffered, ſhould require her to beſtow upon them her ſupport and aſſiſtance, and urge her to proceed in the work of a reformation. To explain their full meaning, a ſchedule, containing particular demands, was at the ſame time to be preſented to her ſcrutiny. To Sir James Sandilands of Calder they committed the important charge of their manifeſto and articles of reformation; and in appointing him to this commiſſion, they conſulted the reſpect which was due both to the government and to themſelves. His character was in the higheſt eſtimation. His ſervices to his country were numerous; his integrity and honour were ſuperior to all ſuſpicion; and his age and experience gave him authority and reverence.

The petition or ſupplication of the Proteſtants was expreſſed in ſtrong but reſpectful terms. They told the queen-regent, that though they had been provoked by great injuries, they had yet, during a long period, abſtained from aſſembling themſelves, and from making known to her their complaints. Baniſhment, confiſcation of goods, and death in its moſt cruel ſhape, were evils with which the reformed had been afflicted; and they were ſtill expoſed to theſe dreadful calamities. Compelled by their ſufferings, they preſumed to aſk a remedy againſt the tyranny of the prelates and the eſtate eccleſiaſtical. They had uſurped an unlimited domination over the minds of men. Whatever they commanded, though without any ſanction from the word of God, muſt be obeyed. Whatever they prohibited, though from their own authority only, it was neceſſary to avoid. All arguments and remonſtrances were equally fruitleſs and vain. The fire, the faggot, and the ſword, were the weapons with which the church enforced and vindicated her mandates. By theſe, of late years, many of their brethren had fallen; and upon this account they were troubled and wounded in their conſciences. For conceiving themſelves to be a part of that power which God had eſtabliſhed in this kingdom, it was their duty to have defended them, or to have concurred with them in an open avowal of their common religion. They now take the opportunity to make this avowal. They break a ſilence which may be miſinterpreted into a juſtification of the cruelties of their enemies. And diſdaining all farther diſſimulation in matters which concern the glory of God, their preſent happineſs, and their future ſalvation, they demand, that the original purity of the Chriſtian religion ſhall be reſtored, and that the government ſhall be ſo improved, as to afford to them a ſecurity in their perſons, their opinions, and their property.

With this petition or ſupplication of the Proteſtants, Sir James Sandilands, preſented their ſchedule of demands, or the preliminary articles of the Reformation. They were in the ſpirit of their ſupplication, and of the following tenor:

528 icles of Reformation.

I. It ſhall be lawful to the reformed to peruſe the Scriptures in the vulgar tongue; and to employ alſo their native language in prayer publicly and in private.

II. It ſhall be permitted to any perſon qualified by knowledge, to interpret and explain the difficult paſſages in the Scriptures.

III. The election of miniſters ſhall take place according to the rules of the primitive church; and thoſe who elect ſhall inquire diligently into the lives and doctrines of the perſons whom they admit to the clerical office.

IV. The holy ſacrament of baptiſm ſhall be celebrated in the vulgar tongue, that its inſtitution and nature may be the more generally underſtood.

V. The holy ſacrament of the Lord's ſupper ſhall likewiſe be adminiſtered in the vulgar tongue; and in this communion, as well as in the ceremonial of baptiſm, a becoming reſpect ſhall be paid to the plain inſtitution of Chriſt Jeſus.

VI. The wicked and licentious lives of the biſhops and eſtate eccleſiaſtical ſhall be reformed; and if they diſcharge not the duties of true and faithful paſtors, they ſhall be compelled to deſiſt from their miniſtry and functions.

Bre

5 The ſtants tered the q regen

The queen-regent now found it neceſſary to flatter the Proteſtants. She aſſured them by Sir James Sandilands, their orator or commiſſioner, that every thing they could legally deſire ſhould be granted to them; and that, in the mean time, they might, without moleſtation, employ the vulgar tongue in their prayers and religious exerciſes. But, upon the pretence that no encouragement might be given to tumults and riot, ſhe requeſted that they would hold no public aſſemblies in Edinburgh or Leith. The Congregation, for this name was now aſſumed by the Proteſtants, were tranſported with theſe tender proofs of her regard; and while they ſought to advance ſtill higher in her eſteem by the inoffenſive quietneſs of their carriage, they were encouraged in the undertaking they had begun, and anxious to accompliſh the work of the Reformation.

Nor to the clergy, who at this time were holding a provincial council at Edinburgh, did the Congregation ſcruple to communicate the articles of the intended reformation. The clergy received their demands with a ſtorm of rage, which died away in an innocent debility. Upon recovering from their paſſions, they offered to ſubmit the controverſy between them and the reformed to a public diſputation. The Congregation did not refuſe this mode of trial; and deſired, as their only conditions, that the Scriptures might be conſidered as the ſtandards of orthodoxy and truth, and that thoſe of their brethren who were in exile and under perſecution might be permitted to aſſiſt them. Theſe requeſts, though reaſonable in a high degree, were not complied with; and the church would allow no rule of right but the canon law and its own councils. Terms of reconciliation were then offered on the part of the eſtate eccleſiaſtical. It held out to the Proteſtants the liberty of praying and adminiſtering the ſacraments in the vulgar tongue, if they would pay reverence to the maſs, acknowledge purgatory, invoke the ſaints, and admit of petitions for the dead. To conditions ſo ineffectual and abſurd the Congregation did not deign to return any anſwer.

5 They to di with Ro cler

The meeting of the parliament approached. The parties in contention were agitated with anxieties, apprehenſions, and hopes. An expectation of a firm and open aſſiſtance from the queen-regent gave courage to the reformed; and, from the parliamentary influence of their friends in the greater and the leſſer baronage, they expected the moſt important ſervices. They drew up with eagerneſs the articles which they wiſhed to be

passed into a law; and as the spirit and sense of their transactions are to be gathered in the completest manner from the papers which were framed by themselves, it is proper to attend to them with a punctilious exactness. Their petitions were few and explicit.

I. They could not, in consequence of principles which they had embraced from a conviction of their truth, participate in the Romish religion. It was therefore their desire, that all the acts of parliament, giving authority to the church to proceed against them as heretics, should be abrogated; or, at least, that their power should be suspended till the disputes which had arisen were determined and brought to a conclusion.

II. They did not mean that all men should be at liberty to profess what religion they pleased, without the controul of authority. They consented that all transgressors in matters of faith should be carried before the temporal judge. But it was their wish that the clergy should have only the power to accuse; and they thought it conformable to justice, that a copy of the criminal charge should be lodged with the party upon trial, and that a competent time should be allowed him to defend himself.

III. They insisted, that every defence consistent with law should be permitted to the party accused; and that objections to witnesses, founded in truth and reason, should operate to his favour.

IV. They desired that the party accused should have permission to interpret and explain his own opinions; and that his declaration should carry a greater evidence than the deposition of any witness: as no person ought to be punished for religion, who is not obstinate in a wicked or damnable tenet.

V. In fine, they urged, that no Protestant should be condemned for heresy, without being convicted, by the word of God, of the want of that faith which is necessary to salvation.

The Congregation presented these articles to the queen-regent, expecting that she would not only propose them to the three estates assembled in parliament, but employ all her influence to recommend them. But finding themselves disappointed, they began to suspect her sincerity; and they were sensible that their petitions, though they should be carried in parliament, could not pass into a law without her consent. They therefore abstained from presenting them; but as their complaints and desires were fully known in parliament, they ordered a solemn declaration to be read there in their behalf, and demanded that it should be inserted in the records of the nation. In this declaration, after expressing their regret for having been disappointed in their scheme of reformation, they protested, that no blame should be imputed to them for continuing in their religion, which they believed to be founded in the word of God; that no danger of life, and no political pains, should be incurred by them, for disregarding statutes which support idolatry, and for violating rites which are of human invention; and that, if insurrections and tumults should disturb the realm, from the diversity of religious opinions, and if abuses should be corrected by violence, all the guilt, disorder, and inconvenience thence arising, instead of being applied to them, should be ascribed to those solely who had refused a timely redress of wrongs, and who had despised petitions presented with the humility of faithful subjects, and for the purposes of establishing the commandments of God, and a most just and salutary reformation.

The three estates received this formidable protest with attention and respect; but the intention of inserting it in the national records was abandoned by the Congregation, upon a formal promise from the queen-regent, that all the matters in controversy should speedily be brought by her to a fortunate issue.

While the Protestants were thus making the most vigorous exertions in behalf of their spiritual liberties, the queen-regent, in order to establish herself the more effectually, used every effort to promote the marriage of her daughter with the dauphin of France. In 1557, commissioners were appointed to negotiate this marriage; but while these negotiations were going on, the court of France acted in the most perfidious manner. At the age of 15, after solemnly ratifying the independency of Scotland, and the succession of the crown in the house of Hamilton, Queen Mary was influenced by the king and her uncles the princes of Lorraine to sign privately three extraordinary deeds or instruments. By the first she conveyed the kingdom of Scotland to the king of France and his heirs, in the default of children of her own body. By the second she assigned him, if she should die without children, the possession of Scotland, till he should receive a million of pieces of gold, or be amply recompensed for the sums expended by him in the education of the queen of Scotland in France. By the third she confirmed both these grants in an express declaration, that they contained the pure and genuine sentiments of her mind; and that any papers which might be obtained, either before or after her marriage, by means of the Scottish parliament, should be invalid, and of no force nor efficacy. On the 24th of April, the nuptials were celebrated; and the dauphin, Francis, was allowed to assume the title of king of Scotland. The French court demanded for him the crown and other ensigns of royalty belonging to Scotland; but the commissioners had no power to comply with their request. It was then desired, that when they returned home, they should use all their influence to procure the crown-matrimonial of Scotland for the dauphin. This also was refused; the court of France was disgusted; and four of the commissioners died, it was supposed of poison, given them by the princes of Lorraine. This subject, however, was pressed, on the return of the surviving commissioners, by the king of France himself, the queen of Scotland, and the queen-regent. The Protestants also joined their interest, hoping by that means to gain over the queen and queen-regent to their party; so that an act of parliament was at length passed, by which the crown-matrimonial was given to the dauphin during the time of his marriage with Queen Mary; but without any prejudice to the liberties of the kingdom, to the heirs of her body, or to the order of succession. With so many restraints, it is difficult to see the advantages which could accrue from this gift so earnestly sought after; and it is very probable, that the usurpations of France in consequence of it, would have been productive of many disturbances; but these were prevented by the death of Francis in December 1560.

But before this event took place, Scotland was, by the intrigues of France, involved in confusion on another account. After the death of Mary queen of England,

land, and daughter to Henry VIII. the princes of Guiſe inſiſted on the claim of Mary queen of Scots to the crown of England, in preference to that of Elizabeth, whom they looked upon as illegitimate. This claim was ſupported by the king of France, who prevailed with the queen of Scots herſelf to aſſume the title of queen of England, and to ſtamp money under that character. The arms of England were quartered with thoſe of France and Scotland: and employed as ornaments for the plate and furniture of Mary and the dauphin. Thus was laid the foundation of an irreconcileable quarrel between Elizabeth and Mary; and to this, in ſome meaſure, are we to aſcribe the inveteracy with which the former perſecuted the unhappy queen of Scotland, at every time ſhe had it in her power.

But while they imprudently excited a quarrel with England, they yet more imprudently quarrelled alſo with the majority of the people of Scotland. As Elizabeth profeſſed the Proteſtant religion, it was eaſily foreſeen, that the *Congregation*, or body of the reformed in Scotland, would never conſent to act againſt her in favour of a Popiſh power; and as they could not be gained, it was reſolved to deſtroy them at once, by putting to death all their leaders. The queen-regent gave intimation of her deſign to re-eſtabliſh Popery, by proclaiming a ſolemn obſervance of Eaſter, receiving the ſacrament according to the Romiſh communion, herſelf, and commanding all her houſehold to receive it in the ſame manner. She next expreſſed herſelf in a contemptuous manner againſt the reformed, affirmed that they had inſulted the royal dignity, and declared her intention of reſtoring it to its ancient luſtre. The preachers of the Congregation were next cited to appear at Stirling, to anſwer the charges which might be brought againſt them. Alexander earl of Glencairn, and Sir Hugh Campbell of Loudon, were deputed to admoniſh her not to perſecute the preachers, unleſs they had been obnoxious by circulating erroneous doctrines, or diſturbing the peace of government. The queen-regent in a paſſion told them, that the preachers ſhould all be baniſhed Scotland, though their doctrines were as ſound as thoſe of St Paul. The deputies urged her former kind behaviour and promiſes; but the queen-regent anſwered, that "the promiſes of princes ought not to be exacted with rigour, and that they were binding only when ſubſervient to their convenience and pleaſure." To this they replied, that in ſuch a caſe they could not look upon her as their ſovereign, and muſt renounce their allegiance as ſubjects.

Soon after this tranſaction, the queen-regent received the news that the Reformation was eſtabliſhed in Perth. Lord Ruthven the provoſt of the city was ſummoned to anſwer for this innovation; but his reply was, that he had no dominion over the minds and conſciences of men. The provoſt of Dundee, being ordered to apprehend an eminent preacher, named *Paul Methven*, ſent him intelligence of the order, that he might provide for his ſafety. The proclamation for obſerving Eaſter was everywhere deſpiſed and neglected, and people exclaimed againſt the maſs as an idol. New citations, in the mean time, had been given to the preachers to appear at Stirling. They obeyed the ſummons; but attended by ſuch multitudes, that the queen-regent, dreading their power, though they were without arms, entreated Mr Erſkine of Dun, whom they had ſent before as a deputy, to ſtop their march; aſſuring him that all proceedings againſt the preachers ſhould be ſtopped. In conſequence of this, the multitude diſmiſſed; yet, when the day came on which the preachers ſhould have appeared, the queen-regent, with unparalleled folly as well as treachery, cauſed them to be declared traitors, and proclaimed it criminal to afford them any ſubſiſtence.

Mr Erſkine, exaſperated by this ſhameful conduct, haſtened to the Congregation, apologized for his conduct, and urged them to proceed to the laſt extremities. At this critical period alſo John Knox returned from Geneva, and joined the Congregation at Perth. The great provocations which the Proteſtants had already received, joined to the impetuous paſſions of the multitude, were now productive of the greateſt diſorders. Images were deſtroyed, monaſteries pulled down, and their wealth either ſeized by the mob or given to the poor. The example of Perth was followed by Cupar in Fife; and ſimilar inſurrections being apprehended in other places, the queen-regent determined to puniſh the inhabitants of Perth in the moſt exemplary manner. With this view ſhe collected an army: but being oppoſed with a formidable power by the Proteſtants, ſhe thought proper to conclude an agreement. The Proteſtants, however, dreaded her inſincerity; and therefore entered into a new covenant to ſtand by and defend one another. Their fears were not vain. The queen-regent violated the treaty almoſt as ſoon as made, and began to treat the Proteſtants with ſeverity. The earl of Argyll, and the prior of St Andrew's, who about this time began to take the title of *Lord James Stuart*, now openly headed the Proteſtant party, and prepared to collect their whole ſtrength. The queen-regent oppoſed them with what forces ſhe had, and which indeed chiefly conſiſted of her French auxiliaries; but, being again afraid of coming to an engagement, ſhe conſented to a truce until commiſſioners ſhould be ſent to treat with the lords of an effectual peace. No commiſſioners, however, were ſent on her part; and the nobles, provoked at ſuch complicated and unceaſing treachery, reſolved to puſh matters to the utmoſt extremity. The firſt exploit of the reformed was the taking of the town of Perth, where the queen-regent had placed a French garriſon. The multitude, elated with this achievement, deſtroyed the palace and abbey of Scone, in ſpite of all the endeavours of their leaders, even of John Knox himſelf, to ſave them. The queen-regent, apprehenſive that the Congregation would commit farther ravages to the ſouthward, reſolved to throw a garriſon into Stirling; but the earl of Argyll and Lord James Stuart were too quick for her, and arrived there the very day after the demolition of the abbey and palace of Scone. The people, incapable of reſtraint, and provoked beyond meaſure by the perfidious behaviour of the Catholic party, demoliſhed all the monaſteries in the neighbourhood, together with the fine abbey of Cambuſkenneth, ſituated on the north bank of the Forth. From Stirling they went to Linlithgow, where they committed their uſual ravages; after which, they advanced to Edinburgh. The queen-regent, alarmed at their approach, fled to Dunbar; and the Proteſtants took up their reſidence in Edinburgh.

Having thus got poſſeſſion of the capital, the Congregation

gregation assumed to themselves the ruling power of the kingdom, appointed preachers in all the churches, and seized the mint, with all the instruments of coining. The queen-regent, unable to dispute the matter in the field, published a manifesto, in which she set forth their seditious behaviour, commanding them to leave Edinburgh within six hours, and enjoining her subjects to avoid their society under the pain of treason. The Congregation having already lost somewhat of their popularity by their violent proceedings, were now incapable of coping with government. As they had not established themselves in any regular body, or provided a fund for their support, they felt their strength decay, and multitudes of them returned to their habitations. Those who remained found themselves obliged to vindicate their conduct; and, in an address to the regent, to disclaim all treasonable intentions. Negotiations again took place, which ended as usual; the queen-regent, who had taken this opportunity of collecting her forces, marched against the Congregation on the 23d of July 1559. The Protestants now found themselves incapable of making head against their enemies; and therefore entered into a negotiation, by which all differences were for the present accommodated. The terms of this treaty were, that the town of Edinburgh should be open to the queen-dowager and her attendants; that the palace of Holyroodhouse and the mint should be delivered up to her; that the Protestants should be subject to the laws, and abstain from molesting the Roman Catholics in the exercise of their religion. On the queen's part, it was agreed, that the Protestants should have the free exercise of their religion, and that no foreign troops should enter the city of Edinburgh.

Notwithstanding this treaty, however, the reformed had no confidence in the queen's sincerity. Having heard of the death of Henry II. of France, and the accession of Francis II. and Mary to that kingdom, they seem to have apprehended more danger than ever. They now entered into a third covenant; in which they engaged themselves to refuse attendance to the queen-dowager, in case of any message or letter; and that immediately on the receipt of any notice from her to any of their number, it should be communicated without reserve, and be made a common subject of scrutiny and deliberation. It was not long before they had occasion for all their constancy and strength. The queen-regent repented of the favourable terms she had granted the reformed; and being denied the favour which she requested of saying mass in the high-church of Edinburgh, she ordered them to be everywhere disturbed in the exercise of their religion.

In this imprudent measure, the queen-regent was confirmed by letters which now came from Francis and Mary, promising a powerful army to support her interests. The envoy who brought these despatches also carried letters to the lord James Stuart, now the principal leader of the Protestants, and natural brother to the queen. The letters were filled with reproaches and menaces, mixed with entreaties; and along with them the envoy delivered a verbal message, that the king his master was resolved rather to expend all the treasures of France than not to be revenged on the rebellious nobles who had disturbed the peace of Scotland. The lord James Stuart was not to be frightened by these menaces. He returned a cool and deliberate answer, apologizing for the Protestants, and vindicating them from the charge of rebellion; but at the same time intimating his full resolution of continuing to head the reformed as he had already done.

Scotla

551 French xiliaries rive, wh alarms t nation.

The letters of Francis and Mary were soon followed by 1000 French soldiers, with money and military stores; and the commander was immediately despatched again to France, to solicit the assistance of as many more soldiers, with four ships of war, and 100 men-at-arms. But before he could set out, La Brosse, another French commander, arrived with 2000 infantry; and that the Congregation might be defeated not only by arms but in disputation, the same ship brought three doctors of the Sorbonne, to show the pernicious tendency of the new doctrines. Thus matters were pushed on beyond all hopes of reconciliation. The nation was universally alarmed on account of the introduction of French troops, to which they saw no end. The queen-regent attempted to quiet the minds of the public by a proclamation; but their fears increased the more. The Congregation assembled at Stirling, where they were joined by the earl of Arran, and soon after by his father the duke of Chatelherault. They next deliberated on the measures to be followed with the queen-regent: and the result of their consultations was, that an expostulatory letter should be addressed to her. This was accordingly done; but as the queen behaved with her usual duplicity, the nobles called the people to arms. Mutual manifestos were now published; and both parties prepared to decide the contest by the sword. The Congregation having seized Broughty castle, marched from thence to Edinburgh. The queen-regent retired to Leith, which she had fortified and filled with French troops. Thither the nobles sent their last message to her, charging her with a design to overthrow the civil liberties of the kingdom. They requested her to command her Frenchmen and mercenaries to depart from Leith, and to make that place open and patent, not only to the inhabitants who had been dispossessed of their houses, but to all the inhabitants of Scotland. They declared, that her denial of this request should be considered by them as a proof of her intention to reduce the kingdom to slavery; in which case, they were determined to employ their utmost power to preserve its independency. Two days after this message, the queen-regent sent to them the Lord Lyon, whom she enjoined to tell them, that she considered their demand not only as presumptuous, but as an encroachment on the royal authority; that it was an indignity to her to be dictated to by subjects; that Frenchmen were not to be treated as foreigners, being entitled to the same privileges with Scotsmen; and that she would neither disband her troops, nor command the town of Leith to be made open and patent. The Lord Lyon then, in the name of the queen-regent, commanded the lords of the Congregation to depart from Edinburgh, and disperse themselves, under the pain of high treason. The Protestants, irritated by this answer, after some deliberation degraded the queen-regent; and to this purpose the nobility, barons, and burgesses, all agreed in subscribing an edict, which was sent to the principal cities in Scotland, and published in them.

The next step taken by the Congregation was to

land.

summon Leith to ſurrender; but meeting with defiance inſtead of ſubmiſſion, it was reſolved to take the town by ſcalade. For this ſervice ladders were framed in the church of St Giles's; a buſineſs which, interrupting the preachers in the exerciſe of public worſhip, made them prognoſticate misfortune and miſcarriage to the Congregation. In the diſpleaſure of the preachers, the common people found a ſource of complaint; and the emiſſaries of the queen-dowager acting with indefatigable induſtry to divide her adverſaries, and to ſpread chagrin and diſſatisfaction among them, diſcontent, animoſity, and terror, came to prevail to a great degree. The duke of Chatelherault diſcouraged many by his example. Defection from the Proteſtants added ſtrength to the queen-dowager. The moſt ſecret deliberations of the confederated lords were revealed to her. The ſoldiery were clamorous for pay; and it was very difficult to procure money to ſatisfy their claims. Attempts to ſooth and appeaſe them, diſcovering their conſequence, engendered mutinies. They put to death a domeſtic of the earl of Argyll, who endeavoured to compoſe them to order: they inſulted ſeveral perſons of rank who diſcovered a ſolicitude to pacify them; and they even ventured to declare, that, for a proper reward, they were ready to ſuppreſs the Reformation, and to re-eſtabliſh the maſs.

555 ſions place ngſt n.

556 y fall diſtreſs treat n Queen abeth.

It was abſolutely neceſſary to give ſatisfaction to the Proteſtant ſoldiers. The lords and gentlemen of the Congregation collected a conſiderable ſum among them; but it was not equal to the preſent exigency. The avarice of many taught them to withhold what they could afford, and the poverty of others did not permit them to indulge their generoſity. It was reſolved, that each nobleman ſhould ſurrender his ſilver plate to be ſtruck into money. By the addreſs, however, of the queen-dowager, the officers of the mint were bribed to conceal, or to convey to a diſtance, the ſtamps and inſtruments of coinage. A gloomy deſpair gave diſquiet to the Congregation, and threatened their ruin. Queen Elizabeth, with whoſe miniſters the confederated lords maintained a correſpondence at this time, had frequently promiſed them her aſſiſtance; but they could not now wait the event of a deputation to the court of England. In an extremity ſo preſſing, they therefore applied for a ſum of money to Sir Ralph Sadler and Sir James Croft, the governors of Berwick; and Cockburn of Ormiſton, who was intruſted with this commiſſion, obtained from them an aid of 4000 crowns. Traitors, however, in the councils of the Congregation, having informed the queen-dowager of his errand and expedition, the earl of Bothwel, by her order, intercepted him upon his return, diſcomfited his retinue, and made a prize of the Engliſh ſubſidy.

557 gliſh ſidy en by queen- ent.

To rouſe the ſpirit of the party, an attack was projected upon Leith, and ſome pieces of artillery were planted againſt it. But before any charge could be made, the French ſoldiers ſallied out to give battle to the troops of the Congregation, poſſeſſed themſelves of their cannon, and drove them back to Edinburgh. A report that the victors had entered this city with the fugitives, filled it with diſorder and diſmay. The earl of Argyll and his Highlanders haſtened to recover the honour of the day, and haraſſed the French in their retreat. This petty conflict, while it elated the queen-dowager, ſerved to augment the deſpondence of the Proteſtants.

558 Pro- ants ated.

Vain of their proweſs, the French made a new ſally from Leith, with a view to intercept a ſupply of proviſions and ſtores for the Congregation. The earl of Arran and the lord James Stuart advanced to attack them, and obliged them to retire. But purſuing them with too much heat, a freſh body of French troops made its appearance. It was prudent to retreat, but difficult. An obſtinate reſiſtance was made. It was the object of the French to cut off the ſoldiery of the Congregation from Edinburgh, and by theſe means to divide the ſtrength of that ſtation. The earl of Arran and the lord James Stuart had occaſion for all their addreſs and courage. Though they were able, however, to effect their eſcape, their loſs was conſiderable, and the victory was manifeſtly on the ſide of their adverſaries.

5 The teſta agai feate

About this time William Maitland of Lethington, ſecretary to the queen-dowager, withdrew ſecretly from Leith, and joined himſelf to the confederated nobles. He had been diſguſted with the jealouſies of the French counſellors, and was expoſed to danger from having embraced the doctrines of the reformed. His reception was cordial, and correſponded to the opinion entertained of his wiſdom and experience. He was ſkilled in buſineſs, adorned with literature, and accuſtomed to reflection. But as yet it was not known, that his want of integrity was in proportion to the greatneſs of his talents.

5 Mait the q dowa ſecre revol the I ſtant

The acceſſion of this ſtateſman to their party could not conſole the lords of the Congregation for the unpromiſing aſpect of their affairs. The two diſcomfitures they had received ſunk deeply into the minds of their followers. Thoſe who affected prudence, retired privately from a cauſe which they accounted to be deſperate; and the timorous fled with precipitation. The wailings and diſtruſt of the brethren were melancholy and infectious; and by exciting the ridicule and ſcorn of the partiſans of the queen-dowager, were augmented the more. A diſtreſs not to be comforted ſeemed to have invaded the Proteſtants; and the aſſociated nobles conſented to abandon the capital. A little after midnight, they retired from Edinburgh; and ſo great was the panic which prevailed, that they marched to Stirling without any ſtop or intermiſſion.

5 They from burgh Stirli

John Knox, who had accompanied the Congregation to Stirling, anxious to recover their unanimity and courage, addreſſed them from the pulpit. He repreſented their misfortunes as the conſequences of their ſins; and entreating them to remember the goodneſs of their cauſe, aſſured them in the end of joy, honour, and victory. His popular eloquence correſponding to all their warmeſt wiſhes, diffuſed ſatisfaction and cheerfulneſs. They paſſed from deſpair to hope. A council was held, in which the confederated nobles determined to ſolicit, by a formal embaſſy, the aid of Queen Elizabeth. Maitland of Lethington, and Robert Melvil, were choſen to negotiate this important tranſaction; and they received the fulleſt inſtructions concerning the ſtate and difficulties of the Congregation, the tyrannical deſigns of the queen-dowager, and the danger which threatened England from the union of Scotland with France.

5 John enco them

The queen of England having maturely conſidered the

land.

the caſe, determined to aſſiſt the reformers; whoſe leaders now diſperſed themſelves, and went to different parts of the kingdom, in order to employ their activity there for the common cauſe. The queen-dowager, imagining that the lords were fled, conceived great hopes of being able to cruſh the reformed at once. Her ſanguine hopes, however, were ſoon checked, on receiving certain intelligence that Queen Elizabeth was reſolved to give them aſſiſtance. She now took the beſt meaſures poſſible, as circumſtances ſtood; and determined to cruſh her enemies before they could receive any aſſiſtance from England. Her French troops took the road to Stirling, and waſted in their march all the grounds which belonged to the favourers of the Reformation. After renewing their depredations at Stirling, they paſſed the bridge there; and proceeding along the ſide of the river, exerciſed their cruelties and oppreſſions in a diſtrict which had diſtinguiſhed itſelf by an ardent zeal againſt Popery. While the terror of their arms was thus diffuſing itſelf, they reſolved to ſeize the town and caſtle of St Andrew's, which they conſidered as an important military ſtation, and as a convenient place of reception for the auxiliaries they expected from France.

But the lord James Stuart employed himſelf to interrupt their progreſs and retard their attempts; and it was his object at the ſame time, to keep the force of the Congregation entire, to hazard no action of importance, and to wait the approach of the Engliſh army. A ſmall advantage was obtained by the French at Petticur; and they poſſeſſed themſelves of Kinghorn. The lord James Stuart, with 500 horſe and 100 foot, entered Dyſart. With this inconſiderable ſtrength he propoſed to act againſt an army of 4000 men. His admirable ſkill in military affairs, and his heroic courage, were eminently diſplayed. During 20 days he prevented the march of the French to St Andrew's, intercepting their proviſions, haraſſing them with ſkirmiſhes, and intimidating them by the addreſs and the boldneſs of his ſtratagems.

Monſieur d'Oyſel, enraged and aſhamed to be diſconcerted and oppoſed by a body of men ſo diſproportioned to his army, exerted himſelf with vigour. The lord James Stuart was obliged to retire. Dyſart and Wemyſs were given to the French troops to be pillaged; and when d'Oyſel was in full march to St Andrew's, he diſcovered a powerful fleet bearing up the frith. It was concluded, that the ſupplies expected from France were arrived. Guns were fired by his ſoldiers, and their joy was indulged in all its extravagance. But this fleet having taken the veſſels which contained their proviſions, and the ordnance with which they intended to improve the fortifications of the caſtle at St Andrew's, a period was put to their rejoicings. Certain news was brought that the fleet they obſerved was the navy of England, which had come to ſupport the Congregation. A conſternation, heightened by the giddineſs of their preceding tranſports, invaded them. Monſieur d'Oyſel perceived now the value and merit of the ſervice which had been performed by the lord James Stuart; and thinking no more of St Andrew's and conqueſt, fled to Stirling, in his way to Leith, from which he dreaded to be intercepted; but he reached that important ſtation after a march of three days.

A formal treaty was now concluded between the lords of the Congregation and Queen Elizabeth; and in the mean time the queen-dowager was diſappointed in her expectations from France. The violent adminiſtration of the houſe of Guiſe had involved that nation in troubles and diſtreſs. Its credit was greatly ſunk, and its treaſury was nearly exhauſted. Perſecutions, and the ſpirit of Calviniſm, produced commotions and conſpiracies; and amidſt domeſtic and dangerous intrigues and ſtruggles, Scotland failed to engage that particular diſtinction which had been promiſed to its affairs. It was not, however, neglected altogether. The count De Martigues had arrived at Leith with 1000 foot and a few horſe. The marquis D'Elbeuf had embarked for it with another body of ſoldiers; but, after loſing ſeveral ſhips in a furious tempeſt, was obliged to return to the haven from which he had ſailed.

In this ſad reverſe of fortune many forſook the queen-dowager. It was now underſtood that the Engliſh army was upon its march to Scotland. The Scottiſh lords who had affected a neutrality, meditated an union with the Proteſtants. The earl of Huntley gave a ſolemn aſſurance that he would join them. Proclamations were iſſued throughout the kingdom, calling upon the ſubjects of Scotland to aſſemble in arms at Linlithgow, to re-eſtabliſh their ancient freedom, and to aſſiſt in the utter expulſion of the French ſoldiery.

The Engliſh fleet, meanwhile, under Winter the vice-admiral, had taken and deſtroyed ſeveral ſhips, had landed ſome troops upon Inchkeith, and diſcomfited a body of French mercenaries. Upon the foundation of theſe acts of hoſtility, the princeſs of Lorraine deſpatched the chevalier de Seure to Queen Elizabeth, to make repreſentations againſt this breach of the peace, and to urge the recal of her ſhips. This ambaſſador affected likewiſe to negotiate concerning the evacuation of Scotland by the French troops, and to propoſe methods by which the king of France might quarter the arms of England without doing a prejudice to Queen Elizabeth. But to prevent the execution of vigorous reſolutions againſt the queen-dowager, and to gain time, were the only objects he had in view. With ſimilar intentions, John Monluc biſhop of Valence, a man of greater addreſs and ability, and equally devoted to the houſe of Guiſe, was alſo ſent at this time to the court of England. Queen Elizabeth, however, and her miniſters, were too wiſe to be amuſed by artifice and dexterity. The lord Grey entered Scotland with an army of 1200 horſe and 6000 foot; and the lord Scroop, Sir James Croft, Sir Henry Percy, and Sir Francis Lake commanded under him. By an inclement policy, the queen-dowager had already waſted all the country around the capital. But the deſolation ſhe had made, while it was ruinous to the Scottiſh peaſants, affected not the army of England. The leaders of the Congregation did not want penetration and foreſight, and had provided themſelves againſt this difficulty. The duke of Chatelherault, the earls of Argyll, Glencairn, and Menteith, the lord James Stuart, and the lords Ruthven, Boyd, and Ochiltree, with a numerous and formidable force, joined the Engliſh commander at Preſton.

Struck with the ſad condition of her affairs, deſpairing of a timely and proper ſuccour from France, and reminded by ſickneſs of her mortality, the queen-dowager

retired from Leith to the caſtle of Edinburgh, and put herſelf under the protection of the lord Erſkine. At the period when ſhe was appointed to the regency, the lord Erſkine had received from the three eſtates the charge of this important fortreſs, with the injunction to hold it till he ſhould know their farther orders; and giving way to the ſolicitations of neither faction, he had kept it with fidelity. By admitting the queen-dowager, he yielded to ſentiments of honour and humanity, and did not mean to depart from his duty. A few only of her domeſtics accompanied her, with the archbiſhop of St Andrew's, the biſhop of Dunkeld, and the earl Mariſchal.

The confederated nobles now aſſembled at Dalkeith to hold a council; and conforming to thoſe maxims of prudence and equity which, upon the eve of hoſtilities, had been formerly exerciſed by them, they invited the queen-dowager to an amicable concluſion of the preſent troubles. In a letter which they wrote to her, they called to her remembrance the frequent manifeſtos and meſſages in which they had preſſed her to diſmiſs the French ſoldiery, who had ſo long oppreſſed the lower ranks of the people, and who threatened to reduce the kingdom itſelf to ſervitude. The averſion, however, with which ſhe had conſtantly received their ſuit and prayers, was ſo great, that they had given way to a ſtrong neceſſity, and had entreated the aſſiſtance of the queen of England to expel theſe ſtrangers by the force of arms. But though they had obtained the powerful protection of this princeſs, they were yet animated with a becoming reſpect for the mother of their ſovereign; and, abhorring to ſtain the ground with Chriſtian blood, were diſpoſed once more to ſolicit the diſmiſſion of theſe mercenaries, with their officers and captains. And that no juſt objection might remain againſt the grant of this their laſt requeſt, they aſſured her, that a ſafe paſſage by land, to the ports of England, ſhould be allowed to the French; or that, if they judged it more agreeable, the navy of Queen Elizabeth ſhould tranſport them to their own country. If theſe propoſals ſhould be rejected, they appealed and proteſted to God and to mankind, that it ſhould be underſtood and believed, that no motive of malice, or hatred, or wickedneſs of any kind, had induced them to employ the fatal expedient of arms and battles; but that they had been compelled to this diſagreeable and diſtreſsful remedy, for the preſervation of their commonwealth, their religion, their perſons, their eſtates, and their poſterity. They begged her to weigh the equity of their petition, to conſider the inconveniences of war, and to think of the reſt and quiet which were neceſſary to relieve the afflictions of her daughter's kingdom; and they beſought her to embalm her own memory, by an immortal deed of wiſdom, humanity, and juſtice.

To give authority and weight to the letter of the aſſociated lords, the lord Grey directed Sir George Howard and Sir James Croft to wait upon the queen-dowager, and to ſtipulate the peaceable departure of the 575 Engliſh troops, *upon the condition that the French* mercenaries were immediately diſmiſſed from her ſervice, and prohibited from reſiding in Scotland. Returning no direct anſwer to the applications made to her, ſhe deſired time to deliberate upon the reſolution which it became her to adopt. This equivocal behaviour corre-

ſponded with the ſpirit of intrigue which had uniformly diſtinguiſhed the queen-dowager; and it is probable, that her engagements with France did not permit her to be open and explicit. Scots

576 The combined armies marched towards Leith. A body of the French, poſted upon a riſing ground called *Hawk-hill*, diſputed their progreſs. During five hours the conflict was maintained with obſtinate valour. At length the Scottiſh horſemen charged the French with a fury which they were unable to reſiſt. They fled to Leith with precipitation; and might have been cut off from it altogether, if the Engliſh cavalry had exerted themſelves. Three hundred of the French ſoldiers periſhed in this action, and a few combatants only fell on the ſide of the Congregation. The Fr defeate the Pro teſtant allies,

577 Leith was inveſted. The pavilions and tents of the Engliſh and Scottiſh nobility were planted at Reſtalrig, and around it. Trenches were caſt; and the ordnance from the town annoying the combined armies, a mount was raiſed, upon which eight cannons were erected. A continued fire from theſe, againſt St Anthony's tower in South Leith, being kept up and managed with ſkill, the walls of this fabric were ſhaken, and the French found it neceſſary to diſmount their artillery.—Negligent from ſecurity, and apprehenſive of no attack, the Engliſh and Scottiſh officers occupied themſelves in amuſements, and permitted a relaxation of military diſcipline. The French, informed of this ſupineneſs and levity, made a ſally from Leith. While ſome of the captains were diverting themſelves at Edinburgh, and the ſoldiery were engaged at dice and cards, they entered the trenches unobſerved, and, puſhing their advantage, put 600 men to the ſword. After this ſlaughter, the Proteſtants were more attentive to their affairs.—Mounts were built at proper diſtances, which, being fortified with ordnance, ſerved as places of retreat and defence in the event of ſudden incurſions; and thus they continued the blockade in a more effectual manner. who la ſiege to Leith.

578 The army under the marquis D'Elbeuf, promiſed ſo often to the queen-regent, was in vain expected by her; but ſhe received, at this time, ſupplies in money and military ſtores; and Monluc biſhop of Valence, though defeated in dexterity by Elizabeth and her miniſters, had arrived in Scotland to try anew the arts of 579 delay and negotiation. Conferences were held by him with the queen-dowager, with the Engliſh commanders, and with the confederated nobles; but no contract or agreement could be concluded. His credentials neither extended to the demolition of Leith, nor to the recal of the French mercenaries: and though he obtained powers from his court to conſent to the former of theſe meaſures, they were yet burdened with conditions which were diſgraceful to the Congregation; who, in the preſent proſperous ſtate of their fortunes, were not diſpoſed to give up any of the objects for which they had ſtruggled ſo long, and to the attainment of which they now looked forward with a ſettled hope and expectation. A party them c off. Fruitleſ negotia with En land.

Though the grave and meaſured orations of Monluc could not overpower the plain and ſtubborn ſenſe of the Congregation, yet as he affected to give them admonitions and warnings, and even ventured to inſult them with menaces, they appear to have conceived a high indignation againſt him. Under this impulſe, and

that

that in ſo advanced a ſtage of their affairs, they might exhibit the determined firmneſs of their reſolutions, and bind to them by an indiſſoluble tie the earl of Huntley and the other perſons who had joined them in conſequence of the Engliſh alliance, they thought of the aſſurance and ſtability of a *new league and covenant*, more ſolemn, expreſſive, and reſolute, than any which they had yet entered into and ſubſcribed.

The nobles, barons, and inferior perſons, who were parties to this bond and aſſociation, bound themſelves in the preſence of Almighty God, as a ſociety, and as individuals, to advance and ſet forward the reformation of religion, and to procure, by every poſſible means, the true preaching of the goſpel, with the proper adminiſtration of the ſacraments, and the other ordinances in connexion with it. Deeply affected, at the ſame time, with the miſconduct of the French ſtateſmen, who had been promoted to high offices; with the oppreſſions of the French mercenaries, whom the queen-dowager kept up and maintained under the colour of authority; with the tyranny of their captains; and with the manifeſt danger of conqueſt to which the country was expoſed, by different fortifications upon the ſea-coaſt, and by other dangerous innovations; they promiſed and engaged, generally and individually, to join with the queen of England's army, and to concur in an honeſt, plain, and unreſerved reſolution to expel all foreigners from the realm, as oppreſſors of public liberty; that by recovering the ancient rights, privileges, and freedom of their nation, they might live for the future under the due obedience of their king and queen, be ruled by the laws and cuſtoms of the country, and by officers and ſtateſmen born and educated among them. It was likewiſe contracted and agreed by the ſubſcribers to this bond and covenant, that no private intelligence by writing or meſſage, or communication of any kind, ſhould be kept up with their adverſaries; and that all perſons who reſiſted the godly enterpriſe in which they were united, ſhould be regarded as their enemies, and reduced to ſubjection and obedience.

When the ſtrong and fervid ſentiment and expreſſion of this new aſſociation were communicated to the queen-dowager, ſhe reſigned herſelf to ſorrow. Her mind, inclined to deſpondence by the increaſe of her malady, felt the more intenſely the cruel diſtractions and diſquiets into which the kingdom had been driven by the ambition of France, her own doating affection for the princes of Lorraine, and the vain prognoſtications of flatterers and courtiers. In the agony of paſſion, ſhe beſought the malediction and curſe of God to alight upon all thoſe who had counſelled her to perſecute the preachers, and to refuſe the petitions of the moſt honourable portion of her ſubjects.

In the mean time the ſiege of Leith was proſecuted. But the ſtrength of the garriſon amounting to more than 4000 ſoldiers, the operations of the beſiegers were ſlow and languid. An accidental fire in the town, which deſtroyed many houſes and a great part of the public granary, afforded them an opportunity of playing their artillery with ſome advantage; and a few days after they made a general aſſault. But the ſcaling-ladders which were applied to the walls being too ſhort, and Sir James Croft, who had been gained to the queen-dowager, having acted a treacherous part, the attempt failed of ſucceſs, and 1000 men were deſtroyed. The combined armies, however, did not loſe their reſolution or their hopes. The Engliſh and Scots animated the conſtancy of one another; and in the ratification of the treaty of Berwick, which was now made, a new ſource of cordiality opened itſelf. Letters alſo had come from the duke of Norfolk, promiſing a powerful reinforcement, giving the expectation of his taking upon him the command of the troops in perſon, and ordering his pavilion to be erected in the camp. Leith began to feel the miſery of famine, and the French to give themſelves to deſpair. The beſiegers abounded in every thing; and the arrival of 2000 men, the expected reinforcement from England, gave them the moſt deciſive ſuperiority over their adverſaries. Frequent ſallies were made by the garriſon, and they were always unſucceſsful. Diſcouraged by defeats, depreſſed with the want of proviſions, and languiſhing under the negligence of France, they were ready to ſubmit themſelves to the mercy of the Congregation. 583 A reinforcement arrives from England. 584

Amidſt this diſtreſs the queen-dowager, waſted with a lingering diſtemper and with grief, expired in the caſtle of Edinburgh. A few days before her death, ſhe invited to her the duke of Chatelherault, the lord James Stuart, and the earls of Argyll, Glencairn, and Mariſchal, to bid them a laſt adieu. She expreſſed to them her ſorrow for the troubles of Scotland, and made it her earneſt ſuit, that they would conſult their conſtitutional liberties, by diſmiſſing the French and Engliſh from their country; and that they would preſerve a dutiful obedience to the queen their ſovereign. She profeſſed an unlimited forgiveneſs of all the injuries which had been done to her; and entreated their pardon for the offences ſhe had committed againſt them. In token of her kindneſs and charity, ſhe then embraced them by turns; and, while the tear ſtarted in her eye, preſented to them a cheerful and ſmiling aſpect. After this interview, the ſhort portion of life which remained to her was dedicated to religion; and that ſhe might allure the Congregation to be compaſſionate to her Popiſh ſubjects and her French adherents, ſhe flattered them, by calling John Willocks, one of the moſt popular of their preachers, to aſſiſt and comfort her by his exhortations and prayers. He made long diſcourſes to her about the abominations of the maſs; but ſhe appears to have died in the communion of the Romiſh church; and her body being tranſported to France, was depoſited in the monaſtery of St Peter, at Rheims, in Champagne, where her ſiſter Renée was an abbeſs. Death of the queen-dowager. 585

The death of the queen-dowager, at a period ſo critical, broke altogether the ſpirit of the French troops. They were blocked up ſo completely, that it was almoſt impoſſible for any ſupplies to reach them either by ſea or land; and France had delayed ſo long to fulfil its magnificent promiſes, that it was no longer in a capacity to take any ſteps towards their accompliſhment. Its internal diſtreſs and diſquiets were multiplying. The nobility, impoveriſhed by wars, were courting the rewards of ſervice, and ſtruggling in hoſtility. The clergy were avaricious, ignorant, and vindictive. The populace, knowing no trade but arms, offered their ſwords to the factious. Francis II. the huſband of Mary, was without dignity or underſtanding. Catharine de Medicis his mother was full of artifice and falſehood. Inſurrections were dreaded in every province. The French troops ſubmit.

cotland. vince. The houſe of Guiſe was encompaſſed with difficulties, and trembling with apprehenſions, ſo that they could not think of perſiſting in their views of diſtant conqueſts. It was neceſſary that they ſhould abandon for a time all the proud projects they had formed for the extenſion of the French monarchy. It was chiefly in the exemption from foreign wars that they could hope to ſupport their own greatneſs, and apply a remedy to the domeſtic diſturbances of France.

586 ncis and ry enter o a ne- iation h Eliza- n;

It appeared to Francis and Mary, that they could not treat in a direct method with the Congregation, whom they affected to conſider as rebellious ſubjects, without derogating from their royal dignity. In negotiating a peace, they therefore addreſſed themſelves to Queen Elizabeth. It was by her offices and interference that they projected a reconciliation with the confederated lords, and that they meant to extinguiſh the animoſities which, with ſo much violence, had agitated the Scottiſh nation. They granted their commiſſion to John Monluc biſhop of Valence, Nicholas Pelleve biſhop of Amiens, Jacques de la Broſſe, Henry Clentin ſieur d'Oyſel, and Charles de la Rochefaucault ſieur de Randan; authorizing them in a body, or by two of their number, to enter into accords and agreements with the queen of England. The Engliſh commiſſioners were Sir William Cecil principal ſecretary of ſtate, Nicolas Wotton dean of Canterbury and York, Sir Ralph Sadler, Sir Henry Percy, and Sir Peter Crew; and the powers of treaty were to be exerciſed by them all in conjunction, or by four, three, or two of them.

587 niſe an mmity he Pro- unts;

The plenipotentiaries of France, though empowered only to treat with England, were yet, by a ſeparate commiſſion, intruſted to aſſure the Congregation, that, notwithſtanding the heinous guilt incurred by them, Francis and Mary were inclined to receive them into favour, upon their repentance and return to obedience; and to abſtain for ever from all inquiry into their conduct. They had full authority, at the ſame time, by this new deed, to hear, in conjunction with the commiſſioners of Elizabeth, the complaints of the Congregation, and to grant, with their conſent, the relief which appeared to them to be the moſt proper and ſalutary.

The nobility and people of Scotland, chooſing for their repreſentatives the lord James Stuart, the lord Ruthven, and Maitland of Lethington, expreſſed their willingneſs to concur in reaſonable meaſures for the reeſtabliſhment of the public union and tranquillity. By the mode of a formal petition, they enumerated their

588 l at laſt ant their ition. grievances, laid claim to a redreſs of them, and beſought an uniform protection to their conſtitution and laws. To this petition the interceſſion of Queen Elizabeth effected the friendly attention of Francis and Mary; and upon a foundation concerted with ſo much propriety, Monluc and Randan, Cecil and Wotton, the acting plenipotentiaries of England and France, drew up and authenticated the celebrated deed of relief and conceſſion which does ſo much honour to the ſpirit, perſeverance, and magnanimity of the Scottiſh nation.

589 ture of ir treaty th the oteſtants. By this accord and agreement, Francis and Mary ſtipulated and conſented, that no French ſoldiers and no foreign troops ſhould ever be introduced into Scotland without the counſel and advice of the three eſtates. They concurred in the opinion, that the French mercenaries ſhould be ſent back into France, and that the fortifications of Leith ſhould be demoliſhed. They agreed that commiſſioners ſhould be appointed to viſit Dunbar, and to point out the works there which ought to be deſtroyed; and they bound and engaged themſelves to build no new fortreſs or place of ſtrength within the kingdom, and to repair no old one, without a parliamentary authority and ſanction. They conſented to extinguiſh all debts which had been contracted for the maintenance of the French and Scotch ſoldiery in their ſervice. They appointed the eſtates of the realm to hold a parliament for the diſcuſſion of affairs of ſtate; and they obliged themſelves to conſider the acts of this aſſembly as valid and effectual in every reſpect. They confirmed the ancient law of the country, which prohibited the princes of Scotland from making peace and war without the advice of the three eſtates. It was accorded and agreed by them, that the three eſtates, in concurrence with the queen, ſhould elect a counſil for the adminiſtration of affairs during her majeſty's abſence. They became bound to employ the natives of Scotland in the management of juſtice both civil and criminal, in the offices of chancellor, keeper of the ſeals, treaſurer, comptroller, and in other ſtations of a ſimilar nature; and to abſtain from the promotion of all foreigners to places of truſt and honour, and from inveſting any clergyman in the charge of affairs of the revenue. They determined to eſtabliſh an act of oblivion, and to forget and bury for ever the memory of all the late tranſactions of war and offence. It was concluded by them, that a general peace and reconciliation ſhould take place among all parties. They expreſſed their determination, that no pretence ſhould be aſſumed by them, from the late contentions, to deprive any of their ſubjects of their eſtates or offices. And they referred the reparation which might be proper to compenſate the injuries that had been ſuſtained by biſhops and eccleſiaſtics, to the judgment of the three eſtates in parliament.

Upon the ſubject of the Reformation, the plenipotentiaries of England and France did not chooſe to deliberate and decide, although articles with regard to it had been preſented to them by the nobles and the people. They referred this delicate topic to the enſuing meeting of the parliament; and the leaders of the Congregation engaged, that deputies from the three eſtates ſhould repair to the king and queen, to know their intention concerning matters of ſuch high importance.

After having granted theſe conceſſions to the nobility and the people of Scotland, upon the part of their reſpective courts, Monluc and Randan, Cecil and Wotton, concluded another deed of treaty and agreement. By this convention it was determined, that the Engliſh and French troops ſhould depart out of Scotland; that all warlike preparations ſhould ceaſe; that the fort of Eymouth ſhould be razed to the ground, in terms of the treaty of Cambray; that Francis and Mary ſhould abſtain from bearing the title and arms of England or Ireland; that it ſhould be conſidered, whether a farther compenſation ſhould be made to Elizabeth for the injuries committed againſt her; and that the king and queen of Scots ſhould be fully and ſincerely reconciled to the nobility and the people of their kingdom. The intereſts of England and France were the particular objects of this agreement. But though the conceſſions to the Proteſtants were not inſerted in it at full length, an

5 Artic latin the F troop

expreſſive

and. expreſſive reference was made to them; and they received a confirmation in terms which could not be miſunderſtood or controverted. This deed recorded the clemency of Francis and Mary to their ſubjects of Scotland, the extreme willingneſs of the nobility and the people to return to their duty and allegiance, the repreſentation they had offered of their grievances, and the requeſt of Queen Elizabeth that redreſs ſhould be afforded to them; and it appealed to the conſequent conceſſions which had been ſtipulated to their advantage.

By theſe important negotiations, the Proteſtants, while they humbled France, flattered Queen Elizabeth; and while they acquired a power to act in the eſtabliſhment of the Reformation, reſtored its civil conſtitu- ...co Scotland. The excluſion of foreigners from offices of ſtate, the limitation of the Scottiſh princes with regard to peace and war, the advancement of the three eſtates to their ancient conſequence, and the act of oblivion of all offences, were acquiſitions moſt extenſively great and uſeful; and, while they gave the fulleſt ſecurity to the reformed, gratified their moſt ſanguine expectations.

I pro- d. The peace, ſo fortunately concluded, was immediately proclaimed. The French mercenaries embarked for their own country, and the Engliſh army took the road to Berwick. Amidſt events ſo joyful, the preachers exhorted the confederated nobles to command the ſolemnity of a thankſgiving. It was ordered accordingly; and after its celebration, the commiſſioners of the boroughs, with ſeveral of the nobility, and the tenants *in capite*, were appointed to chooſe and depute miniſters to preach the goſpel in the principal towns throughout the kingdom. John Knox was called to diſcharge the paſtoral functions at Edinburgh, Chriſtopher Goodman at St Andrew's, Adam Heriot at Aberdeen, John Row at Perth, Paul Methven at Jedburgh, William Chriſtiſon at Dundee, David Ferguſon at Dunfermline, and David Lindſay at Leith. That the buſineſs of the church, at the ſame time, might be managed with propriety, ſuperintendants were elected to preſide over the eccleſiaſtical affairs of particular provinces and diſtricts. Mr John Spotſwood was named the ſuperintendant for the diviſion of Lothian, Mr John Willocks for that of Glaſgow, Mr John Winram for that of Fife, Mr John Erſkine of Dun for that of Angus and Mearns, and Mr John Carſewell for that of Argyll and the Iſles. This inconſiderable number of miniſters and ſuperintendants gave a beginning to the reformed church of Scotland.

93 parliament meets Amidſt the triumph and exultation of the Proteſtants, the meeting of the parliament approached. All perſons who had a title from law, or from ancient cuſtom, to attend the great council of the nation, were called to aſſemble there. While there was a full convention of the greater barons and the prelates, the inferior tenants *in capite*, or the leſſer barons, upon an occaſion ſo great, inſtead of appearing by repreſentation, came in crowds to give perſonally their aſſiſtance and votes; and all the commiſſioners for the boroughs, without exception, preſented themſelves.

It was objected to this parliament when it was aſ- Scotl. ſembled, that it could not be valid, ſince Francis and Mary were not preſent, and had not empowered any perſon to repreſent them. But by the terms of the late conceſſions to the nobility and the people, they had in effect diſpenſed with this formality; and the objection, after having been agitated with heat for ſome days, was rejected by a majority of voices. The lords of the articles were then choſen; and as the Proteſtant party was ſuperior to the Popiſh faction, they were careful in electing the members of this committee, to favour all thoſe who were diſpoſed to forward the work of the Reformation. The firſt object which the lords of the articles held out to the parliament was the ſupplication of the nobility, gentry, and all the other perſons who profeſſed the new doctrines. It required, that the Romiſh church ſhould be condemned and aboliſhed. It reprobated the tenet of tranſubſtantiation, the merit of works, papiſtical indulgences, purgatory, pilgrimages, and prayers to departed ſaints; and conſidering them as peſtilent errors, and as fatal to ſalvation, it demanded, that all thoſe who ſhould teach and maintain them ſhould be expoſed to correction and puniſhment. It demanded, that a remedy ſhould be applied againſt the profanation of the holy ſacraments by the Roman Catholics; and that the ancient diſcipline of the church ſhould be reſtored. In fine, it inſiſted, that the ſupremacy and authority of the pope ſhould be aboliſhed; and that the patrimony of the church ſhould be employed in ſupporting the reformed miniſtry, in the proviſion of ſchools, and in the maintenance of the poor.

59 Suppli- tion of Proteſ-

This ſupplication of the Proteſtants was received in parliament with marks of the greateſt deference and reſpect. The Popiſh doctrines it cenſured, and the ſtrong language it employed, excited no diſpute or altercation. The nobility, however, and the lay-members, did not think it expedient that the patrimony of the church, in all its extent, ſhould be allotted to the reformed miniſtry, and the ſupport of ſchools and the poor. Avoiding, therefore, any explicit ſcrutiny into this point, the parliament gave it in charge to the miniſters and the leading men of the Reformation, to draw up, under diſtinct heads, the ſubſtance and ſenſe of thoſe doctrines which ought to be eſtabliſhed over the kingdom. Within four days this important buſineſs was accompliſhed. The writing or inſtrument to which the reformed committed their opinions was termed, "The Confeſſion of Faith, profeſſed and believed by the Proteſtants within the realm of Scotland (q)." It was read firſt to the lords of the articles. It was then read to the parliament; and the prelates of the Romiſh church were commanded, in the name of God, to make publicly their objections to the doctrines it propoſed. They preſerved a profound ſilence. A new diet was appointed for concluding the tranſaction. The articles of the Confeſſion were again read over in their order, and the votes of the parliament were called. Of the temporal nobility, three only refuſed to beſtow upon it their authority. The earl of Athol, and the lords Somerville and Bothwell, proteſted,

5 A Co- ſion o draw

(q) It is given at full length in Knox, in the collection of confeſſions of faith, Vol. II. and in the ſtatute book, parl. 1567.

otland. ed, that "they would believe as their fathers had done before them." The biſhops and the eſtate eccleſiaſtical, from a conſciouſneſs of the weakneſs of Popery, ſeemed to have loſt all power of ſpeech. No diſſent, no vote, was given by them. "It is long (ſaid the earl Mariſchal), ſince I entertained a jealouſy of the Romiſh faith, and an affection to the reformed doctrines. But this day has afforded me the completeſt conviction of the falſehood of the one, and the truth of the other. The biſhops, who do not conceive themſelves to be deficient in learning, and whoſe zeal for the maintenance of the hierarchy cannot be doubted, have abandoned their religion, and their intereſt in it, as objects which admit of no defence or juſtification." All the other conſtituent members of this great council were zealous for the eſtabliſhment of the Reformation, and affirmed the propriety of its doctrines. Thus the high court of parliament, with great deliberation and ſolemnity, examined, voted, and ratified the confeſſion of the reformed faith.

596 olition ne maſs. A few days after the eſtabliſhment of the Confeſſion of Faith, the parliament paſſed an act againſt the maſs and the exerciſe of the Romiſh worſhip. And it ſcrupled not to ordain, that all perſons ſaying or hearing maſs ſhould, for the firſt offence, be expoſed to the confiſcation of their eſtates, and to a corporal chaſtiſement, at the diſcretion of the magiſtrate; that for the ſecond offence, they ſhould be baniſhed out of the kingdom; and that for the third offence they ſhould incur and ſuffer the pains of death. This fierceneſs, it is to be acknowledged, did not ſuit the generoſity of victory; and while an excuſe is ſought for it in the perfidiouſneſs of the Romiſh prieſthood, it eſcapes not the obſervation of the moſt ſuperficial hiſtorians, that theſe ſeverities were exactly thoſe of which the Proteſtants had complained ſo loudly, and with ſo much juſtice. By another ordination, the parliament, after having declared, that the pope, or biſhop of Rome, had inflicted a deep wound and a humiliating injury upon the ſovereignty and government of Scotland, by his frequent interferences and claims of power, commanded and decreed, that, for the future, his juriſdiction and authority ſhould be dead and extinct; and that all perſons maintaining the ſmalleſt connexion with him, or with his ſect, ſhould be liable to the loſs of honour and offices, proſcription, and baniſhment.

597 ſecuring t of the teſtants.

Theſe memorable and deciſive ſtatutes produced the overthrow of the Romiſh religion. To obtain to theſe proceedings, and to its other ordinances, the approbation of Francis and Mary was an object of the greateſt anxiety, and of infinite moment to the three eſtates. Sir James Sandilands lord St John was therefore appointed to go to France, and to expreſs to the king and queen the affection and allegiance of their ſubjects, to explain what had been done in conſequence of the late conceſſions and treaty, and to ſolicit their royal ratification of the tranſactions of the parliament. The ſpirited behaviour of the Congregation had, however, exceeded all the expectations of the princes of Lorraine; and the buſineſs of the embaſſy, and the ambaſſador himſelf, though a man of character and probity, were treated not only with ridicule, but with inſult and contumely. He returned accordingly without any anſwer to his commiſſion. Inſtead of ſubmitting the heads

598 ncis and ary refuſe confirm acts of s parliament.

and topics of a reformation to Francis and Mary, by a petition or a narrative, the parliament had voted them into laws; and from this informality the validity of its proceedings has been ſuſpected. But it is obſervable of the Proteſtants, that they had not concealed their views with regard to religion and the abolition of Popery; that in the grant of redreſs and conceſſion, and in the deed of treaty, no actual prohibition was made to bar the eſtabliſhment of the Reformation; that a general authority was given to the parliament to decide in affairs of ſtate; and that Francis and Mary were ſolemnly bound to authenticate its tranſactions. Though a formality was invaded, the ſpirit of the treaties was yet reſpected and maintained. The nation, of conſequence, imputed the conduct of Francis and Mary to political reaſons ſuggeſted by the princes of Lorraine, and to the artifices of the Popiſh clergy; and as Elizabeth did not refuſe, upon her part, the ratification of the agreements, and ſolicited and preſſed the French court in vain to adopt the ſame meaſure, a ſtrength and force were thence communicated to this concluſion.

When the three eſtates deſpatched Sir James Sandilands to France, they inſtructed the earls of Morton and Glencairn, with Maitland of Lethington, to repair to the court of England. By theſe ambaſſadors they preſented to Elizabeth their ſincere and reſpectful thanks, for the attention ſhown by her to Scotland, in her late moſt important ſervices. And while they ſolicited the continuance of her favour and protection, entreated, in an earneſt manner, that her majeſty, for the eſtabliſhment of a perpetual peace and amity, would be pleaſed to take in marriage the earl of Arran, the next heir after his father to the Scottiſh monarchy. The queen made new and fervent proteſtations of her regard and attachment; and gave the promiſe of her warmeſt aid when it ſhould be neceſſary, in their juſt defence, upon any future occaſion. She ſpoke in obliging terms of the earl of Arran; but as ſhe found in herſelf no preſent diſpoſition to marriage, ſhe deſired that he might conſult his happineſs in another alliance. She expreſſed a favourable opinion of the Scottiſh nobility; and as a demonſtration of her affection and eſteem, ſhe took the liberty to remind them of the practices which had been employed to overturn their independency, and begged them to conſider the unanimity and concord of their order as a neceſſary guard againſt the ambition and the artifice of the enemies of their nation.

The ſucceſs of the Congregation, though great and illuſtrious, was not yet completely deciſive. The refuſal of Francis and Mary to ratify their proceedings opened a ſource of bitterneſs and inquietude. The Popiſh party, though humbled, was not annihilated. Under the royal protection it would ſoon be formidable. Political conſiderations might ariſe, not only to cool the amity of England, but even to provoke its reſentment. And France, though it could now tranſport no army againſt Scotland, might ſoon be able to adopt that expedient. Cruel diſtractions and ſevere calamities were ſtill to be dreaded. In the narrowneſs of their own reſources they could find no ſolid and permanent ſecurity againſt the rage and weight of domeſtic faction, and the ſtrenuous exertions of an extenſive kingdom. All theſe fair achievements might

be

be blaſted and overthrown. Popery might again build up her towers, and a ſanguinary domination deſtroy alike their religious and civil liberties.

While the anguiſh of melancholy apprehenſions repreſſed the triumph of the Congregation, the event which could operate moſt to their intereſts was announced to them. This event was the death of Francis II. The tie which knit Scotland to France was thus broken. A new ſcene of politics diſplays itſelf. Catharine de Medicis, the queen-mother, ruled Charles IX. and was the perſonal enemy of the queen of Scots. The power and the credit which Mary had lent to her uncles, and the frequent and humiliating diſappointments which the queen-mother had ſuffered from her influence over Francis, were now repaid with a ſtudied indifference and neglect. In the full perfection of her charms, with two crowns upon her head, and looking towards a third, ſhe felt herſelf to be without grandeur and without conſequence. Leaving a court where ſhe had experienced all the enjoyments of which humanity is ſuſceptible, ſhe retired to Rheims, to indulge her ſorrow.

In the humiliation of their queen, and in the change produced in the councils of France, the Proteſtants of Scotland found every poſſible encouragement to proceed with vigour in the full eſtabliſhment of the reformed doctrines. After the diſſolving of the parliament, they turned their thoughts and attention to the plan of policy which might ſuit beſt the tenets and religion for which they had contended. The three eſtates, amidſt their other tranſactions, had granted a commiſſion to Mr John Winram, Mr John Spottiſwood, John Willocks, Mr John Douglas, Mr John Row, and John Knox, to frame and model a ſcheme or platform of eccleſiaſtical government. They were not long in complying with an order ſo agreeable to them, and compoſed what is termed the *Firſt Book of Diſcipline*; in which they explained the uniformity and method which ought to be preſerved concerning doctrine, the adminiſtration of the ſacraments, the election and proviſion of miniſters, and the policy of the church.

A convention of the eſtates gave its ſanction to the Preſbyterian ſcheme of government. But while the Book of Diſcipline ſketched out a policy beautiful for its ſimplicity, yet it required that the patrimony and the rich poſſeſſions of the ancient church ſhould be allotted to the new eſtabliſhment. The reformers, however, ſo ſucceſsful in the doctrines and the policy they had propoſed, were here very unfortunate. This convention of the eſtates did not pay a more reſpectful regard to this propoſal than the celebrated parliament had done, which demoliſhed the maſs and the juriſdiction of the ſee of Rome. They affected to conſider it as no better than a dream. The expreſſion "a devout imagination" was applied to it in mockery; and it was not till after long and painful ſtruggles, that the new eſtabliſhment was able to procure to itſelf a becoming and neceſſary proviſion and ſupport. The Roniſh clergy were ſtrenuous to continue in their poſſeſſions, and to profit by them; and the nobles and the laity having ſeized upon great proportions of the property of the church, were no leſs anxious to retain the acquiſitions they had made.

The averſion entertained from beſtowing riches upon the Preſbyterian eſtabliſhment, encouraged the ardour which prevailed for advancing all the other views and intereſts of the reformed. And this end was alſo promoted in no inconſiderable degree by the inſidious policy of Catharine de Medicis. She was willing to increaſe and to foſter all the difficulties and dangers in the ſituation of the queen of Scots and her ſubjects. Upon this account ſhe had engaged Charles IX. to deſpatch Monſieur Noailles to the Scotch parliament, to urge it in ſtrong terms to renew the ancient league between the two kingdoms, to diſſolve the alliance with England, and to re-eſtabliſh over Scotland the Popiſh doctrines and the Popiſh clergy. A new meeting of the eſtates was aſſembled, which conſidered theſe ſtrange requiſitions, and treated them with the indignation they merited. Monſieur Noailles was inſtructed to inform his ſovereign, that France having acted with cruelty and perfidiouſneſs towards the Scots, by attacking their independency and liberties under the cover and pretence of amity and marriage, did not deſerve to know them any longer as an ally; that principles of juſtice, a love of probity, and a high ſenſe of gratitude, did not permit the Scottiſh parliament to break the confederacy with England, which had generouſly protected their country againſt the tyrannical views of the French court, and the treacherous machinations of the houſe of Guiſe; and that they were never to acknowledge the Popiſh clergy to be a diſtinct order of men, or the legal poſſeſſors of the patrimony of the church; ſince, having aboliſhed the power of the pope, and renounced his doctrines, they could beſtow no favour or countenance upon his vaſſals and ſervants.

To this council of the eſtates a new ſupplication was preſented by the Proteſtants. They departed from the high claim which they had made for the riches and patrimony of the Popiſh church; and it was only requeſted by them, that a reaſonable or decent proviſion ſhould be allotted to the true preachers of the goſpel. This application, however, no leſs than their former exorbitant demand, was treated with neglect and indifference. But amidſt the anxiety manifeſted by the nobles and the tenants of the crown to hold the Preſbyterian clergy in ſubjection and in poverty, they diſcovered the warmeſt zeal for the extenſion and continuance of the reformed opinions. For in this ſupplication of the Proteſtants, an ardent deſire being intimated and urged, that all the monuments of idolatry which remained ſhould be utterly deſtroyed, the fulleſt and moſt unbounded approbation was given to it. An act accordingly was paſſed, which commanded that every abbey-church, every cloiſter, and every memorial whatſoever of Popery, ſhould be finally overthrown and demoliſhed: and the care of this cruel, but popular employment, was committed to thoſe perſons who were moſt remarkable for their keenneſs and ardour in the work of the Reformation. Its execution in the weſtern counties was given in charge to the earls of Arran, Argyll, and Glencairn; the lord James Stuart attended to it in the more northern diſtricts; and in the inland diviſions of the country, it was intruſted to the barons in whom the Congregation had the greateſt confidence. A dreadful devaſtation enſued. The populace, armed with authority, ſpread their ravages over the kingdom. It was deemed an execrable lenity to ſpare any fabric or place where idolatry had been exer-

cified. The churches and religious houſes were everywhere defaced, or pulled to the ground; and their furniture, utenſils, and decorations, became the prizes and the property of the invader. Even the ſepulchres of the dead were ranſacked and violated. The libraries of the eccleſiaſtics, and the regiſters kept by them of their own tranſactions and of civil affairs, were gathered into heaps, and committed to the flames. Religious antipathy, the ſanction of law, the exhortation of the clergy, the hope of ſpoil, and, above all, the ardour to put the laſt hand to the Reformation, concurred to drive the rage of the people to its wildeſt fury; and in the midſt of havock and calamity, the new eſtabliſhment ſurveyed its importance and its power.

The death of Francis II. having left his queen, Mary, in a very diſagreeable ſituation while ſhe remained in France, it now became neceſſary for her to think on returning to her own country. To this ſhe was ſolicited both by the Proteſtants and Papiſts; the former, that they might gain her over to their party; and the latter, hoping that, as Mary was of their own perſuaſion, Popery might once more be eſtabliſhed in Scotland. For this deputation, the Proteſtants choſe Lord James Stuart, natural brother to the queen; and the Papiſts, John Leſly, official and vicar-general of the dioceſe of Aberdeen. The latter got the ſtart of the Proteſtant ambaſſador, and thus had the opportunity of firſt delivering his meſſage. He adviſed her ſtrongly to beware of the lord James Stuart, whom he repreſented as a man of unbounded ambition, who had eſpouſed the Proteſtant cauſe for no other reaſon than that he might advance himſelf to the higheſt employments in the ſtate; nay, that he had already fixed his mind on the crown itſelf. For theſe reaſons he adviſed that the lord James Stuart ſhould be confined in France till the government of Scotland could be completely eſtabliſhed. But if the queen was averſe to this meaſure, he adviſed her to land in ſome of the northern diſtricts of Scotland, where her friends were moſt numerous; in which caſe an army of 20,000 men would accompany her to Edinburgh, to reſtore the Popiſh religion, and to overawe her enemies. The next day the lord James Stuart waited upon her, and gave an advice very different from that of Leſly. The ſureſt method of preventing inſurrections, he ſaid, was the eſtabliſhment of the Proteſtant religion; that a ſtanding army and foreign troops would certainly loſe the affections of her ſubjects; for which reaſon he adviſed her to viſit Scotland without guards and without ſoldiers, and he became ſolemnly bound to ſecure their obedience to her. To this advice Mary, though ſhe diſtruſted its author, liſtened with attention; and Lord James, imagining that ſhe was prejudiced in his favour, took care to improve the favourable opportunity; by which means he obtained a promiſe of the earldom of Marr.

Before Mary ſet out from France, ſhe received an embaſſy from Queen Elizabeth, preſſing her to ratify the treaty of Edinburgh, in which ſhe had taken care to get a clauſe inſerted, that Francis and Mary ſhould *for ever* abſtain from aſſuming the title and arms of England and Ireland. But this was declined by the queen of Scotland, who, in her conference with the Engliſh ambaſſador, gave an eminent proof of her political abilities †. Her refuſal greatly augmented the jealouſies which already prevailed between her and Elizabeth; inſomuch that the latter refuſed her a ſafe paſſage through her dominions into Scotland. This was conſidered by Mary as a high indignity; ſhe returned a very ſpirited anſwer, informing her rival, that ſhe could return to her own dominions without any aſſiſtance from her, or indeed whether ſhe would or not. In the month of Auguſt 1561, Mary ſet ſail from Calais for Scotland. She left France with much regret; and at night ordered her couch to be brought upon deck, deſiring the pilot to awaken her in the morning if the coaſt of France ſhould be in view. The night proved calm, ſo that the queen had an opportunity once more of indulging herſelf with a ſight of that beloved country. A favourable wind now ſprung up, and a thick fog coming on, ſhe eſcaped a ſquadron of men of war which Elizabeth had ſent out to intercept her; and on the 20th of the month ſhe landed ſafely at Leith.

60 Mary in Scotland.

But though the Scots received their queen with the greateſt demonſtrations of joy, it was not long before an irreconcileable quarrel began to take place. The Proteſtant religion was now eſtabliſhed all over the kingdom; and its profeſſors had ſo far deviated from their own principles, or what ought to have been their principles, that they would grant no toleration to the oppoſite party, not even to the ſovereign herſelf. In conſequence of this, when the queen attempted to celebrate maſs in her own chapel of Holyroodhouſe, a violent mob aſſembled, and it was with the utmoſt difficulty that the lord James Stuart and ſome other perſons of high diſtinction could appeaſe the tumult. Mary attempted to allay theſe ferments by a proclamation, in which ſhe promiſed to take the advice of the ſtates in religious matters; and, in the mean time, declared it to be death for any perſon to attempt an innovation or alteration of the religion which ſhe found generally eſtabliſhed upon her arrival in Scotland. Againſt this proclamation the earl of Arran proteſted, and formally told the herald, the queen's proclamation ſhould not protect her attendants and ſervants if they preſumed to commit idolatry and to ſay maſs. John Knox declared from the pulpit, that one maſs was more terrible to him than if 10,000 armed enemies had landed in any part of the kingdom to re-eſtabliſh Popery. The preachers everywhere declaimed againſt idolatry and the maſs; keeping up, by their miſtaken zeal, a ſpirit of diſcontent and ſedition throughout the whole kingdom. John Knox was called before the queen to anſwer for the freedom of his ſpeeches; but his unbounded boldneſs, when there, gave Mary much diſquiet, as not knowing in what manner to deal with him. The freedoms, however, which were taken with the queen, could not induce her to depart from that plan of government which ſhe had laid down in France. To the Proteſtants ſhe reſolved to pay the greateſt attention; from among them ſhe choſe her privy council, and heaped favours upon the lord James Stuart, who for his activity in promoting the Reformation was the moſt popular man in the kingdom; while to her courtiers of the Romam Catholic perſuaſion ſhe behaved with a diſtant formality.

In the mean time, the difference between the two rival queens became every day greater. The queen of Scotland preſſed Elizabeth to declare her the neareſt heir

nd. heir to the crown of England, and Elizabeth preſſed Mary to confirm the treaty of Edinburgh. With this the latter could not comply, as it would in fact have been renouncing for ever the title to that crown for which ſhe was ſo earneſtly contending. Endleſs negotiations were the conſequence, and the hatred of Elizabeth to Mary continually increaſed. This year the queen of Scotland amuſed herſelf by making a circuit through part of her dominions. From Edinburgh ſhe proceeded to Stirling; from thence to Perth, Dundee and St Andrew's. Though received everywhere with the greateſt acclamations and marks of affection, ſhe could not but remark the rooted averſion which had univerſally taken place againſt Popery; and upon her return to Edinburgh, her attention was called to an exertion of this zeal, which may be conſidered as highly characteriſtic of the times. The magiſtrates of this city after their election, enacted rules, according to cuſtom, for the government of their borough. By one of theſe acts, which they publiſhed by proclamation, they commanded all monks, friars, and prieſts, together with all adulterers and fornicators, to depart from the town and its limits within 24 hours, under the pains of correction and puniſhment. Mary, juſtly interpreting this exertion of power to be an uſurpation of the royal authority, and a violation of order, diſplaced the magiſtrates, commanded the citizens to elect others in their room, and granted by proclamation a plenary indulgence to all her ſubjects not convicted of any crime, to repair to and remain in her capital at their pleaſure.

Beſides theſe diſturbances on account of religion, the kingdom was now in confuſion on another account. The long continuance of civil wars had left a proneneſs to tumults and inſurrections everywhere; and thefts, rapine, and licentiouſneſs of every kind, threatened to ſubvert the foundations of civil ſociety. Mary made conſiderable preparations for the ſuppreſſion of theſe diſorders, and appointed the lord James Stuart her chief juſticiar and lieutenant. He was to hold two criminal courts, the one at Jedburgh, and the other at Dumfries. To aſſiſt his operations againſt the banditti, who were armed, and often aſſociated into bodies, a military force was neceſſary; but as there were at preſent neither ſtanding army nor regular troops in the kingdom, the county of Edinburgh, and ten others were commanded to have their ſtrength in readineſs to aſſiſt him. The feudal tenants, and the allodial or free proprietors of theſe diſtricts, in complete armour, and with proviſions for 20 days, were appointed to be ſubſervient to the purpoſes of his commiſſion, and to obey his orders in eſtabliſhing the public tranquillity. In this expedition he was attended with his uſual ſucceſs. He deſtroyed many of the ſtrong holds of the banditti; hanged 20 of the moſt notorious offenders, and ordered 50 more to be carried to Edinburgh, there to ſuffer the penalties of law on account of their rebellious behaviour. He entered into terms with the lord Grey and Sir John Foſter, the wardens of the Engliſh borders, for the mutual benefit of the two nations; and he commanded the chiefs of the diſorderly clans to ſubmit to the queen, and to obey her orders with regard to the ſecuring of the peace, and preventing inſurrections and depredations for the future.

In the mean time the queen was in a very diſagreeable ſituation, being ſuſpected and diſtruſted by both parties. From the conceſſions ſhe had made to the Proteſtants, the Papiſts ſuppoſed that ſhe had a deſign of renouncing their religion altogether; while, on the other hand, the Proteſtants could ſcarcely allow themſelves to believe that they owed any allegiance to an idolater. Diſquiets of another kind alſo now took place. The duke of Chatelherault, having left the Catholics to join the oppoſite party, was neglected by his ſovereign. Being afraid of ſome danger to himſelf, he fortified the caſtle of Dumbarton, which he reſolved to defend; and in caſe of neceſſity to put himſelf under the protection of the queen of England.—The earl of Arran was a man of very ſlender abilities, but of boundleſs ambition. The queen's beauty had made an impreſſion on his heart, and his ambition made him fancy himſelf the fitteſt perſon in the kingdom for her huſband. But his fanaticiſm, and the violence with which he had oppoſed the maſs, diſguſted her. He bore her diſlike with an uneaſineſs that preyed upon his intellects and diſordered them. It was even ſuppoſed that he had concerted a ſcheme to poſſeſs himſelf of her perſon by armed retainers: and the lords of her court were commanded to be in readineſs to defeat any project of this ſort. The earl of Bothwel was diſtinguiſhed chiefly by his prodigalities and the licentiouſneſs of his manners. The earl of Mariſchal had every thing that was honourable in his intentions, but was overwary and ſlow. The earl of Morton poſſeſſed penetration and ability, but was attached to no party or meaſures from any principles of rectitude: His own advantage and intereſt were the motives which governed him. The earl of Huntley the lord chancellor, was unquiet, variable, and vindictive: His paſſions, now fermenting with violence, were ſoon to break forth in the moſt dangerous practices. The earls of Glencairn and Menteith were deeply tinctured with fanaticiſm; and their inordinate zeal for the new opinions, not leſs than their poverty, recommended them to Queen Elizabeth. Her ambaſſador Randolph, adviſed her to ſecure their ſervice, by addreſſing herſelf to their neceſſities. Among courtiers of this deſcription, it was difficult for Mary to make a ſelection of miniſters in whom to confide. The conſequence and popularity of the lord James Stuart, and of Maitland of Lethington, had early pointed them out to this diſtinction; and hitherto they had acted to her ſatisfaction. They were each of eminent capacity: but the former was ſuſpected of aiming at the ſovereignty; the latter was prone to refinement and duplicity; and both were more connected with Elizabeth than became them as the miniſters and ſubjects of another ſovereign.

Beſide the policy of employing and truſting ſtateſmen who were Proteſtants, and the precaution of maintaining a firm peace with England, Mary had it alſo at heart to enrich the crown with the revenues of the ancient church. A convention of eſtates was aſſembled to deliberate upon this meaſure. The biſhops were alarmed with their perilous ſituation. It was made known to them, that the charge of the queen's houſehold required an augmentation; and that as the rents of the church had flowed chiefly from the crown, it was expedient that a proper proportion of them ſhould now be returned to uphold its ſplendour. After long conſultations, the prelates and eſtate eccleſiaſtical, conſider-

land. ing that they exiſted merely by the favour of the queen, conſented to reſign to her the third part of their benefices, to be managed at her pleaſure; with the reſervation that they ſhould be ſecured during their lives againſt all farther payments, and relieved from the burden of contributing to the maintenance of the reformed clergy. With this offer the queen and the convention of eſtates were ſatisfied. Rentals, accordingly, of all their benefices throughout the kingdom, were ordered to be produced by the ancient eccleſiaſtics; the reformed miniſters, ſuperintendants, elders, and deacons, were enjoined to make out regiſters of the grants or proviſions neceſſary to ſupport their eſtabliſhment; and a ſupereminent power of judging in theſe matters was committed to the queen and the privy-council.

While the prelates and eſtate eccleſiaſtical ſubmitted to this offer from the neceſſity of their affairs, it was by no means acceptable to the reformed clergy, who at this time were holding an aſſembly. It was their earneſt wiſh to effect the entire deſtruction of the ancient eſtabliſhment, to ſucceed to a large proportion of their emoluments, and to be altogether independent of the crown. But while the Proteſtant preachers were naturally and unanimouſly of theſe ſentiments, the nobles and gentlemen who had promoted the Reformation were diſpoſed to think very differently. To give too much of the wealth of the church to the reformed clergy, was to inveſt them with a dangerous power. To give too great a proportion of it to the crown, was a ſtep ſtill more dangerous. At the ſame time it was equitable, that the ancient clergy ſhould be maintained during their lives; and it conſiſted with the private intereſt of the noblemen and gentlemen, who had figured during the Reformation, not to conſent to any ſcheme that would deprive them of the ſpoils of which they had already poſſeſſed themſelves out of the ruins of the church, or which they might ſtill be enabled to acquire.

613 ſucceſs ne de- ds of Prote- ts

Thus public as well as private conſiderations contributed to ſeparate and divide the lay Proteſtants and the preachers. The general aſſembly, therefore, of the church, was not by any means ſucceſsful in the views which had called them together at this time, and which they ſubmitted to the convention of eſtates. Doubts were entertained whether the church had any title to aſſemble itſelf. The petition preferred for the complete abolition of idolatry, or for the utter prohibition of the maſs, was rejected, notwithſtanding all the zeal manifeſted by the brethren. The requeſt that Mary ſhould give authority to the book of diſcipline, was not only refuſed, but even treated with ridicule. The only point preſſed by the church, which attracted any notice, was its requiſition of a proviſion or a maintenance; but the meaſure invented for this end was in oppoſition to all its warmeſt deſires.

This meaſure, however, ſo unpromiſing to the preachers in expectation, was found to be ſtill more unſatisfactory upon trial. The wealth of the Romiſh church had been immenſe, but great invaſions had been made upon it. The fears of the eccleſiaſtics, upon the overthrow of Popery, induced them to engage in fraudulent tranſactions with their kinſmen and relations; in conſequence of which many poſſeſſions were conveyed from the church into private hands. For valuable conſiderations, leaſes of church-lands, to endure for many years, or in perpetuity, were granted to ſtrangers and adventurers. Sales alſo of eccleſiaſtical property, to a great extent, had been made by the ancient incumbents; and a validity was ſuppoſed to be given to theſe tranſactions by confirmations from the pope, who was zealous to aſſiſt his votaries. Even the crown itſelf had contributed to make improper diſpoſitions of the eccleſiaſtical revenues. Laymen had been preſented to biſhoprics and church-livings, with the power of diſpoſing of the territory in connexion with them. In this diffuſion of the property of the church, many fair acquiſitions, and much extenſive domain, came to be inveſted in the nobles and the gentry.

From theſe cauſes the grant of the third of their benefices, made by the ancient eccleſiaſtics to the queen, with the burden of maintaining the reformed clergy, was not near ſo conſiderable as might have been expected. But the direction of the ſcheme being lodged in the queen and the privy-council, the advantage to the crown was ſtill greater than that beſtowed upon the preachers. Yet the carrying the project into execution was not without its inconveniences. There were ſtill many opportunities for artifice and corruption; and the full third of the eccleſiaſtical benefices even after all the previous abſtractions of them which had been made, could not be levied by any diligence. For the eccleſiaſtics often produced falſe rentals of their benefices; and the collectors for the crown were not always faithful to the truſt repoſed in them. The complete produce of the thirds did not amount to a great ſum; and it was to operate to the expences of the queen, as well as to the ſupport of the preachers. A ſcanty proportion went to the latter; and yet the perſons who were choſen to fix and aſcertain their particular ſtipends or proviſions were the faſt friends of the Reformation. For this buſineſs was committed in charge to the earls of Argyll and Morton, the lord James Stuart, and Maitland of Lethington, with James Macgill the clerk-regiſter, and Sir John Ballenden the juſtice-clerk. One hundred Scots merks were deemed ſufficient for a common miniſter. To the clergymen of greater intereſt or conſideration, or who exerciſed their functions in more extenſive pariſhes, 300 merks were allotted; and, excepting to ſuperintendants, this ſum was ſeldom exceeded. To the earl of Argyll, to the lord James Stuart, to Lord Erſkine, who had large eccleſiaſtical revenues, their thirds were uſually remitted by the queen; and upon the eſtabliſhment of this fund or revenue, ſhe alſo granted many penſions to perſons about her court and of her houſehold.

The complaints of the preachers were made with little decency, and did not contribute to better their condition. The coldneſs of the Proteſtant laity, and the humanity ſhown to the ancient clergy, were deep wounds both to their pride and to their intereſts. To a mean ſpirit of flattery to the reigning power, they imputed the defection of their friends; and againſt the queen they were animated with the bittereſt animoſity. The poverty in which they were ſuffered to remain inflamed all their paſſions. They induſtriouſly fought to indulge their rancour and turbulence; and inveterate habits of inſult fortified them into a contempt of authority.

To the queen, whoſe temper was warm, the rudeneſs of the preachers was a painful and endleſs inquietude, which, while it foſtered her religious prejudices, had the good effect to confirm her conſtancy to her friends,

and

and to keep alive her gratitude for their activity. The lord James Stuart, who was entitled to her reſpect and eſteem from his abilities, and his proximity to her in blood had merited rewards and honours by his public ſervices and the vigour of his counſels. After his ſucceſsful diſcharge of her commiſſion as chief juſticiar and lord lieutenant, ſhe could not think of allowing him to deſcend from theſe offices, without beſtowing upon him a ſolid and permanent mark of her favour. She advanced him into the rank of her nobility, by conferring upon him the earldom of Marr. At the ſame time ſhe contributed to augment his conſequence, by facilitating his marriage with Agnes the daughter of the earl of Mariſchal; and the ceremonial of this alliance was celebrated with a magnificence and oſtentation ſo extravagant in that age, as to excite the fears of the preachers leſt ſome avenging judgment or calamity ſhould afflict the land. They exclaimed with virulence againſt his riotous feaſting and banquets; and the maſquerades which were exhibited upon this occaſion, attracting in a ſtill greater degree their attention, as being a ſpecies of entertainment hitherto unknown in Scotland, and which was favourable to the profaneneſs of gallantry, they pointed againſt them the keeneſt ſtrokes of their cenſure and indignation.

The abilities of the earl of Marr, the aſcendency he maintained in the councils of his ſovereign, and the diſtinctions which he had acquired, did not fail to expoſe him to uncommon envy. The moſt deſperate of his enemies, and the moſt formidable, was the earl of Huntley. In their rivalſhip for power, many cauſes of diſguſt had ariſen. The one was at the head of the Proteſtants, the other was the leader of the Papiſts. Upon the death of Francis II. Huntley and the Popiſh faction had ſent a deputation to Mary, inviting her to return to Scotland, and offering to ſupport her with an army of 20,000 men. His advances were treated with attention and civility, but his offer was rejected. The invitation of the Proteſtants, preſented by the earl of Marr, was more acceptable to her. Huntley had adviſed her to detain his rival in confinement in France till the Roman Catholic religion ſhould be re-eſtabliſhed in Scotland. This advice ſhe not only diregarded, but careſſed his enemy with particular civilities. Upon her arrival in her own country, Huntley renewed his advances, offering to her to ſet up the maſs in all the northern counties. He even converſed in a preſſing manner upon this ſubject with her uncles and the French courtiers who attended her. Still no real attention was paid to him. He came to her palace, and was received only with reſpect. He was lord high chancellor without influence, and a privy counſellor without truſt. The earl of Marr had the confidence of his ſovereign, and was drawing to him the authority of government. Theſe were cruel mortifications to a man of high rank, inordinate ambition, immenſe wealth, and who commanded numerous and warlike retainers. But he was yet to ſee a ſtroke ſtill more ſeverely excruciating, and far more deſtructive of his conſequence. The opulent eſtate of Marr, which Mary had erected into an earldom and conferred upon his rival, had been lodged in his family for ſome time. He conſidered it as his property, and that it was never to be torn from his houſe. This blow was at once to inſult moſt ſenſibly his pride, and to cut moſt fatally the ſinews of his greatneſs.

After employing againſt the earl of Marr thoſe arts of detraction and calumny which are ſo common in courts, he drew up and ſubſcribed a formal memorial, in which he accuſed him of aiming at the ſovereignty of Scotland. This paper he preſented to the queen; but the arguments with which he ſupported his charge being weak and inconcluſive, ſhe was the more confirmed in her attachment to her miniſter. Huntley then addreſſing himſelf to the earl of Bothwel, a man diſpoſed to deſperate courſes, engaged him to attempt to involve the earl of Marr and the houſe of Hamilton in open and violent contention. Bothwel repreſented to Marr the enmity which had long ſubſiſted between him and the houſe of Hamilton. It was an obſtacle to his greatneſs; and while its deſtruction might raiſe him to the higheſt pinnacle of power, it would be moſt acceptable to the queen, who beſide the hatred which princes naturally entertain to their ſucceſſors, was animated by particular cauſes of offence againſt the duke of Chatelherault and the earl of Arran. He concluded his exhortation with making an unlimited offer of his moſt ſtrenuous ſervices in the execution of this flagitious enterpriſe. The earl of Marr, however, abhorring the baſeneſs of the project, ſuſpicious of the ſincerity of the propoſer, or ſatisfied that his eminence did not require the aid of ſuch arts, rejected all his advances. Bothwel, diſappointed upon one ſide, turned himſelf to the other. He practiſed with the houſe of Hamilton to aſſaſſinate the earl of Marr, whom they conſidered as their greateſt enemy. The buſineſs, he ſaid, might be performed with eaſe and expedition. The queen was in uſe to hunt the deer in the park of Falkland; and there the earl of Marr, unſuſpecting any danger, and ſlenderly attended, might be overpowered and put to death. The perſon of the queen, at the ſame time, might be ſeized; and by detaining her in cuſtody, a ſanction and ſecurity might be given to their crime. The integrity of the earl of Arran revolting againſt this conſpiracy, defeated its purpoſes. Dreading the perpetration of ſo cruel an action, and yet ſenſible of the reſolute determination of his friends, he wrote privately to the earl of Marr, informing him of his danger. But the return of Marr to his letter, thanking him for his intelligence, being intercepted by the conſpirators, Arran was confined by them under a guard in Kinneil-houſe. He effected notwithſtanding his eſcape, and made a full diſcovery of the plot to the queen. Yet in a matter ſo dark he could produce no witneſſes and no written vouchers to confirm his accuſations. He therefore, according to the faſhion of the times, offered to prove his information, by engaging Bothwel in ſingle combat. And though in his examinations before the privy council, his love to the queen, his attachment to the earl of Marr, the atrocity of the ſcheme he revealed, and, above all, his duty and concern for his father the duke of Chatelherault, threw him into a perturbation of mind which expreſſed itſelf violently in his ſpeech, his countenance, and his actions; yet his declarations, in general, were ſo conſiſtent and firm, that it was thought adviſable to take the command of the caſtle of Dumbarton from the duke of Chatelherault, to confine the other conſpirators to different priſons, and to wait the farther diſcoveries which might be made by accident and time.

The

orland. The earl of Huntley, inflamed by theſe diſappointments, invented other devices. He excited a tumult while the queen and the earl of Marr were at St Andrew's with only a few attendants; imagining that the latter would ſally forth to quell the inſurgents, and that a convenient oppottunity would thus be afforded for putting him to the ſword without detection. The caution, however, of the earl of Marr, defeating this purpoſe, he ordered ſome of his retainers to attack him in the evening when he ſhould leave the queen; but theſe aſſaſſins being ſurpriſed in their ſtation, Huntley affected to excuſe their being in arms in a ſuſpicious place and at a late hour, by frivolous apologies, which, though admitted, could not be approved.

About this period, two letters were received by Mary from the pope and the cardinal of Lorrain, in conſequence of the intrigues of the earl of Huntley and the Roman Catholic faction. They preſſed her to conſider, that while this nobleman was the moſt powerful of her ſubjects, he was by far the moſt zealous in the intereſts of the church of Rome. They entreated her to flatter him with the hope of her marriage with Sir John Gordon his ſecond ſon; held out to her magnificent promiſes of money and military ſupplies, if ſhe would ſet herſelf ſeriouſly to recover to power and ſplendour the ancient religion of her country; and recommended it to her to take meaſures to deſtroy the more ſtrenuous Proteſtants about her court, of whom a roll was tranſmitted to her, which included the name of her confidant and miniſter the earl of Marr. Theſe letters could not have reached her at a juncture more unfavourable for their ſucceſs. The earl of Marr, to whom ſhe communicated them, was encouraged to proceed with the greateſt vigour in undermining the deſigns and the importance of his enemies.

522 John don nds d Ogil- nd is chend- New incidents exaſperated the animoſities of the enemies of the earl of Marr and his own. Sir John Gordon and the lord Ogilvie having a private diſpute, happened to meet each other in the high ſtreet of Edinburgh. They immediately drew their ſwords; and the lord Ogilvie receiving a very dangerous wound, Sir John Gordon was committed to priſon by the magiſtrates. The queen, at this time in Stirling, was informed by them of the riot; and while they expreſſed a fear leſt the friends of the priſoner ſhould riſe up in arms to give him his liberty, they mentioned a ſuſpicion which prevailed, that the partizans of the lord Ogilvie were to aſſemble themſelves to vindicate his quarrel. The queen, in her reply, after commending their diligence, inſtructed them to continue to have a watch over their priſoner; made known her deſire that the law ſhould take its courſe; and counſelled them to have no apprehenſions of the kindred of the parties at

523 ſcapes pri- variance, but to rely upon the earl of Marr for providing a ſufficient force for their protection. Sir John Gordon, however, found the means to break from his confinement; and flying into Aberdeenſhire, filled the retainers of his family with his complaints, and added to the diſquiets of his father the earl of Huntley.

The queen, upon returning to Edinburgh, held a conſultation upon affairs of ſtate with her privy-council; and ſoon after ſet out upon a progreſs to the northern parts of her kingdom. At Aberdeen ſhe was met by the lady Huntley, a woman of deep diſſimulation and of refined addreſs; who endeavoured to conciliate her affections, was prodigal of flattery, expreſſed her zeal for the Popiſh religion, and let fall inſinuations of the great power of her huſband. She then interceded with the queen for forgiveneſs to her ſon: and begged with a keen importunity, that he might be permitted to have the honour to kiſs her hand. But Mary having told her, that the favour ſhe had ſolicited could not poſſibly be granted till her ſon ſhould return to the priſon from which he had eſcaped, and ſubmit to the juſtice of his country, the lady Huntley engaged that he ſhould enter again into cuſtody, and only entreated, that, inſtead of being confined at Edinburgh, he ſhould be conducted to the caſtle of Stirling. This requeſt was complied with; and in the proſecution of the buſineſs, a court of juſticiary being called, Sir John Gordon made his appearance, and acknowledged himſelf to be the queen's priſoner. The lord Glamis was appointed to conduct him to the caſtle of Stirling. But upon the road to this fortreſs, he deceived the vigilance of his guards, haſtened back, and gathering 1000 horſemen among his retainers, intruſted his ſecurity to the ſword.

62 and at tempts raiſe a bellion

In the mean time, the queen continued her progreſs. The earl of Huntley joined himſelf to her train. His anxiety to induce her to allow him to attend her to his houſe of Strathbogy was uncommon; his entreaties were even preſſed beyond the bounds of propriety. The intelligence arrived of the eſcape and rebellion of Sir John Gordon. The behaviour of the father and the ſon awakened in her the moſt alarming ſuſpicions. Aſſembling her privy-council, who, according to the faſhion of thoſe times, conſtituted her court, and attended her perſon in her progreſſes though her dominions; ſhe, with their advice, commanded her heralds to charge Sir John Gordon and his adherents to return to their allegiance, and to ſurrender up to her their houſes of ſtrength and caſtles, under the pains of high treaſon and forfeiture. Diſdaining now to go to the houſe of the earl of Huntley, where, as it afterwards appeared, that nobleman had made ſecret preparations to hold her in captivity, ſhe advanced to Inverneſs by a different route. In the caſtle of Inverneſs ſhe propoſed to take up her reſidence; but Alexander Gordon the deputy governor, a dependent of the family of Huntley, refuſed to admit her. She was terrified with the proſpect of a certain and imminent danger. Her attendants were few in number, the town was without walls, and the inhabitants were ſuſpected. In this extremity, ſome ſhips in the river were kept in readineſs as a laſt refuge; and ſhe iſſued a proclamation, commanding all her loyal ſubjects in thoſe parts immediately to repair to her for her protection. The Fraſers and Monroes came in crowds to make her the offer of their ſwords. The Clan Chattan, though called to arms by the earl of Huntley, forſook his ſtandard for that of their ſovereign, when they diſcovered that his intentions were hoſtile to her. She employed this ſtrength in laying ſiege to the caſtle, which ſurrendered itſelf upon the firſt aſſault. The lives of the common ſoldiers were ſpared, but the deputy-governor was inſtantly executed. The queen, full of apprehenſions, returned to Aberdeen.

To intimidate the earl of Huntley, to puniſh the troubles which his family had created to the queen, and to convince him that his utter ruin was at hand,

a meaſure

and. a meaſure infinitely humiliating was now concerted and put in practice. The earl of Marr reſigned the rich eſtate of that name to the lord Erſkine, who laid claim to it as his right; and received in recompenſe, after its erection into an earldom, the territory of Murray, which made an extenſive portion of the poſſeſſions of the earl of Huntley.

The lady Huntley haſtened to Aberdeen to throw herſelf at the feet of her ſovereign, to make the offer of the moſt humble ſubmiſſions on the part of her huſband, and to avert by every poſſible means the downfal of his greatneſs. But all acceſs to the queen was refuſed to her; and the earl of Huntley was ſummoned to appear in perſon before the privy-council, to anſwer for his conduct, and to make a full reſignation of all his caſtles and fortreſſes. He did not preſent himſelf, and was declared to be in open rebellion. A new proclamation was circulated by the queen to collect together a ſufficient ſtrength to ſubdue the inſurgents. The command of her troops was given to the earl of Murray, who put them inſtantly into motion. Huntley advancing towards Aberdeen to give them battle, was informed of their approach. He halted at Corrichie, ſolacing himſelf with the hope of a deciſive victory. The army of the queen was the moſt numerous; but there were ſeveral companies in it in whom little confidence could be placed. Theſe the earl of Murray poſted in the front of the battle, and commanded them to begin the attack. They recoiled upon him in diſorder, according to his expectation; but a reſolute band in whom he truſted, holding out their ſpears, obliged them to take a different courſe. Their confuſion and flight made Huntley conceive that the day was his own. He therefore ordered his ſoldiers to throw aſide their lances, and to ruſh upon the enemy ſword in hand. His command was obeyed, but with no precaution or diſcipline. When his men came to the place where the earl of Murray had ſtationed himſelf, the points of the extended ſpears of his firm battalion put a termination to their progreſs. The panic communicated by this unexpected reſiſtance was improved by the vigour with which he preſſed the aſſailants. In their turn they took to flight. The companies of the queen's army which had given way in the beginning of the conflict were now diſpoſed to atone for their miſconduct; and taking a ſhare in the battle, committed a ſignal ſlaughter upon the retainers of the earl of Huntley. This nobleman himſelf expired in the throng of the purſuit. His ſons Sir John Gordon and Adam Gordon were made priſoners, with the principal gentlemen who had aſſiſted him.

Mary, upon receiving the tidings of this ſucceſs, diſcovered neither joy nor ſorrow. The paſſions, however, of the earl of Murray and his party were not yet completely gratified. Sir John Gordon was brought immediately to trial, confeſſed his guilt, and was condemned to ſuffer as a traitor. The ſentence accordingly was executed, amidſt a multitude of ſpectators, whoſe feelings were deeply affected, while they conſidered his immature death, the manlineſs of his ſpirit, and the vigour of his form. Adam Gordon, upon account of his tender age, was pardoned; and fines were levied from the other captives of condition according to their wealth. The lord Gordon, after the battle of Corrichie, fled to his father-in-law the duke of Chatelherault, and put himſelf under his protection; but was delivered up by that nobleman, all whoſe endeavours in his favour were ineffectual. He was convicted of treaſon, and condemned; but the queen was ſatisfied with confining him in priſon. The dead body of the earl of Huntley was carried to Edinburgh, and kept without burial, till a charge of high treaſon was preferred againſt him before the three eſtates. An oſtentatious diſplay was made of his criminal enterpriſes, and a verdict of parliament pronounced his guilt. His eſtates, hereditary and moveable, were forfeited; his dignity, name, and memory, were pronounced to be extinct; his enſigns armorial were torn from the book of arms; and his poſterity were rendered unable to enjoy any offices, honour, or rank, within the realm.

Scotl

626

While theſe ſcenes were tranſacting, Mary, who was ſincerely ſolicitous to eſtabliſh a ſecure amity between the two kingdoms, opened a negotiation to effectuate an interview with Elizabeth. Secretary Maitland, whom ſhe employed in this buſineſs, met with a moſt gracious reception at the court of London. The city of York was appointed as the place where the two queens ſhould expreſs their mutual love and affection, and bind themſelves to each other in an indiſſoluble union; the day of their meeting was fixed; the faſhion and articles of their interview were adjuſted; and a ſafe conduct into England was granted to the queen of Scots by Elizabeth. But in this advanced ſtate of the treaty it was unexpectedly interrupted. The diſturbances in France, the perſecution of the Proteſtants there, and the dangerous conſequence which threatened the reformed countries, ſeemed to require Elizabeth to be particularly upon her guard, and to watch with eagerneſs againſt the machinations of the adverſaries of her religion. Upon theſe pretences ſhe declined for a ſeaſon the projected interview; ſending to Mary with this apology Sir Henry Sidney, a miniſter of ability, whom ſhe inſtructed to dive into the ſecret views of the Scottiſh queen. This was a ſevere diſappointment to Mary; but it is reaſonable to believe, that Elizabeth acted in the negotiation without ſincerity, and upon principles of policy. It was not her intereſt to admit into her kingdom a queen who had pretenſions to her crown, and who might ſtrengthen them; who might raiſe the expectations of her Roman Catholic ſubjects, and advance herſelf in their eſteem; and who far ſurpaſſed her in beauty, and in the bewitching allurement of converſation and behaviour.

An int view p poſed b tween ry and lizabet but in

62

Amidſt affairs of great moment, a matter of ſmaller conſequence, but which is intereſting in its circumſtances, deſerves to be recorded. Chatelard, a gentleman of family in Dauphiny, and a relation of the chevalier de Bayard, had been introduced to Queen Mary by the ſieur Damville, the heir of the houſe of Montmorency. Poliſhed manners, vivacity, attention to pleaſe, the talent of making verſes, and an agreeable figure, were recommendations to this man. In the court they drew attention to him. He made himſelf neceſſary in all parties of pleaſure at the palace. His aſſiduities drew to him the notice of the queen; and, at different times, ſhe did him the honour to dance with him. His complaiſance became gradually more familiar. He entertained her with his wit and good humour; he made verſes upon her beauty and accompliſhments; and her politeneſs and condeſcenſion inſinuated

Chatel falls in with th queen.

into

into him other ſentiments than gratitude and reverence. He could not behold her charms without feeling their power: and inſtead of ſtifling in its birth the moſt dangerous of all the paſſions, he encouraged its growth. In an unhappy moment, he entered her apartment; and, concealing himſelf under her bed, waited the approach of night. While the queen was undreſſing, her maids, diſcovered his ſituation, and gave her the alarm. Chatelard was diſmiſſed with diſgrace; but ſoon after received her pardon. The frenzy, however, of his love compelling him to repeat his crime, it was no longer proper to ſhow any compaſſion to him. The delicate ſituation of Mary, the noiſe of theſe adventures, which had gone abroad, and the rude ſuſpicions of her ſubjects, required that he ſhould be tried for his offences and puniſhed. This imprudent man was accordingly condemned to loſe his head; and the ſentence was put in execution.

The diſagreeable circumſtances in which Mary found herſelf involved by reaſon of her quarrel with Elizabeth, the exceſſive bigotry and overbearing ſpirit of her Proteſtant ſubjects, together with the adventure of Chatelard, and the calumnies propagated in conſequence of it, determined her to think of a ſecond marriage. Her beauty and expectations of the crown of England, joined to the kingdom which ſhe already poſſeſſed, brought her many ſuitors. She was addreſſed by the king of Sweden, the king of Navarre, the prince of Condé, the duke of Ferrara, Don Carlos of Spain, the archduke Charles of Auſtria, and the duke of Anjou. Her own inclination was to give the preference, among theſe illuſtrious lovers, to the prince of Spain; but her dermination, from the firſt moment, was to make her wiſhes bend to other conſiderations and to render her deciſion upon this important point as agreeable as poſſible to Queen Elizabeth, to the Engliſh nation, and to the Proteſtants of both kingdoms. Her ſucceſſion to the crown of England was the object neareſt her heart; and Elizabeth, who wiſhed to prevent her from marrying altogether, contrived to impreſs upon her mind an opinion that any foreign alliance would greatly obſtruct that much deſired event. She therefore pitched upon two of her own ſubjects, whom ſhe ſucceſſively recommended as fit matches for the queen of Scots; and ſhe promiſed, that upon her acceptance of either of them, her right of inheritance ſhould be inquired into and declared. Lord Robert Dudley, afterwards earl of Leiceſter, was the firſt perſon propoſed; and except a manly face and fine figure he had not one quality that could recommend him to the Scottiſh princeſs. Whilſt Mary received this ſuitor with ſome degree of compoſure, ſhe did not altogether repreſs her ſcorn. "She had heard good accounts (ſhe owned) of the gentleman; but as Queen Elizabeth had ſaid, that in propoſing a huſband to her, ſhe would conſult her honour, ſhe aſked what honour there could be in marrying a ſubject?" The Engliſh queen then brought under the eye of Mary another ſuitor, leſt her thoughts ſhould return to a foreign alliance. This was Lord Darnley, of the houſe of Stuart itſelf, whoſe birth was almoſt equal to her own, and whom the Scottiſh princeſs was induced to accept as a huſband by motives which we have detailed elſewhere. (See MARY.) Elizabeth however was not more ſincere in this propoſal than in the former; for after permitting Darnley and his father the earl of Lenox to viſit Scotland merely with a view of diverting the attention of the queen from the continent, ſhe threw every obſtacle in the way of the marriage which art and violence could contrive. When ſhe found Mary ſo much entangled, that ſhe could hardly draw back, or make any other choice than that of Darnley, Elizabeth attempted to prevent her from going farther on; and now intimated her diſapprobation of that marriage, which ſhe herſelf had not only originally planned, but, in theſe latter ſtages, had forwarded by every means in her power. The whole council of Elizabeth declared againſt the marriage. Even from her own ſubjects Mary met with conſiderable oppoſition. An inveterate enmity had taken place between the duke of Chatelherault and the earl of Lenox, in conſequence of which the former deſerted the court, and very few of the Hamiltons repaired to it. The lord James Stuart, now earl of Murray, ſought to promote the match with Lord Dudley. In conſequence of this he was treated openly with diſreſpect by the earl of Lenox; he loſt the favour of his ſovereign, and Darnley threatened him with his vengeance when he ſhould be married to the queen. John Knox in the mean time behaved in the moſt furious manner, forgetting not only the meek and peaceable behaviour of a Chriſtian, but the allegiance of a ſubject. This preacher even interfered with the marriage of his ſovereign. He warned the nobility, that if they allowed a Papiſt or an infidel to obtain her perſon and the government of Scotland, they would be guilty, to the full extent of their power, of baniſhing Jeſus Chriſt from the kingdom, of bringing down upon it the vengeance of God, of being a curſe to themſelves, and of depriving their queen of all comfort and conſolation. As Darnley was a Papiſt, he was of conſequence execrated by the whole body of Proteſtants, laity as well as clergy; while, on the other hand, he was ſupported by the earls of Athol and Caithneſs, the lords Ruthven and Hume, and the whole Popiſh faction.

It was exceedingly unfortunate for the queen, that neither Lord Darnley himſelf, nor his father the earl of Lenox, had any talents for buſineſs; and as they naturally had the direction of the queen's affairs, it is no wonder that they were very ill managed. But a ſource of oppoſition, more violent than any imperfections of their own, roſe up to them in the attachment which they diſcovered to a perſon upon whom the queen had of late beſtowed her favour with an imprudent prodigality. David Rizzio from a mean origin raiſed himſelf to a diſtinguiſhed eminence. He was born at Turin, where his farther earned a ſubſiſtence as a muſician. Varieties of ſituation and adventure, poverty, and misfortunes, had taught him experience. In the train of the count de Morette, the ambaſſador from the duke of Savoy, he had arrived in Scotland. The queen, deſirous to complete her band of muſic, admitted him into her ſervice. In this humble ſtation he had the dexterity to attract her attention; and her French ſecretary falling into diſgrace, from negligence and incapacity, he was promoted to diſcharge the duties of his office. A neceſſary and frequent admiſſion to her company afforded him now the fulleſt opportunity to recommend himſelf to her; and while ſhe approved his manners, ſhe was ſenſible of his fidelity and his talents. His mind, however, was not ſufficiently vigorous to bear with ſucceſs and proſperity. Ambition grew upon him with preferment. He

and. interfered in affairs of moment, intruded himſelf into the conventions of the nobles at the palace, and was a candidate for greatneſs. The queen conſulted with him upon the moſt difficult and important buſineſs, and intruſted him with real power. The ſuppleneſs, ſervility, and unbounded complaiſance which had characterized his former condition, were exchanged for inſolence, oſtentation, and pride. He exceeded the moſt potent barons in the ſtateline's of his demeanour, the ſumptuouſneſs of his apparel, and the ſplendour of his retinue. The nobles, while they deſpiſed the lowneſs of his birth, and deteſted him as a foreigner, and a favourite, were mortified with his grandeur, and inſulted with his arrogance. Their anger and abhorrence were driven into fury; and while this undeſerving minion, to uphold his power, courted Darnley, and with officious aſſiduities advanced his ſuit with the queen, he haſtened not only his own ruin, but laid the foundations of cruel outrages and of public calamity.

rl of To the earl of Murray the exaltation of Rizzio, ſo y offenſive in general to the nation, was humiliating in a more particular degree. His interference for the earl of Leiceſter, the partiality he entertained for Elizabeth, his connexions with Secretary Cecil, and the favour he had ſhown to Knox, had all contributed to create in Mary a ſuſpicion of his integrity. The practices of Darnley and Rizzio were thence the more effectual; and the fulleſt weight of their influence was employed to undermine his power. His paſſions and diſguſts were violent; and in his mind he meditated revenge. Mary, aware of her critical ſituation, was ſolcitous to add to her ſtrength. Bothwel, who had been impriſoned for conſpiring againſt the life of the earl of Murray, and who had eſcaped from confinement, was called from France; the earl of Sutherland, an exile in Flanders, was invited home to receive his pardon; and George Gordon, the ſon of the earl of Huntley, was admitted to favour, and was ſoon to be reinſtated in the wealth and honours of his family.

As ſoon as Bothwel arrived, the earl of Murray inſiſted that he ſhould be brought to a trial for having plotted againſt his life, and for having broke from the place of his confinement. This was agreed to; and on the day of trial Murray made his appearance with 800 of his adherents. Bothwel did not chooſe to contend with ſuch a formidable enemy; he therefore fled to France, and a proteſtation was made, importing that his fear of violence had been the cauſe of his flight. The queen commanded the judge not to pronounce ſentence. Murray complained loudly of her partiality, and engaged deeper and deeper in cabals with Queen Elizabeth. Darnley, in the mean time, preſſed his ſuit with eagerneſs. The queen uſed her utmoſt endeavours to cauſe Murray ſubſcribe a paper expreſſing a conſent to her marriage; but all was to no purpoſe. However, many of the nobility did ſubſcribe this paper; and ſhe ventured to ſummon a convention of the eſtates at Stirling, to whom ſhe opened the buſineſs of the marriage; and who approved of her choice, provided the Proteſtant religion ſhould continue to be the eſtabliſhment.

In the mean time ambaſſadors arrived from England, with a meſſage importing Elizabeth's entire diſapprobation and diſallowance of the queen's marriage with Lord Darnley. But to theſe ambaſſadors Mary only replied, that matters were gone too far to be recalled; and that Elizabeth had no ſolid cauſe of diſpleaſure, ſince, by her advice, ſhe had fixed her affections not upon a foreigner, but upon an Engliſhman; and ſince the perſon ſhe favoured was deſcended of a diſtinguiſhed lineage, and could boaſt of having in his veins the royal blood of both kingdoms. Immediately after this audience ſhe created Lord Darnley a lord and a knight. The oath of knighthood was adminiſtered to him. He was made a baron and a banneret, and called *Lord Armanagh*. He was belted earl of Roſs. He then promoted 14 gentlemen to the honour of knighthood, and did homage to the queen, without any reſervation of duty to the crown of England, where his family had for a long time reſided. His advancement to the duke of Albany was delayed for a little time; and this was ſo much reſented by him, that, when informed of it by the lord Ruthven, he threatened to ſtab that nobleman with his dagger.

In the mean time the day appointed for the aſſembly of parliament, which was finally to determine the ſubject of the marriage, was now approaching. The earl of Murray, encouraged by the apparent firmneſs of Elizabeth, goaded on by ambition, and alarmed with the approbation beſtowed by the convention of the eſtates on the queen's choice of Lord Darnley, perceived that the moment was at hand when a deciſive blow ſhould be ſtruck. To inſpirit the reſentment of his friends, and to juſtify in ſome meaſure the violence of his projects, he affected to be under apprehenſions of being aſſaſſinated by the lord Darnley. His fears were founded abroad; and he avoided to go to Perth, where he affirmed that the plot againſt him was to be carried into execution. He courted the enemies of Darnley with unceaſing aſſiduity; and he united to him in a confederacy the duke of Chateſherault, and the earls of Argyll, Rothes, and Glencairn. It was not the ſole object of their aſſociation to oppoſe the marriage. They engaged in more criminal enterpriſes. They meditated the death of the earl of Lenox and the lord Darnley; and while the queen was upon the road to Calander place to viſit the lord Livingſtone, they propoſed to intercept her and to hold her in captivity. In this ſtate of her humiliation, Murray was to advance himſelf into the government of the kingdom, under the character of its regent. But Mary having received intelligence of their conſpiracy, the earl of Athol and the lord Ruthven raiſed ſuddenly 300 men to protect her in her journey. Defeated in this ſcheme, the earl of Murray and his aſſociates did not relinquiſh their cabals. They thought of new achievements; and the nation was filled with alarms, ſuſpicions, and terror.

Amidſt the arts employed by the Scottiſh malcontents to inflame the animoſities of the nation, they forgot not to inſiſt upon the dangers which threatened the Proteſtant religion from the advancement of Lord Darnley, and from the rupture that muſt enſue with England. Letters were everywhere diſperſed among the faithful, reminding them of what the eternal God had wrought for them in the abolition of idolatry, and admoniſhing them to oppoſe the reſtoration of the maſs. A ſupplication was preſented to the queen, complaining of idolaters, and inſiſting upon their puniſhment. In the preſent juncture of affairs it was received with unuſual reſpect; and Mary inſtructed the Popiſh eccleſiaſtics to

Scotla

63 Diſtur ces ra by the teſtan

land. abſtain from giving offence of any kind to the Proteſtants. A prieſt, however, having celebrated the maſs, was taken by the brethren, and expoſed to the inſults and fury of the populace at the market-place of Edinburgh, in the garments of his profeſſion, and with the chalice in his hand; and the queen having given a check to this tumultuous proceeding, the Proteſtants, riſing in their wrath, were the more confirmed in the belief that ſhe meant to overthrow their religion. The moſt learned and able of the clergy held frequent conſultations together; and while the nation was diſturbed with dangerous ferments, the General Aſſembly was called to deliberate upon the affairs of the church. Their hope of ſucceſs being proportioned to the difficulties in the ſituation of the queen, they were the leſs ſcrupulous in forming their reſolutions; and the commiſſioners, whom they deputed to her, were ordered to demand a parliamentary ratification of their deſires.

They inſiſted, that the maſs, with every remain whatſoever of Popery, ſhould be univerſally ſuppreſſed throughout the kingdom; that in this reformation, the queen's perſon and houſehold ſhould be included; and that all Papiſts and idolaters ſhould be puniſhed upon conviction according to the laws. They contended, that perſons of every deſcription and degree ſhould reſort to the churches upon Sunday, to join in prayers, and to attend to exhortations and ſermons; that an independent proviſion ſhould be aſſigned for the ſupport of the preſent clergy, and for their ſucceſſors; that all vacant benefices ſhould be conferred upon perſons found to be qualified for the miniſtry, upon the trial and examination of the ſuperintendants; that no biſhopric, abbey, priory, deanery, or other living, having many churches, ſhould be beſtowed upon a ſingle perſon; but that, the plurality of the foundation being diſſolved, each church ſhould be provided with a miniſter; that the glebes and manſes ſhould be allotted for the reſidence of the miniſters, and for the reparation of churches; that no charge in ſchools or univerſities, and no care of education, either public or private, ſhould be intruſted to any perſon who was not ſound and able in doctrine, and who was not approved by the ſuperintendants; that all lands which of old had been devoted to hoſpitality, ſhould again be made ſubſervient to it; that the lands and rents which formerly belonged to the monks of every order, with the annuities, alterages, obits, and the other emoluments which had appertained to prieſts, ſhould be employed in the maintenance of the poor and the upholding of ſchools; that all horrible crimes, ſuch as idolatry, blaſphemy, breaking of the Sabbath, witchcraft, ſorcery, enchantment, adultery, manifeſt whoredom, the keeping of brothels, murder, and oppreſſion, ſhould be puniſhed with ſeverity; that judges ſhould be appointed in every diſtrict, with powers to pronounce ſentences and to execute them; and, in fine, that for the eaſe of the labouring huſbandmen, ſome order ſhould be deviſed concerning a reaſonable payment of the tythes.

637 To theſe requiſitions, the queen made an anſwer full
leration of moderation and humanity. She was ready to agree
ne with the three eſtates in eſtabliſhing the reformed reli-
n. gion over the ſubjects of Scotland; and ſhe was ſteadily reſolved not to throw into hazard the life, the peace, or the fortune, of any perſon whatſoever upon account of his opinions. As to herſelf and her houſehold, ſhe was perſuaded that her people would not urge her to adopt tenets in contradiction to her own conſcience, and thereby involve her in remorſe and uneaſineſs. She had been nouriſhed and brought up in the Romiſh faith; ſhe conceived it to be founded on the word of God; and ſhe was deſirous to continue in it. But, ſetting aſide her belief and religious duty, ſhe ventured to aſſure them, that ſhe was convinced from political reaſons, that it was her intereſt to maintain herſelf firm in the Roman Catholic perſuaſion. By departing from it, ſhe would forfeit the amity of the king of France, and that of other princes who were now ſtrongly attached to her; and their diſaffection could not be repaired or compenſated by any new alliance. To her ſubjects ſhe left the fulleſt liberty of conſcience; and they could not ſurely refuſe to their ſovereign the ſame right and indulgence. With regard to the patronage of benefices, it was a prerogative and property which it would ill become her to violate. Her neceſſities, and the charge of her royal dignity, required her to retain in her hands the patrimony of the crown. After the purpoſes, however, of her ſtation, and the exigences of government, were ſatisfied, ſhe could not object to a ſpecial aſſignment of revenue for the maintenance of the miniſtry; and, on the ſubject of the other articles which had been ſubmitted to her, ſhe was willing to be directed by the three eſtates of the kingdom, and to concur in the reſolutions which ſhould appear to them the moſt reaſonable and expedient. 6

The clergy, in a new aſſembly or convention, expreſ- The
ſed a high diſpleaſure with this return to their addreſs. ſtates
They took the liberty to inform the queen, that the diſple
doctrines of the Reformation which ſhe refuſed to adopt, with
were the religion which had been revealed by Jeſus anſw
Chriſt, and taught by the apoſtles. Popery was of all perſuaſions the leaſt alluring, and had the feweſt recommendations. In antiquity, conſent of people, authority of princes, and number of proſelytes, it was plainly inferior to Judaiſm. It did not even reſt upon a foundation ſo ſolid as the doctrines of the Alcoran. They required her, therefore, in the name of the eternal God, to embrace the means of attaining the truth, which were offered to her in the preaching of the word, or by the appointment of public diſputations between them and their adverſaries. The errors of the maſs were placed before her in all their deformity. The ſayer of it, the action itſelf, and the opinions expreſſed in it, were all pronounced to be equally abominable. To hear the maſs, or to gaze upon it, was to commit the complicated crimes of ſacrilege, blaſphemy, and idolatry. Her delicacy in not renouncing her opinions from the apprehenſion of offending the king of France and her other allies, they ridiculed as impertinent in the higheſt degree. They told her, that the true religion of Chriſt was the only means by which any confederacy could endure; and that it was far more precious than the alliance of any potentate whatſoever, as it would bring to her the friendſhip of the King of kings. As to patronages, being a portion of her patrimony, they intended not to defraud her of her rights: but it was their judgment, that the ſuperintendants ought to make a trial of the qualifications of candidates for the miniſtry; and it was the duty of the patron to preſent a perſon to the benefice, it was the buſineſs of the church to manage his inſtitution or collation. For without this

reſtraint,

nd. reſtraint, there would be no ſecurity for the fitneſs of the incumbent; and if no trials or examinations of miniſters took place, the church would be filled with miſrule and ignorance. Nor was it right or juſt that her majeſty ſhould retain to herſelf any part of the revenue of benefices; as it ought to be all employed to the uſes of the clergy, for the purpoſes of education, and for the ſupport of the poor. And as to her opinion, that a ſuitable aſſignment ſhould be made for them, they could not but thank her with reverence: but they begged to ſolicit and importune her to condeſcend upon the particulars of a proper ſcheme for this end, and to carry it into execution; and that, taking into a due conſideration the other articles of their demands, ſhe would ſtudy to comply with them, and to do juſtice to the religious eſtabliſhment of her people.

From the fears of the people about their religion, diſturbances and inſurrections were unavoidable; and before Mary had given her anſwer to the petitions or addreſs of the clergy, the Proteſtants, to a formidable number, had marched to St Leonard's Craig; and, dividing themſelves into companies, had choſen captains to command them. But the leaders of this tumult being apprehended and committed to cloſe cuſtody, it ſubſided by degrees; and the queen, upon the interceſſion of the magiſtrates of Edinburgh, inſtead of bringing them to trial, gave them a free pardon. To quiet, at the ſame time, the apprehenſions which had gone abroad, and to controvert the inſidious reports which had been induſtriouſly ſpread of her inclination to overturn the reformed doctrines, ſhe repeatedly iſſued proclamations, aſſuring her ſubjects, that it was her fixed determination not to moleſt or diſturb any perſon whatſoever upon account of his religion or conſcience; and that ſhe had never preſumed even to think of any innovation that might endanger the tranquillity or do a prejudice to the happineſs of the commonwealth.

While Mary was conducting her affairs with diſcernment and ability, the earl of Murray and his confederates continued their conſultations and their intrigues. After their diſappointment in the conſpiracy againſt the queen and the Lord Darnley, they perceived that their only hope of ſucceſs or ſecurity depended upon Elizabeth; and as Randolph had promiſed them her protection and aſſiſtance, they ſcrupled not to addreſs a letter to her, explaining their views and ſituation. The pretences of their hoſtility to their ſovereign upon which they affected to inſiſt, were her ſettled deſign to overturn the Proteſtant religion, and her rooted deſire to break all correſpondence and amity with England. To prevent the accompliſhment of theſe purpoſes, they ſaid, was the object of their confederacy; and with her ſupport and aid they did not doubt of being able to advance effectually the emolument and advantage of the two kingdoms. In the preſent ſtate of their affairs, they applied not, however, for any ſupply of her troops. An aid from her treaſury was now only neceſſary to them; and they engaged to beſtow her bounty in the manner the moſt agreeable to her inclinations and her intereſts. The pleaſure with which Elizabeth received their application was equal to the averſion ſhe had conceived againſt the queen of Scots. She not only granted to them the relief they requeſted, but aſſured them by Randolph of her eſteem and favour while they ſhould continue to uphold the reformed religion and the connexion of the two nations. Flattered by her aſſurances and generoſity, they were ſtrenuous to gain partizans, and to diſunite the friends of their ſovereign; and while they were ſecretly preparing for rebellion, and for trying their ſtrength in the field, they diſſeminated among the people the tenets, That a Papiſt could not legally be their king: that the queen was not at liberty of herſelf to make the choice of a huſband; and that, in a matter ſo weighty, ſhe ought to be entirely directed by the determination of the three eſtates aſſembled in parliament. Scotla

641 Treache of Eliza beth.

Elizabeth, at the ſame time, carrying her diſſimulation to the moſt criminal extremity, commanded Randolph to aſk an audience of Mary; and to counſel her to nouriſh no ſuſpicions of the earl of Murray and his friends; to open her eyes to their ſincerity and honour; and to call to mind, that as their ſervices had hitherto preſerved her kingdom in repoſe, her jealouſies of them might kindle it into combuſtion, make the blood of her nobles to flow, and caſt into hazard her perſon and her crown. Full of aſtoniſhment at a meſſage ſo rude and ſo improper, the queen of Scots deſired him to inform his miſtreſs, that ſhe required not her inſtructions to diſtinguiſh between patriotiſm and treachery; that ſhe was fully ſenſible when her will or purpoſe was reſiſted or obeyed; and that ſhe poſſeſſed a power which was more than ſufficient to repreſs and to puniſh the enormities and the crimes of her ſubjects. The Engliſh reſident went now to the earl of Lenox and the lord Darnley, and charged them to return to England. The former expreſſed an apprehenſion of the ſeverity of his queen, and ſought an aſſurance of her favour before he could venture to viſit her dominions. The latter, exerting greater fortitude, told him, that he acknowledged no duty or obedience but to the queen of Scots. The reſident treating this anſwer as diſreſpectful to Elizabeth, turned his back upon the Lord Darnley, and retired without making any reverence, or bidding him an adieu.

The behaviour of Elizabeth, ſo fierce and ſo perfidious, was well calculated to confirm all the intentions of Mary; and this, doubtleſs, was one of the motives with which ſhe was actuated. But while the queen of Scots was eager to accompliſh her marriage, ſhe was not inattentive to the riſing troubles of her country. The parliament which ſhe had appointed could not now be held: it was therefore prorogued to a more diſtant day; and the violence of the times did not then permit it to aſſemble. By letters ſhe invited to her, with all their retainers, the moſt powerful and the moſt eminent of her ſubjects. Bothwel was recalled anew from France; and by general proclamations ſhe ſummoned to her ſtandard the united force of her kingdom. The caſtle of Edinburgh was likewiſe provided amply with ſtores and ammunition, that, in the event of misfortunes, it might afford her a retreat and defence. The alacrity with which her ſubjects flocked to her from every quarter, informed her of her power and popularity; and while it ſtruck Murray and his adherents with the danger to which they were expoſed, it declared to them the opinion entertained by the nation of the iniquity and the ſelfiſhneſs of their proceedings.

642 Marriag of Mary with L Darnley

On the 29th of July 1565, the ceremony of marriage between the queen and Lord Darnley was performed. The latter had been previouſly created duke of Albany.

644 rebel- nobles n into land.

Albany. The day before the marriage, a proclamation was publiſhed, commanding him to be ſtyled *king of the realm*, and that all letters after their marriage ſhould be directed in the names of her huſband and herſelf. The day after it, a new proclamation was iſſued confirming this act: he was pronounced king by the ſound of trumpets, and aſſociated with the queen in her government. This meaſure ſeems to have been the effect of the extreme love the queen had for her huſband, which did not permit her to ſee that it was an infringement of the conſtitution of the kingdom; though perhaps ſhe might alſo be urged to it by the preſſing eagerneſs of Lord Darnley himſelf, and the partial counſels of David Rizzio. The earl of Murray made loud complaints, remonſtrated, that a king was impoſed upon the nation without the conſent of the three eſtates, and called upon the nation to arm againſt the beginnings of tyranny. The malcontents accordingly were immediately in arms; but their ſucceſs was not anſwerable to their wiſhes. The bulk of the nation were ſatisfied with the good intentions of their ſovereign, and ſhe herſelf took the earlieſt opportunity of cruſhing the rebellion in its infancy. The earl of Murray was declared a traitor; and ſimilar ſteps were taken with others of the chiefs of the rebels. She then took the field againſt them at the head of a conſiderable army; and having driven them from place to place, obliged them at laſt to take refuge in England. Queen Elizabeth received them with that duplicity for which her conduct was ſo remarkable. Though ſhe herſelf had countenanced, and even excited them to revolt, ſhe refuſed to give an audience to their deputies. Nay, ſhe even cauſed them to emit a public declaration, that neither ſhe, nor any perſon in her name, had ever excited them to their rebellious practices. Yet, while the public behaviour of Elizabeth was ſo acrimonious, ſhe afforded them a ſecure retreat in her kingdom, treated the earl of Murray in private with reſpect and kindneſs, and commanded the earl of Bedford to ſupply him with money. Mary, however, reſolved to proceed againſt the rebels with an exemplary rigour. The ſubmiſſions of the duke of Chatelherault alone, who had been leſs criminal than the reſt, were attended to. But even the favour which he obtained was precarious and uncertain; for he was commanded to uſe the pretence of ſickneſs, and to paſs for ſome time into foreign countries. A parliament was called: and a ſummons of treaſon being executed againſt the earls of Argyll, Glencairn, and Rothes, with others of the principal rebels, they were commanded to appear before the three eſtates; in default of which their lives and eſtates were declared to be forfeited.

Scot

In the mean time Throgmorton the Engliſh ambaſſador ſolicited the pardon of the rebels; which Mary was at firſt inclined to grant. However, by the perſuaſion of the court of France, ſhe was not only induced to proceed againſt them with rigour, but acceded to the treaty of Bayonne, by which the deſtruction of the Proteſtants was determined. This meaſure filled the whole court with terror and diſmay. The rebels were acquainted with the danger of their ſituation; and being now driven deſperate, they were ready to engage in the moſt atrocious deſigns. Unhappily, the ſituation of affairs in Scotland rendered the accompliſhment of their purpoſes but too eaſy. Violent diſguſts had taken place between the queen and her huſband. Her fondneſs had been exceſſive; but ſhe ſoon perceived that the qualities of his mind were not proportioned to his perſonal accompliſhments. He was proud, diſdainful, and ſuſpicious. No perſuaſions could correct his wilfulneſs; and he was at the ſame time giddy and obſtinate, inſolent and mean. The queen in conſequence began to ſhow an indifference towards him; which he took care to augment, by ſhowing the like indifference towards her, and engaging in low intrigues and amours, indulging himſelf in diſſipation and riot, &c. However, the deſire of dominion was her ruling paſſion: and the queen, finding his total incapacity for exerciſing his power to any good purpoſe, had excluded him from it altogether. He was therefore at preſent a proper object for the machinations of the rebels, and readily entered into an agreement with them to depoſe the queen; vainly thinking by that means that he ſhould ſecure the crown to himſelf. However, as the parliament was ſoon to aſſemble, in which the rebels had every reaſon to believe that they would be condemned for high treaſon, it was neceſſary that the kingdom ſhould be thrown into diſorder before that time came, otherwiſe their fate was inevitable. Practiſing on the imbecility of Darnley, they perſuaded him that a criminal correſpondence ſubſiſted between the queen and David Rizzio (R). For this reaſon the queen reſolved upon his deſtruction; and the conſpirators hoped thereby not only to get an indemnity to themſelves, but to effect a total revolution at court, and the entire humiliation of Bothwel, Huntley, and Athol, who were the aſſociates of Rizzio. However, in order to ſave themſelves,

64 Mary cedes treaty Bayon

64 The conſp the de tion o vid R with t bellio noble

(R) That there ſubſiſted a criminal intercourſe between Mary and Rizzio is a ſcandal which is now given up by her enemies. It ſeems to reſt on the authority of Buchanan and Knox: and their evidence in this caſe is clearly of no weight, not only from their being the ſtrenuous partizans of her adverſaries, but from the multitude of falſehoods which they anxiouſly detail to calumniate her. The love ſhe felt for Darnley was extreme, and their acquaintance commenced a month or two after the appointment of Rizzio to be her ſecretary for French affairs. She became pregnant ſoon after her marriage; and it was during her pregnancy that Rizzio was aſſaſſinated. Theſe are ſtriking preſumptions in her favour. And what ſeems to put her innocence out of all queſtion, is the ſilence of the ſpies and reſidents of Elizabeth with regard to this amour; for, if there had been any thing real in it, they could not have made their court to their queen more effectually than by declaring to her its peculiarities; and their want of delicacy, ſo obſervable in other circumſtances, would have induced them upon this occaſion to give the greateſt foulneſs and deformity to their information.

It appears that Rizzio was ill-favoured, and of a diſagreeable form. Buchanan ſays of him, "Non faciem cultus honeſtabat, ſed facies cultum deſtruebat." Hiſt. Scot. lib. xvii. This expreſſion is very ſtrong; but it would have little weight if other authors had not concurred in giving a ſimilar deſcription of Rizzio. In a book entitled

md

ſelves, they engaged the king to ſubſcribe a bond, affirming that the project of aſſaſſinating Rizzio was altogether of his own deviting; acknowledging that he had ſolicited them to take a part in it, from the apprehenſions that reſiſtance might be made to him; and agreeing, upon the word and honour of a prince, to protect and ſecure them againſt every hazard and injury to which they might be expoſed from the achievement of his enterpriſe. Having procured this ſecurity, and having allured the earl of Lenox the king's father to approve their meaſures, they adjuſted the method of the projected murder; and deſpatched a meſſenger to the Engliſh frontier, advertiſing the earl of Murray and the rebels of their intentions, and inviting them to return to the court.

3

Upon the 9th day of March, about 7 o'clock in the evening, armed men, to the number of 500, ſurrounded the palace of Holyroodhouſe. The earl of Morton and the Lord Lindſay entered the court of the palace, with 160 perſons. The queen was in her chamber at ſupper, having in her preſence her natural ſiſter the counteſs of Argyll, her natural brother Robert commendator of Holyroodhouſe, Betou of Creich maſter of the houſehold, Arthur Erſkine, and David Rizzio. The king entering the apartment, ſeated himſelf by her ſide. He was followed by the Lord Ruthven, who being waſted with ſickneſs, and caſed in armour, exhibited an appearance that was hideous and terrible. Four ruffians attended him. In a hollow voice he commanded Rizzio to leave a place which did not become him. The queen, in aſtoniſhment and conſternation, applied to the king to unfold to her this myſterious enterpriſe. He affected ignorance. She ordered Ruthven from her preſence, under the pain of treaſon; declaring to him at the ſame time, that if Rizzio had committed any crime, ſhe would produce him before the parliament, and puniſh him according to the laws. Ruthven drawing his dagger, advanced towards Rizzio. The queen roſe to make an exertion of her authority. The unfortunate ſtranger laid hold of her garments, crying out for juſtice and mercy. Other conſpirators ruſhing into the chamber, overturned the table, and increaſed the diſmay and confuſion. Loaded piſtols were preſented to the boſom of the queen. The king held her in his arms. George Douglas, ſnatching the dagger of his ſovereign, plunged it into the body of Rizzio. The wounded and ſcreaming victim was dragged into the antichamber; and ſo eager were the aſſaſſins to complete their work, that he was torn and mangled with 56 wounds.

Scotlan

While the queen was preſſing the king to gratify her inquiries into the meaning of a deed ſo execrable, Ruthven returned into their preſence. She gave a full vent to indignation and reproach. Ruthven, with an intolerable coldneſs and deliberation, informed her, that Rizzio had been put to death by the counſel of her huſband, whom he had diſhonoured; and that by the perſuaſion of this minion ſhe had refuſed the crown-matrimonial to the king, had engaged to re-eſtabliſh the ancient religion, had reſolved to puniſh the earl of Murray and his friends, and had intruſted her confidence to Bothwel and Huntley, who were traitors. The king, taking the part of Ruthven, remonſtrated againſt her proceedings, and complained that from the time of her familiarity with Rizzio, ſhe had neither regarded, nor entertained, nor truſted him. His ſuſpicions and ingratitude ſhocked and tortured her. His connexion with the conſpirators gave her an ominous anxiety. Apprehenſions of outrages ſtill more atrocious invaded her. In theſe agitated and miſerable moments ſhe did not loſe herſelf in the helpleſſneſs of ſorrow. The loftineſs of her ſpirit communicated relief to her; and wiping away her tears, ſhe exclaimed, that it was not now a ſeaſon for lamentation, but for revenge.

The earls of Huntley, Bothwel, and Athol, the lords Fleming and Levingſton, and Sir James Balfour, who were obnoxious to the conſpirators, and at this time in the palace, found all reſiſtance to be vain. Some of them eluding the vigilance of Morton, made their eſcape; and others were allowed to retire. The provoſt and magiſtrates of Edinburgh getting intelligence of the tumult, ordered the alarm bell to be rung. The citizens, apprehenſive and anxious, approached in crowds to inquire into the welfare of their ſovereign; but ſhe was not permitted to addreſs herſelf to them. The conſpirators told her, that if ſhe preſumed to make any harangue, they would "cut her in pieces, and caſt her over the walls." The king called to the people that ſhe was well, and commanded them to diſperſe. The queen was ſhut up in her chamber, uncertain of her fate, and without the conſolation or attendance of her women.

In the morning a proclamation was iſſued by the king, without the knowledge of his queen, prohibiting the meeting of the parliament, and ordering the members to retire from the city. The rebellious lords now

returned

---

entitled, "Le Livre de la Morte de la Reyne d'Ecoſſe," and printed in the year 1587, he is ſaid to be "diſgracié de corps." Cauſſin, ap. Jebb, p. 37. This work, too, while it records the unkindneſs of nature to his perſon, has obſerved, that he was in his old age when he made a figure in the court of Mary. "Elle traittoit ordinairement avec David Riccio ſon ſecretaire, homme agé et prudent, qui poſſedoit ſon oreille." Ibid. And other authors give their teſtimonies to the ſame purpoſe.

It is probable that the panegyriſts of Mary exaggerate ſomewhat the imperfections as well as the good qualities of Rizzio. But there ſeems in general to be no reaſon to doubt his fidelity and talents, any more than his uglineſs and ſenility. He had therefore a better title to be her ſecretary than her lover. It is an abſurdity to think that a queen ſo young and beautiful would yield herſelf to deformity and old age. A common proſtitute muſt be brought to endure this misfortune. The capacity of the man was a recommendation to him; and as he owed every thing to her bounty, and was a ſtranger, ſhe had the greateſt reaſon to rely upon his faithfulneſs. The perfidiouſneſs and duplicity of her courtiers drew cloſer the tie of her connexion; and as Rizzio was ſtudious to make himſelf agreeable, and was ſkilful in games of hazard, he was always ready to be a party with her in thoſe innocent amuſements which fill up the littleſs intervals of life. Keith. Append. p. 124.

returned from England, and arrived at Edinburgh within 24 hours after the aſſaſſination of Rizzio. The queen, knowing of how much conſequence it was for her to gain the earl of Murray, invited him to wait upon her. Notwithſtanding the extreme provocation which ſhe had met with, Mary ſo far commanded her paſſions, that ſhe gave him a favourable reception. After informing him of the rudeneſs and ſeverity of the treatment ſhe had met with, the queen obſerved, that if he had remained in friendſhip with her at home, he would have protected her againſt ſuch exceſſes of hardſhip and inſult. Murray with an hypocritical compaſſion, ſhed abundance of tears; while the queen ſeemed to entertain no doubt of his ſincerity, but gave him room to hope for a full pardon of all his offences. In the mean time however, the conſpirators held frequent conſultations together, in which it was debated, whether they ſhould hold the queen in perpetual captivity or put her to death; or whether they ſhould content themſelves with committing her to cloſe cuſtody in Stirling caſtle till they ſhould obtain a parliamentary ſanction to their proceedings, eſtabliſh the Proteſtant religion by the total overthrow of the maſs, and inveſt the king with the crown-matrimonial and the government of the kingdom.

Mary now began to perceive the full extent of her wretchedneſs; and therefore, as her laſt reſource, applied to the king, whom ſhe treated with all thoſe blandiſhments uſually employed by the fair ſex when they want to gain the aſcendancy over the other. The king, who, with all his faults, had a natural facility of temper, was eaſily gained over. The conſpirators were alarmed at his coldneſs, and endeavoured to fill his mind with fears concerning the duplicity of his wife; but, finding they could not gain their point, they at laſt began to treat of an accommodation. The king brought them a meſſage, importing, that Mary was diſpoſed to bury in oblivion all memory of their tranſgreſſions; and he offered to conduct them into her preſence. The earls of Murray and Morton, with the lord Ruthven, attended him into her preſence; and, falling on their knees before the queen, made their apologies and ſubmiſſions. She commanded them to riſe; and having deſired them to recollect her abhorrence of cruelty and rapaciouſneſs, ſhe aſſured them with a gracious air, that inſtead of deſigning to forfeit their lives, and poſſeſs herſelf of their eſtates, ſhe was inclined to receive them into favour, and to give a full pardon, not only to the nobles who had come from England, but to thoſe who had aſſaſſinated David Rizzio. They were accordingly ordered to prepare the bonds for their ſecurity and forgiveneſs, which the queen promiſed to take the earlieſt opportunity of ſubſcribing; but in the mean time the king obſerved, that the conſpirators ought to remove the guards which they had placed around the queen, that all ſuſpicion of reſtraint might be taken away. The meaſure could not with any propriety be oppoſed, and the guards were therefore diſmiſſed; upon which the queen, that very night left her palace at midnight, and took the road to Dunbar, accompanied by the king and a few attendants.

The news of the queen's eſcape threw the conſpirators into the utmoſt conſternation; as ſhe immediately iſſued proclamations for her ſubjects to attend her in arms, and was powerfully ſupported. They ſent there-

fore the lord Semple, requeſting, with the utmoſt humility, her ſubſcription to their deeds of pardon and ſecurity; but to this meſſage ſhe returned an unfavourable anſwer, and advanced towards Edinburgh with an army of 8000 men. The conſpirators now fled with the utmoſt precipitation. Even John Knox retired to Kyle till the ſtorm ſhould blow over. On the queen's arrival at Edinburgh, a privy council was inſtantly called, in which the conſpirators were charged to appear as guilty of murder and treaſon; their places of ſtrength were ordered to be rendered up to the officers of the crown; and their eſtates and poſſeſſions were made liable to confiſcation and forfeiture.

But while the queen was thus eager to puniſh the conſpirators, ſhe was ſenſible that ſo many of the nobility, by uniting in a common cauſe, might raiſe a powerful party in oppoſition to her; for which reaſon ſhe endeavoured to detach the earl of Murray from the reſt, by making him offers of pardon. Sir James Melvil accordingly pledged himſelf to produce his pardon and that of his adherents, if he would ſeparate from Morton and the conſpirators. He accordingly became cold and diſtant to them, and exclaimed againſt the murder as a moſt execrable action; but notwithſtanding his affected anger, when the conſpirators fled to England, he furniſhed them with letters of recommendation to the earl of Bedford. After the flight of the conſpirators, the king thought it neceſſary for him to deny his having any ſhare in the action. He therefore embraced an opportunity of declaring to the privy council his total ignorance of the conſpiracy againſt Rizzio; and not ſatisfied with this, he, by public proclamations at the market place of his capital, and over the whole kingdom, proteſted to the people at large that he had never beſtowed upon it, in any degree, the ſanction of his command, conſent, aſſiſtance, or approbation.

In the mean time the queen granted a full and ample pardon to the earls of Murray, Argyll, Glencairn, and Rothes, and their adherents; but towards the conſpirators ſhe remained inexorable. This lenity, to Murray eſpecially, proved a ſource of the greateſt inquietude to the queen; for this nobleman, blind to every motive of action diſtinct from his own ambition, began to contrive new plots, which though diſappointed for a time, ſoon operated to the deſtruction of the queen, and almoſt to the ruin of the nation.

In 1566, the queen was delivered of a prince, who received the name of *James*. This happy event, however did not extinguiſh the quarrel betwixt her and the king. His deſire to intrude himſelf into her authority, and to fix a ſtain upon her honour, his ſhare in the murder of Rizzio, and his extreme meanneſs in publicly denying it afterwards, could not fail to impreſs her with the ſtrongeſt ſentiments of deteſtation and contempt. Unable, however, totally to diveſt herſelf of regard for him, her behaviour, though cold and diſtant, was yet decent and reſpectful. Caſtlenau, at this time ambaſſador extraordinary from France, conceived that a reconciliation might be effected, and employed himſelf ſome time in this friendly office. Nor were his endeavours altogether ineffectual. The king and queen ſpent two nights together; and proceeded in company with each other, to Meggatland in Tweeddale, in order to enjoy the diverſion of the chaſe, attended by the earls of Huntley, Bothwel, Murray, and other nobles. From thence

thence they paſſed to Edinburgh, and then took the road to Stirling. Had the king been endowed with any prudence, he would have made the beſt uſe of this opportunity to have regained the affections of his queen; but, inſtead of this, finding that he was not immediately intruſted with power, his peeviſhneſs ſuggeſted to him a deſign of going abroad. To Monſieur du Croc, the French reſident, who had attended Mary at Stirling, he ventured to communicate his chimerical project. This ſtateſman repreſented to him its wildneſs and inefficacy; and could hardly believe that he was ſerious. To his father the earl of Lenox, who paid him a viſit at this place immediately upon Mary's departure from it, he likewiſe communicated his intention; and all the entreaties, arguments, and remonſtrances of this nobleman to make him drop his deſign, were without ſucceſs. He provided a veſſel, and kept it in readineſs to carry him from his dominions. The earl of Lenox, after returning to Glaſgow, where he uſually reſided, gave way to his paternal anxieties, and ſolicited the queen by letter to interfere with her authority and perſuaſions; and upon the evening of the day in which ſhe received this deſpatch, the king alighted at Holyroodhouſe. But the names of the nobles who were with the queen being announced to him, he objected to three of them, and inſiſted that they ſhould be ordered to depart, before he would enter within the gates of the palace. The queen, alarmed with a demeanour ſo rude and ſo unwarrantable, condeſcended to leave her company and her palace to meet him; and it was with great difficulty that ſhe was able to entice him into her own apartment. There he remained with her during the night. She communicated to him his father's letter, and employed every art and blandiſhment to engage him to explain his perverſe deſign. But he gave her no return or ſatisfaction. He was unmoved with her kindneſs; and his ſilence, dejection, and peeviſhneſs, augmented her diſtreſs. In the morning, ſhe called her privy council to aſſemble in the palace, and invited to her Monſieur du Croc the French envoy. By the biſhop of Roſs ſhe explained the intention of the king, and made known the deſpatch of the earl of Lenox. The privy council were urgent to know the reaſons of a voyage that appeared to them ſo inexplicable; and earneſtly preſſed the king to unboſom himſelf. If his reſolution proceeded from diſcontent, and if there were perſons in the kingdom who had given him cauſes of offence, they aſſured him, that they were ready, upon his information, to take the neceſſary ſteps to make him eaſy and happy. No quality or rank ſhould exempt thoſe from inquiry and puniſhment who had committed miſdemeanors againſt him. This, they ſaid, conſiſted with his honour, with the honour of the queen, and with their own. If, however, he had received no ſufficient provocation to juſtify his behaviour, and if he had no title to complain of actual injuries, they admoniſhed him to remember, that his flight from a queen ſo beautiful, and from a kingdom ſo ancient and noble, would expoſe him to the greateſt ridicule and diſgrace. They pointed out the happineſs of his fortune, and counſelled him not to part lightly with all its flattering advantages. The queen herſelf, taking his hand into her's, and preſſing it with affection, beſought him to ſay by what act or deed ſhe had unfortunately induced him to conceive ſo fatal a purpoſe. Her memory did not reproach her with any crime or indiſcretion which affected his honour or her integrity; yet if, without any deſign upon her part, ſhe had incurred his diſpleaſure, ſhe was diſpoſed to atone for it; and ſhe begged him to ſpeak with entire freedom, and not in any degree to ſpare her. Monſieur de Croc then addreſſed him, and employed his intereſt and perſuaſions to make him reveal his inquietudes. But all this reſpectful attention and ceremonious duty were ineffectual. Obſtinately froward, he refuſed to confeſs that he intended any voyage, and made no mention of any reaſons of diſcontent. He yet acknowledged with readineſs, that he could not with juſtice accuſe the queen of any injury or offence. Oppreſſed with uneaſineſs and perturbation, he prepared to retire; and, turning to her, ſaid "Adieu, Madam! you ſhall not ſee me for a long time." He then bowed to the French envoy, and to the lords of the privy council.

He haſtened back to Stirling, leaving the queen and her council in ſurpriſe and aſtoniſhment. They reſolved to watch his motions with anxiety, and could not conjecture what ſtep he would take. Mary, to prevent the effect of rumours to her diſadvantage, deſpatched a courier to advertiſe the king of France and the queen-mother of his conduct. It was not poſſible that a prince ſo meanly endowed with ability could make any impreſſion upon her allies. Nor did it appear to be in his power to excite any domeſtic inſurrection or diſturbance. He was univerſally odious; and, at this time, the queen was in the higheſt eſtimation with the great body of her ſubjects. After paſſing ſome days at Stirling, he addreſſed a letter to the queen, in which, after hinting at his deſign of going abroad, he inſinuated his reaſons of complaint. He was not truſted by her with authority, and ſhe was no longer ſtudious to advance him to honour. He was without attendants; and the nobility had deſerted him. Her anſwer was ſenſible and temperate. She called to his remembrance the diſtinctions ſhe had conferred upon him, the uſes to which he had put the credit and reputation accruing from them, and the heinous offences he had encouraged in her ſubjects. Though the plotters againſt Rizzio had repreſented him as the leader of their enterpriſe, ſhe had yet abſtained from any accuſation of him, and had even behaved as if ſhe believed not his participation in the guilt of that project. As to the defects of his retinue, ſhe had uniformly offered him the attendance of her own ſervants. As to the nobility, they were the ſupports of the throne, and independent of it. Their countenance was not to be commanded, but won. He had diſcovered too much ſtatelineſs to them; and they were the proper judges of the deportment that became them. If he wiſhed for conſequence, it was his duty to pay them court and attention; and whenever he ſhould procure and conciliate their regard and commendation, ſhe would be happy to give him all the importance that belonged to him.

In the mean time, the earls of Murray and Bothwel were induſtriouſly ſtriving to widen the breach between the king and queen, and at the ſame time to foment the diviſion between the king and his nobles. The earl of Morton excited diſturbances on the borders; and as no ſettled peace had taken place there ſince Mary's marriage, there was the greateſt reaſon to believe that he would ſucceed in his attempts. Proclamations

otland.

6,59 falls , but overs.

clamations were therefore iſſued by the queen to call her ſubjects to arms; and ſhe proceeded to Jedburgh, to hold juſtice courts, and to puniſh traitors and diſorderly perſons. In the courſe of this journey ſhe was taken dangerouſly ill; inſomuch that, believing her death to be at hand, ſhe called for the biſhop of Roſs, telling him to bear witneſs, that ſhe had perſevered in that religion in which ſhe had been nouriſhed and brought up; taking the promiſe of her nobles, that after her death they would open her laſt will and teſtament, and pay the reſpect to it that conſiſted with the laws; recommending to them the rights of her infant ſon, and the charge of educating him in ſuch a manner as might enable him to rule the kingdom of his anceſtors with honour; and entreating them to abſtain from all cruelty and perſecution of her Roman Catholic ſubjects. Notwithſtanding her apprehenſions, however, and the extreme violence of her diſtemper, the queen at laſt recovered perfect health. As ſoon as ſhe was able to travel, ſhe viſited Kelſo, Wark caſtle, Hume, Langton, and Wedderburn. The licentious borderers, on the firſt news of her recovery, laid down their arms. Being deſirous to take a view of Berwick, the queen advanced to it with an attendance of 1000 horſe. Sir John Forſter, the deputy warden of the Engliſh marches, came forth with a numerous retinue, and conducted her to the moſt proper ſtation for ſurveying it, and paid her all the honours in his power, by a full diſcharge of the artillery, and other demonſtrations of joy. Continuing her journey, ſhe paſſed to Eymouth, Dunbar, and Tantallon; proceeding thence to Craigmillar caſtle, where ſhe propoſed to remain till the time of the baptiſm of the prince, which was ſoon to be celebrated at Stirling.

660 kindneſs he king.

During the ſevere ſickneſs of the queen, her huſband kept himſelf at a diſtance: but when ſhe was ſo far recovered as to be out of danger, he made his appearance; and being received with ſome coldneſs and formality, he retired ſuddenly to Stirling. This cruel neglect was a moſt ſenſible mortification to her; and while ſhe ſuffered from his ingratitude and haughtineſs, ſhe was not without ſuſpicions that he was attempting to diſturb the tranquillity of her government. She was ſeized with a ſettled melancholy; and, in her anguiſh, often wiſhed for death to put a period to her exiſtence. Her nobles, who were caballing againſt her, remarked her condition, and took advantage of it. Bothwel, who had already recommended himſelf by his ſervices, redoubled his efforts to heighten the favour which theſe ſervices had induced her to conceive for him. At this time, it is probable, he ſought to

661 divorce propoſed

gain the affection of the queen, with a view to marry her himſelf, providing a divorce from her huſband could be obtained, which was now become the ſubject of conſultation by Murray and his aſſociates. After much deliberation, the queen herſelf was acquainted with this project; and it was told her, that provided ſhe would pardon the earl of Morton and his aſſociates, the means ſhould be found of effectuating the divorce. This was urged as a matter of ſtate by the earls of Murray, Lethington, Argyll, and Huntley; and the queen was invited to conſider it as an affair which might be managed without any interference on her part. The queen replied, that ſhe would liſten to them, upon condition that the divorce could be obtained according to the laws, and that it ſhould not be any way prejudicial to her ſon: but if they meant to operate their purpoſe by a diſregard to theſe points, they muſt not think any more of it; for rather than conſent to their views, ſhe would endure all the torments, and abide by all the perils, to which her ſituation expoſed her.

Sco

Lethington upon this, in the name of the reſt, engaged to make her quit of her huſband, without prejudice to her ſon; words which could not be underſtood otherwiſe than as pointing at murder. Lord Murray (added he), who is here preſent, ſcrupulous as he is, will connive; and behold our proceedings without opening his lips. The queen immediately made anſwer, "I deſire that you will do nothing from which any ſtain may be fixed upon my honour or conſcience: and I therefore require the matter to reſt as it is, till God of his goodneſs ſend relief: What you think to be of ſervice to me may turn out to my diſpleaſure and harm."

It appears, however, that from this moment a plot was formed by Murray, Bothwel, and Lethington, againſt the life of Darnley, and by ſome of them probably againſt the queen herſelf; and that Morton, who with the other conſpirators againſt Rizzio had received a pardon, was cloſely aſſociated with them in their nefarious deſigns. That profligate peer was, in his way to Scotland, met at Whittingham by Bothwel and the ſecretary. They propoſed to him the murder of the king, and required his aſſiſtance, alleging that the queen herſelf conſented to the deed; to which Morton by his own account replied, that he was diſpoſed to concur, provided he was ſure of acting under any authority from her; but Bothwel and Lethington having returned to Edinburgh, on purpoſe to obtain ſuch an authority, ſent him back a meſſage, That the queen would not permit any converſation upon that matter.

In the mean time, preparations were made for the baptiſm of the young prince; to aſſiſt at which the queen left Craigmillar and went to Stirling. The ceremony was performed on the 17th of December 1566. After the baptiſmal rites were performed, the name and titles of the prince were three times proclaimed by the heralds to the ſound of trumpets. He was called and deſigned, Charles James, James Charles, prince and ſteward of Scotland, duke of Rotheſay, earl of Carrick, lord of the Iſles, and baron of Renfrew. Amidſt the ſcenes of joy diſplayed on this occaſion, the king ſhowed his folly more than he had done before. As Elizabeth did not mean to acknowledge him in his ſovereign capacity, it was neither conſiſtent with the dignity of the queen, nor his own, that he ſhould be preſent at the baptiſm. He did not indeed preſent himſelf either at the ceremony or the entertainments and maſquerades with which it was accompanied. At this juncture, however, though he had often kept at a greater diſtance before, he took up his reſidence at Stirling, as if he had meant to offend the queen, and to expoſe their quarrels to the world. Du Croc, who was inclined to be favourable to him, was ſo ſtruck with the impropriety of his behaviour, that he affected to have inſtructions from France to avoid all intercourſe with him: and when the king propoſed to pay him a viſit, he took the liberty to inform him, that there were two paſſages in his chamber; and that if his

Abſ havi the

majeſty

majeſty ſhould enter by the one, he ſhould be conſtrained to go out by the other.

While he reſided at Stirling, the king chiefly confined himſelf to his chamber. His ſtrange behaviour to the queen did not give the public any favourable idea of him; and as the earl of Murray and his faction took care to augment the general odium, no court was paid to him by foreign ambaſſadors. His ſituation, therefore, was exceedingly uncomfortable; but though he muſt have been conſcious of his imprudence and folly, he did not alter his conduct. In a ſullen humour he left Stirling, and proceeded to Glaſgow. Here he fell ſick, with ſuch ſymptoms as ſeemed to indicate poiſon. He was tormented with violent pains, and his body was all covered over with puſtules of a bluiſh colour; ſo that his death was daily expected. Mary did not repay his coldneſs to her by negligence. She ſet out immediately for Glaſgow, and waited on him with all the aſſiduity of an affectionate wife, until he recovered: after which ſhe returned with him to Edinburgh; and as the low ſituation of the palace of Holyroodhouſe was thought to render it unhealthy, the king was lodged in a houſe which had been appointed for the ſuperior of the church, called *St Mary's in the Fields*. This houſe ſtood upon a high ground, and in a ſalubrious air; and here ſhe ſtaid with him ſome days.—Here the conſpirators thought proper to finiſh their plot in the moſt execrable manner. On the 10th of February 1567, about two o'clock in the morning, the houſe where the king reſided was blown up by gunpowder. The exploſion alarming the inhabitants, excited a general curioſity, and brought multitudes to the place from whence it proceeded. The king was found dead and naked in an adjoining field, with a ſervant who uſed to ſleep in the ſame apartment with him. On neither was there any mark of fire or other external injury.

The queen was in the palace of Holyroodhouſe taking the diverſion of a maſked ball, which was given to honour the marriage of a favourite domeſtic, when the news of the king's death was brought to her. She ſhowed the utmoſt grief, and appeared exaſperated to the laſt degree againſt the perpetrators of a deed at once ſo ſhocking and barbarous. The moſt expreſs and peremptory orders were given to inquire after the perpetrators by every poſſible method. A proclamation was iſſued by the privy council, aſſuring the people, that the queen and nobility would leave nothing undone to diſcover the murderers of the king. It offered the ſum of 2000l. and an annuity for life, to any perſon who ſhould give information of the deviſers, counſellors, and perpetrators of the murder; and it held out this reward, and the promiſe of a full pardon, to the conſpirator who ſhould make a free confeſſion of his own guilt, and that of the confederates. On the fourth day after this proclamation was publiſhed, a placard was affixed to the gate of the city-priſon, affirming, that the earl of Bothwel, James Balfour, David Chalmers, and black John Spence, were the murderers. No name, however, was ſubſcribed to this intelligence, nor was any demand made for the proffered reward; ſo that it was difficult to know whether this advertiſement had been dictated by a ſpirit of calumny or the love of juſtice.

In the mean time, the earl of Murray conducted himſelf with his uſual circumſpection and avarice. Upon a pretence that his wife was dangerouſly ſick at his caſtle in Fife, he, the day before the murder, obtained the queen's permiſſion to pay a viſit to her. By this means he propoſed to prevent all ſuſpicion whatever of his guilt. He was ſo full, however, of the intended project, that while he was proceeding on his journey, he obſerved to the perſon who accompanied him, "This night, before morning, the lord Darnley ſhall loſe his life." When the blow was ſtruck, he returned to Edinburgh to carry on his practices. Among foreign nations, the domeſtic diſputes of the queen and her huſband being fully known, it was with the greater eaſe that reports could be propagated to her diſadvantage. To France letters were deſpatched expreſſing, in fervent terms, her participation in the murder. In England, the miniſters and courtiers of Elizabeth could not flatter that princeſs more agreeably, than by induſtriouſly detracting from the honour and the virtue of the Scottiſh queen. Within her own dominions a ſimilar ſpirit of outrage exerted itſelf, and not without ſucceſs. As her reconciliation with her huſband could not be unknown to her own ſubjects, it was interpreted to be diſſimulation and treachery. The Proteſtant clergy, who were her moſt determined enemies, poſſeſſed a leading direction among the populace; and they were the friends and the partizans of the earl of Murray. Open declamations from the pulpit were made againſt Bothwel, and ſtrong inſinuations and biting ſurmiſes were thrown out againſt the queen. Papers were diſperſed, making her a party with Bothwel in the murder. Every art was employed to provoke the frenzy of the people. Voices, interrupting the ſilence of the night, proclaimed the infamy of Bothwel; and portraits of the regicides were circulated over the kingdom.

The queen's determination, however, to ſcrutinize into the matter was unabated: and to the earl of Lennox, the king's father, ſhe paid an attention which he could only have expected from her upon an emergency of this kind. Having preſſed her by letter to the moſt diligent inquiry after the regicides, ſhe returned an anſwer ſo completely to his wiſhes, that he was fully convinced of the ſincerity and rigour with which ſhe intended to proceed againſt them: and he urged her to aſſemble the three eſtates, that their advice might direct the order and manner of their trial. She wrote to him, that an aſſembly of the ſtates was already proclaimed; and that it was her earneſt and determined will and purpoſe, that no ſtep ſhould be neglected that could conduce to the advancement and execution of juſtice. Yielding to his anxieties, he addreſſed her anew, entreating that the trial might not be delayed; obſerving, that it was not a matter of parliamentary inquiry; adviſing, that it would be more proper to proceed to it with the greateſt expedition; and urging her to commit to priſon all the perſons who had been named and deſcribed in the papers and placards which had been ſet up in the public places of the city. The queen informed him, that although ſhe had thought it expedient to call a meeting of the parliament at this juncture, it was not her meaning that the proceedings againſt the regicides ſhould be delayed till it was actually aſſembled. As to the placards and papers to which he alluded, they were ſo numerous and contradictory,

that ſhe could not well determine upon which to act: but if he would condeſcend to mention the names which, in his opinion, were moſt ſuſpicious, ſhe would inſtantly command that thoſe ſteps ſhould be taken which the laws directed and authorized. He in return named the earl of Bothwel, James Balfour, David Chalmers, black John Spence, Francis Sebaſtian, John de Burdeaux, and Joſeph the brother of David Rizzio; and aſſured her majeſty, that his ſuſpicions of theſe perſons were weighty and ſtrong. In reply to his information, Mary gave him her ſolemn promiſe, that the perſons he had pointed out ſhould abide and undergo their trial in conformity to the laws, and that they ſhould be puniſhed according to the meaſure of their guilt: and ſhe invited him to leave immediately his retirement, and to meet her at her court, that he might witneſs the proceedings againſt them, and the zeal with which ſhe was animated to perform the part that became her.

While the queen carried on this correſpondence with the earl of Lennox, ſhe reſided partly at the palace of the lord Seton, at the diſtance of a few miles from her capital, and partly at Holyroodhouſe. By the time that ſhe ſent her invitation to him, ſhe was reſiding in her capital. She delayed not to confer with her counſellors, and to lay before them the letters of the earl of Lenox. Bothwel was earneſt in his proteſtations of innocence; and he even expreſſed his wiſh for a trial, that he might eſtabliſh his integrity. No facts pointed to his guilt; there had appeared no accuſer but the earl of Lenox; and no witneſſes had been found who could eſtabliſh his criminality. Her privy council ſeemed to her to be firmly perſuaded that he was ſuffering under the malice of defamation. Murray, Morton, and Lethington, whatever might be their private machinations, were publicly his moſt ſtrenuous defenders; and they explained the behaviour of the earl of Lenox to be the effect of hatred and jealouſy againſt a nobleman who had outrun him ſo far in the career of ambition. But though all the arts of Murray and Bothwel, Morton and Lethington, were exerted to their utmoſt extent to miſlead the queen, they were not able to withhold her from adopting the ſtrain of conduct which was the moſt proper and the moſt honourable to her. It was her own ardent deſire that the regicides ſhould be puniſhed: ſhe had given her ſolemn promiſe to the earl of Lenox, that the perſons whom he ſuſpected ſhould be proſecuted; and amidſt all the appearances in favour of Bothwel, and all the influence employed to ſerve him, it is to be regarded as a ſtriking proof of her honour, vigour, and ability, that ſhe could accompliſh this meaſure. An order, accordingly, of the privy council was made, which directed, that the earl of Bothwel, and all the perſons named by Lenox, ſhould be brought to trial for the murder of the king, and that the laws of the land ſhould be carried into full execution. The 12th of April was appointed for the trial. A general invitation was given to all perſons whatſoever to prefer their accuſations. The earl of Lenox was formally cited to do himſelf juſtice, by appearing in the high court of juſticiary, and by coming forward to make known the guilt of the culprits.

In the mean time, it was proper to repreſs that ſpirit of outrage that had manifeſted itſelf againſt the queen. No diſcoveries, however, were made, except againſt James Murray, brother to Sir William Murray of Tullibardin, who at different times had publiſhed placards injurious to her. He was charged to appear before the privy-council: but refuſing to obey its citation, it was made a capital offence for any commander of a veſſel to convey him out of the kingdom; and the reſolution was taken to puniſh him with an exemplary ſeverity. Effecting, however, his eſcape, he avoided the puniſhment due to his repeated and deteſtable acts of calumny and treaſon.

The day for the trial of Bothwel approached. The conſpirators, notwithſtanding their power, were not without apprehenſions. Their preparations, however, for their ſafety had been anxious; and, among other practices, they neglected not to attempt to throw a panic into the earl of Lenox. They were favoured by his conſciouſneſs of his unpopularity, and his want of ſtrength, by his timidity and his ſpirit of jealouſy. Suſpicions of the queen's guilt were inſinuated into him; and the dangers to which he might be expoſed by inſiſting on the trial were ſet before him in the ſtrongeſt colours. He was ſenſible of her averſion to him; and his weakneſs and the ſovereign authority were contraſted. His friends concurred with his enemies to intimidate him, from the ſpirit of flattery, or from a real belief that his ſituation was critical. By the time he had reached Stirling, in his way to Edinburgh, his fears predominated. He made a full ſtop. He was no longer in haſte to proceed againſt the regicides. He addreſſed a letter to the queen, in which he ſaid he had fallen into ſuch ſickneſs, that he could not travel; and he affirmed, that he had not time to prepare for the trial and to aſſemble his friends. He complained, too, that Bothwel and his accomplices had not been committed to cuſtody; he inſiſted, that this ſtep ſhould be taken; and he requeſted, that a day at a greater diſtance might be appointed for the trial. After the lengths to which matters had gone, this conduct was moſt improper; and it is only to be accounted for from terror or capriciouſneſs. His indiſpoſition was affected; he had been invited by Mary to wait upon her at Edinburgh at an early period, to concert his meaſures; and the delay he aſked was in ſtrong contradiction to his former entreaties. After the invitation ſent to him, he might have relied with ſafety upon the protection of the queen, without any gathering of his friends; from the time of her private intimation to him, and of the legal citations of her officers, there had paſſed a period more than ſufficient for the purpoſe of calling them together; and indeed to ſuppoſe that there was any neceſſity for their aſſiſtance, was an inſult to government, and a matter of high indecency. There was more juſtice in the complaint, that the earl of Bothwel and his accomplices had not been taken into cuſtody; and yet even in this peculiarity, he was himſelf to blame in a great degree. For he had not obſerved the precaution of that previous diſplay of evidence, known in the Scottiſh law under the term of a precognition, which is common in all the groſſer offences, and which the weighty circumſtances of the preſent caſe rendered ſo neceſſary as a foundation for the confinement and conviction of the criminals.

An

is re-

An application for the delay of a trial ſo important, upon the night immediately preceding the day ſtated for it, and reciting reaſons of no concluſive force, could not with propriety be attended to. The privy-council refuſed the demand of the earl of Lenox. The court of juſticiary was aſſembled. The earl of Argyll acted in his character of lord high juſticiar; and was aided by four aſſeſſors, Robert Pitcairn, commendator of Dunfermline, and the lord Lindſay, with Mr James Macgill and Mr Henry Balnaves, two lords of the ſeſſion. The indictment was read, and the earls of Bothwell and Lenox were called upon; the one as the defender, the other as the accuſer. Bothwel, who had come to the court with an attendance of his vaſſals, and a band of mercenary ſoldiers, did not fail to preſent himſelf: but Lenox appeared only by his ſervant Robert Cunnyngham; who, after apologizing for his abſence from the ſhortneſs of the time, and the want of the preſence of his friends, deſired that a new day ſhould be appointed for the trial; and proteſted that if the jury ſhould now enter upon the buſineſs, they would incur the guilt of wilful error, and their verdict be of no force or authority.

This remonſtrance and proteſtation appeared not to the court of ſufficient importance to interrupt the trial. They paid a greater reſpect to the letters of the earl of Lenox to the queen inſiſting upon an immediate proſecution, and to the order of the privy-council conſequent upon them. The jury who conſiſted of men of rank and condition, after conſidering and reaſoning upon the indictment for a conſiderable time, were unanimous in acquitting Bothwel of all ſhare and knowledge of the king's murder. The machinations however of Morton, which we have mentioned in the life of MARY, were ſo apparent, that the earl of Caithneſs, the chancellor of the aſſize, made a declaration in their name and his own, that no wilful error ought to be imputed to them for their verdict; no proof, vouchers, or evidence, to confirm or ſupport the criminal charge having been ſubmitted to them. At the ſame time, he offered a proteſtation for himſelf, that there was a miſtake in the indictment, the 9th day of February inſtead of the 10th being expreſſed in it as the date of the murder. It is not to be doubted, but that this flaw in the indictment was a matter of deſign, and with a view to the advantage of Bothwel, if the earl of Lenox had made his appearance againſt him. And it has been remarked as moſt indecent and ſuſpicious, that ſoldiers in arms ſhould have accompanied him to the court of juſtice; that during the trial, the earl of Morton ſtood by his ſide to give him countenance and to aſſiſt him; and that the four aſſeſſors to the chief juſticiar were warm and ſtrenuous friends to the earl of Murray.

74
wel
tted.

Immediately after his trial, Bothwel ſet up in a conſpicuous place a writing, ſubſcribed by him, challenging to ſingle combat, any perſon of equal rank with himſelf, who ſhould dare to affirm that he was guilty of the king's murder. To this challenge an anſwer was publiſhed, in which the defiance was accepted upon the condition that ſecurity ſhould be given for a fair and equal conflict; but no name being ſubſcribed to this paper it was not underſtood to correſpond with the law of arms; and of conſequence no ſtep was taken for the fighting of the duel. Two days after the parliament met, and there the party of Bothwel appeared equally formidable. The verdict in his favour was allowed to be true and juſt. He was continued in his high offices; and obtained a parliamentary ratification of the place of keeper of Dunbar caſtle, with the eſtates in connexion with it; and other favours were conferred upon Murray, with the reſt of the nobles ſuſpected as accomplices in the murder.

A very ſhort time after the final acquitment of Bothwel, he began to give a greater looſe to his ambition, and conceived hopes of gaining the queen in marriage. It has been already remarked, that he had inſidiouſly endeavoured to gain her affection during the lifetime of her huſband: but though he might have ſucceeded in this, the recent death of the king in ſuch a ſhocking manner, and the ſtrong ſuſpicions which muſt neceſſarily ſtill reſt upon him, notwithſtanding the trial he had undergone, neceſſarily prevented him from making his addreſſes openly to her. He therefore endeavoured to gain the nobility over to his ſide; which having done one by one, by means of great promiſes, he invited them to an entertainment, where they agreed to ratify a deed pointing him out to the queen as a perſon worthy of her hand, and expreſſing their reſolute determination to ſupport him in his pretenſions. This extraordinary bond was accordingly executed; and Murray's name was firſt in the liſt of ſubſcribers, in order to decoy others to ſign after him; but that he might appear innocent of what he knew was to follow, he had before any uſe was made of the bond, aſked and obtained the queen's permiſſion to go to France. In his way thither he viſited the court of Elizabeth, where he did not fail to confirm all the reports which had ariſen to the diſadvantage of Mary; and he now circulated the intelligence that ſhe was ſoon to be married to Bothwel. Her partizans in England were exceedingly alarmed; and even Queen Elizabeth herſelf addreſſed a letter to her, in which ſhe cautioned her not to afford ſuch a miſchevious handle to the malice of her enemies.

Mary, upon the diſſolution of the parliament, had gone to Stirling to viſit the young prince. Bothwel armed with the bond of the nobles, aſſembled 1000 horſe under the pretext of protecting the borders, of which he was the warden; and meeting her upon her return to her capital, diſmiſſed her attendants, and carried her to his caſtle at Dunbar. The arts which he uſed there to effect the accompliſhment of his wiſhes we have mentioned under another article, (See MARR). But having been married only ſix months before to Lady Jane Gordon, ſiſter to the earl of Huntley, it was neceſſary to procure a divorce before he could marry the queen. This was eaſily obtained. The parties were couſins within the prohibited degrees, and had not obtained a diſpenſation from Rome. Their marriage, therefore, in the opinion of the queen and her Roman Catholic ſubjects, was illicit, and a profane mockery of the ſacrament of the church. The huſband had alſo been unfaithful; ſo that two actions of divorce were inſtituted. The lady commenced a ſuit againſt him in the court of the commiſſaries, charging him as guilty of adultery with one of her maids. The earl himſelf brought a ſuit againſt his wife before the court of the archbiſhop of St Andrew's upon the plea of conſanguinity.

land. guinity. By both courts their marriage was decided to be void; and thus two ſentences of divorce were pronounced.

Bothwel now conducted the queen from Dunbar to her capital. But inſtead of attending her to her palace of Holyrood-houſe, his jealouſy and apprehenſions induced him to lodge her in the caſtle of Edinburgh, where he could hold her in ſecurity againſt any attempt of his enemies. To give ſatisfaction, however, to her people, and to convince them that ſhe was no longer a priſoner, a public declaration upon her part appeared to be a meaſure of expediency. She preſented herſelf, therefore, in the court of ſeſſion; the lords chancellor and preſident, the judges, and other perſons of diſtinction, being preſent. After obſerving that ſome ſtop had been put to the adminiſtration of juſtice upon account of her being detained at Dunbar againſt her will by the Lord Bothwel, ſhe declared, that though ſhe had been highly offended with the outrage offered to her, ſhe was yet inclined to forget it. His courteouſneſs, the ſenſe ſhe entertained of his paſt ſervices to the ſtate, and the hope with which ſhe was impreſſed of his zeal and activity for the future, compelled her to give him and his accomplices in her impriſonment a full and complete pardon. She at the ſame time deſired them to take notice, that ſhe was now at her freedom and liberty; and that ſhe propoſed, in conſideration of his merits, to take an early opportunity of promoting him to new and diſtinguiſhed honours.

680 ns of mar- e pro- ied.

It was underſtood that the queen was immediately to advance him to be her huſband. The order was given for the proclamation of the banns; and Mr John Craig, one of the miniſters of Edinburgh, was deſired to perform this buſineſs. But though the order was ſubſcribed by the queen, he refuſed abſolutely his compliance without the authority of the church. The brethren, after long reaſonings, granted him permiſſion to diſcharge this duty. His ſcruples, notwithſtanding, and delicacy, were not yet removed. He proteſted, that, in obeying their deſire, he ſhould be allowed to ſpeak his own ſentiments concerning the marriage, and that his publiſhing the banns ſhould infer no obligation in him to officiate in the ſolemnity. In his congregation, accordingly, before a crowded audience, and in the preſence of ſeveral noblemen and privy-counſellors, he declared that the marriage of the queen and the earl of Bothwel was unlawful, and that he was prepared to give his reaſons for this opinion to the parties themſelves. He added, that if leave to do this was denied him, he would either abſtain altogether from proclaiming the banns, or take the liberty, after proclaiming them, to inform his people of the cauſes of his diſapprobation of the marriage. He was carried before the lords of the privy-council; and the earl of Bothwel called upon him to explain his behaviour. He anſwered, that the church had prohibited the marriage of perſons ſeparated for adultery; and that the divorce between him and his wife muſt have been owing to colluſion; ſince the ſentence had been given with precipitation, and ſince his new contract was ſo ſudden; and he objected to him the abduction and raviſhment of the queen, and the ſuſpicion of his guilt in the king's murder. This bold language drew no reply from Bothwel that was ſatisfactory to Mr Craig, or that could intimidate him. He proclaimed in his church the banns of the marriage; but he told the congregation, that he diſcharged the ſuggeſtions of his conſcience in pronouncing it to be a detectable and ſcandalous engagement. He expreſſed the ſorrow he felt for the conduct of the nobility, who ſeemed to approve it from their flattery or ſilence: and addreſſing himſelf to the faithful, he beſought them to pray to the Almighty that he would turn a reſolution intended againſt law, reaſon, and religion, into a comfort and benefit to the church and the kingdom. Theſe freedoms were too great to paſs unnoticed. Mr Craig was ordered anew to attend the privy-council; and he was reprimanded with ſeverity for exceeding the bounds of his commiſſion. He had the courage to defend himſelf. His commiſſion, he ſaid, was founded in the word of God, poſitive law, and natural reaſon; and upon the foundation of theſe topics he was about to prove that the marriage muſt be univerſally foul and odious, when the earl of Bothwel commanded him to be ſilent. The privy-council, ſtruck with the vigour of the man, and apprehenſive of the public diſcontents, did not dare to inflict any puniſhment upon him; and this victory over Bothwel, while it heightened all the ſuſpicions againſt him, ſerved to encourage the enemies of the queen, and to undermine the reſpect of her ſubjects.

681 itude Mr John g.

Mary, before ſhe rendered her hand to Bothwel, created him duke of Orkney. The ceremony was performed in a private manner, after the rules of the Popiſh church; but, to gratify the people, it was likewiſe ſolemnized publicly according to the Proteſtant rites by Adam Bothwel biſhop of Orkney, an eccleſiaſtic who had renounced the Epiſcopal order for the Reformation. It was celebrated with little pomp and feſtivity. Many of the nobles had retired to their ſeats in the country; and thoſe who attended were thoughtful and ſad. Du Croc, the French ambaſſador, ſenſible that the match would be diſpleaſing to his court, refuſed to give his countenance to the ſolemnity. There were no acclamations of the common people. Mary herſelf was not inconſcious of the imprudence of the choice ſhe had made, and looked back with ſurpriſe and ſorrow to the train of circumſtances which had conducted her to this fatal event. Forſaken by her nobles, and impriſoned at Dunbar, ſhe was in ſo perilous a ſituation that no remedy could ſave her honour but death. Her marriage was the immediate and neceſſary conſequence of that ſituation (s). It was the

6 The marriage celebrated

point

(s) "The queen (ſays Melvil) could not but marry him; ſeeing he had raviſhed her and lain with her againſt her will." Memoirs, p. 159. In the following paſſage, from a writer of great authority, in our hiſtory, this topic is touched with no leſs exactneſs, but with greater delicacy. After Mary had remained a fortnight under the power of a daring profligate adventurer, ſays Lord Hailes, few foreign princes would have ſolicited her hand.

point for which her enemies had laboured with a wicked and relentleſs policy.

Mary was unfortunate in her ſecond marriage, but much more ſo in her third. Bothwell had neither talents for buſineſs nor affection for his wife. Ambitious and jealous to the laſt degree, he ſought only to eſtabliſh himſelf in power, while his fears and jealouſies made him take the moſt improper means. The marriage had already thrown the nation into a ferment; and the leaſt improper exerciſe of power, or indeed an appearance of it, even on the part of the queen, would be ſufficient to ruin them both for ever. Perhaps the only thing which at this juncture could have pacified the people, would have been the total abolition of Popery, which they had often required. But this was not thought of. Inſtead of taking any ſtep to pleaſe the people, Bothwel endeavoured to force the earl of Marr to deliver up the young prince to his cuſtody.—This was ſufficient to make the flame, which had hitherto been ſmothered, break out with all its violence. It was univerſally believed that Bothwel, who had been the murderer of the father, deſigned to take away the life of the ſon alſo, and the queen was thought to participate in all his crimes. The earl of Murray now took advantage of the queen's unfortunate ſituation to aggrandize himſelf and effect her ruin. After having viſited the Engliſh court, he proceeded to France, where he aſſiduouſly diſſeminated all the reports againſt the queen which were injurious to her reputation; and where, without being expoſed to ſuſpicion, he was able to maintain a cloſe correſpondence with his friends Morton and Lethington, and to inſpirit their machinations. His aſſociates, true to his ambition and their own, had promoted all the ſchemes of Bothwel upon the queen with a power and influence which had enſured their ſucceſs. In confederacy with the earl of Murray himſelf, they had conſpired with him to murder the king. Aſſiſted with the weight of the earl of Murray, they had managed his trial, and operated the verdict which acquitted him. By the ſame arts, and with the ſame views, they had joined with him to procure the bond of the nobles recommending him to the queen as a huſband, aſſerting his integrity and innocence, recounting his noble qualities, expreſſing an unalterable reſolution to ſupport the marriage againſt every oppoſer and adverſary, and recording a wiſh that a defection from its objects and purpoſes ſhould be branded with everlaſting ignominy, and held out as a moſt faithleſs and perjured treachery. When the end, however, was accompliſhed for which they had been ſo zealous, and when the marriage of the queen was actually celebrated, they laid aſide the pretence of friendſhip, and were in haſte to entitle themſelves to the ignominy which they had invited to fall upon them. The murder of the king, the guilt of Bothwell, his acquittal, his divorce, and his marriage, became the topics of their complaints and declamation. Upon the foundation of this hated marriage, they even ventured privately to infer the privity of the queen to all his iniquity and tranſactions; and this ſtep ſeemed doubtleſs, to the maſs of her own ſubjects and to more diſtant obſervers, a ſtrong confirmation of all the former ſuſpicions to her ſhame which had been circulated with ſo much artifice. Their imputations and devices excited againſt her, both at home and abroad, the moſt indignant and humiliating odium. Amidſt the ruins of her fame, they thought to bury for ever her tranquillity and peace; and in the convulſions they had meditated, they already were anticipating the downfal of Bothwel, and ſnatching at the crown that tottered on her head.

But while this cabal were proſecuting their private ends, ſeveral noblemen, not leſs remarkable for their virtue than their rank, were eager to vindicate the national integrity and honour. The earl of Athol, upon the king's murder, had retired from the court, and was waiting for a proper ſeaſon to take revenge upon the regicides. The earl of Marr, uneaſy under the charge of the young prince, was ſolicitous to make himſelf ſtrong, that he might guard him from injury. Motives ſo patriotic and honourable drew applauſe and partizans. It was ſufficient to mention them. By private conference and debate, an aſſociation was inſenſibly formed to puniſh the murderers of the king, and to protect the perſon of the prince. Morton and Lethington encouraged and promoted a combination from which they might derive ſo much advantage. A convention accordingly was appointed at Stirling, for the purpoſe of conſulting upon the meaſures which it was moſt expedient to purſue. They agreed to take an early opportunity to appear in the field; and when they ſeparated, it was to collect their retainers, and to inſpirit their paſſions.

Of this confederacy, the leading men were the earls of Argyll, Athol, Morton, Marr, and Glencairn; the lords Hume, Semple, and Lindſay; the barons Kirkaldy of Grange, Murray of Tullibardin, and Maitland of Lethington. The earl of Bothwel was ſenſible, that if he was to ſit upon a throne, he muſt wade to it through blood. By his advice, two proclamations were iſſued in the name of the queen, under the pretence of ſuppreſſing inſurrections and depredations upon the borders. By the former, ſhe called together in arms, upon an early day, the earls, barons, and freeholders of the diſtricts of Forfar and Perth, Strathern and Menteith, Clackmannan, Kinroſs, and Fife. By the latter ſhe charged the greater and leſſer baronage, with all the inferior proprietors of the ſhires of Linlithgow and Edinburgh, and the conſtabulary of Haddington and Berwick, to prepare immediately for war, and to keep themſelves in readineſs to march upon her order. Theſe military preparations admoniſhed the aſſociation to be firm and active, and added to the public inquietudes and diſcontents. The rumours againſt the queen were moſt violent and loud. It was ſaid, that ſhe meant

---

hand. Some of her ſubjects might ſtill have fought that honour; but her compliance would have been humiliating beyond meaſure. It would have left her at the mercy of a capricious huſband; it would have expoſed her to the diſgrace of being reproached, in ſome ſullen hour, for the adventure at Dunbar. Mary was ſo ſituated, at this critical period, that ſhe was reduced to this horrid alternative; either to remain in a friendleſs and hazardous celibacy, or to yield her hand to Bothwel." Remarks on the Hiſtory of Scotland, p. 204.

land. to overturn the conſtitution and the laws; that ſhe had been careleſs of the health of her ſon, and was altogether indifferent about his preſervation; that ſhe had ſeparated herſelf from the councils and aſſiſtance of her nobles; and that ſhe wiſhed to make her whim or diſcretion the only rule of her government. Agitated with the hazardous ſtate of her affairs, ſhe publiſhed a new proclamation, in which ſhe employed herſelf to refute theſe accuſations; and in which ſhe took the opportunity to expreſs, in a very forcible manner, not only her attachment to her people and the laws, but the fond affection that ſhe bore to the prince, whom ſhe conſidered as the chief joy of her life, and without whom all her days would be comfortleſs.

The declarations of the queen were treated with ſcorn. The nobles, abounding in vaſſals, and having the hearts of the people, were ſoon in a ſituation to take the field. They were advancing to the capital. The royal army was not yet aſſembled; and the queen and Bothwel ſuſpected that the caſtle of Edinburgh would ſhut its gates upon them. The fidelity of Sir James Balfour the deputy-governor had been ſtaggered by the practices of the earl of Marr and Sir James Melvil. Mary left her palace of Holyroodhouſe, and was conducted to Borthwick caſtle. The aſſociated lords, informed of her flight, took the road to this fortreſs with 2000 horſe. The lord Hume, by a rapid march, preſented himſelf before it with the diviſion under his command: but being unable to guard all its avenues, the queen and Bothwel effected their eſcape to Dunbar; where the ſtrength of the fortifications gave them a full ſecurity againſt a ſurpriſe.

Upon this ſecond diſappointment, the nobles reſolved to enter Edinburgh, and to augment their ſtrength by new partizans. The earl of Huntley and the lord Boyd were here on the ſide of the queen, with the archbiſhop of St Andrew's, the biſhop of Roſs, and the abbot of Kilwinning. They endeavoured to animate the inhabitants to defend their town and the cauſe of their ſovereign. But the tide of popularity was favourable to the confederated lords. The magiſtrates ordered the gates of the city to be ſhut; but no farther reſiſtance was intended. The lords, forcing St Mary's port, found an eaſy admittance, and took poſſeſſion of the capital. The earl of Huntley and the queen's friends fled to the caſtle, to Sir James Balfour, who had been the confidant of Bothwel, and who agreed to protect them, although he was now concluding a treaty with the inſurgents.

The aſſociated lords now formed themſelves into a council, and circulated a proclamation. By this paper they declared, that the queen being detained in captivity, was neither able to govern her realm, nor to command a proper trial to be taken of the king's murder. In an emergency ſo preſſing, they had not deſpaired of their country; but were determined to deliver the queen from bondage, to protect the perſon of the prince, to revenge the murder of the king, and to vindicate the nation from the infamy it had hitherto ſuffered through the impunity of the regicides. They therefore commanded in general all the ſubjects of Scotland whatſoever, and the burgeſſes and inhabitants of Edinburgh in particular, to take a part with them, and to join in the advancement of purpoſes ſo beneficial and ſalutary. The day after they had publiſhed this proclamation, they iſſued another in terms that were ſtronger and more reſolute. They definitively expreſſed their perſuaſion of Bothwel's guilt in the rape and ſeduction of the queen, and in his perpetration of the king's murder, in order to accompliſh his marriage. They inculcated it as their firm opinion, that Bothwel was now inſtigated with a deſign to murder the young prince, and that he was collecting troops with this view. Addreſſing themſelves, therefore, to all the ſubjects of the realm, whether they reſided in counties or in boroughs, they invited them to come forward to their ſtandard; and deſired them to remember, that all perſons who ſhould preſume to diſobey them ſhould be treated as enemies and traitors.

Bothwel, in the mean time, was not inactive; and the proclamations of the queen had brought many of her vaſſals to her aſſiſtance. Four thouſand combatants ranged themſelves on her ſide. This force might augment as ſhe approached to her capital; and Bothwel was impatient to put his fortunes to the iſſue of a battle. He left the ſtrong caſtle of Dunbar, where the nobles were not prepared to aſſail him, and where he might have remained in ſafety till they diſperſed themſelves. For their proclamations were not ſo ſucceſsful as they had expected; their proviſions and ſtores were ſcanty; and the zeal of the common people, unſupported by proſperity, would ſoon have abated. Imprudent precipitation ſerved them in a moſt effectual manner. When the queen had reached Gladſmuir, ſhe ordered a manifeſto to be read to her army, and to be circulated among her ſubjects. By this paper, ſhe replied to the proclamations of the confederated nobles, and charged them with treachery and rebellion. She treated their reaſons of hoſtility as mere pretences, and as inventions which could not bear to be examined. As to the king's murder, ſhe proteſted, that ſhe herſelf was fully determined to revenge it, if ſhe could be ſo fortunate as to diſcover its perpetrators. With regard to the bondage from which they were ſo deſirous to relieve her, ſhe obſerved, that it was a falſehood ſo notorious, that the ſimpleſt of her ſubjects could confute it; for her marriage had been celebrated in a public manner, and the nobles could hardly have forgotten that they had ſubſcribed a bond recommending Bothwel to be her huſband. With regard to the induſtrious defamations of this nobleman, it was urged, that he had diſcovered the utmoſt ſolicitude to eſtabliſh his innocence. He had invited a ſcrutiny into his guilt; the juſtice of his country had abſolved him; the three eſtates aſſembled in parliament were ſatisfied with the proceedings of his judges and jury; and he had offered to maintain his quarrel againſt any perſon whatſoever who was equal to him in rank and of an honeſt reputation. The nobles, ſhe ſaid, to give a fair appearance to their treaſon, pretended, that Bothwel had ſchemed the deſtruction of the prince, and that they were in arms to protect him. The prince, however, was actually in their own cuſtody; the uſe they made of him was that of a ſkreen to their perfidiouſneſs; and the real purpoſes with which they were animated, were the overthrow of her greatneſs, the ruin of her poſterity, and the uſurpation of the royal authority. She therefore entreated the aid of her faithful ſubjects; and as the prize of their valorous ſervice, ſhe held out to them the eſtates and poſſeſſions of the rebels.

The

land.

The aſſociated nobles, pleaſed at the approach of the queen, put themſelves in motion. In the city of Edinburgh they had gathered an addition to their forces; and it happened that the Scottiſh officer who commanded the companies, which, in this period, the king of Denmark was permitted to enliſt in Scotland, had been gained to aſſiſt them. He had juſt completed his levies; and he turned them againſt the queen. The nobles, after advancing to Muſſelburgh, refreſhed their troops. Intelligence was brought that the queen was upon her march. The two armies were nearly equal in numbers; but the preference in point of valour and diſcipline, belonged deciſively to the ſoldiers of the nobles. The queen poſted herſelf on the top of Carberry hill. The lords taking a circuit to humour the ground, ſeemed to be retreating to Dalkeith; but wheeling about, they approached to give her battle. They were ranged in two diviſions. The one was commanded by the earl of Morton and the lord Hume. The other was directed by the earls of Athol, Marr, and Glencairn, with the lords Lindſay, Ruthven, Sempil, and Sanquhar. Bothwel was the leader of the royal forces; and there ſerved under him the lords Seton, Yeſter, and Borthwick.

It was not without apprehenſions that Mary ſurveyed the formidable appearance of her enemies. Du Croc, the French ambaſſador, haſtened to interpoſe his good offices and to attempt an accommodation. He aſſured the nobles of the peaceful inclinations of the queen; and that the generoſity of her nature diſpoſed her not only to forgive their preſent inſurrection, but to forget all their former tranſgreſſions. The earl of Morton informed him, that they had not armed themſelves againſt the queen, but againſt the murderer of the late king; and that if ſhe would ſurrender him up to them, or command him to leave her, they would conſent to return to their duty. The earl of Glencairn deſired him to obſerve, that the extremity to which they had proceeded might have inſtructed him that they meant not to aſk pardon for any offence they had committed, but that they were reſolved to take cognizance of injuries which had provoked their diſpleaſure. This aſpiring language confounded Du Croc, who had been accuſtomed to the worſhipful ſubmiſſions that are paid to a deſpot. He conceived that all negotiation was fruitleſs, and withdrew from the field in the expectation that the ſword would immediately give its law and determine every diff rence.

Mary was full of perturbation and diſtreſs. The ſtate into which ſhe had been brought by Bothwel did not fail to engage her ſerious reflection. It was with infinite regret that ſhe conſidered the conſequences of her ſituation at Dunbar. Nor had his behaviour ſince her marriage contributed to allay her inquietudes. The violence of his paſſions, his ſuſpicions, and his guilt, had induced him to ſurround her with his creatures, and to treat her with inſult and indignity. She had been almoſt conſtantly in tears. His demeanour, which was generally rude and indecent, was often ſavage and brutal. At different times his provocations were ſo inſulting that ſhe had even attempted to arm her hand againſt her life, and was deſirous of relieving her wretchedneſs by ſpilling her blood. Upon this account, ſhe was now encompaſſed with dangers. Her crown was in hazard. Under unhappy agitations, ſhe rode through the ranks of her army, and found her ſoldiers diſpirited. Whatever reſpect they might entertain for her, they had none for her huſband. His own retainers and dependents only were willing to fight for him. He endeavoured to awaken the royal army to valour, by throwing down the gauntlet of defiance againſt any of his adverſaries who ſhould dare to encounter him. His challenge was inſtantly accepted by Kirkaldy of Grange, and by Murray of Tullibardin. He objected that they were not peers. The lord Lindſay diſcovered the greateſt impatience to engage him, and his offer was admitted; but the queen interpoſing her prerogative, prohibited the combat. All the pride and hopes of Bothwel ſunk within him. His ſoldiers in ſmall parties were ſecretly abandoning their ſtandards. It was equally perilous for the queen to fight or to fly. The moſt prudent expedient for her was to capitulate. She deſired to confer with Kirkaldy of Grange, who remonſtrated to her, againſt the guilt and wickedneſs of Bothwel, and counſelled her to abandon him. She expreſſed her willingneſs to diſmiſs him upon the condition that the lords would acknowledge their allegiance and continue in it. Kirkaldy paſſed to the nobles, and received their authority to aſſure her that they would honour, ſerve, and obey her as their princeſs and ſovereign. He communicated this intelligence to her. She adviſed Bothwel to provide for his ſafety by flight; and Kirkaldy admoniſhed him not to neglect this opportunity of effecting his eſcape. Overwhelmed with ſhame, diſappointment, terror, remorſe, and deſpair, this miſerable victim of ambition and guilt turned his eyes to her for the laſt time. To Kirkaldy of Grange ſhe ſtretched out her hand: he kiſſed it; and taking the bridle of her horſe, conducted her towards the nobles. They were approaching her with becoming reverence. She ſaid to them, "I am come my lords, to expreſs my reſpect, and to conclude our agreement; I am ready to be inſtructed by the wiſdom of your counſels; and I am confident that you will treat me as your ſovereign." The earl of Morton, in the name of the confederacy, ratified their promiſes, and addreſſed her in theſe words: "Madam, you are here among us in your proper place; and we will pay you as much honour, ſervice, and obedience, as ever in any former period was offered by the nobility to the princes your predeceſſors."

This gleam of ſunſhine was ſoon overcaſt. She remained not many hours in the camp, till the common ſoldiers inſtigated by her enemies, preſumed to inſult her with the moſt unſeemly reproaches. They exclaimed indignantly againſt her as the murderer of her huſband. They reviled her as a lewd adultereſs in the moſt open manner, and in a language the moſt coarſe and the moſt opprobrious. The nobility forgot their promiſes, and ſeemed to have neither honour nor humanity. She had changed one miſerable ſcene for a diſtreſs that was deeper and more hopeleſs. They ſurrounded her with guards, and conducted her to her capital. She was carried along its ſtreets, and ſhown to her people in captivity and ſadneſs. She cried out to them to commiſerate and protect her. They withheld their pity, and afforded her no protection. Even new inſults were offered to her. The loweſt of the populace, whom the declamations of the clergy had driven into rage and madneſs, vied with the ſoldiery in the licentious

tious outrage of invective and execration. She beſought Maitland to ſolicit the lords to repreſs the inſupportable atrocity of her treatment. She conjured him to let them know, that ſhe would ſubmit herſelf implicitly to the determination of the parliament. Her entreaties and her ſufferings made no impreſſion upon the nobles. They continued the ſavage cruelty of their demeanour. She implored, as the laſt requeſt ſhe would prefer to them, that they would lead her to her palace. This conſolation, too, was refuſed to her. They wiſhed to accuſtom her ſubjects to behold her in diſgrace, and to teach them to triumph over her misfortunes. In the moſt mortifying and afflicting hour ſhe had ever experienced, oppreſſed with fatigue, and diſfigured with duſt and ſorrow, they ſhut her up in the houſe of the lord provoſt: leaving her to revolve in her anxious and agitated mind the indignities ſhe had already endured, and to ſuffer in anticipation the calamities they might yet inflict upon her.

The malice of Morton and his adherents was ſtill far from being gratified. In the morning when the queen looked from the window of the apartment to which ſhe had been confined, ſhe perceived a white banner diſplayed in ſuch a manner as to fix her attention. There was delineated upon it the body of the late king ſtretched at the foot of a tree, and the prince upon his knees before it, with a label from his mouth, containing this prayer, "Judge and revenge my cauſe, O Lord!" This abominable banner revived all the bitterneſs of her afflictions. The curioſity of the people drew them to a ſcene ſo new and ſo affecting. She exclaimed againſt the treachery of her nobles; and ſhe begged the ſpectators to relieve her from their tyranny. The eventful ſtory of the preceding day had thrown her capital into a ferment. The citizens of a better condition crowded to behold the degraded majeſty of their ſovereign. Her ſtate of humiliation, ſo oppoſite to the grandeur from which ſhe had fallen, moved them with compaſſion and ſympathy. They heard her tale, and were filled with indignation. Her lamentations, her diſorder, her beauty, all ſtimulated their ardour for her deliverance. It was announced to the nobles, that the tide of popular favour had turned towards the queen. They haſtened to appear before her, and to aſſure her, with ſmiles and courteſy, that they were immediately to conduct her to the palace, and to reinſtate her in her royalty. Impoſing upon her credulous nature, and that beautiful humanity which characterized her even in the moſt melancholy ſituations of her life, they prevailed with her to inform the people, that ſhe was pacified, and that ſhe wiſhed them to diſperſe themſelves. They ſeparated in obedience to her deſire. The nobles now conveyed her to Holyroodhouſe. But nothing could be farther from their intentions than her re-eſtabliſhment in liberty and grandeur. They held a council, in which they deliberated concerning the manner in which they ought to diſpoſe of her. It was reſolved, that ſhe ſhould be confined during her life in the fortreſs of Lochleven; and they ſubſcribed an order for her commitment.

A reſolution ſo ſudden, ſo perfidious, and ſo tyrannical, filled Mary with the utmoſt aſtoniſhment, and drew from her the moſt bitter complaints and exclamations. Kirkaldy of Grange, perceiving with ſurpriſe the lengths to which the nobles had proceeded, felt his honour take the alarm for the part he had acted at their deſire. He expoſtulated with them upon their breach of truſt, and cenſured the extreme rigour of the queen's treatment. They counſelled him to rely upon the integrity of their motives; ſpoke of her paſſion for Bothwel as moſt vehement, and inſiſted on the danger of intruſting her with power. He was not convinced by their ſpeeches; and earneſtly recommended lenient and moderate meaſures. Diſcreet admonitions, he ſaid, could not fail of impreſſing her with a full ſenſe of the hazards and inconveniences of an improper paſſion, and a little time would cure her of it. They aſſured him, that when it appeared that ſhe deteſted Bothwel, and had utterly abandoned his intereſts, they would think of kindneſs and moderation. But this, they urged, could hardly be expected; for they had recently intercepted a letter from her to this nobleman, in which ſhe expreſſed, in the ſtrongeſt terms, the warmth of her love, and her fixed purpoſe never to forſake him (T). Kirkaldy was deſired to peruſe this letter; and he preſſed them no longer with his remonſtrances. The queen, in the mean time, ſent a meſſage to this generous ſoldier, complaining of the cruelty of her nobles, and reminding him that they had violated their engagements. He inſtantly addreſſed an anſwer to it, recounting the reproaches he had made to them; ſtating his advice; deſcribing the ſurpriſe with which he had read her intercepted letter; and conjuring her to renounce and forget a moſt wicked and flagitious man, and, by this victory over herſelf, to regain the love and reſpect of her

(T) "Mr Hume is candid enough to give up the authenticity of this letter; and indeed, ſo far as I have obſerved, there is not the ſlighteſt pretence of a reaſon for conceiving it to be genuine; (*Hiſt. of England*, Vol. V. p 120.) It was not mentioned by the earl of Morton and his adherents to Throgmorton, when Elizabeth interfered in the affairs of Scotland upon the impriſonment of the queen in the caſtle of Lochleven: a period of time when theſe ſtateſmen were deſirous to throw out every imputation to her prejudice, and when in particular they were abuſing her with vehemence for her attachment to Bothwel; (*Keith*, p. 419.) Nor was it made uſe of by Murray before the Engliſh commiſſioners. Mary, in the condition to which the nobles had reduced her, could not well think of a ſtep of this ſort, although her attachment to Bothwel had been as ſtrong as they were pleaſed to pronounce it. For, not to ſpeak of the greatneſs of her diſtreſs, ſhe was guarded by them ſo ſtrictly, as to make it vain for her to pretend to elude their vigilance. In regard, too, to her love of Bothwel, it is not clear that it was ever real. While the king was alive, there are no traces of their improper intercourſe. The affair of Dunbar was a criminal ſeduction. The arts of a profligate man overcame her. There was no ſentiment of love upon either ſide. After her marriage, his rudeneſs extinguiſhed in her altogether any remain of kindneſs and reſpect; and hence the coldneſs with which ſhe parted with him." *Stuart's Hiſtory of Scotland*, Vol. I. p. 253. note.

her ſubjects. The device of a letter from her to Bothwel completed the amazement of the queen. So unprincipled a contempt of every thing that is moſt ſacred, ſo barbarous a perſeverance in perfidiouſneſs and injuſtice, extinguiſhed every ſentiment of hope in her boſom. She conceived that ſhe was doomed to inevitable deſtruction, and ſunk under a pang of unutterable anguiſh.

The lords Ruthven and Lindſay arrived in this paroxyſm of her diſtreſs, to inform her, that they were commanded to put in execution the order for her commitment. They charged her women to take from her all her ornaments and her royal attire. A mean dreſs was put upon her; and in this diſguiſe they conveyed her with precipitation to the priſon appointed for her. The lords Seton, Yeſter, and Borthwick, endeavoured to reſcue her, but failed in the attempt. She was delivered over to William Douglas the governor of the caſtle of Lochleven, who had married the mother of the earl of Murray, and was himſelf nearly related to the earl of Morton. See MARY.

Upon the ſame day on which the nobles ſubſcribed the order for the impriſonment of the queen, they entered into a bond of concurrence or confederacy. By this deed they bound and cemented themſelves into a body for the ſtrenuous proſecution of their quarrel; and it detailed the purpoſes which they were to forward and purſue. They propoſed to puniſh the murderers of the king, to examine into the queen's rape, to diſſolve her marriage, to preſerve her from the bondage of Bothwel, to protect the perſon of the prince, and to reſtore juſtice to the realm. The ſanction of a moſt ſolemn oath confirmed their reliance upon one another; and in advancing their meaſures, they engaged to expoſe and employ their lives, kindred, and fortunes.

It is eaſy to ſee, notwithſtanding all the pretended patriotiſm of the rebels, that nothing was farther from their intentions than to proſecute Bothwel and reſtore the queen to her dignity. They had already treated her in the vileſt manner, and allowed Bothwel to eſcape when they might eaſily have apprehended and brought him to any trial they thought proper. To exalt themſelves was their only aim. Eleven days after the capitulation at Carberry hill, they held a convention, in which they very properly aſſumed the name of *lords of the ſecret council*, and iſſued a proclamation for apprehending Bothwel as the murderer of the king; offering a reward of 1000 crowns to any perſon who ſhould bring him to Edinburgh. A ſearch had been made for the murderers of the king that very night in which the queen was confined in Lochleven caſtle. One Sebaſtian a Frenchman, and Captain Blackader, were then apprehended; and ſoon after James Edmondſtone, John Blackader, and Mynart Fraſer, were taken up and impriſoned. The people expected full and ſatisfactory proofs of the guilt of Bothwel, but were diſappointed. The affirmation of the nobles, that they were poſſeſſed of evidence which could condemn him, appeared to be no better than a pretence or artifice. Sebaſtian found means to eſcape; the other perſons were put to the torture, and ſuſtained it without making any confeſſion that the nobles could publiſh. They were condemned, however, and executed, as being concerned in the murder. In their dying moments they proteſted their innocence.

A ſanguine hope was entertained that Captain Blackader would reveal the whole ſecret at the place of execution, and a vaſt multitude of ſpectators were preſent. No information, however, could be derived from what he ſaid with regard to the regicides; but while he ſolemnly proteſted that his life was unjuſtly taken away, he averred it as his belief that the earls of Murray and Morton were the contrivers of the king's murder.

The lords of the ſecret council now proceeded to the greateſt enormities. They robbed the palace of Holyroodhouſe of its furniture and decorations; converted the queen's plate into coin: and poſſeſſed themſelves of her jewels, which were of great value; and while the faction at large committed theſe acts of robbery, the earl of Glencairn with ſolemn hypocriſy demoliſhed the altar in the queen's chapel, and defaced and deſtroyed all its pictures and ornaments. Theſe exceſſive outrages, however, loſt them the favour of the people, and an aſſociation was formed in favour of the queen. The court of France, as ſoon as the news of Mary's impriſonment arrived, deſpatched M. de Villeroy to condole with her upon her misfortunes: but the lords of the ſecret council would not admit him to ſee her, upon which he immediately returned to his own country. The earl of Murray, however, was at this time in France; and to the promiſes of this ambitious and treacherous wretch the king truſted, imagining him to be a ſteady friend to the unfortunate queen. Elizabeth alſo pretended friendſhip, and threatened the aſſociated lords; but as they had every reaſon to doubt her ſincerity, they paid no regard to her threats, and even refuſed to admit her ambaſſador to Mary's preſence.

From all theſe appearances of friendſhip Mary neither did nor could derive any real aſſiſtance. On the 24th of July 1567, the lord Lindſay, whoſe imperious behaviour, ſays Dr Stuart, approached to inſanity, was ordered by the lords to wait upon the queen at Lochleven. He carried with him three deeds or inſtruments, and was inſtructed not to be ſparing in rudeneſs and menaces in order to compel her to ſubſcribe them. By the firſt, ſhe was to reſign her crown to her infant-ſon; by the ſecond, ſhe appointed the earl of Murray regent of Scotland; and by the third, ſhe conſtituted a council to direct the prince till this nobleman ſhould arrive in Scotland, or in the event of his death or refuſal of the office. On the part of the queen all reſiſtance was vain. Sir Robert Melvil aſſured her, that her beſt friends were of opinion, that what ſhe did by compulſion, and in a priſon, could have no power to bind her; and of this ſhe was alſo aſſured by Throgmorton, the Engliſh ambaſſador, in a letter which Sir Robert Melvil brought in the ſcabbard of his ſword. Mary therefore, forlorn and helpleſs, could not reſiſt the barbarous rudeneſs with which Lindſay preſſed the ſubſcription of the papers, though ſhe would not read them. Five days after, the lords of the ſecret council met at Stirling, for the coronation of the young prince, and conſidered themſelves as repreſenting the three eſtates of the kingdom. A proteſtation was made in the name of the duke of Chatelherault, that this ſolemnity ſhould neither prejudge his rights of ſucceſſion nor thoſe of the other princes of the blood. The young prince being preſented to them, the lords Lindſay and Ruthven appeared, and in the name of the queen renounced in his favour her right and title to the crown, gave up the papers

papers ſhe had ſubſcribed, and ſurrendered the ſword, ſceptre, and royal crown. After the papers were read, the earls of Morton, Athol, Glencairn, Marr, and Menteith, with the maſter of Graham, the lord Hume, and Bothwel biſhop of Orkney, received the queen's reſignation in favour of her ſon in the name of the three eſtates. After this formality, the earl of Morton, bending his body, and laying his hand upon the Scriptures, took the coronation oath for the prince, engaging that he ſhould rule according to the laws, and root out all heretics and enemies to the word of God. Adam Bothwel then anointed the prince king of Scotland; a ceremony with which John Knox was diſpleaſed, as believing it to be of Jewiſh invention. This prelate next delivered to him the ſword and the ſceptre, and finally put the crown upon his head. In the proceſſion to the caſtle from the church, where the inauguration was performed, and where John Knox preached the inauguration ſermon, the earl of Athol carried the crown, Morton the ſceptre, Glencairn the ſword, and the earl of Marr carried the prince in his arms. Theſe ſolemnities received no countenance from Elizabeth; and Throgmorton, by her expreſs command, was not preſent at them.

Soon after this ceremony, the earl of Murray returned from France; and his preſence gave ſuch a ſtrength and firmneſs to his faction, that very little oppoſition could be given by the partiſans of Mary, who were unſettled and deſponding for want of a leader. A little time after his arrival, this monſtrous hypocrite and traitor waited upon his diſtreſſed and inſulted ſovereign at Lochleven. His deſign was to get her to deſire him to accept of the regency, which he otherwiſe pretended to decline. The queen, unſuſpicious of the deepneſs of his arts, conſcious of the gratitude he owed to her, and truſting to his natural affection, and their tie of a common father, received him with a tender welcome. She was in haſte to pour forth her ſoul to him; and with tears and lamentations related her condition and her ſufferings. He heard her with attention: and turned occaſionally his diſcourſe to the topics which might lead her to open to him her mind without diſguiſe in thoſe ſituations in which he was moſt anxious to obſerve it. His eye and his penetration were fully employed; but her diſtreſs awakened not his tenderneſs. He ſeemed to be in ſuſpenſe; and from the guardedneſs of his converſation ſhe could gather neither hope nor fear. She begged him to be free with her, as he was her only friend. He yielded to her entreaties as if with pain and reluctance; and taking a comprehenſive ſurvey of her conduct, deſcribed it with all the ſeverity that could affect her moſt. He could diſcover no apology for her miſgovernment and diſorders; and, with a mortifying plainneſs, he preſſed upon her conſcience and her honour. At times ſhe wept bitterly. Some errors ſhe confeſſed; and againſt calumnies ſhe warmly vindicated herſelf. But all ſhe could urge in her behalf made no impreſſion upon him; and he ſpoke to her of the mercy of God as her chief refuge. She was torn with apprehenſions, and nearly diſtracted with deſpair. He dropped ſome words of conſolation; and after expreſſing an attachment to her intereſts, gave her his promiſe to employ all his conſequence to ſecure her life. As to her liberty, he told her, that to achieve it was beyond all his efforts; and that it was not good for her to deſire it. Starting from her ſeat, ſhe took him in her arms, and kiſſing him as her deliverer from the ſcaffold, ſolicited his immediate acceptance of the regency. He declared he had many reaſons to refuſe the regency. She implored and conjured him not to abandon her in the extremity of her wretchedneſs. There was no other method, ſhe ſaid, by which ſhe herſelf could be ſaved, her ſon protected, and her realm rightly governed. He gave way to her anxiety and ſolicitations. She beſought him to make the moſt unbounded uſe of her name and authority, deſired him to keep for her the jewels that yet remained with her, and recommended it to him to get an early poſſeſſion of all the forts of her kingdom. He now took his leave of her, and embracing anew this pious traitor, ſhe ſent her bleſſing with him to the prince her ſon.

In the mean time the wretched earl of Bothwel was ſtruggling with the greateſt difficulties. Sir William Murray and Kirkaldy of Grange had put to ſea in ſearch of him. He had been obliged to exerciſe piracy in order to ſubſiſt himſelf and his followers. His purſuers came upon him unexpectedly at the Orkney iſlands, and took three of his ſhips; but he himſelf made his eſcape. Soon after, having ſeized a Turkiſh trader on the coaſt of Norway, two ſhips of war belonging to the king of Denmark gave chaſe to him as a pirate. An engagement enſued, in which Bothwel was taken. His officers and mariners were hanged in Denmark; but Bothwel himſelf, being known by ſome Scottiſh merchants, had his life ſpared. He was thrown, however, into a dungeon, where he remained ten years; and at laſt died melancholy and diſtracted. The regent ſent commiſſioners to the king of Denmark to demand him as a priſoner; but that prince, conſidering him as a traitor and uſurper, totally diſregarded his requeſt.

The dreadful fate of Bothwel did not make any alteration in the ſituation of the queen. Her enemies, bent on calumniating her, produced letters, which they ſaid were written and ſent by her to that licentious nobleman during the life of the king. Theſe letters are now univerſally admitted to have been forged by the rebels themſelves, who practiſed likewiſe upon ſome ſervants of Bothwel to accuſe the queen of the murder of her huſband. The letters for ſome time gained credit; but the confeſſions of the ſervants were all in her favour. When on the ſcaffold, they addreſſed themſelves to the people; and after having ſolemnly declared the innocence of the queen, they proteſted before God and his angels, that the earl of Bothwel had informed them that the earls of Murray and Morton were the contrivers of the king's murder.

It was impoſſible that ſuch tranſactions as theſe could advance the popularity of the regent. His unbounded ambition and cruelty to his ſovereign began at laſt to open the eyes of the nation; and a party was forming itſelf in favour of the queen. She herſelf had been often meditating her eſcape from her priſon; and ſhe at laſt effected it by means of a young gentleman, George Douglas, brother to her keeper, who had fallen in love with her. On the 2d day of May 1568, about ſeven o'clock in the evening, when her keeper was at ſupper with his family, George Douglas, poſſeſſing himſelf of the keys of the caſtle, haſtened to her apartment, and conducted her out of priſon. Having locked the gates of

of the caſtle, they immediately entered a boat which waited for them; and being rowed acroſs the lake, the lord Seton received the queen with a choſen band of horſemen in complete armour. That night he conveyed her to his houſe of Niddrie in Weſt Lothian; where having reſted a few hours, ſhe ſet out for Hamilton.

The eſcape of the queen threw her enemies into the greateſt conſternation. Many forſook the regent openly; and ſtill more made their ſubmiſſions privately, or concealed themſelves. He did not, however, deſpond; but reſolved to defend himſelf by force of arms. The queen ſoon found herſelf at the head of 6000 men, and the regent oppoſed her with 4000. Mary, however, did not think it proper to riſk a battle; knowing the capacity of the regent as a general, and that his officers were all men of approved valour and experience. But in this prudent reſolution ſhe was over-ruled by the impetuoſity of her troops. A battle was fought on the 13th of May 1568, at Langſide near Glaſgow; in which Mary's army was defeated, and her laſt hopes blaſted. The unfortunate queen fled towards Kirkcudbright; where finding a place of ſafety, ſhe deliberated on the plan ſhe ſhould afterwards follow. The reſult of her deliberations, as frequently happens in caſes of perplexity, led her to take the worſt ſtep poſſible. Notwithſtanding all the perfidy which ſhe had found in Elizabeth, Mary could not think that ſhe would now refuſe to afford her a refuge in her dominions; and therefore determined to retire into England. To this ſhe had been ſolicited by Elizabeth herſelf during her confinement in Lochleven caſtle; and ſhe now reſolved, in oppoſition to the advice of her moſt faithful counſellors, to make the fatal experiment.

In obedience to her order, the lord Herries addreſſed a letter to Mr Lauder, the deputy-commander at Carliſle; and after detailing her defeat at Langſide, deſired to know if ſhe might truſt herſelf upon Engliſh ground. This officer wrote inſtantly an anſwer, in which he ſaid, that the lord Scroop the warden of the frontiers being abſent, he could not of his private authority give a formal aſſurance in a matter which concerned the ſtate of a queen: but that he would ſend by poſt to his court to know the pleaſure of his ſovereign; and that if in the mean time any neceſſity ſhould force Mary to Carliſle, he would receive her with joy, and protect her againſt her enemies. Mary, however, before the meſſenger could return, had embarked in a fiſhing boat with ſixteen attendants. In a few hours ſhe landed at Wirkington in Cumberland; and from thence ſhe proceeded to Cockermouth, where ſhe continued till Mr Lauder, having aſſembled the gentlemen of the country, conducted her with the greateſt reſpect to the caſtle of Carliſle.

To Elizabeth ſhe announced her arrival in a deſpatch, which deſcribed her late misfortunes in general and pathetic terms, and in which ſhe expreſſed an earneſt ſolicitude to pay her a viſit at her court, and the deep ſenſe ſhe entertained of her friendſhip and generoſity. The queen of England, by obliging and polite letters, condoled with her upon her ſituation, and gave her aſſurances of all the favour and protection that were due to the juſtice of her cauſe. But as they were not accompanied with an invitation to London, Mary took the alarm. She thought it expedient to inſtruct Lord Fleming to repair to France; and ſhe intruſted Lord Herries with a moſt preſſing remonſtrance to Elizabeth. Her anxiety for an interview in order to vindicate her conduct, her ability to do ſo in the moſt ſatisfactory manner, and her power to explain the ingratitude, the crimes, and the perfidy of her enemies, were urged to this princeſs. A delay in the ſtate of her affairs was repreſented as nearly equivalent to abſolute deſtruction. An immediate proof was therefore requeſted from Elizabeth of the ſincerity of her profeſſions. If ſhe was unwilling to admit into her preſence a queen, a relation, and a friend, ſhe was reminded, that as Mary's entrance into her dominions had been voluntary, her departure ought to be equally free and unreſtrained. She valued the protection of the queen of England above that of every other potentate upon earth; but if it could not be granted, ſhe would ſolicit the amity, and implore the aid, of powers who would commiſerate her afflictions, and be forward to relieve them. Amidſt remonſtrances, however, which were ſo juſt and ſo natural, Mary failed not to give thanks to Elizabeth for the courteſy with which ſhe had hitherto been treated in the caſtle of Carliſle. She took the opportunity alſo to beg of this princeſs to avert the cruelty of the regent from her adherents, and to engage him not to waſte her kingdom with hoſtility and ravages; and ſhe had the prudence to pay her compliments in an affectionate letter to Secretary Cecil, and to court his kind offices in extricating her from her difficulties and troubles.

But the queen of England was not to be moved by remonſtrances. The voluntary offer of Mary to plead her cauſe in the preſence of Elizabeth, and to ſatisfy all her ſcruples, was rejected. Her diſaſters were rather a matter of exultation than of pity. The deliberations of the Engliſh queen, and thoſe of her ſtateſmen, were not directed by maxims of equity, of compaſſion, or of generoſity. They conſidered the flight of Mary into England as an incident that was fortunate and favourable to them; and they were ſolicitous to adopt thoſe meaſures which would enable them to draw from it the greateſt profit and advantage. If the queen of Scots were allowed to return to her own dominions, it was probable that ſhe would ſoon be in a condition to deſtroy the earl of Murray and his faction, who were the friends of England. The houſe of Hamilton, who were now zealous in the intereſts of France, would riſe into conſideration and power. England would be kept in perpetual turmoils upon the frontiers; Ireland would receive moleſtation from the Scots, and its diſturbances grow important and dangerous. Mary would renew with redoubled ardour her deſigns againſt the Proteſtant religion; and a French army would again be introduced into Scotland. For theſe reaſons, Elizabeth and her miniſters determining not to reſtore the queen of Scots to her throne, conſidered what would be the probable conſequences of permitting her to remain at liberty in England. In this ſituation, ſhe would augment the number of her partizans, ſend to every quarter her emiſſaries, and inculcate her title to the crown. Foreign ambaſſadors would afford her aid, and take a ſhare in her intrigues; and Scotland, where there was ſo high an object to be gained, would enter with cordiality into her views. This plan being alſo hazardous, it was deliberated whether the

tland. queen of Scots, might not be allowed to take a voyage into France. But all the pretenſions which had hitherto threatened the crown of Elizabeth would in this caſe be revived. A ſtrong reſentment to her would even urge Mary and Charles IX. to the boldeſt and moſt deſperate enterpriſes. The party of the queen of Scots in England, ſtrong from motives of religion and affection, and from diſcontents and the love of change, would ſtimulate their anger and ambition. England had now no territories in France. A war with that country and with Scotland would involve the greateſt dangers. Upon revolving theſe meaſures and topics, Elizabeth and her counſellors were induced to conclude, that it was by far the wiſeſt expedient to keep the queen of Scots in confinement, to invent methods to augment her diſtreſs, to give countenance to the regent, and to hold her kingdom in dependence and ſubjection.

722 y re- e to ine her ife.

In conſequence of this cruel and unjuſt reſolution, Mary was acquainted, that ſhe could not be admitted into Elizabeth's preſence till ſhe had cleared herſelf of the crimes imputed to her; ſhe was warned not to think of introducing French troops into Scotland; and it was hinted, that for the more ſecurity ſhe ought to be removed farther from the frontier. This meſſage at once ſhowed Mary the imprudence of her conduct in truſting herſelf to Elizabeth. But the error could not now be remedied. She was watched to prevent her eſcape, and all her remonſtrances were vain. The earl of Murray had offered to accuſe her; and it was at laſt concluded that Elizabeth could not, conſiſtently with her own honour and the tranquillity of her government, ſuffer the queen of Scots to come into her preſence, to depart out of England, or to be reſtored to her dignity, till her cauſe ſhould be tried and decided. An order was given to remove her from Carliſle caſtle to a place of ſtrength at a greater diſtance from the borders, to confine her more cloſely, and to guard againſt all poſſibility of an eſcape.

724 ry is oved n Car- , and ely rded.

In conſequence of theſe extraordinary tranſactions, a trial took place, perhaps the moſt remarkable for its injuſtice and partiality of any recorded in hiſtory. Mary, confined and apprehenſive, ſubmitted to be tried as they thought proper. The regent, who was to be the accuſer, was ſummoned into England, and commiſſioners were appointed on both ſides. On the 4th of October, the commiſſioners met at York; and four days after, the deputies of the queen of Scots were called to make known their complaints. They related the moſt material circumſtances of the cruel uſage ſhe had received. Their accuſations were an alarming introduction to the buſineſs in which the regent had embarked; and notwithſtanding the encouragement ſhown to him by Elizabeth, he was aſſaulted by apprehenſions. The artifices of Maitland added to his alarms. Inſtead of proceeding inſtantly to defend himſelf, or to accuſe the queen, he ſought permiſſion to relate his doubts and ſcruples to the Engliſh commiſſioners. In his own name, and with the concurrence of his aſſociates, he demanded to know whether they had ſufficient authority from Elizabeth to pronounce, in the caſe of the murder, Guilty or not guilty, according to the evidence that ſhould be laid before them; whether they would actually exerciſe this power; whether, in the event of her criminality, their ſovereign ſhould be delivered to him and his friends, or detained in England in ſuch a way as that no danger ſhould enſue from her activity; and whether, upon her conviction, the queen of England would allow his proceedings, and thoſe of his party, to be proper, maintain the government of the young king, and ſupport him in the regency in the terms of the act of parliament which had confirmed him in that office. To theſe requiſitions, it was anſwered, upon the part of the Engliſh deputies, that their commiſſion was ſo ample, that they could enter into and proceed with the controverſy; and that they had liberty to declare, that their ſovereign would not reſtore the queen of Scots to her crown, if ſatisfactory proofs of her crime ſhould be produced; but that they knew not, and were not inſtructed to ſay, in what manner ſhe would finally conduct herſelf as to her perſon and puniſhment. With regard to the ſovereignty of the prince, and the regency of the earl of Murray, they were points, they obſerved, which might be canvaſſed in a future period. Theſe replies did not pleaſe the regent and his aſſociates; and they requeſted the Engliſh commiſſioners to tranſmit their doubts and ſcruples to be examined and anſwered by Elizabeth.

Scot

But while the regent diſcovered in this manner his apprehenſions, he yet affirmed that he was able to anſwer the charges imputed to him and his faction; and this being in a great meaſure a diſtinct matter from the controverſy of the murder, he was deſired to proceed in it. It was contended, that Bothwel, who had the chief concern in the murder of Lord Darnley, poſſeſſed ſuch credit with the queen, that within three months after that horrible event, he ſeized her perſon and led her captive to Dunbar, obtained a divorce from his wife, and married her: that the nobility, being moved with his crimes, did confederate to puniſh him; to relieve her from the tyranny of a man who had raviſhed her, and who could not be her huſband; and to preſerve the life of the prince: that having taken arms for theſe purpoſes, the earl marched againſt them; but that, propoſing to decide the quarrel by ſingle combat, his challenge was accepted: that he declined, notwithſtanding, to enter the liſts, and fled: that the queen, preferring his impunity to her own honour, favoured his eſcape by going over to the nobility: that they conducted her to Edinburgh, where they informed her of the motives of their proceedings, requeſted her to take the proper ſteps againſt him and the other regicides, and entreated her to diſſolve her pretended marriage, to take care of her ſon, and to conſult the tranquillity of her realm: that this treatment being offenſive to her, ſhe menaced them with vengeance, and offered to ſurrender her crown if they would permit her to poſſeſs the murderer of her huſband: that her inflexible mind, and the neceſſities of the ſtate, compelled them to keep her at a diſtance from him, and out of the way of a communication with his adherents: that during her confinement, finding herſelf fatigued with the troubles of royalty, and unfit for them from vexation of ſpirit and the weakneſs of her body and intellect, ſhe freely and of her own will reſigned her crown to her ſon, and conſtituted the earl of Murray to the regency; that the king accordingly had been crowned, and Murray admitted to the regency; that the ſanction of the three eſtates aſſembled in parliament having confirmed theſe appointments, an univerſal

land. verſal obedience of the people had enſued, and a ſteady adminiſtration of juſtice had taken place: that certain perſons, however, envious of the public order and peace, had brought her out of priſon, and had engaged to ſubvert the government; that they had been diſappointed in their wicked attempts; and that it was moſt juſt and equitable, that the king and the regent ſhould be ſupported in power, in oppoſition to a rebellious and turbulent faction.

28 uted e de- of

This apology, ſo imperfect, ſo impudent, and ſo irreconcileable with hiſtory, received a complete confutation from the deputies of the queen of Scots. To take arms againſt her becauſe Bothwel had her favour, was, they ſaid, a lame juſtification of the earl of Murray and his friends; ſince it had never been properly manifeſted to her that he was the murderer of her huſband. He had indeed been ſuſpected of this crime; but had been tried by his peers, and acquitted. His acquittal had been ratified in parliament, and had obtained the expreſs approbation of the party who were now ſo loud in accuſing him and who had conſpired againſt her authority. Theſe rebels had even urged her to accompliſh her marriage with him, had recommended him as the fitteſt perſon to govern the realm, and had ſubſcribed a bond aſſerting his innocence, and binding themſelves to challenge and puniſh all his adverſaries and opponents. They had never, either before or after the marriage, like true ſubjects, advertiſed the queen of his guilt, till, having experience of their ſtrength, they ſecretly took arms, and inveſted her in Bothwick caſtle. The firſt mark of their diſpleaſure was the ſound of a trumpet in hoſtility, and the diſplay of warlike banners. She made her eſcape to Dunbar; and they returning to Edinburgh, levied troops, iſſued proclamations, took the field againſt her, under the pretence of delivering her from his tyranny, and got poſſeſſion of her perſon. She was willing to prevent the effuſion of blood, and was very far from preferring his impunity to her honour. Kirkaldy of Grange, in obedience to inſtructions from them, deſired her to cauſe him to retire, and invited her to paſs to them under the promiſe of being ſerved and obeyed as their ſovereign. She conſented, and Kirkaldy taking Bothwel by the hand, recommended it to him to depart, and aſſured him that no man would purſue him. It was by their own contrivance that he fled; and it was in their power to have taken him; but they ſhowed not the ſmalleſt deſire to make him their priſoner. He remained, too, for ſome time in the kingdom, and was unmoleſted by them; and it was not till he was upon the ſeas that they affected to go in ſearch of him. When ſhe ſurrendered herſelf in the ſight of their army, the earl of Morton ratified the ſtipulations of Kirkaldy, made obeiſance to her in their names, and promiſed her all the ſervice and honour which had ever been paid to any of her predeceſſors. They were not ſlaves, however, to their engagements. They carried her to Edinburgh, but did not lodge her in her palace. She was committed to the houſe of a burgeſs, and treated with the vileſt indignities. She indeed broke out into menaces, and threatened them; nor was this a matter either of blame or of wonder. But it was utterly falſe that ſhe had ever made any offer to give away her crown, if ſhe might poſſeſs Bothwel. In the midſt of her ſufferings, ſhe had even required them by Secretary Maitland to ſpecify their complaints, and beſought them to allow her to appear in parliament, and to join and aſſiſt in ſeeking a remedy to them from the wiſdom of the three eſtates. This overture, however, ſo ſalutary and ſubmiſſive, they abſolutely rejected.—They were animated by purpoſes of ambition, and had not in view a relief from grievances. They forced her from her capital in the night, and impriſoned her in Lochleven; and there, they affirm, being exhauſted with the toils of government and the languors of ſickneſs, ſhe, without conſtraint or ſolicitation, reſigned her crown to her ſon, and appointed the earl of Murray to be regent during his minority. This indeed was to aſſume an unlimited power over facts; but the truth could neither be concealed, nor overturned, nor palliated. She was in the vigour of youth, unaſſailed by maladies, and without any infirmity that could induce her to ſurrender the government of her kingdom Nor was it unknown to them that the earl of Athol and the barons Tullibardin and Lethington, principal men of their council, deſpatched Sir Robert Melvil to her with a ring and preſents, with a recommendation to ſubſcribe whatever papers ſhould be laid before her, as the only means in her power to ſave her life, and with an aſſurance that what ſhe did under captivity could not operate any injury to her. Melvil, too, communicated to her an intimation in writing from Sir Nicholas Throgmorton, which gave her the ſame advice and the ſame aſſurance. To Sir Nicholas Throgmorton ſhe ſent an anſwer, informing him that ſhe would follow his counſel; and enjoining him to declare to his miſtreſs her hapleſs ſtate, and that her reſignation of her crown was conſtrained. Nor did this ambaſſador neglect her commiſſion; and it was a popular perſuaſion that Elizabeth would have marched an army to her relief, if ſhe had not been intimidated by the threat of the rebels, that the blood of the queen of Scots would be the wages of her ſoldiers. It was alſo not to be contradicted, that when the lord Lindſay preſented to his ſovereign the inſtruments of reſignation, he menaced her with a cloſer priſon and a ſpeedy death if ſhe ſhould refuſe to ſubſcribe them. It was under an extreme terror, and with many tears, that ſhe put her name to them. She did not conſider them as her deeds; did not read them; and proteſted, that when ſhe was at liberty, ſhe would diſavow ſubſcriptions which had been extorted from her. Even Douglas, the keeper of Lochleven, could not endure to be a witneſs of the violence employed againſt her. He departed out of her preſence, that he might not ſee her ſurrender her rights againſt her will; and he ſought and obtained from her a certificate, that he was not acceſſory to this compulſion and outrage. Nor did it conſiſt with the ſlighteſt probability or reaſon, that ſhe would, of her own will and accord, execute a reſignation of her royal eſtate, and retain no proviſion for her future maintenance. Yet by theſe extraordinary deeds, the condition to which ſhe was reduced was moſt miſerable and wretched. For no portion whatever of her revenue was reſerved to her, and no ſecurity of any kind was granted either for her liberty or her life. As to the coronation of the prince, it could have no validity, as being founded in a pretended and forced reſignation. It was alſo defective in its form; for there were in Scotland more than an hundred earls, biſhops, and lords; and of theſe the whole, or at leaſt the major part, ought

Scot

to

land. to concur in matters of importance. Now there did not aſſiſt in it more than four earls, ſix lords, one biſhop, and two or three abbots. Proteſtations, too, were openly made, that nothing tranſacted at that period ſhould be any prejudice to the queen, her eſtate, and the blood-royal of Scotland. Neither could it be rightly conceived, that if the queen had willingly ſurrendered her dignities, ſhe would have named the earl of Murray to the regency in preference to the duke of Chatelherault, who had a natural and proper claim to it, and who had deſerved well of her country by diſcharging that high office during her minority. As to the ratification of the inveſtiture of the young prince, and the regency of the earl of Murray, by the eſtates, it was obſervable, that this was done in an illegal parliament. It was an invalid confirmation of deeds which in themſelves had no inherent power or efficacy. The principal nobility, too, objected in this parliament to this ratification. Proteſtations were made before the lords of the articles, as well as before the three eſtates, to interrupt and defeat tranſactions which were in a wild hoſtility to the conſtitution and the laws. Neither was it true that the government of the king and the regent was univerſally obeyed, and adminiſtered with equity and approbation: for a great diviſion of the nobility never acknowledged any authority but that of the queen, and never held any courts but in her name; and it was notorious, that the adminiſtration of the uſurpers had been marked and diſtinguiſhed by enormous cruelties and oppreſſions. Many honourable families and loyal ſubjects had been perſecuted to ruin, and plundered of their wealth, to gratify the retainers and ſoldiers who upheld this inſolent domination; and murder and bloodſhed, theft and rapine, were prevalent to a degree unheard of for many ages. Upon all theſe accounts, it was inferred, that Elizabeth ought to ſupport the queen of Scots, to reſtore her to her crown, and to overthrow the power of a moſt unnatural and rebellious faction.

29 regent ble to f.

To theſe facts the regent did not pretend to make any objection; and though required by the Engliſh commiſſioners to produce ſounder and better reaſons for his treatment of the queen, he did not advance any thing in his own behalf. He even allowed the charges of treaſon and uſurpation to be preſſed againſt him, without preſuming to anſwer. This ſurpriſing behaviour, which might readily have been conſtrued into an acknowledgment of his guilt, it ſeems, proceeded from ſome conferences which he had with the duke of Norfolk. This nobleman was a zealous partizan for the ſucceſſion of Mary to the Engliſh crown. He was ſtrongly poſſeſſed with the opinion, that his miſtreſs, while ſhe was diſpoſed to gratify her animoſity and jealouſies againſt the queen of Scots, was ſecretly reſolved, by fixing a ſtain upon her, to exclude her altogether from the ſucceſſion, and to involve her ſon in her diſgrace. He was eager to defeat a purpoſe, which he conceived to be not only unjuſt in itſelf, but highly detrimental to his country. It was in his power to act with this view; and he obſerved with pleaſure, that Maitland of Lethington was favourable to Mary. To this ſtateſman, accordingly, he ventured to expreſs his ſurpriſe, that the regent could be allured to think of an attempt ſo blameable as that of criminating his ſovereign. If Mary had really given offence by miſcar-

riage and miſtakes, it yet was not the buſineſs of a good ſubject induſtriouſly to hold her out to ſcorn. Anxious and repeated conferences were held by them; and at length it was formally agreed, that the regent ſhould not accuſe the queen of Scots; and that the duke in return ſhould protect him in the favour of Elizabeth, and ſecure him in the poſſeſſion of his regency. Sco

His trem dioul and crify

But while the regent engaged himſelf in this intrigue with the duke of Norfolk, he was deſirous notwithſtanding of gratifying the reſentments of Elizabeth, and of advancing his own intereſts by undermining ſecretly the fame and reputation of his ſovereign. He inſtructed Maitland, George Buchanan, James Macgill, and John Wood, to go to the duke of Norfolk, the earl of Suſſex, and Sir Ralph Sadler, and to communicate to them as private perſons, and not in their character of commiſſioners, the letters to Bothwel and the other proofs upon which he affirmed the guilt of the queen of Scots. It was his deſire that they would examine theſe papers, give their opinion of them to Elizabeth, and inform him whether ſhe judged them ſufficient evidences of Mary's concern in the murder of her huſband. If this ſhould be her opinion, he teſtified his own readineſs, and that of his aſſociates, to ſwear that the papers were genuine, and of the hand-writing of the queen. By this operation, he was ſolicitous to eſtabliſh his vouchers as inconteſtable, and as teſtimonies of record. The commiſſioners examined his papers, and heard the comments of Buchanan and his other aſſiſtants; but they do not ſeem to have beſtowed the fulleſt credit upon them. They deſcribed them, however, to Elizabeth; pointed out the places of them which were ſtrongeſt againſt Mary; and allowed that their force and meaning were very great, if their genuineneſs could be demonſtrated. But of their genuineneſs they acknowledged that they had no other evidence than ſtout aſſertions, and the offer of oaths. The earl of Suſſex, in a private deſpatch to Secretary Cecil, does more than inſinuate *, that he thought Mary would be able to prove the letters palpable forgeries; and with reſpect to the murder of the king, he declares in plain terms, that from all he could learn, Murray and his faction would, upon a judicial trial, be found by "proofs hardly to be denied," more criminal in that charge than the queen herſelf. Elizabeth and her miniſters, upon the receipt of ſuch deſpatches, did not think it expedient to empower them to adopt a method of proof ſo palpably ſuſpicious, and in which ſhe could not openly concur, without groſsly violating even the appearance of probity. The regent had before attempted to engage her in a direct aſſurance of the validity of his papers, when he ſubmitted copies of them to her inſpection by his ſecretary Mr Wood. His attempt at this juncture was of a ſimilar kind; and it could not recommend him to the Engliſh commiſſioners.

* Rol of D meny' ſory, Book

Nor were theſe the only tranſactions which took place during the continuance of the commiſſioners at York. The inventive and refining genius of Lethington had ſuggeſted to him a project, which he communicated in confidence to the biſhop of Roſs. It received the warm approbation of this eccleſiaſtic; and they determined to put it to a trial. While they attended the duke of Norfolk to the diverſion of hawking, they inſinuated into him the notion of his allying himſelf with the queen of Scots. Her beauty, her accompliſh-

ment, and her kingdom, were high allurements to this nobleman; and as he was the greateſt ſubject of England, and perhaps of Europe, he ſeemed not to be unworthy of them. The propoſal was very flattering to the admiration he entertained of Mary, to his ambition, and to his patriotiſm. The more he thought of it, he was the more convinced of its propriety. His acceſs to be informed of the practices of the regent, deſtroyed in him the operation of theſe ſlanders by which her enemies were ſo active to traduce her. In this ſtate of his mind, the lady Scroop, his ſiſter, who reſided at Bolton Caſtle with Mary, completely confirmed his reſolution. For from her he learned the orderly carriage and the amiable diſpoſitions of the queen of Scots. He was now impatient to have a fit ſeaſon to make her formally the offer of his hand.

Elizabeth in the mean time was thrown into confuſion by the refuſal of the regent to accuſe the queen of Scots. To give a poſitive anſwer to his doubts and ſcruples was not conſiſtent with her honour; and yet, without this condeſcenſion, ſhe was aſſured that the Scottiſh deputies would not exhibit their charge or crimination. Having deceived Mary therefore with fair promiſes, ſhe was active in gaining over the regent to her views; which having done, he conſented at laſt to prefer his accuſation againſt Mary before the commiſſioners, who now met at Weſtminſter by the command of Elizabeth. The charge was expreſſed in general and preſumptive terms. It affirmed, that as James earl of Bothwel was the chief executor of the murder of King Henry, ſo the queen was his perſuader and counſel in the device; that ſhe was a maintainer and fortifier of this unnatural deed, by ſtopping the inquiſition into it and its puniſhment, and by taking in marriage the principal regicide; that they had begun to exerciſe a cruel tyranny in the commonwealth, and had formed a reſolution of deſtroying the innocent prince, and of tranſferring the crown from the true line of its kings to a bloody murderer and a godleſs tyrant; and that the eſtates of the realm, finding her unworthy to reign, had ordered her to reſign the crown, her ſon to be crowned, and the earl of Murray to be eſtabliſhed in the regency. Before this accuſation was preferred, the earl of Lenox preſented himſelf before the Engliſh commiſſioners; made a lamentable declaration of his griefs, and produced to them the letters which had paſſed between him and Mary concerning the murder, with a writing which contained a direct affirmation of her guilt.

The deputies of Mary were aſtoniſhed at this accuſation, being a violent infringement of a proteſtation which they had formerly given in, and which had been accepted, namely, that the crown, eſtate, perſon, and honour of the queen of Scots, ſhould be guarded againſt every aſſault and injury; yet in all theſe particulars ſhe was touched and affected. It was underſtood that no judicial proceedings ſhould take place againſt her; yet ſhe was actually arraigned as a criminal, and her deputies were called upon to defend her. They diſcovered not, however, any apprehenſion of the validity of the charge; and while they fully explained the motives which actuated the earl of Murray and his faction in their proceedings, they imputed to perſons among themſelves the guilt of the king's murder. They affirmed, that the queen's adverſaries were the accomplices of Bothwel; that they had ſubſcribed a bond conſpiring the death of the king; and that their guilt had been atteſted in the ſight of 10,000 ſpectators by thoſe of their confederates who had already been executed. They exclaimed againſt the enormous ingratitude, and the unparalleled audacity of men, who could forget ſo completely all the obligations which they owed to their ſovereign; and who, not ſatisfied with uſurping her power, could even charge her with a murder which they themſelves had committed. They repreſented the ſtrong neceſſity which had ariſen for the fulleſt vindication of their miſtreſs; and they ſaid, that in ſo weighty an extremity, they could not poſſibly ſuppoſe that ſhe would be reſtrained from appearing in her own defence. They had her inſtructions, if her honour was touched, to make this requiſition; and till it was granted, they inſiſted, that all proceedings in the conference ſhould be at an end. A refuſal of this liberty, in the ſituation to which ſhe was driven, would be an infallible proof that no good was intended to her. It was their wiſh to deal with ſincerity and uprightneſs; and they were perſuaded, that without a proper freedom of defence, their queen would neceſſarily fall a victim to partiality and injuſtice. They therefore earneſtly preſſed the Engliſh commiſſioners, that ſhe might be permitted to preſent herſelf before Elizabeth, the nobles of England, and the embaſſadors of foreign nations, in order to manifeſt to the world the injuries ſhe had ſuffered, and her innocence.

After having made theſe ſpirited repreſentations to the Engliſh commiſſioners, the deputies of Mary deſired to have acceſs to the queen of England. They were admitted accordingly to an audience; and in a formal addreſs or petition they detailed what had happened, inſiſted that the liberty of perſonal defence ſhould be allowed to their miſtreſs, and demanded that the earl of Murray and his aſſociates ſhould be taken into cuſtody, till they ſhould anſwer to ſuch charges as ſhould be preferred againſt them. She deſired to have ſome time to turn her thoughts to matters of ſuch high importance; and told them, that they might ſoon expect to hear from her.

The biſhop of Roſs, and the other deputies of Mary, in the mean time, ſtruck with the perfidious management of the conference, convinced of the jealouſies and paſſions of Elizabeth, ſenſible that her power over her commiſſioners was unlimited, and anxious for the deliverance of their miſtreſs, made an overture for an accommodation to the earl of Leiceſter and Sir William Cecil. They propoſed, that the original meaning of the conference ſhould ſtill be adhered to, notwithſtanding the accuſation which had been preſented by the earl of Murray; and that Elizabeth, diſregarding it as an effort of faction, ſhould proceed to a good agreement between Mary and her ſubjects. For this ſcheme, which is ſo expreſſive of their ſuſpicions of Elizabeth and of her commiſſioners, they had no authority from their miſtreſs. They acknowledged accordingly, that it was made without her inſtructions, and intimated that they were moved to it by their anxiety for peace and the re-eſtabliſhment of the affairs of the Scottiſh nation. They were introduced at Hampton-court to Elizabeth; who liſtened to their motion, and was averſe from it. They then repeated the deſires of the petition they had preſented to her; but ſhe did not think

Scotlan

733 They a admitte an audi by Eliz beth,

734 and ma propoſa accomm dation.

cotland. think it right that the queen of Scots ſhould yet have the liberty to defend herſelf in perſon. She confeſſed, indeed, that it was reaſonable that Mary ſhould be heard in her own cauſe; but ſhe affirmed, that ſhe was at a loſs at what time ſhe ſhould appear, in what place, and to whom ſhe ſhould addreſs herſelf. While ſhe let fall, however, the hope that Mary might obtain the permiſſion ſo repeatedly and ſo earneſtly requeſted, ſhe expreſſed her reſolution that the earl of Murray ſhould firſt be heard in ſupport of his charge, and that ſhe ſhould attend to the proofs which he affirmed himſelf in readineſs to produce. After this buſineſs ſhould be tranſacted, ſhe told the deputies of Mary that ſhe would again confer with them. It was to no purpoſe that they objected to a procedure ſo ſtrange and ſo improper. An accuſation, ſaid they, is given; the perſon accuſed is anxious to defend herſelf; this privilege is denied to her; and yet a demand is to be made for the vouchers of her guilt. What is this but an open violation of juſtice? It did not become them to diſpute her pleaſure in her own dominions: but they would not, they informed her, conſent to a meaſure which was ſo alarming to the intereſts of their queen; and if it was adopted, ſhe might expect that a proteſt againſt its validity would be lodged with her commiſſioners.

*735 ameful oduct of zabeth.

736 reation ween com- lioners.

The Engliſh commiſſioners reſumed the conference, and were about to demand from the earl of Murray the proofs with which he could ſupport his accuſation. The biſhop of Roſs and his aſſociates being admitted to them, expreſſed themſelves in conformity to the converſation they had held with Elizabeth. They declared, that it was unnatural and prepoſterous in their ſovereign to think of receiving proofs of the guilt of the queen of Scots before ſhe was heard in her own defence; and they proteſted, that in the event of this proceeding, the negotiation ſhould be diſſolved, and Elizabeth be diſarmed of all power to do any prejudice to her honour, perſon, crown, and eſtate. The commiſſioners of the Engliſh queen were affected with this proteſtation, and felt more for the honour of their miſtreſs than for their own. They refuſed to receive it, becauſe there were engroſſed in it the words of the refuſal which Elizabeth had given to the petition for Mary. They did not chooſe to authenticate the terms of this refuſal by their ſubſcriptions; and were ſolicitous to ſuppreſs ſo palpable a memorial of her iniquity. They alleged, that the language of her refuſal had not been taken down with accuracy; and they preſſed Mary's deputies to preſent a ſimpler form of proteſtation. The biſhop of Roſs and his colleagues yielded not, however, immediately to their inſidious importunity; but, repeating anew their proteſtation as they had at firſt planned it, included the expreſs words of Elizabeth; and, when compelled by the power of the commiſſioners to expunge the language of the Engliſh queen, they ſtill inſiſted upon their proteſtation. An interruption was thus given to the validity of any future proceedings which might affect the reputation of the queen of Scots. The earls of Murray and Morton, with their friends, were very much diſappointed. For they had ſolaced themſelves with the hope of a triumph before there was a victory; and thought of obtaining a decree from Elizabeth, which while it ſhould pronounce the queen of Scots to be an adultereſs and a murderer, would exalt them into the Sco ſtation and character of virtuous men and honourable ſubjects.

Though the conference ought naturally to have terminated upon this proteſtation of the deputies of Mary againſt the injuſtice of Elizabeth, yet it did not ſatisfy the latter princeſs that the accuſation only had been delivered to her commiſſioners; ſhe was ſeriouſly diſpoſed to operate a judicial production of its vouchers. The charge would thus have a more regular aſpect, and be a ſounder foundation upon which to build, not only the infamy of the Scottiſh queen, but her own juſtification for the part ſhe had acted. Her commiſſioners accordingly, after the biſhop of Roſs and his colleagues had retired, diſregarding their proteſtation, called upon the earl of Murray and his aſſociates to make their appearance. The pretence, however, employed for drawing from him his papers was ſufficiently artful, and bears the marks of that ſyſtematic duplicity which ſo ſhamefully characterizes all the tranſactions of Elizabeth at this period. Sir Nicholas Bacon the lord keeper addreſſed himſelf to the earl of Murray. He ſaid, that, in the opinion of the queen of England, it was a matter ſurpriſing and ſtrange, that he ſhould accuſe his ſovereign of a crime moſt horrible, odious to God and man, againſt law and nature; and which, if proved to be true, would render her infamous in all the kingdoms of the world. But though he had ſo widely forgot his duty, yet had not Elizabeth renounced her love of a good ſiſter, a good neighbour, and a good friend; and it was her will, that he and his company ſhould produce the papers by which they imagined they were able to maintain their accuſation. The earl of Murray, in his turn, was not wanting in diſſimulation. He expreſſed himſelf to be very ſorry for the high diſpleaſure he had given to Elizabeth by his charge againſt Mary, and for the obſtinacy of the Scottiſh queen and her deputies, which made it neceſſary for him to vindicate himſelf by diſcovering her diſhonour. Under the load of this double and affected ſorrow, he made an actual and formal exhibition of the vouchers by which he pretended to fix and eſtabliſh her criminality. A particular account and examination of theſe vouchers, the reader will find in our life of MARY, and in the works to which we have there referred.

7 Eliza demar vouch the cr laid t ry's c

To enumerate all the ſhifts to which Elizabeth and the adverſaries of Mary were put, in order to make the ſtrange evidence that was produced wear ſome degree of plauſibility, would far exceed our bounds. It is ſufficient to ſay, that after having wearied themſelves with prevarication and falſehood; after having preſſed Mary to abdicate her crown, a requiſition with which ſhe never would comply; and after having finally refuſed to hear her in her own defence; Elizabeth on the 10th of January 1569, gave leave to the earl of Murray and his accomplices to depart her dominions; telling them, that ſince they came into England, nothing had been objected to them which could hurt their honour as men, or affect their allegiance as ſubjects. At the ſame time ſhe told them, that they had produced no information or evidence by which ſhe was entitled to conceive any bad opinion of the queen of Scots. It was therefore her pleaſure to allow the affairs of Scotland to continue preciſely in the condition in which they were ſituated at the beginning of the conference. Three

73 Conclu of Ma trial.

days

cotland. days after this, they formally took their leave of the queen of England. The deputies of Mary remonſtrated, proteſted, and argued to no purpoſe; the Engliſh privy-council, with the moſt provoking indifference, told them, that "the earl of Murray had promiſed to their ſovereign, for himſelf and his company to return to England at any time ſhe ſhould call upon him. But, in the mean time, the queen of Scots could not, for many ſtrong reaſons, be ſuffered to take her departure out of England. As to her deputies, they would move Elizabeth to allow them to return to Scotland; and they believed that ſhe would not detain them."

Mary was exceedingly diſappointed and chagrined by this ſingular iſſue of her cauſe. Her friends during this period had increaſed, and the cruel and injurious treatment ſhe had met with was ſo flagrant, that the earl of Murray and his faction were apprehenſive of a ſudden reverſe of fortune. The earls of Argyll and Huntley proteſted againſt the injuſtice of their proceedings, at the ſame time that they openly accuſed the earl of Murray and Maitland of Lethington as the aſſociates of Bothwel in the murder of the king. This charge, according to the cuſtom of the times, they offered to prove as true and certain by the law of arms; and they proteſted, that if their adverſaries ſhould delay to anſwer their challenge, they ſhould be held as confeſſing themſelves guilty of the murder. Elizabeth, however, foreſeeing ſomething of this kind, had diſmiſſed Murray and his adherents with precipitation, ſo that there could now be no formal production of it before the Engliſh commiſſioners. However, it was known and publiſhed in the court of Elizabeth. Murray made an evaſive reply, and Lethington made none at all.

739 l of urray, char- with king's rder, chal- ged to gle com-

740 ary com- ted to ter con- ement.

This, however, afforded no relief to the unhappy queen of Scotland. Her inveterate and treacherous enemy held her faſt, and endeavoured by every method in her power to render her life miſerable. Mary, on the other hand, never loſt either her ſpirit or her dignity. She attempted to rouſe in the minds of her nobles that paſſion for liberty which had once ſo much diſtinguiſhed the Scottiſh nation, but which now ſeemed to be exchanged for a ſervile ſubjection to the queen of England. But ſome deſpatches which preſſed theſe topics being intercepted, Mary was removed from Bolton to Tutbury caſtle, where ſhe was intruſted to the earl of Shrewſbury, and committed to cloſer confinement than ſhe had yet experienced; while Elizabeth diſperſed manifeſtoes all over the northern counties of England, complaining of reports injurious to her honour, and diſclaiming all hoſtile intentions towards the liberties of Scotland.

741 e regent ures nſelf in wer.

In the mean time Murray returned to Scotland, where he took every method to eſtabliſh himſelf in his ill-acquired power. Mary had commanded the duke of Chatelherault to return to Scotland, in order to raiſe forces for her behoof: but this nobleman had been long detained in England by the artifices of Elizabeth, ſo that Murray had arrived there before him. The duke, however, began to raiſe forces, and might have proved a troubleſome antagoniſt, had not Murray deceived him by a pretended negotiation, and got him into his power; immediately after which he impriſoned him, and forced moſt of the other lords who were on that ſide to ſubmit.

When the news of this important event reached the queen of Scots, ſhe inſtructed the biſhop of Roſs to repair to Elizabeth, and to make remonſtrances in their behalf. By the agency of this eccleſiaſtic, whom ſhe had conſtituted her ambaſſador, ſhe meant to conduct her tranſactions with the queen of England; and from the concluſion of the conferences, ſhe had been meditating a proper plan upon which to accompliſh her liberty and reſtoration. The biſhop of Roſs, after complaining loudly of the rigorous proceedings of the regent, and intimating the general belief which prevailed that he was ſupported by the Engliſh court, preſſed the propriety of a final ſettlement of the affairs of his miſtreſs. With this view, he was admitted by Elizabeth and her privy-counſellors to frequent conferences; and they even deſired him to preſent to them in writing the articles which he was commanded to propoſe as the foundation of a treaty. He failed not to comply with this injunction; and it was the import of his ſchedule of agreement, that Mary ſhould engage never to moleſt Elizabeth, and the lawful heirs of her body, reſpecting the ſucceſſion to the crown of England and Ireland, if ſhe could obtain ſufficient ſecurity that upon their demiſe her rights would be reſpected: that a new treaty of alliance and friendſhip ſhould be concluded between the two queens, by the advice of the eſtates of both kingdoms; that this league ſhould be ratified by their oaths and ſeals, and confirmed by parliamentary acts; and, if any farther aſſurance ſhould be deemed neceſſary on the part of Mary, that ſhe would procure the kings of France and Spain to be the guarantees of her punctuality and concord; that in compliance with the pleaſure of Elizabeth, ſhe would extend her clemency to all her ſubjects who had offended her, under the proviſion that they would ſubmit to her ſovereignty, deliver up the prince her ſon, reſtore her caſtles, give back her jewels, and ſurrender to her friends and ſervants the eſtates and poſſeſſions of which they had been deprived; that the murder of the king ſhould be puniſhed againſt all the actors in it without delay, and according to the laws; that, to prevent Bothwel from returning to Scotland, and to pleaſe thoſe who imagined that it was in his power to excite ferments and trouble, ſhe would be bound to inſtitute a proceſs of divorce againſt him; and that theſe articles being adjuſted, the queen of England ſhould allow her to proceed to Scotland, under a ſafe and honourable convoy, to be re-eſtabliſhed by the three eſtates in her realm and government, and to be gratified with the diſſolution of all the acts and ſtatutes which had been paſſed to her prejudice.

Scotl 74 Negot nous i Engla

74 Adva are m in the jected riage Mary the du Norfo

Theſe heads of alliance were received with a reſpect and cordiality which were not uſually paid to the tranſactions of Mary in the court of Elizabeth; and the biſhop of Roſs was elated with expectations. Their juſtice, however, was not the ſole, or even the chief, cauſe of this attention and complaiſance. A combination of the Engliſh nobles had taken place againſt Cecil, whoſe power and credit were objects of indignation and jealouſy; and the duke of Norfolk had been active and ſucceſsful in promoting the ſcheme of his marriage with the queen of Scots. Taking advantage of the condition of parties, he had practiſed with the principal nobility to encourage his pretenſions to Mary; and he ſecretly communicated to them the promiſes of

tland. support he had received from the earl of Murray. By the advice and influence of Sir Nicholas Throgmorton, he engaged in his behalf the earl of Leiceſter; and this nobleman imparted the matter to the earls of Pembroke and Arundel. The duke himſelf was able to conciliate the favour of the earls of Derby, Bedford, Shrewſbury, Southampton, Northampton, Northumberland, Weſtmorland, and Suſſex. In the mean time, he was eagerly preſſing Mary herſelf with his ſuit and importunities; and had mutually exchanged the tokens of a conſtant and ſincere love. It was in this forward ſtate of the match, that the biſhop of Roſs drew up the ſchedule of articles for the accommodation of the rival queens.

744 Eng- nobles poſe ar- s to y.

At the deſire of Elizabeth, her privy-council conferred with the biſhop upon theſe articles at different times; and they expreſſed themſelves to be highly pleaſed with their general import and meaning. Little doubt was entertained of their ſucceſs; and the earl of Leiceſter, in order to complete the buſineſs, and to ſerve the duke of Norfolk, undertook to give them a more ſpecial force, and to improve them by the introduction of a ſtipulation about the marriage of the queen of Scots. According to his ſcheme of agreement, it was required of Mary, that ſhe ſhould be a party to no attempt againſt the rights and titles of the queen of England, or her heirs; that ſhe ſhould conſent to a perpetual league, offenſive and defenſive, between the two kingdoms; that ſhe ſhould finally eſtabliſh the Proteſtant religion in Scotland; that ſhe ſhould admit to her favour thoſe of her ſubjects who had appeared againſt her; that if ſhe had made any aſſignment of her kingdom to the duke of Anjou, in the expectation of a marriage to be contracted between them, it ſhould be diſſolved; and that inſtead of looking to a foreign prince, whoſe alliance would be dangerous, not only to the religion but to the liberty of the two realms, ſhe would agree to marry the duke of Norfolk, the firſt peer of England. Theſe articles being communicated to the biſhop of Roſs, he was deſired to tranſmit them to Mary; but, as they touched upon ſome points concerning which he had no inſtructions, he declined this office, and recommended the propriety of their employing a ſpecial meſſenger of their own in a commiſſion of ſuch high importance. They accordingly appointed Mr Candiſh to go with them to the queen of Scots, and, in a formal deſpatch, they extolled the merits of the duke of Norfolk; aſſured her of the general favour and ſupport of the Engliſh nobility, if ſhe ſhould approve of his love: and intimated their belief that Elizabeth would not be averſe from a marriage which gave the certain promiſe of tranquillity and happineſs to the two kingdoms. This deſpatch was in the handwriting of Leiceſter; and it was ſubſcribed by this nobleman, and the earls of Arundel and Pembroke, and the lord Lumley.

745 ary s- ees to the aty pro- ſed to r.

Mary, in the ſolitude of her priſon, received this application with pleaſure. By the lord Boyd ſhe returned a very favourable anſwer to it; but took the liberty to admoniſh them of the neceſſity of their ſecuring the good-will of Elizabeth, leſt her diſlike of the treaty of the marriage ſhould excite new diſaſters and misfortunes, and involve the duke of Norfolk in inconveniency and danger. This advice, the ſuggeſtion of her delicacy and prudence, did not draw ſufficiently their attention. The duke of Norfolk was now impatient to conclude this great tranſaction, in which he had engaged himſelf; and admitted into his councils many nobles whom he had hitherto neglected to court, and many gentlemen who were conſiderable from their diſtinction and fortunes. The countenance and conſent of the kings of France and Spain were thought neceſſary to the meaſures in agitation, and were ſolicited and obtained. In the univerſality of the applauſe with which they were honoured, it was ſuppoſed that Elizabeth would be allured into a cordial acknowledgment of their propriety, or be compelled to afford them a reluctant approbation; and ſo ardent a belief prevailed of their fortunate termination, that the marriage-contract was actually intruſted to the keeping of M. Fenelon the French ambaſſador.

Soc

The activity of the duke of Norfolk with the Engliſh nobles did not ſo much engroſs his attention as to make him forget the regent. He kept up with him a cloſe correſpondence in conſequence of the concert into which they had entered, and received the moſt ample aſſurances of his fidelity and ſervice. The moſt ſanguine and ſeducing hopes elated him. The regent, while he ſtipulated for terms of favour and ſecurity to himſelf and his faction, appeared to be full of the marriage, as a meaſure from which the greateſt advantages would ariſe to the two kingdoms, to the two queens, and to the true religion. The match, in the meanwhile, was anxiouſly concealed from Elizabeth; but ſhe was zealouſly preſſed to conclude an accommodation with Mary, on the foundation of the ſchedule of agreement preſented by the biſhop of Roſs. After having had many conferences with her privy-council, ſhe ſeemed inclined to treat definitively for the reſtoration of the queen of Scots, and actually agreed to open the tranſaction to the regent. The lord Boyd was ſent into Scotland upon this buſineſs; and while he carried her letters, he was intruſted with deſpatches from Mary, the duke of Norfolk, and Sir Nicholas Throgmorton.

As the regent was returning from his northern expedition, he was ſaluted at Elgin by the lord Boyd, who immediately laid before him the deſpatches and inſtructions with which he had been charged. The queen of England, in her letters, made three propoſitions in behalf of Mary, and intimated a deſire that one of them ſhould be accepted. The queen of Scots, ſhe ſaid, might be reſtored fully and abſolutely to her royal eſtate: ſhe might be aſſociated in the government with her ſon, have the title of *queen*, and, till the prince ſhould attain the age of 17 years, the adminiſtration might continue in the regent; or ſhe might be permitted to return to Scotland in a private ſtation, and have an honourable appointment to maintain her in a ſafe and happy obſcurity. The deſpatches from Mary to the regent deſired, that judges might immediately be allowed to inquire into the legality of her marriage with Bothwel: and that, if it was found to have been concluded in oppoſition to the laws, it ſhould be declared void, and that the liberty be granted to her of entering anew into a matrimonial engagement. The duke of Norfolk expreſſed to the regent the gratitude he felt for his friendſhip; promiſed him the command of the fulleſt exertions of his conſequence and power; entreated him to proceed expeditiouſly in promoting

The poſa Eliz

The que Ma

Imp niti Nor

promoting the buſineſs of the marriage, and referred him to the inſtructions of Lord Boyd for a ſatisfactory anſwer to any doubts which might give him diſguſt or uneaſineſs. By the letters of Throgmorton, the regent was advertiſed that the marriage of the queen of Scots with the duke of Norfolk was a certain and decided point; and he was counſelled to concur heartily and expeditiouſly in this tranſaction, that his conſent might not ſeem to have been extorted. Maitland of Lethington was recommended to him by this ſtateſman, as the perſon whom he ſhould chooſe to repreſent him in the Engliſh court, as he could negotiate beſt the terms and mode of his ſecurity and of that of his party. In fine, Throgmorton entreated him not to be troubled with any preciſe ſcruples or objections, for that his overthrow, if he reſiſted, would be inevitable; and, in the view of his ſervices and cordiality, he aſſured him, that no man's friendſhip would be accepted with greater affection, and no man's eſtimation be higher or more fortunate. The zeal of Throgmorton induced him alſo, upon this occaſion, to addreſs to Maitland a deſpatch, in which he was infinitely importunate to haſten his expedition to England, in the character to which he recommended him. He complimented him as the fitteſt perſon to open the match to the Engliſh queen, on the part of the regent and the Scottiſh nobility; and he repreſented the ſucceſs of the ſcheme to be infallible, as Elizabeth would never be ſo unwiſe as to put her own ſafety, the peace of her kingdom, and the preſervation of her people, in competition with the partial devices that might proceed from the vanity and the paſſions of any perſon whatſoever. He enumerated the names of the Engliſh nobility who had confederated to promote the marriage. He enlarged upon it as an expedient full of wiſdom, and as advantageous in the higheſt degree to religion and the ſtate. He pointed out the laſting and inſeparable connexion of England and Scotland, as its happy and undoubted conſequence. For, if James VI. ſhould die, the ſceptres of the two kingdoms might devolve to an Engliſh prince; and if he ſhould attain to manhood, he might marry the daughter of the duke of Norfolk, and unite, in his perſon, the two crowns.

Theſe weighty deſpatches employed fully the thoughts of the regent. The calls of juſtice and humanity were loud in the behalf of Mary; his engagements to Norfolk were preciſe and definitive; and the commiſſion of Elizabeth afforded him the command of the moſt important ſervices. But, on the other hand, the reſtoration of Mary, and her marriage, would put an end for ever to his greatneſs; and, amidſt all the ſtipulations which could be made for his protection, the enormity of his guilt was ſtill haunting him with ſuſpicions and terror. His ambition and his ſelfiſh ſenſibilities were an overmatch for his virtue. He practiſed with his partiſans to throw obſtacles in the way of the treaty and the marriage; and, on the pretence of deliberating concerning the reſtoration of Mary, and on her divorce from Bothwel, a convention of the eſtates was ſummoned by him to aſſemble at Perth. To this aſſembly the letters of Elizabeth were recited; and her propoſitions were conſidered in their order. The full reſtoration of Mary to her dignity was accounted injurious to the authority of the king, and her aſſociation with her ſon in the government was judged improper and dangerous; but it was thought that her deliverance from priſon, and her reduction to a private ſtation, were reaſonable expedients. No definitive decree, however was pronounced. The letters of Mary were then communicated to this council, and gave riſe to vehement debates. She had written and ſubſcribed them in her character of queen of Scotland. This carriage was termed *inſolent* and *imperious* by the friends of the regent. They alſo held it unſafe to examine her requeſts, till they ſhould be communicated to Elizabeth; and they inſinuated, that ſome inclement and partial device was concealed under the purpoſe of her divorce from the earl of Bothwel. The favourers of Mary endeavoured to apologize for the form of the letters, by throwing the blame upon her ſecretaries; and engaged, that while the commiſſaries, or judges, were proceeding in the buſineſs of the divorce, new deſpatches in the proper method ſhould be applied for and procured. They were heard with evident ſymptoms of diſpleaſure; and exclaimed, "that it was wonderful to them, that thoſe very perſons who lately had been ſo violent for the ſeparation of the queen and Bothwel ſhould now be ſo averſe from it." The partiſans of the regent replied, "that if the queen was ſo eagerly ſolicitous to procure the divorce, ſhe might apply to the king of Denmark to execute Bothwel as the murderer of her huſband; and that then ſhe might marry the perſon who was moſt agreeable to her." The paſſions of the two factions were inflamed to a moſt indecent extremity, and the convention broke up with ſtrong and unequivocal marks of hoſtility and anger.

Notwithſtanding the caution with which Mary and Norfolk carried on their intrigues, intimations of them had come to Elizabeth. Norfolk himſelf, by the advice of the earl of Pembroke, had ventured to diſcloſe his ſecret to Sir William Cecil, who affected to be friendly to him. The regent, in anſwer to her letters, tranſmitted to her the proceedings of the convention at Perth. The application of Mary for a divorce was a key to the ambitious hopes of the duke of Norfolk. She commanded Sir William Cecil to apply himſelf to diſcover the conſpiracy. This ſtateſman betrayed the confidence with which he had been intruſted; and Elizabeth, while the duke was attending her at Farnham, diſcovering a mixture of pleaſantry and paſſion, admoniſhed him to be careful on what pillow he repoſed his head. The earl of Leiceſter, alarmed by his fears, revealed to her at Titchfield the whole proceedings of the duke of Norfolk and his friends. Her fury was ungovernable; and at different times ſhe loaded Norfolk with the ſevereſt reproaches and contumely, for preſuming to think of a marriage with the queen of Scots without the ſanction of her concurrence. Inſulted with her diſcourſe and her looks, abandoned by Leiceſter, and avoided by other nobles in whom he had confided, he felt his courage to forſake him. He left the court at Southampton without taking his leave, and went to London to the earl of Pembroke. New intimations of her diſpleaſure were announced to him, and he retired to his ſeat at Kinninghall in Norfolk. His friends preſſed him to take the field, and to commit his ſafety to the ſword; but having no inclination to involve his country in the miſeries of war, he rejected their advice; and addreſſing an apology to E-

lizabeth, protested that he never meant to depart from the fidelity which he owned to her; and that it was his fixed resolution to have applied for her consent to his marriage with the queen of Scots. In return, she ordered him to repair to her court at Windsor; and, as he appeared to be irresolute, a messenger was despatched to take him into custody. He was first confined to the house of Paul Wentworth, at Burnham, in the neighbourhood of Windsor, and then committed to the Tower. The earls of Pembroke and Arundel, the lord Lumley, Sir Nicholas Throgmorton, and the bishop of Ross, were also apprehended and confined.

Elizabeth, amidst the ferment of her inquietudes, forgot not to gratify her revenge by insulting the queen of Scots. The name of Mary was sufficient to convulse her with anger. The earl of Huntingdon, who affected to have pretensions to the crown of England that were preferable to those of the Scottish princess, was joined with the earl of Shrewsbury in the office of guarding her. His instructions were rigorous, and he was disposed to exceed them. The earl of Shrewsbury considered it as an indignity to have an associate who was a declared enemy to his charge, who had an interest in her death, and who was remarkable for a natural ferocity of disposition. Mary exclaimed against the indelicacy and rudeness of Elizabeth, and protested that all her intentions were commendable and innocent. Huntingdon took a delight in her sufferings. He ransacked her coffers with a view of making discoveries; but her prudence had induced her to destroy all the evidences of her transactions with the duke of Norfolk; and the officious assiduity of this jailor was only rewarded with two cyphers which he could not comprehend. The domestics whom she favoured were suspected and dismissed. Her train of attendants was diminished. An unrelenting watch was kept upon her. No couriers were allowed to carry her despatches. No messengers were admitted to her presence; and all the letters from her friends were ordered to be intercepted, and to be conveyed to the queen of England.

The proceedings of the convention at Perth were afflicting to Elizabeth, to Mary, and to the duke of Norfolk. In the former they created suspicions of the regent; and they were a certain annunciation to the latter, that he was resolved to support himself in the government of Scotland. Uncertain rumours had reached Elizabeth of the interviews he had held with Norfolk in the business of the marriage. Her surprise and indignation were infinite. Mr Wood who brought from the regent his answer to her letter, was treated with disrespect. Secretary Cecil despatched instructions to the Lord Hunsdon, the governor of Berwick, to watch his operations with a jealous eye. Elizabeth, by a special envoy, required from him an explanation of his ambiguous carriage. The regent, true to his interests, apologized to her for his connexions with the duke of Norfolk, by laying open the design of that nobleman to cut him off, in his way to Scotland, by a full communication of whatever had passed between them in relation to Mary, and by offers of an unlimited submission and obedience.

While the duke of Norfolk was carrying on his intrigues with Mary, the scheme of an insurrection for her deliverance was advancing under the direction of the earls of Northumberland and Westmorland. Motives of religion were the chief foundation of this conspiracy; and the more zealous Catholics over England were concerned in it. Mary, however, by the advice of the duke of Norfolk, who was afraid of her matching with a foreign prince, did not enter into it with cordiality. It advanced notwithstanding; and the agents of the pope were lavish of exhortations and donatives. The duke of Alva, by the order of his master the king of Spain, encouraged the conspirators with the offer of 20,000 men from the Netherlands; and, under the pretence of adjusting commercial disputes, he sent into England Chiapini Vitelli marquis of Celona, an officer of ability, that he might be at hand, and prepared to take the command of them.—The report of an insurrection was universal. Elizabeth kept an army of 15,000 men near her person. The queen of Scots was removed to Coventry, a place of great strength; and if a superior and commanding force should appear before it, her ferocious keeper, it is said, had orders to assassinate her. Repeated commands were sent to the earls of Northumberland and Westmorland, to repair to court. But the imprisonment of the duke of Norfolk and his friends had struck a panic into them. They conceived that their conspiracy was discovered; and putting themselves at the head of their followers, they issued their manifesto. The restoration of Popery, the establishment of the titles of Mary to the English crown, and the reformation of abuses in the commonwealth, were the avowed objects of their enterprise. But they had embarked in a business for which they were altogether unequal. Their efforts were feeble and desultory. The duke of Alva forgot his promises. Wherever the peace was disturbed by insurgents, there were troops to oppose them. The vigilance of Elizabeth disconcerted with ease the operations of men whom no resources or popularity could have conducted to greatness, and who could neither conquer nor die. The earl of Westmorland, after concealing himself for some time in Scotland, effected an escape into Flanders, where he passed a miserable and useless existence; and the earl of Northumberland being taken by the regent, was imprisoned in the castle of Lochleven.

As the fury of Elizabeth abated, her resentment to the duke of Norfolk lost its power; and she failed not to distinguish between the intrigues of an honourable ambition, and the practices of an obstinate superstition. It was the result of the examination of this nobleman, and of the confessions of the other prisoners, that Lethington had schemed the business of the marriage, and that the earl of Murray had encouraged it; that her consent was understood to be necessary to its completion; and that Mary herself had warmly recommended the expedient of consulting her pleasure. Upon receiving proper admonitions, the earls of Pembroke, Arundel, the Lord Lumley, Sir Nicholas Throgmorton, and the bishop of Ross, were released from confinement; and, after a more tedious imprisonment, the duke of Norfolk himself was admitted to his liberty. This favour, however, was not extended to him till he had not only submissively acknowledged his presumption in the business of the marriage; but had fully revealed whatever had passed between Mary and him, and solemnly engaged himself never more to think of this alliance,

liance, and never more to take any concern whatſoever in her affairs.

The regent, in the meanwhile, was very anxious to recover the good opinion of Elizabeth. Her treatment of Mr Wood, and her diſcovery of his practices, had excited his apprehenſions. He therefore aſſembled at Stirling a convention of the eſtates; and taking her letters a ſecond time into conſideration, returned her a reply to them by Robert Pitcairn abbot of Dunfermline, in a ſtyle ſuited to her temper and jealouſies, and from which ſhe could deciſively infer, that no favour of any kind would be ſhown to the queen of Scots. But this baſe condeſcenſion, though aſſiſted by his treachery to the duke of Norfolk, not being ſufficient, in his opinion, to draw to him completely the cordiality of the queen of England, he was preparing to gratify her with another ſacrifice. The partiality of Maitland to Mary, and his intrigues with Norfolk and the Engliſh malcontents, had rendered him uncommonly obnoxious to Elizabeth and her miniſtry. The late commotions had been chiefly aſcribed to his arts; and it was natural to dread new calamities and tumults from the fruitful ſpring of his invention. Under the pretence of employing his ſervice in deſpatches to England, the regent invited him to Stirling. He was then with the earl of Athol at Perth; and ſuſpecting ſome improper device, he obeyed the ſummons with reluctance. When he took his place in the privy-council, Captain Crawford, the miſion of the earl of Lenox, who had diſtinguiſhed himſelf in the trial of Mary, accuſed him, in direct terms, of being a party in the murder of the late king. The regent affected aſtoniſhment, but permitted him to be taken into cuſtody. He was ſoon after ſent to Edinburgh under a guard, and admoniſhed to prepare for his trial. Upon ſimilar charges, the lord Seton and Sir James Balfour were ſeized upon and impriſoned.

1756 Kirkaldy of Grange, the governor of the caſtle of Edinburgh, who was warmly attached to Maitland, after having remonſtrated in vain with the regent on the violence of his conduct, employed addreſs and ſtratagem in the ſervice of his friend. Under the cover of night, he went with a guard of ſoldiers to the lodgeing where Maitland was confined; and ſhowing a forged warrant for taking his perſon into his keeping, got poſſeſſion of him. Kirkaldy had now in his caſtle the duke of Chatelherault, the lord Herries, and Maitland. The regent ſent for him to a conference; but he refuſed to obey his meſſage. He put himſelf and his fortreſs under the direction of his priſoners. The regent, condeſcending to pay him a viſit, was more laviſh than uſual of his promiſes and kindneſs. His arts, however, only excited the diſdain of this generous ſoldier. Since he could not lead out Maitland to the block, he inſtituted a proceſs of treaſon againſt him, in order to forfeit his eſtates. Kirkaldy, by the mouth of a trumpeter, deſired him to commence ſimilar actions againſt the earl of Morton and Mr Archibald Douglas, as it was notorious that they were parties to the king's murder. This meſſenger was likewiſe charged with delivering a challenge from him to Mr Archibald Douglas, and another from the lord Herries to the earl of Morton. This diſappointment, and theſe indignities, made a deep impreſſion upon the regent; and, in a thoughtful diſſatisfied humour, about this time, he made a ſhort progreſs towards the Engliſh border, courting popularity, and deſerving it, by an attention to order and juſtice.

Elizabeth, flattered by his ſubmiſſive advances, and pleaſed with his ambition, was now diſpoſed to gratify his fulleſt wiſhes; and ſhe perceived, that by delivering to him the queen of Scots, ſhe would effectually relieve herſelf of a priſoner whoſe vigour and intrigues were a conſtant interruption to her repoſe. A treaty for this purpoſe was entered into and concluded. The regent was to march an army to the Engliſh frontiers, and to receive from her his ſovereign into her own dominions, the victim of his power, and the ſport of his paſſions. No hoſtages and no ſecurity were ſtipulated for her entertainment and good uſage. His authority over her was to be without any limits. Upon his part, he was to deliver to Elizabeth the young prince, to put her in poſſeſſion of the principal forts of Scotland, and to aſſiſt her with troops in the event of a war with France. This treaty, ſo fatal to Mary, and ſo ruinous to the independence of Scotland, eſcaped not the vigilance of the biſhop of Roſs. He complained of it in the ſtrongeſt terms to Elizabeth; and declared it to be equivalent to a ſentence of death againſt his miſtreſs. The ambaſſadors of France and Spain were alſo ſtrenuous in their remonſtrances to her upon this ſubject. All reſiſtance, however, was unavailing; and the execution of the treaty ſeemed inevitable. Yet how vain are the loftieſt ſchemes of human pride! The career of the regent was haſtening to its termination; and the hand of an aſſaſſin put a period to his dream of royalty. Scotland did not loſe its liberties; but Mary continued to be unfortunate.

James Hamilton of Bothwellhaugh, who had been taken a priſoner at the battle of Langſide, obtained his liberty and life; but his eſtates were forfeited.—His wife, the heireſs of Woodhouſlee, retired upon this emergency to her paternal inheritance, in the hope that it might eſcape the rapacity of the regent. He had, however, given it away in a gift to one of his favourites, Sir James Ballenden; and the inſtruments of his power having the inhumanity to ſtrip her of her garments, and to turn her naked out of her houſe, in a cold and dark night, ſhe became diſtracted before the morning. Hamilton vowed revenge; and the regent made a mockery of his threats. This contempt inſpirited his paſſions; and the humiliation of the houſe of Hamilton, to which he was nearly allied, foſtered the eagerneſs of his diſcontents. The madneſs of party fermented in him with the atrociouſneſs of rage. His mind reconciled itſelf to aſſaſſination. After watching for ſome time a proper opportunity to commit his horrible purpoſe, he found it at Linlithgow. The regent was to paſs through this town in his way from Stirling to Edinburgh. Intimations reached him that Hamilton was now to perpetrate his deſign: and he unaccountably neglected them. The aſſaſſin, in a houſe that belonged to the archbiſhop of St Andrew's, waited deliberately his approach; and firing his muſket from a window, ſhot him through the body. The wound, when examined, was not judged to be mortal; but the regent finding its pain to increaſe, prepared himſelf for death; and in a few hours after he expired. A fleet horſe of the abbot of Arbroath's carried the aſſaſſin to the palace of Hamilton; and from

cotland. from thence he ſoon after effected his eſcape into France.

The death of the earl of Murray made no favourable alteration in the affairs of Mary. Confuſion and diſorder prevailed throughout the kingdom; and though the friends of the queen were promiſed aſſiſtance from France, nothing effectual was done for them. At laſt the regency was conferred upon the earl of Lenox; an enemy to his queen, and who treated her friends with the utmoſt rigour. At the ſame time Elizabeth continued to amuſe with negotiations her unhappy rival. She granted liberty to the biſhop of Roſs to repair to the queen of Scots, who had been removed to Chatſworth, and to confer with her on the ſubject of the intended accord and treaty. Mary, conforming to the advances of Elizabeth, authorized the Lord Levingſton to paſs to her dominions, and to deſire her friends to appoint a deputation of their number to give their aſſiſtance in promoting the ſalutary purpoſe of eſtabliſhing the tranquillity of their country: and after meeting with ſome interruptions upon the Engliſh borders from the earl of Suſſex, this nobleman executed ſucceſsfully his commiſſion. The queen's lords gave powers to ten nobles to act in a body, or by two of their number, in the intended negotiation: and a ſafe-conduct from Elizabeth allowed them to enter the Engliſh realm, and to remain in it during the ſpace of ſix months.

While the lord Levingſton was conſulting the intereſts of Mary with her friends in Scotland, the biſhop of Roſs was making earneſt ſuit with Elizabeth to proceed in the projected negotiation. His ſolicitations were not ineffectual; and Sir William Cecil and Sir Walter Mildmay received the inſtructions of their miſtreſs to wait upon the queen of Scots at Chatſworth. The heads of accommodation which they propoſed were explicit and particular; and the rigour they diſcovered towards the Scottiſh princeſs ſeemed to vouch their ſincerity. It was propoſed, that a perfect amity ſhould take place between the two queens; that all the treaties which had formerly been concluded by the two nations ſhould receive an ample confirmation; that the queen of Scots ſhould ratify the treaty of Edinburgh, and forbear from advancing any title or claim to the crown of England during the life of Elizabeth, or to the prejudice of the heirs of her body; that in caſe of foreign invaſions, the two realms ſhould mutually aſſiſt each other; that all foreign ſoldiers ſhould be ordered to depart out of Scotland; that in the future, ſtrangers of the profeſſion of arms ſhould be prohibited from repairing to it, and from taking up their reſidence in any of its caſtles or houſes of ſtrength; that Mary ſhould hold no correſpondence, directly or indirectly, with any ſubject of England, without the permiſſion of the Engliſh queen; that the earl of Northumberland, and the Engliſh rebels in Scotland, ſhould be delivered up to Elizabeth; that redreſs ſhould be given to the ſubjects of England for the ſpoils committed upon them by the Scottiſh borderers; that the murderers of the lord Darnley and the earl of Murray ſhould be duly and effectually puniſhed; that before the queen of Scots ſhould be ſet at liberty, the young prince her ſon ſhould be brought into England, and that he ſhould continue in the keeping of Elizabeth till the death of his mother, or till her reſignation to him of her crown on attaining his majority; that the queen of Scots ſhould not enter into a negotiation for her marriage without the knowledge of the queen of England, nor conclude it without her approbation, or that of the greateſt part of the Scottiſh nobility; that none of the ſubjects of Scotland ſhould be ſuffered to go to Ireland without the ſafe-conduct of Elizabeth; and that Mary ſhould deliver to her ſiſter all the teſtimonies and writings which had been ſent from France, renouncing and diſavowing the pretended marriage between her and the duke of Anjou. Beſides theſe articles of agreement, it was propoſed by another treaty to adjuſt the differences of the queen of Scots and her ſubjects; and Sir William Cecil and Sir Walter Mildmay embraced the preſent opportunity of conferring with her upon this buſineſs, under the pretence of facilitating its management in the future ſtages of its progreſs.

Sc

During their ſtay at Chatſworth, theſe ſtateſmen were completely ſatisfied with the behaviour of the queen of Scots. The candour, ſincerity, and moderation, which ſhe diſplayed, were full aſſurances to them that upon her part there was no occaſion to apprehend any improper policy or art; and the calamities of her condition were a ſtill ſecurer pledge of her compliance. Elizabeth, upon hearing their report, affected to be highly pleaſed with her ſiſter, and ſent a meſſage to the earl of Lenox, inſtructing him in the conditions which had been ſubmitted to Mary; and deſiring him to deſpatch commiſſioners into England to deliberate in the treaty, and to conſult his intereſt and that of his faction. Nor did Mary neglect to tranſmit to her friends in Scotland the propoſed terms of agreement; and the biſhop of Roſs, who had aſſiſted her in the conferences with Sir William Cecil and Sir Walter Mildmay, conveyed intimations of them to the pope, the king of France, and the duke of Alva; beſought their advice, and informed theſe princes, that unleſs an effectual relief could be expected from their favour, the neceſſities of her condition would compel her to ſubſcribe to the hard and humiliating dictates of the queen of England.

But while Mary and her friends were indulging the hope of a termination to her troubles, Elizabeth was ſecretly giving comfort to her adverſaries, and encouraging them to throw obſtacles in the way of the treaty. Sir William Cecil wrote to the regent, expreſſing his diſapprobation of the negotiations at Chatſworth; deſiring him not to be apprehenſive of the boaſtings of the adherents of the queen of Scots; and adviſing him to make choice of commiſſioners, in the name of the king, in whoſe conſtancy and fortitude he could rely, and whom no addreſs could allure from his intereſt, or from the common cauſe in which he and his friends were embarked. The earl of Suſſex alſo ſent him deſpatches, in which he admoniſhed him to turn his anxious attention to the approaching negotiation, and to inſiſt on ſecure ſtipulations for the preſervation of the prince, for his own ſafety, and for a general indemnity to the nobles and their adherents, whoſe party he had eſpouſed. In every event, he repreſented it as proper for him to pay the greateſt reſpect to Elizabeth; and, if no treaty ſhould be concluded, he adviſed him to be prepared for reducing the friends of Mary to obedience, and for defending himſelf againſt invaſions from abroad. By theſe artifices, the regent and his

faction

faction were inclined to intimate to Elizabeth their warm diſſatisfaction with the terms of agreement which ſhe had propoſed to Mary; and Pitcairn abbot of Dunfermline, who had been appointed ſecretary of ſtate in the room of Maitland of Lethington, was deputed to her upon this buſineſs. He exclaimed againſt the treaty as wild and impolitic; and contended, that no ſtipulations could bind Mary, whoſe religion taught her to keep no faith with heretics; that her claims to the Engliſh crown, and her reſentment againſt the queen of England, as well as her own ſubjects, would immediately upon her reſtoration, involve the two kingdoms in blood; and that no peace or quiet could be expected or enjoyed, but by adhering to the ſalutary maxim of detaining her in a ſure and cloſe captivity. Elizabeth did not diſcourage theſe inclement ſentiments; and Pitcairn was aſſured by her, that from her natural love to the king, and her regard to the nobles who upheld his authority, ſhe would faithfully provide for their ſecurity; and that if juſtice ſhould appear deciſively upon their ſide, ſhe would even ſtrenuouſly maintain their quarrel and their conſequence.

Mary had been carried to Sheffield, and was recovering from a feveriſh indiſpoſition. To this place the biſhop of Galloway, and the lord Levingſton, who had been ſelected by her friends to be her acting deputies in England, repaired in order to impart to her the ſtate of affairs in Scotland, and to receive her commands. After repeated conferences on the ſubject of the approaching treaty, ſhe gave them her commiſſion and inſtructions, and joining them to the biſhop of Roſs, ſent them to Elizabeth. They claimed an audience of this princeſs, and were admitted to it at Hampton-court. Having preſented their credentials, they informed her, that they were ready to conclude a treaty of concord and agreement, upon principles the moſt extenſive and liberal; and, repreſenting to her the impoveriſhed and tumultuous ſtate of their country, they begged her to proceed in the buſineſs with expedition. The orders, they ſaid, which they had received, and their own inclinations, diſpoſed them to follow her advice and counſel in all points which were honourable and conſiſtent with reaſon; and as her protection was the only refuge of the adverſaries of their queeen, they took the liberty to obſerve, that it was completely in her power to put a period to all diſturbances and animoſity, and to accompliſh an accord, which would not only confer upon her the higheſt reputation, but be of the moſt ſignal utility to the two kingdoms. Elizabeth declared, that it would pleaſe and flatter her in no common degree to advance in the negotiation; and that it was a pain to her that the regent, by his delay in ſending commiſſioners, ſhould diſcover any averſion from it. This anſwer was deemed very favourable by the biſhop of Roſs and his aſſociates; and they obtained her authority to deſpatch a meſſenger to the regent to haſten his operations.

In the mean time, Mary received deſpatches from the pope, the king of France, and the duke of Alva: and they concurred in recommending it to her to accept of the articles of accommodation which were offered by Elizabeth. The Turk was giving employment to the pope and the king of Spain; Charles IX. already enfeebled by the obſtinate valour of the Huguenots, was buſy in deceiving them with appearances of peace, and in plotting their overthrow; and the duke of Alva felt himſelf inſecure in his government of the Netherlands. But while they ſtrongly adviſed Mary to conclude an agreement with the queen of England, they were yet laviſh to her of their expreſſions of a conſtant amity; and if the treaty ſhould miſcarry, they promiſed to make the moſt ſtrenuous exertions in her behalf, and to aſſiſt her adherents with money, ammunition, and troops.

The earl of Morton, the abbot of Dunfermline, and Mr James Macgill, had been appointed by the regent and his faction to be their commiſſioners in the name of the king; and at length their arrival was announced to Elizabeth. Conforming to the ſpirit of their party, the earl of Morton and his colleagues took an early opportunity to juſtify to her the depoſition of the queen of Scots, and by this means to interrupt the progreſs of the treaty. In an elaborate memorial, they affected to conſider Mary as unworthy to reign, and aſſerted the conſtitutional power of the people to curb her ambition, and to throw her down from royalty. They endeavoured to intrench themſelves within the authority of laws, civil, canon, and municipal; and they recited opinions to her prejudice by many pious divines. But though the general poſition, that the people have a title to reſiſt the dominion of the ſovereign is clear and indubitable; yet their application of it to the queen of Scots was wildly precarious and improper. To ſpeak of her tyranny, and her violation of the rights of her people, was even a wanton mockery of truth and juſtice; for inſtead of having aſſumed an illegal exorbitancy of power, ſhe had ſuffered in her own perſon and rights, and had been treated by her ſubjects with the moſt cruel and tyrannical inſolence. Elizabeth, who was unwilling and afraid to enter anew into the conduct of Mary, who was fully ſenſible of the inſolence of her adverſaries, and who did not approve of any maxims that preſſed againſt the majeſty of princes, received their memorial with ſurpriſe and indignation. She perceived not, ſhe told them, any reaſon that could vindicate the ſeverity which had been ſhown to the queen of Scots by her enemies; and adviſed them to conſider, that in the preſent negotiation it was their proper buſineſs to conſult the ſecurity of the king and of their faction.

Upon the part of Elizabeth, the commiſſioners were the lord keeper Bacon, the earls of Suſſex and Leiceſter, the lord Clynton, the lord chamberlain, Sir William Cecil, who about this time was created Lord Burleigh, Sir Francis Knollys, Sir James Croft, Sir Walter Mildmay, and Sir Thomas Smith. The deputies of Mary were invited to meet with the Engliſh commiſſioners in the houſe of the lord keeper; and after he had ſtated the general purpoſes of the treaty, he intimated to them, that there were two points which required a particular diſcuſſion. A proper ſecurity, he ſaid, ought to be given by the queen of Scots for her due performance of the ſtipulations of the agreement with Elizabeth; and it was expedient to concert the mode of the pardon and indemnity which ſhe was to extend to the ſubjects of Scotland who had offended her. As an aſſurance of the accommodation with his miſtreſs, he demanded, that the duke of Chatelherault, the earls of Huntley and Argyll, the lords Hume and Herries, with another perſon of high rank, ſhould be ſurrendered to her.

land. her, and remain in England for three years; that the caſtles of Dumbarton and Hume ſhould be in her poſſeſſion during the ſame period; and as to the article concerning the delivery of the prince into her cuſtody, he obſerved, that it would be required from the regent, the queen of Scots not having the power of its performance. The deputies of Mary, ſurpriſed with this language, entreated the Engliſh delegates to reflect, that their queen, if deprived of the moſt faithful of her nobles, and of her ſtrongeſt forts, could have little deſire or ambition to return to her own kingdom; for ſhe would thus be unable to protect herſelf againſt the turbulence of her ſubjects, and be a ſovereign without friends, and without ſtrength. They were inclined, they ſaid, to put their commiſſion and powers to the fulleſt ſtretch, in order to gratify Elizabeth; and they would agree, that two earls and two barons ſhould be ſurrendered for two years, as hoſtages of the fidelity of their ſovereign; under the reſtriction, that they might be exchanged every ſix months for perſons of an equal condition, if they ſhould be deſirous of returning to their own country. As to the giving up of any forts or caſtles, they would not agree to it, becauſe among the other inconveniencies of this meaſure, ſimilar claims would be competent to the king of France, by the ſpirit of the treaty of Edinburgh, which ſtipulated, that no French or Engliſh troops ſhould be admitted into Scotland. The lord keeper Bacon, reſuming his diſcourſe, told them, that the whole realm of Scotland, its prince, nobles, and caſtles, were an inadequate pledge to the queen of England; and that, if his advice would be followed, the queen of Scots ſhould not obtain her liberty upon any kind of ſecurity which could be granted by the Scottiſh nation. In all public treaties, ſaid the delegates of Mary, no further aſſurance can be required from a ſovereign than what conſiſts with his ſafety; and when exactions are preſſed from a contracting party in a league which are ruinous and impoſſible, it is underſtood that a foundation is ſought to break off the negotiation. The Engliſh commiſſioners, now interfering in a body, declared upon their honour, that it was the meaning of Elizabeth to agree to the reſtoration of the queen of Scots to her crown and realm upon receiving ſufficient aſſurances for the articles of the accommodation; that the ſecurity offered for her acceptance, ſhould be ſubmitted to her deliberation; and that they would immediately proceed to confer with the deputies for the king of Scots.

7 with ng's es.

The Engliſh commiſſioners were not unacquainted with the ſentiments of the earl of Morton and his colleagues; and it was from this quarter that they expected a reſolute and definitive interruption to the treaty. Nor did theſe delegates diſappoint the expectations conceived of them. After affecting to take a comprehenſive view of the articles under debate, they declared, that their commiſſion gave them authority to treat about the amity of the two kingdoms, and the maintenance of the true religion; but that it conferred upon them no power to receive their queen into Scotland, or to ſurrender to Elizabeth the perſon of their king. They therefore begged not to be urged to accede to a league which, in ſome future period, might expoſe them to a charge of high treaſon.

8 ech cts eaty.

This ſingular declaration was conſidered to be ſolid and weighty by the Engliſh commiſſioners; and, in a new conference, it was communicated by them to the deputies of Mary. The biſhop of Roſs and his aſſociates were diſguſted with this formal impertinence. They did not heſitate to pronounce the plea of an inſufficient commiſſion from the king to his delegates to be an unworthy and moſt frivolous ſubterfuge. The authors, they ſaid, of the depoſition of their ſovereign did not need any authority but their own to ſet her at liberty; the prince was not yet five years of age, and could give them no inſtructions: and the regent was wholly dependent upon the will and pleaſure of the queen of England. It was repreſented in return by the Engliſh delegates, that the commiſſion of King James to his deputies, having been peruſed by Elizabeth, was accounted by her to be inſufficient; and that it was her opinion, that the earl of Morton ſhould return to Scotland to hold a parliament for obtaining new powers. The biſhop of Roſs exclaimed, that the queen of Scots had been amuſed with deceitful promiſes, that the prudence of Elizabeth had been corrupted by partial counſels, and that the allegations and pretences held out for interrupting the negotiation were affected and unreal. The inſtructions, he ſaid, from his ſovereign to her commiſſioners, were to negotiate and to conclude, and not to trifle; and they would not by any means conſent to protract, by artificial delays, a treaty which the queen of England, if her intentions were ſincere and right, could immediately terminate upon reaſonable and honourable terms. His ſpeech and his demeanour he acknowledged to be free and open; and he beſought them to excuſe him, ſince, having been made an inſtrument to abuſe his miſtreſs with falſe hopes, he could not but reſent the indignity, and expreſs what he knew and what he felt. The Engliſh deputies, addreſſing him and his colleagues, obſerved, that as the friends of Mary, and thoſe of the king her ſon, could not come to an agreement, and as their queen was refuſed the aſſurance ſhe expected, they held their commiſſion to be at an end, and were no longer at liberty to negotiate.

76 The a ted co tion o two q

The inſincerity of Elizabeth, and the failure of the league or agreement, filled Mary with reſentment and complaints. Her animoſities, and thoſe of Elizabeth, were increaſed and fortified. She was in haſte to communicate to her allies the unworthy treatment ſhe had received; and ſhe ſent her commands to her adherents in Scotland to riſe up in arms, to repoſe no truſt in truces which were prejudicial and treacherous, and to employ all their reſources and ſtrength in the humiliation of the regent and his faction. Elizabeth, who by this time apprehended no enterpriſe or danger from Charles IX. or the duke of Alva, reſolved, on the other hand, to gave a ſtrong and effectual ſupport to the king's friends, and to diſunite by ſtratagem, and oppreſs by power, the partizans of the Scottiſh princeſs. The zeal of the biſhop of Roſs having raiſed her anger, ſhe commanded him to depart from London; and Mary, in contempt of her mandate, ordered him to remain there under the privilege of her ambaſſador. The high and unbroken ſpirit of the Scottiſh queen, in the midſt of her misfortunes, never once awakened the generous admiration of Elizabeth. While it uniformly inflamed her rage, it ſeems alſo to have excited her terror. With a puſillanimous meanneſs, ſhe ſent a deſpatch to the earl of Shrewſbury, inſtructing him to keep his charge in the cloſeſt

ledge of Paul's ſtyle and manner, that he would peruſe his other epiſtles with much greater eaſe.

That the epiſtle to the Romans was written at Corinth by St Paul, is aſcertained by the teſtimony of the ancient Chriſtians. It was compoſed in the year 58, in the 24th year after Paul's converſion, and is the ſeventh epiſtle which he wrote. From the Acts of the Apoſtles we learn that it muſt have been written within the ſpace of three months; for that was the whole period of Paul's reſidence in Greece, (Acts xx. 1, 2, 3.)

The following analyſis of this epiſtle we have taken from a valuable little treatiſe, entitled, A Key to the New Teſtament, which was written by Dr Percy biſhop of Dromore. It exhibits the intention of the apoſtle, and the arguments which he uſes to prove his different propoſitions, in the moſt conciſe, diſtinct, and connected manner, and affords the beſt view of this epiſtle that we have ever ſeen.

"The Chriſtian church at Rome appears not to have been planted by an apoſtle; wherefore St Paul, leſt it ſhould be corrupted by the Jews, who then ſwarmed in Rome, and of whom many were converted to Chriſtianity, ſends them an abſtract of the principal truths of the goſpel, and endeavours to guard them againſt thoſe erroneous notions which the Jews had of juſtification, and of the election of their own nation.

"Now the Jews aſſigned three grounds for juſtification. Firſt, 'The extraordinary piety and merits of their anceſtors, and the covenant made by God with theſe holy men.' They thought God could not hate the children of ſuch meritorious parents: and as he had made a covenant with the patriarchs to bleſs their poſterity, he was obliged thereby to pardon their ſins. Secondly, 'A perfect knowledge and diligent ſtudy of the law of Moſes.' They made this a plea for the remiſſion of all their ſins and vices. Thirdly, 'The works of the Levitical law,' which were to expiate ſin, eſpecially circumciſion and ſacrifices. Hence they inferred that the Gentiles muſt receive the whole law of Moſes, in order to be juſtified and ſaved.

"The doctrine of the Jews concerning election was, 'That as God had promiſed to Abraham to bleſs his ſeed, to give him not only ſpiritual bleſſings, but alſo the land of Canaan, to ſuffer him to dwell there in proſperity, and to conſider him as his church upon earth:' That therefore this bleſſing extended to their whole nation, and that God was bound to fulfil theſe promiſes to them, whether they were righteous or wicked, faithful or unbelieving. They even believed that a prophet ought not to pronounce againſt their nation the prophecies with which he was inſpired; but was rather to beg of God to expunge his name out of the book of the living.

"Theſe previous remarks will ſerve as a key to unlock this difficult epiſtle, of which we ſhall now give a ſhort analyſis. See *Michaelis's Lectures on the New Teſtament.*

"I. The Epiſtle begins with the uſual ſalutation with which the Greeks began their letters, (chap. i. 1—7.)

"II. St Paul profeſſes his joy at the flouriſhing ſtate of the church at Rome, and his deſire to come and preach the goſpel, (ver. 8—19.): then he inſenſibly introduces the capital point he intended to prove, viz.

"III. The ſubject of the goſpel (ver. 16, 17.), that it reveals a righteouſneſs unknown before, which is derived ſolely from faith, and to which Jews and Gentiles have an equal claim.

"IV. In order to prove this, he ſhows (chap. i. 18.—iii. 20.) that both Jews and Gentiles are 'under ſin,' i. e. that God will impute their ſins to Jews as well as to Gentiles.

"His arguments may be reduced to theſe ſyllogiſms (chap. ii. 1. 17—24.) 1. 'The wrath of God is revealed againſt thoſe who hold the truth in unrighteouſneſs; i. e. who acknowledge the truth, and yet ſin againſt it. 2. The Gentiles acknowledged truths; but, partly by their idolatry, and partly by their other deteſtable vices, they ſinned againſt the truth they acknowledged. 3. Therefore the wrath of God is revealed againſt the Gentiles, and puniſheth them. 4. The Jews have acknowledged more truths than the Gentiles, and yet they ſin. 5. Conſequently the Jewiſh ſinners are yet more expoſed to the wrath of God (ch. ii. 1—12.) Having thus proved his point, he anſwers certain objections to it. *Obj.* 1. 'The Jews were well grounded in their knowledge, and ſtudied the law.' He anſwers, 'If the knowledge of the law, without obſerving it, could juſtify them, then God could not have condemned the Gentiles, who knew the law by nature, (chap. ii. 13—16.) *Obj.* 2. 'The Jews were circumciſed.' *Anſ.* That is, ye are admitted by an outward ſign into the covenant with God. This ſign will not avail you when ye violate that covenant (chap. ii. 25. to the end). *Obj.* 3. 'According to this doctrine of St Paul, the Jews have no advantage before others.' *Anſ.* Yes, they ſtill have advantages; for unto them are committed the oracles of God. But their privileges do not extend to this, that God ſhould overlook their ſins, which, on the contrary, Scripture condemns even in the Jews (chap. iii. 1—19.) *Obj.* 4. 'They had the Levitical law and ſacrifices.' *Anſ.* From hence is no remiſſion, but only the knowledge of ſin, (chap. iii. 20.)

"V. From all this St Paul concludes, that Jews and Gentiles may be juſtified by the ſame means, namely, without the Levitical law, through faith in Chriſt: And in oppoſition to the imaginary advantages of the Jews, he ſtates the declaration of Zechariah, that God is the God of the Gentiles as well as of the Jews, (ch. iii. 21. to the end.)

"VI. As the whole bleſſing was promiſed to the faithful deſcendants of Abraham, whom both Scripture and the Jews call his children, he proves his former aſſertion from the example of Abraham; who was an idolater before his call, but was declared juſt by God, on account of his faith, long before his circumciſion. Hence he takes occaſion to explain the nature and fruits of faith, (chap. iv. 1. v. 11.)

"VII. He goes on to prove from God's juſtice, that the Jews had no advantages over the Gentiles with reſpect to juſtification. Both Jews and Gentiles had forfeited life and immortality, by the means of one common father of their race, whom they themſelves had not choſen. Now as God was willing to reſtore immortality by a new ſpiritual head of a covenant, viz. Chriſt, it was juſt that both Jews and Gentiles ſhould ſhare in this new repreſentative of the whole race (ch. v. 12. to the end).—Chap. v. ver. 15, 16. amounts to this negative queſtion, "Is it not fitting that the free gift ſhould extend as far as the offence?"

Scripture.

" VIII. He ſhows that the doctrine of juſtification, as ſtated by him, lays us under the ſtrongeſt obligations of holineſs, (ch. vi. 1. to the end.)

" IX. He ſhows that the law of Moſes no longer concerns us at all; for our juſtification ariſes from our appearing in God's ſight, as if actually dead with Chriſt on account of our ſins; but the law of Moſes was not given to the dead. On this occaſion he proves at large, that the eternal power of God over us is not affected by this; and that whilſt we are under the law of Moſes we perpetually become ſubject to death, even by ſins of inadvertency, (ch. vii. 1. to the end.)

" X. Hence he concludes, that all thoſe, and thoſe only, who are united with Chriſt, and for the ſake of his union do not live according to the fleſh, are free from all condemnation of the law, and have an undoubted ſhare in eternal life, (ch. viii. 1—17.)

" XI. Having deſcribed their bleſſedneſs, he is aware that the Jews, who expected a temporal happineſs, ſhould object to him, that Chriſtians notwithſtanding endure much ſuffering in this world. He anſwers this objection at large, (ch. viii. 18. to the end.)

" XII. He ſhows that God is not the leſs true and faithful, becauſe he doth not juſtify, but rather rejects and puniſhes, thoſe Jews who would not believe the Meſſiah, (ch. ix. x. xi.) In diſcuſſing this point, we may obſerve the cautious manner in which, on account of the Jewiſh prejudices, he introduces it (ch. ix. 1—5.), as well as in the diſcuſſion itſelf.

" He ſhows that the promiſes of God were never made to all the poſterity of Abraham, and that God always reſerved to himſelf the power of chooſing thoſe ſons of Abraham whom, for Abraham's ſake, he intended to bleſs, and of puniſhing the wicked ſons of Abraham; and that with reſpect to temporal happineſs or miſery, he was not even determined in his choice by their works. Thus he rejected Iſhmael, Eſau, the Iſraelites in the deſert in the time of Moſes, and the greater part of that people in the time of Iſaiah, making them a ſacrifice to his juſtice, (ch. ix. 6—29.)

" He then proceeds to ſhow that God had reaſon to reject moſt of the Jews then living, becauſe they would not believe in the Meſſiah, though the goſpel had been preached to them plainly enough, (chap. ix. 30. x. to the end.) However, that God had not rejected all his people, but was ſtill fulfilling his promiſe upon many thouſand natural deſcendants of Abraham, who believed in the Meſſiah, and would in a future period fulfil them upon more; for that all Iſrael would be converted, (ch. xi. 1—32.) And he concludes with admiring the wiſe counſels of God, (ver. 33. to the end.)

" XIII. From the doctrine hitherto laid down, and particularly from this, that God has in mercy accepted the Gentiles; he argues, that the Romans ſhould conſecrate and offer themſelves up wholly to God. This leads him to mention in particular ſome Chriſtian duties, (ch. xii.), viz.

" XIV. He exhorts them to be ſubject to magiſtrates (ch. xiii. 1—7.); the Jews at that time being given to ſedition.

" XV. To love one another heartily (ver. 2—10.) And,

" XVI. To abſtain from thoſe vices which were conſidered as things indifferent among the Gentiles, (ver. 11. to the end.)

" XVII. He exhorts the Jews and Gentiles in the Chriſtian church to brotherly unity, (ch. xiv. 2. xv. 13.)

" XVIII. He concludes his Epiſtle with an excuſe for having ventured to admoniſh the Romans, whom he had not converted; with an account of his journey to Jeruſalem; and with ſome ſalutations to thoſe perſons whom he meant to recommend to the church at Rome." See *Michaelis's Lectures on the New Teſtament.*

Corinth was a wealthy and luxurious city, built upon the iſthmus which joins the Morea to the northern parts of Greece. In this city Paul had ſpent two years founding a Chriſtian church, which conſiſted of a mixture of Jews and Gentiles, but the greater part Gentiles.

About three years after the apoſtle had left Corinth, he wrote this Epiſtle from Epheſus in the year 56 or 57, and in the beginning of Nero's reign. That it was written from Epheſus, appears from the ſalutation with which the Epiſtle cloſes, (chap. xvi. 19.) " The churches of Aſia ſalute you. Aquila and Priſcilla ſalute you much in the Lord." From theſe words it is evident, in the firſt place, that the Epiſtle was written in Aſia. 2dly, It appears from Acts xviii. 18, 19. that Aquila and Priſcilla accompanied Paul from Corinth to Epheſus, where they ſeem to have continued till Paul's departure.

St Paul had certainly kept up a conſtant intercourſe with the churches which he had founded; for he was evidently acquainted with all their revolutions. They ſeem to have applied to him for advice in thoſe difficult caſes which their own underſtanding could not ſolve; and he was ready on all occaſions to correct their miſtakes.

This Epiſtle conſiſts of two parts. 1. A reproof for thoſe vices to which they were moſt propenſe; 2. An anſwer to ſome queries which they had propoſed to him.

The Corinthians, like the other Greeks, had been accuſtomed to ſee their philoſophers divide themſelves into different ſects; and as they brought along with them into the Chriſtian church their former opinions and cuſtoms, they wiſhed, as before, to arrange themſelves under different leaders. In this Epiſtle Paul condemns theſe diviſions as inconſiſtent with the ſpirit of Chriſtianity, which inculcates benevolence and unanimity, and as oppoſite to the conduct of Chriſtian teachers, who did not, like the philoſophers, aſpire after the praiſe of eloquence and wiſdom. They laid no claim to theſe nor to any honour that cometh from men. The apoſtle declares, that the Chriſtian truths were revealed from heaven; that they were taught with great plainneſs and ſimplicity, and proved by the evidence of miracles, (chap. i. 1.) He diſſuades them from their diviſions and animoſities, by reminding them of the great trial which every man's work muſt undergo; of the guilt they incurred by polluting the temple or church of God; of the vanity of human wiſdom; and of glorying in men. He admoniſhes them to eſteem the teachers of the goſpel only as the ſervants of Chriſt; and to remember that every ſuperior advantage which they enjoyed was to be aſcribed to the goodneſs of God, (chap. iii. 4.)

2. In the fifth chapter the apoſtle conſiders the caſe of a notorious offender, who had married his ſtepmother;

pture. ther; and tells them, that he ought to be excommunicated. He also exhorts the Christians not to associate with any person who led such an openly profane life.

3. He censures the Corinthians for their litigious disposition, which caused them to prosecute their Christian brethren before the Heathen courts. He expresses much warmth and surprise that they did not refer their differences to their brethren; and concludes his exhortations on this subject by assuring them that they ought rather to allow themselves to be defrauded than to seek redress from Heathens (chap. v. 1—9.)

4. He inveighs against those vices to which the Corinthians had been addicted before their conversion, and especially against fornication, the criminality of which they did not fully perceive, as this vice was generally overlooked in the system of the philosophers, (chap. vi. 10. to the end.)

85 an. cer- que- which had osed to

Having thus pointed out the public irregularities with which they were chargeable, he next replies to certain questions which the Corinthians had proposed to him by letter. He, 1. Determines some questions relating to the marriage state; as, 1st, Whether it was good to marry under the existing circumstances of the church? And, 2d, Whether they should withdraw from their partners if they continued unbelievers? (ch. vii.)

2. He instructs them how to act with respect to idol offerings. It could not be unlawful in itself to eat the food which had been offered to idols; for the consecration of flesh or wine to an idol did not make it the property of the idol, an idol being nothing, and therefore incapable of property. But some Corinthians thought it lawful to go to a feast in the idol temples, which at the same time were places of resort for lewdness, and to eat the sacrifices whilst praises were sung to the idol. This was publicly joining in the idolatry. He even advises to abstain from such participation as was lawful, rather than give offence to a weak brother; which he enforces by his own example, who had abstained from many lawful things, rather than prove a scandal to the gospel, (chap. vii. ix. x.)

3. He answers a third query concerning the manner in which women should deliver any thing in public, when called to it by a divine impulse. And here he censures the unusual dress of both sexes in prophesying, which exposed them to the contempt of the Greeks, among whom the men usually went uncovered and the women veiled.

Being thus led to the consideration of the abuses that prevailed in their public worship, he goes on to censure the irregularities which were committed at their love feasts, or, as we term them, the *Lord's Supper*. It was a common practice with the Greeks at their social suppers for every man to bring his own provisions along with him, not, however, to share them with the company, but to feast upon them in a solitary manner. Thus the rich ate and drank to excess, while the poor were totally neglected. The Corinthians introduced the same practice in the celebration of the Lord's Supper, thus confounding it with their ordinary meals, and without ever examining into the end of the institution. It was this gross abuse that Paul reproves in the 11th chapter. He also censures their conduct in the exercise of the extraordinary gifts of the Holy Ghost; he shows them they all proceeded from the same spirit, and were intended for the instruction of Christian societies; that all Christians ought to be united in mutual love; and that tenderness ought to be shown to the most inconsiderable member, as every one is subservient to the good of the whole (chap. xii.) In the 13th chapter he gives a beautiful description of benevolence, which has been much and justly admired. He represents it as superior to the supernatural gifts of the spirit, to the most exalted genius, to universal knowledge, and even to faith. In the 14th chapter he cautions the Corinthians against ostentation in the exercise of the gift of languages, and gives them proper advices. Scripture.

4. He asserts the resurrection of the dead, in opposition to some of the Corinthians who denied it, founding it upon the resurrection of Jesus Christ, which he considers as one of the most essential doctrines of Christianity. He then answers some objections to the resurrection, drawn from our not being capable of understanding how it will be accomplished, (chap. xv.) He then concludes with some directions to the Corinthian church concerning the manner of collecting alms; promises them a visit, and salutes some of the members.

186 The second Epistle to the Corinthians was written from Macedonia in the year 57, about a year after the former. See 2 Cor. ix. 1—5. viii. and xiii. 1. The second Epistle to the Corinthians.

St Paul's first Epistle had wrought different effects among the Corinthians: many of them examined their conduct; they excommunicated the incestuous man; requested St Paul's return with tears; and vindicated him and his office against the false teacher and his adherents. Others of them still adhered to that adversary of St Paul, expressly denied his apostolic office, and even furnished themselves with pretended arguments from that Epistle. He had formerly promised to take a journey from Ephesus to Corinth, thence to visit the Macedonians, and return from them to Corinth (2 Cor. i. 15, 16.) But the unhappy state of the Corinthian church made him alter his intention (verse 23.), since he found he must have treated them with severity. Hence his adversaries partly argued, 1. That St Paul was irresolute and unsteady, and therefore could not be a prophet: 2. The improbability of his ever coming to Corinth again, since he was afraid of them. Such was the state of the Corinthian church when St Paul, after his departure from Ephesus, having visited Macedonia, (Acts xx. 1.) received an account of the above particulars from Titus (2 Cor. vii. 5, 6.), and therefore wrote them his second Epistle about the end of the same year, or the beginning of 58. 187 State of the Corinthian church.

188 View of the contents of this Epistle.

But to give a more distinct view of the contents of this Epistle:

1. The apostle, after a general salutation, expresses his grateful sense of the divine goodness; professing his confidence in God, supported by a sense of his own integrity; makes an apology for not having visited the Corinthians as he had intended, and vindicates himself from the charge of fickleness, (chap. i.)

2. He forgives the incestuous man, whose conduct had made so deep an impression on the apostle's mind, that one reason why he had deferred his journey to Corinth was, that he might not meet them in grief, nor till he had received advice of the effect of his apostolical admonitions. He mentions his anxiety to meet Titus at Troas, in order to hear of their welfare; expresses

Scripture. his thankfulneſs to God for the ſucceſs attending his miniſtry, and ſpeaks of the Corinthians as his credentials, written by the finger of God, (chap. ii. iii. 1—6.)

3. He treats of the office committed to him of preaching the redemption; and highly prefers it to preaching the law: to which probably his adverſaries had made great pretences. They had ridiculed his ſufferings; which he ſhows to be no diſgrace to the goſpel or its miniſters; and here he gives a ſhort abſtract of the doctrine he preaches, (chap. iii. 6. v. to the end.)

He expatiates with great copiouſneſs on the temper with which, in the midſt of afflictions and perſecutions, he and his brethren executed their important embaſſy; and with great affection and tenderneſs he exhorts them to avoid the pollution of idolatry, (chap. vi.) He endeavours to win their confidence, by telling them how much he rejoiced in their amendment and welfare, and how ſorry he had been for the diſtreſs which his neceſſary reproofs had occaſioned, (chap. vii.) He then exhorts them to make liberal contributions for the Chriſtians in Judæa. He recommends to them the example of the Macedonians, and reminds them of the benevolence of the Lord Jeſus. He expreſſes his joy for the readineſs of Titus to aſſiſt in making the collection; and makes alſo honourable mention of other Chriſtian brethren, whom he had joined with Titus in the ſame commiſſion, (chap. viii.) He then, with admirable addreſs, urges a liberal contribution, and recommends them to the divine bleſſing, (chap. ix.)

4. Next he obviates ſome reflections which had been thrown upon him for the mildneſs of his conduct, as if it had proceeded from fear. He aſſerts his apoſtolical power and authority, cautioning his opponents againſt urging him to give too ſenſible demonſtrations of it, (chap. x.) He vindicates himſelf againſt the inſinuations of ſome of the Corinthians, particularly for having declined pecuniary ſupport from the church; an action which had been ungenerouſly turned to his diſadvantage. To ſhow his ſuperiority over thoſe deſigning men who had oppoſed his preaching, he enumerates his ſufferings; gives a detail of ſome extraordinary revelations which he had received; and vindicates himſelf from the charge of boaſting, by declaring that he had been forced to it by the deſire of ſupporting his apoſtolical character, (chap. xi. xii.) He cloſes the Epiſtle, by aſſuring them with great tenderneſs how much it would grieve him to demonſtrate his divine commiſſion by ſeverer methods.

189 Epiſtle to the Galatians.

The Galatians were deſcended from thoſe Gauls who had formerly invaded Greece, and afterwards ſettled in Lower Aſia. St Paul had preached the goſpel among them in the year 51, ſoon after the council held at Jeruſalem, (Acts xvi. 6.) Aſia ſwarmed at that time with zealots for the law of Moſes, who wanted to impoſe it upon the Gentiles, (Acts xv. 1.) Soon after St Paul had left the Galatians, theſe falſe teachers had got among them, and wanted them to be circumciſed, &c. This occaſioned the following Epiſtle, which Michaelis thinks was written in the ſame year, before St Paul left Theſſalonica. Dr Lardner dates it about the end of the year 52, or in the very beginning of 53, before St Paul ſet out to go to Jeruſalem by way of Epheſus.

The date and occaſion.

The ſubject of this Epiſtle is much the ſame with that of the Epiſtle to the Romans; only this queſtion is more fully conſidered here, "Whether circumciſion, and an obſervance of the Levitical law, be neceſſary to the ſalvation of a Chriſtian convert?" It appears, theſe Judaizing Chriſtians, whoſe indirect views St Paul expoſes (Acts xv. 1. Gal. x. 3. 9.), at firſt only repreſented circumciſion as neceſſary to ſalvation; but afterwards they inſiſted upon the Chriſtians receiving the Jewiſh feſtivals, (Gal. iv. 10.)

As St Paul had founded the churches of Galatia, and inſtructed them in the Chriſtian religion, he does not ſet before them its principal doctrines as he had done in the Epiſtle to the Romans; but referring them to what he had already taught (chap. i. 8, 9.), he proceeds at once to the ſubject of the Epiſtle.

As it appears from ſeveral paſſages of this Epiſtle, particularly chap. i. 7, 8, 10. and chap. v. 11. that the Judaizing Chriſtians had endeavoured to perſuade the Galatians that Paul himſelf had changed his opinion, and now preached up the Levitical law; he denies that charge, and affirms that the doctrines which he had taught were true, for he had received them from God by immediate revelation. He relates his miraculous converſion; aſſerts his apoſtolical authority, which had been acknowledged by the diſciples of Jeſus; and, as a proof that he had never inculcated a compliance with the Moſaic law, he declares that he had oppoſed Peter at Antioch for yielding to the prejudices of the Jews.

Having now vindicated his character from the ſuſpicion of fickleneſs, and ſhown that his commiſſion was divine, he argues that the Galatians ought not to ſubmit to the law of Moſes: 1. Becauſe they had received the Holy Ghoſt and the gifts of miracles, not by the law, but by the goſpel, (chap. iii. 1—5.) 2. Becauſe the promiſes which God made to Abraham were not reſtricted to his circumciſed deſcendants, but extended to all who are his children by faith, (chap. iii. 6—18.) In anſwer to the objection, *To what then ſerveth the law?* he replies, That it was given becauſe of tranſgreſſion; that is to preſerve them from idolatry till the Meſſiah himſelf ſhould come. 3. Becauſe all men, whether Jews or Gentiles, are made the children of God by faith, or by receiving the Chriſtian religion, and therefore do not ſtand in need of circumciſion, (ch. iii. 26—29.) From the 1ſt verſe of chapter iv. to the 11th, he argues that the law was temporary, being only fitted for a ſtate of infancy; but that the world, having attained a ſtate of manhood under the Meſſiah, the law was of no further uſe. In the remaining part of chap. iv. he reminds them of their former affection to him, and aſſures them that he was ſtill their ſincere friend. He exhorts them to ſtand faſt in the liberty with which Chriſt had made them free; for the ſons of Agar, that is, thoſe under the law given at Mount Sinai, are in bondage, and to be caſt out; the inheritance being deſigned for thoſe only who are the free-born ſons of God under the ſpiritual covenant of the goſpel.

The apoſtle next confutes the falſe report which had been ſpread abroad among the Galatians, that Paul himſelf preached up circumciſion. He had already indirectly refuted this calumny by the particular account which he gives of his life; but he now directly and openly contradicts it in the following manner:

1. By

Scripture.

1. By assuring them, that all who thought circumcision necessary to salvation could receive no benefit from the Christian religion, (chap. v. 2—4.)

2. By declaring, that he expected justification only by faith, (ver. 5, 6.)

3. By testifying, that they had once received the truth, and had never been taught such false doctrines by him, (ver. 7, 8.)

4. By insinuating that they should pass some censure on those who misled them (ver. 9, 10.), by declaring that he was persecuted for opposing the circumcision of the Christians, (ver. 11.)

5. By expressing a wish that those persons should be cut off who troubled them with his doctrine.

This Epistle affords a fine instance of Paul's skill in managing an argument. The chief objection which the advocates for the Mosaic law had urged against him was, that he himself preached circumcision. In the beginning of the Epistle he overturns this slander by a statement of facts, without taking any express notice of it; but at the end fully refutes it, that it might leave a strong and lasting impression upon their minds.

He next cautions them against an idea which his arguments for Christian liberty might excite, that it consisted in licentiousness. He shows them it does not consist in gratifying vicious desires; for none are under stronger obligations to moral duties than the Christian. He recommends gentleness and meekness to the weak (chap. vi. 1—5.), and exhorts them to be liberal to their teachers, and unto all men (ver. 6—10.) He concludes with exposing the false pretences of the Judaizing teachers, and asserting the integrity of his own conduct.

194 Epistle to the Ephesians.

Ephesus was the chief city of all Asia on this side Mount Taurus. St Paul had passed through it in the year 54, but without making any stay, (Acts xviii. 19—21.) The following year he returned to Ephesus again, and staid there three years, (chap. xix.) During his abode there he completed a very flourishing church of Christians, the first foundations of which had been laid by some inferior teachers. As Ephesus was frequented by persons of distinction from all parts of Asia Minor, St Paul took the opportunity of preaching in the ancient countries (ver. 10.); and the other churches of Asia were considered as the daughters of the church of Ephesus; so that an Epistle to the Ephesians was, in effect, an epistle to the other churches of Asia at the same time.

195 The date

Dr Lardner shows it to be highly probable that this Epistle was written in the year 61, soon after Paul's arrival at Rome.

196 and design of it.

As Paul was in a peculiar manner the apostle of the Gentiles, and was now a prisoner at Rome in consequence of having provoked the Jews, by asserting that an observance of the Mosaic law was not necessary to obtain the favour of God, he was afraid lest an advantage should be taken of his confinement to unsettle the minds of those whom he had converted. Hearing that the Ephesians stood firm in the faith of Christ, without submitting to the law of Moses, he writes this Epistle to give them more exalted views of the love of God, and of the excellence and dignity of Christ. This Epistle is not composed in an argumentative or didactic style: The first three chapters consist almost entirely of thanksgivings and prayers, or glowing descriptions of the blessings of the Christian religion. This circumstance renders them a little obscure; but by the assistance of the two following epistles, which were written on the same occasion, and with the same design, the meaning of the apostle may be easily discovered. The last three chapters contain practical exhortations. He first inculcates unity, love, and concord, from the consideration that all Christians are members of the same body, of which Christ is the head. He then advises them to forsake the vices to which they had been addicted while they remained heathens. He recommends justice and charity; strenuously condemns lewdness, obscenity, and intemperance, vices which seem to have been too common among the Ephesians. In the 6th chapter he points out the duties which arise from the relations of husbands and wives, parents and children, masters and servants; and concludes with strong exhortations to fortitude, which he describes in an allegorical manner.

Scripture.

197 Epistle to the Philippians.

The church at Philippi had been founded by Paul, Silas, and Timothy (Acts xvi.), in the year 51, and had continued to show a strong and manly attachment to the Christian religion, and a tender affection for the apostle. Hearing of his imprisonment at Rome, they sent Epaphroditus, one of their pastors, to supply him with money. It appears from this Epistle that he was in great want of necessaries before this contribution arrived; for as he had not converted the Romans, he did not consider himself as entitled to receive supplies from them. Being a prisoner, he could not work as formerly; and it was a maxim of his never to accept any pecuniary assistance from those churches where a faction had been raised against him. From the Philippians he was not averse to receive a present in the time of want, because he considered it as a mark of their affection, and because he was assured that they had conducted themselves as sincere Christians.

198 The date

It appears from the apostle's own words, that this letter was written while he was a prisoner at Rome, (chap. i. 7, 13. iv. 22.); and from the expectation which he discovers (chap. ii. 24.) of being soon released and restored to them, compared with Philemon v. 22. and Heb. xiii. 13. where he expresses a like expectation in stronger terms, it is probable that this was written towards the end of his first imprisonment in the year 62.

199 and design of it.

The apostle's design in this Epistle, which is quite of the practical kind, seems to be, "to comfort the Philippians under the concern they had expressed at the news of his imprisonment; to check a party spirit that appears to have broke out among them, and to promote, on the contrary, an entire union and harmony of affection; to guard them against being seduced from the purity of the Christian faith by Judaizing teachers; to support them under the trials with which they struggled; and, above all, to inspire them with a concern to adorn their profession by the most eminent attainments in the divine life." After some particular admonitions in the beginning of the 4th chapter, he proceeds in the 8th verse to recommend virtue in the most extensive sense, mentioning all the different foundations in which it had been placed by the Grecian philosophers. Towards the close of the Epistle, he makes his acknowlegments to the Philippians for the seasonable and libe-

Scripture.

ral ſupply which they had ſent him, as it was ſo convincing a proof of their affection for him, and their concern for the ſupport of the goſpel, which he preferred far above any private ſecular intereſt of his own; expreſsly diſclaiming all ſelfiſh, mercenary views, and aſſuring them with a noble ſimplicity, that he was able upon all occaſions to accommodate his temper to his circumſtances; and had learned, under the teachings of Divine grace, in whatever ſtation Providence might ſee fit to place him, therewith to be content. After which, the apoſtle, having encouraged them to expect a rich ſupply of all their wants from their God and Father, to whom he devoutly aſcribes the honour of all, concludes with ſalutations from himſelf and his friends at Rome to the whole church, and a ſolemn benediction, (verſe 10. to the end); and declares, that he rejoiced in their liberality chiefly on their own account.

200 Epiſtle to the Coloſſians — Date and deſign of it.

The Epiſtle to the Coloſſians was written while Paul was in priſon (chap. iv. 3.), and was therefore probably compoſed in the year 62. The intention of the apoſtle, as far as can be gathered from the epiſtle itſelf, was to ſecure the Coloſſians from the influence of ſome doctrines that were ſubverſive of Chriſtianity, and to excite them to a temper and behaviour worthy of their ſacred character. A new ſect had ariſen, which had blended the oriental philoſophy with the ſuperſtitious opinions of the Jews.

201 To guard the Coloſſians againſt the dangerous doctrines of the Jews.

They held 1. That God was ſurrounded by demons or angels, who were mediators with God, and therefore to be worſhipped. 2. That the ſoul is defiled by the body; that all bodily enjoyments hurt the ſoul, which they believed to be immortal, though they ſeem to have denied the reſurrection of the body, as it would only render the ſoul ſinful by being reunited to it. 3. That there was a great myſtery in numbers, particularly in the number ſeven; they therefore attributed a natural holineſs to the ſeventh or Sabbath day, which they obſerved more ſtrictly than the other Jews. They ſpent their time moſtly in contemplation; abſtained from marriage, and every gratification of the ſenſes; uſed waſhings, and thought it ſinful to touch certain things; regarded wine as poiſon, &c.

Percy's Key to the New Teſtament.

202 The arguments which the apoſtle employs.

The arguments againſt theſe doctrines are managed with great ſkill and addreſs. He begins with expreſſing great joy for the favourable character which he had heard of them, and aſſures them that he daily prayed for their farther improvement. Then he makes a ſhort digreſſion, in order to deſcribe the dignity of Jeſus Chriſt; declares that he had created all things, whether thrones or dominions, principalities and powers; that he alone was the head of the church, and had reconciled men to the Father. The inference from this deſcription is evident, that Jeſus was ſuperior to angels; that they were created beings, and ought not to be worſhipped. Thus he indirectly confutes one doctrine before he formally oppoſes it. Paul now returns from his digreſſion in the 21ſt verſe to the ſentiments with which he had introduced it in the 13th and 14th verſes, and again expreſſes his joy that the Philippians remained attached to the goſpel, which was to be preached to the Gentiles, without the reſtraints of the ceremonial law. Here again he ſtates a general doctrine, which was inconſiſtent with the opinions of thoſe who were zealous for the law of Moſes; but he leaves the Coloſſians to draw the inference, (chap. i.)

Having again aſſured them of his tender concern for their welfare, for their advancement in virtue, and that they might acknowledge the myſtery of God, that is, that the goſpel was to ſuperſede the law of Moſes, he proceeds directly to caution them againſt the philoſophy of the new teachers, and their ſuperſtitious adherence to the law; ſhows the ſuperiority of Chriſt to the angels, and warns Chriſtians againſt worſhipping them. He cenſures the obſervation of Sabbaths, and rebukes thoſe who required abſtinence from certain kinds of food, and cautions them againſt perſons who aſſume a great appearance of wiſdom and virtue (chap. ii.)

Scrip

Exho tions.

In the 3d chapter he exhorts them, that, inſtead of being occupied about external ceremonies, they ought to cultivate pure morality. He particularly guards them againſt impurity, to which they had before their converſion been much addicted. He admoniſhes them againſt indulging the iraſcible paſſions, and againſt committing falſehood. He exhorts them to cultivate the benevolent affections, and humility, and patience. He recommends alſo the relative duties between huſbands and wives, parents and children, maſters and ſervants. He enjoins the duties of prayer and thankſgiving (chap. iv. 2.), and requeſts them to remember him in their petitions. He enjoins affability and mild behaviour to the unconverted Heathens (verſe 6.); and concludes the epiſtle with matters which are all of a private nature, except the directions for reading this epiſtle in the church of Laodicea, as well as in the church of Coloſſe.

Firſt to th Theſſa

This epiſtles is addreſſed to the inhabitants of Theſſalonica, the capital of Macedonia, a large and populous city. It appears from the Acts, chapter xvii. 1. that the Chriſtian religion was introduced into this city by Paul and Silas, ſoon after they had left Philippi. At firſt they made many converts; but at length the Jews, ever jealous of the admiſſion of the Gentiles to the ſame privileges with themſelves, ſtirred up the rabble, which aſſaulted the houſe where the apoſtle and his friends lodged; ſo that Paul and Silas were obliged to flee to Berea, where their ſucceſs was ſoon interrupted by the ſame reſtleſs and implacable enemies. The apoſtle then withdrew to Athens; and Timothy, at his deſire, returned to Theſſalonica (1 Theſſ. iii. 2.) to ſee what were the ſentiments and behaviour of the inhabitants after the perſecution of the Jews. From Athens Paul went to Corinth, where he ſtayed a year and ſix months; during which, Timothy returned with the joyful tidings that the Theſſalonians remained ſteadfaſt to the faith, and firmly attached to the apoſtle, notwithſtanding his flight. Upon this he ſent them this epiſtle, A. D. 52, in the 12th year of Claudius. Th

This is generally reckoned the firſt epiſtle which Paul wrote; and we find he was anxious that it ſhould be read to all the Chriſtians. In chap. v. 27. he uſes theſe words; "I adjure you by the Lord, that this epiſtle be read unto all the holy brethren." This direction is very properly inſerted in his firſt epiſtle.

The intention of Paul in writing this epiſtle was evidently to encourage the Theſſalonians to adhere to the Chriſtian religion. This church being ſtill in its infancy, and oppreſſed by the powerful Jews, required to be eſtabliſhed in the faith. St Paul, therefore, in the three firſt chapters, endeavours to convince the Theſſalonians of the truth and divinity of his goſpel, both by

and of

the

Scripture. the miraculous gifts of the Holy Ghoſt which had been imparted, and by his own conduct when among them.

While he appeals, in the firſt chapter, to the miraculous gifts of the Holy Spirit, he is very liberal in his commendations. He vindicates himſelf from the charge of timidity, probably to prevent the Theſſalonians from forming an unfavourable opinion of his fortitude, which his flight might have excited. He aſſerts, that he was not influenced by ſelfiſh or diſhonourable motives, but that he was anxious to pleaſe God and not man. He expreſſes a ſtrong affection for them, and how anxious he was to impart the bleſſings of the goſpel. He congratulates himſelf upon his ſucceſs; mentions it to their honour that they received the goſpel as the word of God and not of man, and therefore did not renounce it when perſecution was raiſed by the Jews. He expreſſes a ſtrong deſire to viſit the Theſſalonians; and aſſures them he had been hitherto retained againſt his will.

As a farther proof of his regard, the apoſtle informs them, that when he came to Athens, he was ſo much concerned, leſt, being diſcouraged by his ſufferings, they ſhould be tempted to caſt off their profeſſion, that he could not forbear ſending Timothy to comfort and ſtrengthen them; and expreſſes, in very ſtrong terms, the ſenſible pleaſure he felt, in the midſt of all his afflictions, from the favourable account he received of their faith and love: to which he adds, that he was continually praying for their farther eſtabliſhment in religion, and for an opportunity of making them another viſit, in order to promote their edification, which lay ſo near his heart, (chap. iii. throughout.)

Having now ſhown his paternal affection for them, with great addreſs he improves all that influence which his zeal and fidelity in their ſervice muſt naturally have given him to inculcate upon them the precepts of the goſpel. He recommends chaſtity, in oppoſition to the prevailing practice of the heathens; juſtice, in oppoſition to fraud. He praiſes their benevolence, and encourages them to cultivate higher degrees of it. He recommends induſtry and prudent behaviour to their heathen neighbours. In order to comfort them under the loſs of their friends, he aſſures them that thoſe who were fallen aſleep in Jeſus ſhould be raiſed again at the laſt day, and ſhould, together with thoſe who remained alive, be caught up to meet their Lord, and ſhare his triumph, (chap. iv.) He admoniſhes them to prepare for this ſolemn event, that it might not come upon them unawares; and then concludes the Epiſtle with various exhortations.

207 Second Epiſtle to the Theſſalonians.

The ſecond Epiſtle to the Theſſalonians appears to have been written ſoon after the firſt, and from the ſame place; for Silvanus or Silas, and Timothy, are joined together with the apoſtle in the inſcriptions of this Epiſtle, as well as of the former.

208 Contents of

The apoſtle begins with commending the faith and charity of the Theſſalonians, of which he had heard a favourable report. He expreſſes great joy on account of the patience with which they ſupported perſecution; and obſerves that their perſecution was a proof of a righteous judgment to come, where their perſecutors would meet with their proper recompenſe, and the righteous be delivered out of all their afflictions. He aſſures them of his conſtant prayers for their farther improvement, in order to attain the felicity that was promiſed, (chap. i.) Scripture.

From miſunderſtanding a paſſage in his former letter, it appears that the Theſſalonians believed the day of judgment was at hand. To rectify this miſtake, he informs them that the day of the Lord will not come till a great apoſtaſy has overſpread the Chriſtian world, the nature of which he deſcribes (G). Symptoms of this myſtery of iniquity had then appeared; but the apoſtle expreſſes his thankfulneſs to God that the Theſſalonians had eſcaped this corruption. He exhorts them to ſteadfaſtneſs, and prays that God would comfort and ſtrengthen them, (chap. ii.)

He requeſts the prayers of the Theſſalonians for him and his two aſſiſtants, at the ſame time expreſſing his confidence that they would pay due regard to the inſtructions which he had given them. He then proceeds to correct ſome irregularities. Many of the Theſſalonians ſeem to have led an idle diſorderly life; theſe he ſeverely reproves, and commands the faithful to ſhun their company if they ſtill remained incorrigible.

209 First Epiſtle to Timothy, when written.

When the firſt Epiſtle to Timothy was written, it is difficult to aſcertain. Lardner dates it in 56; Mill, Whitby, and Macknight, place it in 64; but the arguments on which each party founds their opinion are too long to inſert here.

210 Intention and contents of it.

Timothy was the intimate friend and companion of Paul, and is always mentioned by that apoſtle with much affection and eſteem. Having appointed him to ſuperintend the church of Epheſus during a journey which he made to Macedonia, he wrote this letter, in order to direct him how to diſcharge the important truſt which was committed to him. This was the more neceſſary, as Timothy was young and unexperienced, (1 Tim. iv. 12.) In the beginning of the Epiſtle he reminds him of the charge with which he had intruſted him, to wit, to preſerve the purity of the goſpel againſt the pernicious doctrines of the Judaizing teachers, whoſe opinions led to frivolous controverſies, and not to a good life. He ſhows the uſe of the law of Moſes, of which theſe teachers were ignorant. This account of the law, he aſſures Timothy, was agreeable to the repreſentation of it in the goſpel, with the preaching of which he was intruſted. He then makes a digreſſion, in the fulneſs of his heart, to expreſs the ſenſe which he felt of the goodneſs of God towards him.

In the ſecond chapter the apoſtle preſcribes the manner in which the worſhip of God was to be performed in the church of Epheſus; and in the third explains the qualifications of the perſons whom he was to ordain as biſhops and deacons. In the fourth chapter he foretels the great corruptions of the church which were to prevail in future times, and inſtructs him how to ſupport the ſacred character. In the fifth chapter he

(G) For an explanation of this prophecy, Dr Hurd's Sermons may be conſulted. He applies it to the papal power, to which it correſponds with aſtoniſhing exactneſs.

Scripture. he teaches Timothy how to admoniſh the old and young of both ſexes; mentions the age and character of ſuch widows as were to be employed by the ſociety in ſome peculiar office: and ſubjoins ſome things concerning the reſpect due to elders. In the ſixth chapter he deſcribes the duties which Timothy was to inculcate on ſlaves; condemns trifling controverſies and pernicious diſputes; cenſures the exceſſive love of money, and charges the rich to be rich in good works.

211 Second Epiſtle to Timothy.

That the ſecond Epiſtle to Timothy was written from Rome is univerſally agreed; but whether it was during his firſt or ſecond impriſonment has been much diſputed. That Timothy was at Epheſus or in Aſia Minor when this Epiſtle was ſent to him, appears from

212 Deſign and contents of it.

the frequent mention in it of perſons reſiding at Epheſus. The apoſtle ſeems to have intended to prepare Timothy for thoſe ſufferings which he foreſaw he would be expoſed to. He exhorts him to conſtancy and perſeverance, and to perform with a good conſcience the duties of the ſacred function.

The falſe teachers, who had before thrown this church into confuſion, grew every day worſe: inſomuch that not only Hymenæus, but Philetus, another Epheſian heretic, now denied the reſurrection of the dead. They were led into this error by a diſpute about words. At firſt they only annexed various improper ſignifications to the word *reſurrection*, but at laſt they denied it altogether (H); pretending that the reſurrection of the dead was only a reſurrection from the death of ſin, and ſo was already paſt. This error was probably derived from the eaſtern philoſophy, which placed the origin of ſin in the body, (chapter ii.) He then forewarns him of the fatal apoſtaſy and declenſion that was beginning to appear in the church; and at the ſame time animates him, from his own example and the great motives of Chriſtianity, to the moſt vigorous and reſolute diſcharge of every part of the miniſterial office.

213 Epiſtle to Titus.

This Epiſtle is addreſſed to Titus, whom Paul had appointed to preſide over the church of Crete. It is difficult to determine either its date or the place from which it was ſent. The apoſtle begins with reminding

214 Deſign and contents of it.

Titus of the reaſons for which he had left him at Crete; and directs him on what principles he was to act in ordaining Chriſtian paſtors: the qualifications of whom he particularly deſcribes. To ſhow him how cautious he ought to be in ſelecting men for the ſacred office, he reminds him of the art of the Judaizing teachers, and the bad character of the Cretans, (chapter i.)

He adviſes him to accommodate his exhortations to the reſpective ages, ſexes, and circumſtances, of thoſe whom it was his duty to inſtruct; and to give the greater weight to his inſtructions, he admoniſhes him to be an example of what he taught, (chap. ii.) He exhorts him alſo to teach obedience to the civil magiſtrate, becauſe the Judaizing Chriſtians affirmed that no obedience was due from the worſhippers of the true God to magiſtrates who were idolaters. He cautions againſt cenſoriouſneſs and contention, and recommends meekneſs; for even the beſt Chriſtians had formerly been wicked, and all the bleſſings which they enjoyed they derived from the goodneſs of God. He then enjoins Titus ſtrenuouſly to inculcate good works, and to avoid uſeleſs controverſies; and concludes with directing him how to proceed with thoſe heretics who attempted to ſow diſſenſion in the church. Scr

The Epiſtle to Philemon was written from Rome at the ſame time with the Epiſtles to the Coloſſians and Philippians, about A. D. 62 or 63. The occaſion of the letter was this: Oneſimus, Philemon's ſlave, had robbed his maſter and fled to Rome; where, happily for him, he met with the apoſtle, who was at that time a priſoner at large, and by his inſtructions and admonitions was converted to Chriſtianity, and reclaimed to a ſenſe of his duty. St Paul ſeems to have kept him for ſome conſiderable time under his eye, that he might be ſatisfied of the reality of the change; and, when he had made a ſufficient trial of him, and found that his behaviour was entirely agreeable to his profeſſion, he would not detain him any longer for his own private convenience, though in a ſituation that rendered ſuch an aſſiſtant peculiarly deſirable (compare ver. 13, 14.), but ſent him back to his maſter; and, as a mark of his eſteem, entruſted him, together with Tychicus, with the charge of delivering his Epiſtle to the church at Coloſſe, and giving them a particular account of the ſtate of things at Rome, recommending him to them, at the ſame time, as a faithful and beloved brother, (Col. iv. 9.) And as Philemon might well be ſuppoſed to be ſtrongly prejudiced againſt one who had left his ſervice in ſo infamous a manner, he ſends him this letter, in which he employs all his influence to remove his ſuſpicions, and reconcile him to the thoughts of taking Oneſimus into his family again. And whereas St Paul might have exerted that authority which his character as an apoſtle, and the relation in which he ſtood to Philemon as a ſpiritual father, would naturally give him, he chooſes to entreat him as a friend; and with the ſofteſt and moſt inſinuating addreſs urges his ſuit, conjuring him by all the ties of Chriſtian friendſhip that he would not deny him his requeſt: and the more effectually to prevail upon him, he repreſents his own peace and happineſs as deeply intereſted in this event; and ſpeaks of Oneſimus in ſuch terms as were beſt adapted to ſoften his prejudices, and diſpoſe him to receive one who was ſo dear to himſelf, not merely as a ſervant, but as a fellow Chriſtian and a friend. Epi Phil —1 deſi Dod Fam poſit

It is impoſſible to read over this admirable Epiſtle, without being touched with the delicacy of ſentiment, and the maſterly addreſs that appear in every part of it. We ſee here, in a moſt ſtriking light, how perfectly conſiſtent true politeneſs is, not only with all the warmth and ſincerity of the friend, but even with the dignity of the Chriſtian and the apoſtle. And if this letter were to be conſidered in no other view than as a mere human compoſition, it muſt be allowed a maſterpiece in its kind. As an illuſtration of this remark, it may not be improper The and whi apo cov this

(H) This is by no means uncommon amongſt men; to begin to diſpute about the ſignification of words, and to be led gradually to deny the thing ſignified. This appears to have been the cauſe of moſt diſputes, and the general beginnings of ſcepticiſm and infidelity.

Scripture. improper to compare it with an epiſtle of Pliny, that ſeems to have been written upon a ſimilar occaſion, (Lib. IX. let 21.); which, though penned by one that was reckoned to excel in the epiſtolary ſtyle, and though it has undoubtedly many beauties, yet muſt be acknowledged, by every impartial reader, vaſtly inferior to this animated compoſition of the apoſtle.

217 iſtle to e He- ews was mpoſed Paul.

The Epiſtle to the Hebrews has been generally aſcribed to Paul; but the truth of this opinion has been ſuſpected by others, for three reaſons: 1. The name of the writer is nowhere mentioned, neither in the beginning nor in any other part of the Epiſtle. 2. The ſtyle is ſaid to be more elegant than Paul's. 3. There are expreſſions in the Epiſtle which have been thought unſuitable to an apoſtle's character. 1. In anſwer to the firſt objection, Clemens Alexandrinus has aſſigned a very good reaſon: "Writing to the Hebrews (ſays he), who had conceived a prejudice againſt him, and were ſuſpicious of him, he wiſely declined ſetting his name at the beginning, leſt he ſhould offend them." 2. Origen and Jerome admired the elegance of the ſtyle, and reckoned it ſuperior to that which Paul has exhibited in his Epiſtles: but as ancient teſtimony had aſſigned it to Paul, they endeavoured to anſwer the objection, by ſuppoſing that the ſentiments were the apoſtle's, but the language and compoſition the work of ſome other perſon. If the Epiſtle, however, be a tranſlation, which we believe it to be, the elegance of the language may belong to the tranſlator. As to the compoſition and arrangement, it cannot be denied that there are many ſpecimens in the writings of this apoſtle not inferior in theſe qualities to the Epiſtle to the Hebrews. 3. It is objected, that in Heb. ii. 3. the writer of this Epiſtle joins himſelf with thoſe who had received the goſpel from Chriſt's apoſtles. Now Paul had it from Chriſt himſelf.. But Paul often appeals to the teſtimony of the apoſtles in ſupport of thoſe truths which he had received from revelation: We may inſtance 1 Cor. xv. 5, 6, 7, 8.; 2 Tim. ii. 2.

acknight the Epi- s.

218 Quoted as s by anent wri- ers.

This Epiſtle is not quoted till the end of the ſecond century, and even then does not ſeem to have been univerſally received. This ſilence might be owing to the Hebrews themſelves, who ſuppoſing this letter had no relation to the Gentiles, might be at no pains to diffuſe copies of it. The authors, however, on whoſe teſtimony we receive it as authentic, are entitled to credit; for they lived ſo near the age of the apoſtles, that they were in no danger of being impoſed on; and from the numerous liſt of books which they rejected as ſpurious, we are aſſured that they were very careful to guard againſt impoſition. It is often quoted as Paul's by Clemens Alexandrinus, about the year 194. It is received and quoted as Paul's by Origen, about 230; by Dionyſius biſhop of Alexandria in 247; and by a numerous liſt of ſucceeding writers.

219 Written in he Syro- Chaldaic anguage.

The Epiſtle to the Hebrews was originally written in Hebrew, or rather Syro-Chaldaic; a fact which we believe on the teſtimony of Clemens Alexandrinus, Jerome, and Euſebius. To this it has been objected, that as theſe writers have not referred to any authority, we ought to conſider what they ſay on this ſubject merely as an opinion. But as they ſtate no reaſons for adopting this opinion, but only mention as a fact that Paul wrote to the Hebrews in their native language, we muſt allow that it is their teſtimony which they produce, and not their opinion. Euſebius informs us, Scripture. that ſome ſuppoſed Luke the Evangeliſt, and others Clemens Romanus, to have been the tranſlator.

According to the opinion of ancient writers, particularly Clemens Alexandrinus, Jerome, and Euthalius, this Epiſtle was addreſſed to the Jews in Paleſtine.— The ſcope of the Epiſtle confirms this opinion.

220 Date of it.

Having now given ſufficient evidence that this Epiſtle was written by Paul, the time when it was written may be eaſily determined: For the ſalutation from the ſaints of Italy (chap. iv. 24.), together with the apoſtle's promiſe to ſee the Hebrews (ver. 23.), plainly intimate, that his confinement was then either ended or on the eve of being ended. It muſt therefore have been written ſoon after the Epiſtles to the Coloſſians, Epheſians, and Philemon, and not long before Paul left Italy, that is, in the year 61 or 62.

Percy's Key to the New Teſtament.

As the zealous defenders of the Moſaic law would naturally inſiſt on the divine authority of Moſes, on the majeſty and glory attending its promulgation by the miniſtry of angels, and the great privileges it afforded thoſe who adhered to it; the apoſtle ſhows,

I. That in all theſe ſeveral articles Chriſtianity had an infinite ſuperiority to the law.

221 Deſign of it to prove to the Jews the truth of the Chriſtian religion, and its ſuperiority to the law of Moſes;

This topic he purſues from chap. i. to xi. wherein he reminds the believing Hebrews of the extraordinary favour ſhown them by God, in ſending them a revelation by his own Son, whoſe glory was far ſuperior to that of angels (chap. i. throughout); very naturally inferring from hence the danger of deſpiſing Chriſt on account of his humiliation, which, in perfect conſiſtence with his dominion over the world to come, was voluntarily ſubmitted to by him for wiſe and important reaſons; particularly to deliver us from the fear of death, and to encourage the freedom of our acceſs to God (chap. ii. throughout). With the ſame view he magnifies Chriſt as ſuperior to Moſes, their great legiſlator; and from the puniſhment inflicted on thoſe who rebelled againſt the authority of Moſes, infers the danger of contemning the promiſes of the goſpel (chap. iii. 2—13.) And as it was an eaſy tranſition to call to mind on this occaſion that reſt in Canaan to which the authority inveſted in Moſes was intended to lead them; the apoſtle hence cautions them againſt unbelief, as what would prevent their entering into a ſuperior ſtate of reſt to what the Jews ever enjoyed (chap. iii. 14. iv. 11.) This caution is ſtill farther enforced by awful views of God's omniſcience, and a lively repreſentation of the high prieſthood of Chriſt (chap. iv. to the end; and chap. v. throughout). In the next place, he intimates the very hopeleſs ſituation of thoſe who apoſtatize from Chriſtianity (chap. vi. 1—9.); and then, for the comfort and confirmation of ſincere believers, diſplays to them the goodneſs of God, and his faithful adherence to his holy engagements; the performance of which is ſealed by the entrance of Chriſt into heaven as our forerunner (chap. vi. 9. to the end). Still farther to illuſtrate the character of our Lord, he enters into a parallel between him and Melchizedec as to their title and deſcent; and, from inſtances wherein the prieſthood of Melchizedec excelled the Levitical, infers, that the glory of the prieſthood of Chriſt ſurpaſſed that under the law (chap. vii. 1—17.) From theſe premiſes the apoſtle argues, that the Aaronical prieſthood was not only excelled, but conſummated by that of Chriſt,

Scripture.

to which it was only introductory and ſubſervient; and of courſe, that the obligation of the law was henceforth diſſolved (chap. vii. 18. to the end). Then recapitulating what he had already demonſtrated concerning the ſuperior dignity of Chriſt's prieſthood, he thence illuſtrates the diſtinguiſhed excellence of the new covenant, as not only foretold by Jeremiah, but evidently enriched with much better promiſes than the old (chap. viii. throughout): explaining farther the doctrine of the prieſthood and interceſſion of Chriſt, by comparing it with what the Jewiſh high prieſts did on the great day of atonement (chap. ix. 1—14). Afterwards he enlarges on the neceſſity of ſhedding Chriſt's blood, and the ſufficiency of the atonement made by it (chap. ix. 15. to the end); and proves that the legal ceremonies could not by any means purify the conſcience; whence he infers the inſufficiency of the Moſaic law, and the neceſſity of looking beyond it, (chap. x. 1—15). He then urges the Hebrews to improve the privileges which ſuch a high prieſt and covenant conferred on them, to the purpoſes of approaching God with confidence, to a conſtant attendance on his worſhip, and moſt benevolent regards to each other (chap. x. 15—25.)

The apoſtle having thus obviated the inſinuations and objections of the Jews, for the ſatisfaction and eſtabliſhment of the believing Hebrews, proceeds,

222 And to animate them to bear perſecution with fortitude.

II. To prepare and fortify their minds againſt the ſtorm of perſecution which in part had already befallen them, which was likely to continue, and be often renewed, he reminds them of thoſe extremities they had endured, and of the fatal effects which would attend their apoſtaſy (chap. x. 26. to the end); calling to their remembrance the eminent examples of faith and fortitude exhibited by holy men, and recorded in the Old Teſtament (chap. xi. 1—29.) he concludes his diſcourſe with glancing at many other illuſtrious worthies; and, beſides thoſe recorded in Scripture, refers to the caſe of ſeveral who ſuffered under the perſecution of Antiochus Epiphanes (2 Maccab. chap. viii. &c. chap. xi. 30. xii. 2.)

Having thus finiſhed the argumentative part of the Epiſtle, the apoſtle proceeds to the proper application; in which he exhorts the Hebrew Chriſtians to patience, peace and holineſs, (chap. xii. 3—14.); cautions them againſt ſecular views and ſenſual gratifications, by laying before them the incomparable excellence of the bleſſings introduced by the goſpel, which even the Jewiſh economy, glorious and magnificent as it was, did by no means equal; exhorts them to brotherly affection, purity, compaſſion, dependance on the divine care, ſtedfaſtneſs in the profeſſion of truth, a life of thankfulneſs to God, and benevolence to man: and concludes the whole with recommending their pious miniſters to their particular regard, entreating their prayers, ſaluting and granting them his uſual benediction.

223 The ſeven Catholic epiſtles.

The ſeven following Epiſtles, one of James, two of Peter, three of John, and one of Jude, have been diſtinguiſhed by the appellation of *catholic* or *general* epiſtles, becauſe moſt of them are inſcribed, not to particular churches or perſons, but to the body of Jewiſh or Gentile converts over the world. The authenticity of ſome of theſe has been frequently queſtioned, viz. the Epiſtle of James, the ſecond of Peter, the Epiſtle of Jude, and the ſecond and third of John. The ancient Chriſtians were very cautious in admitting any books into their canon whoſe authenticity they had any reaſon to ſuſpect. They rejected all the writings forged by heretics in the name of the apoſtles, and certainly, therefore, would not receive any without firſt ſubjecting them to a ſevere ſcrutiny. Now, though theſe five epiſtles were not immediately acknowledged as the writings of the apoſtles, this only ſhows that the perſons who doubted had not received complete and inconteſtable evidence of their authenticity. But as they were afterwards univerſally received, we have every reaſon to conclude that upon a ſtrict examination they were found to be the genuine productions of the apoſtles. The truth is, ſo good an opportunity had the ancient Chriſtians of examining this matter, ſo careful were they to guard againſt impoſition, and ſo well founded was their judgment concerning the books of the New Teſtament, that as Dr Lardner obſerves, no writing which they pronounced genuine has been yet proved ſpurious, nor have we at this day the leaſt reaſon to believe any book genuine which they rejected.

Scri
Mac on th ſtles.

2 Epiſt Jame Leſs.

That the Epiſtle of James was written in the apoſtolical age is proved by the quotations of ancient authors. Clemens Romanus and Ignatius ſeem to have made references to it. Origin quotes it once or twice.—There are ſeveral reaſons why it was not more generally quoted by the firſt Chriſtian writers. Being written to correct the errors and vices which prevailed among the Jews, the Gentiles might think it of leſs importance to them, and therefore take no pains to procure copies of it. As the author was ſometimes denominated James the Juſt, and often called Biſhop of Jeruſalem, it might be doubted whether he was one of the apoſtles. But its authenticity does not ſeem to have been ſuſpected on account of the doctrines which it contains. In modern times, indeed, Luther called it a ſtrawy epiſtle (*epiſtola ſtraminea*), and excluded it from the ſacred writings, on account of its apparent oppoſition to the apoſtle Paul concerning juſtification by faith.

This Epiſtle could not be written by James the Elder, the ſon of Zebedee, and brother of John, who was beheaded by Herod in the year 44, for it contains paſſages which refer to a future period. It muſt, therefore, have been the compoſition of James the Leſs, the ſon of Alpheus, who was called *the Lord's brother*, becauſe he was the ſon of Mary, the ſiſter of our Lord's mother. As to the date of this Epiſtle, Lardner fixes it in the year 61 or 62.

2 The

James the Leſs ſtatedly reſided at Jeruſalem, whence he hath been ſtyled by ſome ancient fathers biſhop of that city, though without ſufficient foundation. Now James being one of the apoſtles of the circumciſion, while he confined his perſonal labours to the inhabitants of Judea, ſo it was very natural for him to endeavour by his writings to extend his ſervices to the Jewiſh Chriſtians who were diſperſed abroad in more diſtant regions. For this purpoſe, there are two points which the apoſtle ſeems to have principally aimed at, though he hath not purſued them in an orderly and logical method, but in the free epiſtolary manner, handling them jointly or diſtinctly as occaſions naturally offered. And theſe were, "to correct thoſe errors both in doctrine and practice into which the Jewiſh Chriſtians had fallen, which might otherwiſe have produced fatal conſequen-

Dodd Famil poſitor

2 and d of it.

ces;

Scripture. ces; and then to eſtabliſh the faith and animate the hope of ſincere believers, both under their preſent and their approaching ſufferings."

The opinions which he is moſt anxious to refute are theſe, that God is the author of ſin, (ch. i. 13.); that the belief of the doctrines of the goſpel was ſufficient to procure the favour of God for them, however deficient they were in good works, (ch. ii.) He diſſuades the Jews from aſpiring to the office of teachers in the third chapter, becauſe their prejudices in favour of the law of Moſes might induce them to pervert the doctrines of the goſpel. He therefore guards them againſt the ſins of the tongue, by repreſenting their pernicious effects; and as they thought themſelves wiſe and intelligent, and were ambitious of becoming teachers, he adviſes them to make good their pretenſions, by ſhowing themſelves poſſeſſed of that wiſdom which is from above, (ch. iii.)

The deſtruction of Jeruſalem was now approaching; the Jews were ſplit into factions, and often ſlaughtered one another; the apoſtle, therefore, in the fourth chapter, admoniſhes them to purify themſelves from thoſe vices which produced tumults and bloodſhed. To rouſe them to repentance, he foretels the miſeries that were coming upon them. Laſtly, He checks an irreligious ſpirit that ſeems to have prevailed, and concludes the Epiſtle with ſeveral exhortations.

227 irſt Epiſtle of eter.

The authenticity of the firſt Epiſtle of Peter has never been denied. It is referred to by Clemens Romanus, by Polycarp, and is quoted by Papias, Irenæus, Clemens Alexandrinus, and Tertullian. It is addreſſed to the ſtrangers ſcattered through Pontus, &c. who are evidently Chriſtians in general, as appears from chap. ii. 10. "In time paſt they were not a people, but are now the people of God." From Peter's ſending the ſalutation of the church at Babylon to the Chriſtians in Pontus, &c. it is generally believed that he wrote it in Babylon. There was a Babylon in Egypt and another in Aſſyria. It could not be the former, for it was an obſcure place, which ſeems to have had no church for the four firſt centuries. We have no authority to affirm that Peter ever was in Aſſyria. The moſt probable opinion is that of Grotius, Whitby, Lardner, as well as of Euſebius, Jerome, and others, that by Babylon Peter figuratively means Rome. Lardner dates it in 63 or 64, or at the lateſt 65.

228 he date

229 nd deſign f it.

St Peter's chief deſign is to confirm the doctrine of St Paul, which the falſe teachers pretended he was oppoſing; and to aſſure the proſelytes that they ſtood in the true grace of God, (ch. v. 12.) With this view he calls them elect; and mentions, that they had been declared ſuch by the effuſion of the Holy Ghoſt upon them, (ch. i. 1, 2.) He aſſures them that they were regenerate without circumciſion, merely through the goſpel and reſurrection of Chriſt, (ver. 3, 4, 21—25.); and that their ſufferings were no argument of their being under the diſpleaſure of God, as the Jews imagined, (ver. 6—12.) He recommends it to them to hope for grace to the end, (ver. 13.) He teſtifies, that they were not redeemed by the Paſchal lamb, but through Chriſt, whom God had preordained for this purpoſe before the foundation of the world, (ver. 18—20.)

The ſecond Epiſtle of Peter is not mentioned by any ancient writer extant till the fourth century, from which time it has been received by all Chriſtians except the Syrians. Jerome acquaints us, that its authenticity was diſputed, on account of a remarkable difference between the ſtyle of it and the former Epiſtle. But this remarkable difference in ſtyle is confined to the 2d chapter of the 2d Epiſtle. No objection, however, can be drawn from this circumſtance; for the ſubject of that chapter is different from the reſt of Peter's writings, and nothing is ſo well known as that different ſubjects ſuggeſt different ſtyles. Peter, in deſcribing the character of ſome flagitious impoſtors, feels an indignation which he cannot ſuppreſs: it breaks out, therefore, in the bold and animated figures of an oriental writer. Such a diverſity of ſtyle is not uncommon in the beſt writers, eſpecially when warmed with their ſubject. Scripture.

230 Second Epiſtle of Peter. The authenticity of it proved

231 from internal evidence.

This objection being removed, we contend that this Epiſtle was written by Peter, from the inſcription, *Simon Peter, a ſervant and an apoſtle of Jeſus Chriſt.* It appears from chap. i. 16, 17, 18, that the writer was one of the diſciples who ſaw the transfiguration of our Saviour. Since it has never been aſcribed to James or John, it muſt therefore have been Peter. It is evident, from chap. iii. 1. that the author had written an Epiſtle before to the ſame perſons, which is another circumſtance that proves Peter to be the author.

It is acknowledged, however, that all this evidence is merely internal; for we have not been able to find any external evidence upon the ſubject. If, therefore, the credit which we give to any fact is to be in proportion to the degree of evidence with which it is accompanied, we ſhall allow more authority due to the goſpels than to the epiſtles; more to thoſe epiſtles which have been generally acknowledged than to thoſe which have been controverted; and therefore no doctrine of Chriſtianity ought to be founded ſolely upon them. It may alſo be added, that perhaps the beſt way of determining what are the eſſential doctrines of Chriſtianity would be to examine what are the doctrines which occur oftenеſt in the goſpels; for the goſpels are the plaineſt parts of the New Teſtament; and their authenticity is moſt completely proved. They are therefore beſt fitted for common readers. Nor will it be denied, we preſume, that our Saviour taught all the doctrines of the Chriſtian religion himſelf; that he repeated them on different occaſions, and inculcated them with an earneſtneſs proportionable to their importance. The Epiſtles are to be conſidered as a commentary on the eſſential doctrines of the goſpel, adapted to the ſituation and circumſtances of particular churches, and perhaps ſometimes explaining doctrines of inferior importance. 1. The eſſential doctrines are therefore firſt to be ſought for in the goſpels, and to be determined by the number of times they occur. 2. They are to be ſought for, in the next place, in the uncontroverted Epiſtles, in the ſame manner. 3. No eſſential doctrine ought to be founded on a ſingle paſſage, nor on the authority of a controverted Epiſtle.

That Peter was old, and near his end, when he wrote this Epiſtle, may be inferred from chap. i. 14. "Knowing that ſhortly I muſt put off this tabernacle, even as our Lord Jeſus has ſhown me." Lardner thinks it was written ſoon after the former. Others, perhaps with more accuracy, date it in 67.

232 Deſign of it.

The general deſign of this Epiſtle is, to confirm the doctrines and inſtructions delivered in the former; "to excite the Chriſtian converts to adorn, and ſtedfaſtly adhere

Scripture.

here to their holy religion, as a religion proceeding from God, notwithſtanding the artifices of falſe teachers, whoſe character is at large deſcribed; or the perſecution of their bitter and inveterate enemies."

233 First Epiſtle of John. Its authenticity and ſtyle.

The firſt Epiſtle of John is aſcribed by the unanimous ſuffrage of the ancients to the beloved diſciple of our Lord. It is referred to by Polycarp; is quoted by Papias, by Irenæus; and was received as genuine by Clemens Alexandrinus, by Dionyſius of Alexandria, by Cyprian, by Origen, and Euſebius. There is ſuch a reſemblance between the ſtyle and ſentiments of this Epiſtle and thoſe of the Goſpel according to John, as to afford the higheſt degree of internal evidence that they are the compoſition of the ſame author. In the ſtyle of this apoſtle there is a remarkable peculiarity, and eſpecially in this Epiſtle. His ſentences, conſidered ſeparately, are exceeding clear and intelligible; but when we ſearch for their connexion, we frequently meet with greater difficulties than we do even in the Epiſtles of St Paul. The principal ſignature and characteriſtic of his manner is an artleſs and amiable ſimplicity, and a ſingular modeſty and candour, in conjunction with a wonderful ſublimity of ſentiment. His conceptions are apparently delivered to us in the order in which they aroſe to his own mind, and are not the product of artificial reaſoning or laboured inveſtigation.

It is impoſſible to fix with any preciſion the *date* of this Epiſtle, nor can we determine to what perſons it was addreſſed.

234 Deſign of it.

The leading deſign of the apoſtle is to ſhow the inſufficiency of faith, and the external profeſſion of religion, ſeparate from morality; to guard the Chriſtians to whom he writes againſt the deluſive arts of the corrupters of Chriſtianity, whom he calls Antichriſt; and to inculcate univerſal benevolence. His admonitions concerning the neceſſity of good morals, and the inefficacy of external profeſſions, are ſcattered over the Epiſtle, but are moſt frequent in the 1ſt, 2d, and 3d chapters. The enemies or corrupters of Chriſtianity, againſt whom he contends, ſeem to have denied that Jeſus was the Meſſiah, the Son of God (chap. ii. 22. v. 1.), and had actually come into the world in a human form, chap. iv. 2, 3.) The earneſtneſs and frequency with which this apoſtle recommends the duty of benevolence is remarkable. He makes it the diſtinguiſhing characteriſtic of the diſciples of Jeſus, the only ſure pledge of our love to God, and the only aſſurance of eternal life, (chap. iii. 14, 15.) Benevolence was his favourite theme, which he affectionately preſſed upon others, and conſtantly practiſed himſelf. It was conſpicuous in his conduct to his great Maſter, and in the reciprocal affection which it inſpired in his ſacred breaſt. He continued to recommend it in his laſt words. When his extreme age and infirmities had ſo waſted his ſtrength that he was incapable to exerciſe the duties of his office, the venerable old man, anxious to exert in the ſervice of his Maſter the little ſtrength which ſtill remained, cauſed himſelf to be carried to church, and, in the midſt of the congregation, he repeated theſe words, "Little children, love one another."

235 Second and third Epiſtle of John.

It has been obſerved by Dr Mill that the ſecond and third Epiſtles of John are ſo ſhort, and reſemble the firſt ſo much in ſentiment and ſtyle, that it is not worth while to contend about them. The ſecond Epiſtle conſiſts only of 13 verſes; and of theſe eight may be found in the 1ſt Epiſtle, in which the ſenſe or language is preciſely the ſame.

Scri

The ſecond Epiſtle is quoted by Irenæus, and was received by Clemens Alexandrinus. Both were admitted by Athanaſius, by Cyril of Jeruſalem, and by Jerome. The ſecond is addreſſed to a woman of diſtinction, whoſe name is by ſome ſuppoſed to be *Cyria* (taking κυρια for a proper name), by others *Eclecta*. The third is inſcribed to Gaius, or Caius according to the Latin orthography, who, in the opinion of Lardner, was an eminent Chriſtian, that lived in ſome city of Aſia, not far from Epheſus where St John chiefly reſided after his leaving Judea. The time of writing theſe two Epiſtles cannot be determined with any certainty. They are ſo ſhort that an analyſis of them is not neceſſary.

Epiſt Jude auth city

The Epiſtle of Jude is cited by no ancient Chriſtian writer extant before Clemens Alexandrinus, about the year 194; but this author has tranſcribed eight or ten verſes in his Stromata and Pedagogue. It is quoted once by Tertullian about the year 200; by Origen frequently about 230. It was not however received by many of the ancient Chriſtians, on account of a ſuppoſed quotation from a book of Enoch. But it is not certain that Jude quotes any book. He only ſays that *Enoch propheſied, ſaying, The Lord cometh with ten thouſand of his ſaints.* Theſe might be words of a prophecy preſerved by tradition, and inſerted occaſionally in different writings. Nor is there any evidence that there was ſuch a book as Enoch's prophecies in the time of Jude, though a book of that name was extant in the ſecond and third centuries. As to the date of this Epiſtle nothing beyond conjecture can be produced.

and ſign.

The deſign of it is, by deſcribing the character of the falſe teachers, and the puniſhments to which they were liable, to caution Chriſtians againſt liſtening to their ſuggeſtions, and being thereby perverted from the faith and purity of the goſpel.

The caly auth ty p

The Apocalypſe or Revelation has not always been unanimouſly received as the genuine production of the apoſtle John. Its authenticity is proved, however, by the teſtimony of many reſpectable authors of the firſt centuries. It is referred to by the martyrs of Lyons: it was admitted by Juſtin Martyr as the work of the apoſtle John. It is often quoted by Irenæus, by Theophilus biſhop of Antioch, by Clement of Alexandria, by Tertullian, by Origen, and by Cyprian of Carthage. It was alſo received by heretics, by Novatus and his followers, by the Donatiſts, and by the Arians. For the firſt two centuries no part of the New Teſtament was more univerſally acknowledged, or mentioned with higher reſpect. But a diſpute having ariſen about the millennium, Caius with ſome others, about the year 212, to end the controverſy as ſpeedily and effectually as poſſible, ventured to deny the authority of the book which had given occaſion to it.

Th of i

The book of Revelation, as we learn from Rev. i. 9. was written in the iſle of Patmos. According to the general teſtimony of ancient authors, John was baniſhed into Patmos in the reign of Domitian, and reſtored by his ſucceſſor Nerva. But the book could not be publiſhed till after John's releaſe, when he returned to Epheſus. As Domitian died in 96, and his perſecution

did

Scripture. did not commence till near the end of his reign, the Revelation might therefore be publiſhed in 96 or 97.

Here we ſhould conclude; but as the curious reader may deſire to be informed how the predictions revealed in this book of St John have uſually been interpreted and applied, we ſhall conſiſtently with our ſubject ſubjoin *a key to the prophecies contained in the Revelation*. This is extracted from the learned diſſertations of Dr Newton, biſhop of Briſtol (1): to which the reader is referred for a more full illuſtration of the ſeveral parts, as the conciſeneſs of our plan only admits a ſhort analyſis or abridgement of them.

Nothing of a prophetical nature occurs in the firſt three chapters, except, 1. What is ſaid concerning the church of Epheſus, that her "candleſtick ſhall be removed out of its place," which is now verified, not only in this, but in all the other Aſiatic churches which exiſted at that time; the light of the goſpel having been taken from them, not only by their hereſies and diviſions from within, but by the arms of the Saracens from without: And, 2. Concerning the church of Smyrna, that ſhe ſhall "have tribulation ten days;" that is, in prophetic language, "ten years;" referring to the perſecution of Dioclеſian, which alone of all the general perſecutions laſted ſo long.

The next five chapters relate to the opening of the *Seven Seals*; and by theſe ſeals are intimated ſo many different periods of the prophecy. Six of theſe ſeals are opened in the ſixth and ſeventh chapters.

The *firſt ſeal* or period is memorable for conqueſts. It commences with Veſpaſian, and terminates in Nerva; and during this time Judea was ſubjugated. The *ſecond ſeal* is noted for war and ſlaughter. It commences with Trajan, and continues through his reign, and that of his ſucceſſors. In this period, the Jews were entirely routed and diſperſed; and great was the ſlaughter and devaſtation occaſioned by the contending parties. The *third ſeal* is characterized by a rigorous execution of juſtice, and an abundant proviſion of corn, wine, and oil. It commences with Septimius Severus. He and Alexander Severus were juſt and ſevere emperors, and at the ſame time highly celebrated for the regard they paid to the felicity of their people, by procuring them plenty of every thing, and particularly corn, wine, and oil. This period laſted during the reigns of the Septimian family. The *fourth ſeal* is diſtinguiſhed by a concurrence of evils, ſuch as war, famine, peſtilence, and wild beaſts; by all which the Roman empire was remarkably infeſted from the reign of Maximin to that of Dioclеſian. The *fifth ſeal* begins at Dioclеſian, and is ſignalized by the great perſecution, from whence aroſe that memorable æra, the Era of Martyrs. With Conſtantine begins the *ſixth ſeal*, a period of revolutions, pictured forth by great commotions in earth and in heaven, alluding to the ſubverſion of Paganiſm and the eſtabliſhment of Chriſtianity. This period laſted from the reign of Conſtantine the Great to that of Theodoſius the Firſt. The *ſeventh ſeal* includes under it the remaining parts of the prophecy, and comprehends ſeven periods diſtinguiſhed by the ſounding of ſeven trumpets. Scripture.

As the ſeals foretold the ſtate of the Roman empire before and till it became Chriſtian, ſo the trumpets foreſhow the fate of it afterwards; each trumpet being an alarm to one nation or other, rouſing them up to overthrow that empire.

Four of theſe trumpets are ſounded in the eighth chapter.

At the ſounding of the firſt, Alaric and his Goths invade the Roman empire, beſiege Rome twice, and ſet it on fire in ſeveral places. At the ſounding of the ſecond, Attila and his Huns waſte the Roman provinces, and compel the eaſtern emperor Theodoſius the Second, and the weſtern emperor Valentinian the Third, to ſubmit to ſhameful terms. At the ſounding of the third, Genſeric and his Vandals arrive from Africa; ſpoil and plunder Rome, and ſet ſail again with immenſe wealth and innumerable captives. At the ſounding of the fourth, Odoacer and the Heruli put an end to the very name of the weſtern empire; Theodoric founds the kingdom of the Oſtrogoths in Italy; and at laſt Italy becomes a province of the eaſtern empire, Rome being governed by a duke under the exarch of Ravenna. As the foregoing trumpets relate chiefly to the downfal of the weſtern empire, ſo do the two following to that of the eaſtern. They are ſounded in the ninth, tenth, and part of the eleventh chapters. At the ſounding of the fifth trumpet, Mahomet, that blazing ſtar, appears, opens the bottomleſs pit, and with his locuſts the Arabians darkens the ſun and air. And at the ſounding of the ſixth, a period not yet finiſhed, the four angels, that is, the four ſultans, or leaders of the Turks and Othmans, are looſed from the river Euphrates. The Greek or Eaſtern empire was cruelly "hurt and tormented" under the fifth trumpet; but under the ſixth, it was "ſlain," and utterly deſtroyed.

The Latin or Weſtern Church not being reclaimed by the ruin of the Greek or Eaſtern, but ſtill perſiſting in their idolatry and wickedneſs; at the beginning of the tenth chapter, and under the ſound of this ſixth trumpet, is introduced a viſion preparative to the prophecies reſpecting the Weſtern Church, wherein an angel is repreſented, having in his hand a little book, or codicil, deſcribing the calamities that ſhould overtake that church. The meaſuring of the temple ſhows, that during all this period there will be ſome true Chriſtians, who will conform themſelves to the rule of God's word, even whilſt the outer court, that is, the external and more extenſive part of this temple or church, is trodden under foot by Gentiles, i. e. ſuch Chriſtians as, in their idolatrous worſhip and perſecuting practice, reſemble and outdo the Gentiles themſelves. Yet againſt theſe corrupters of religion there will always be ſome true witneſſes to proteſt, who, however they may be overborne at times, and in appearance reduced to death, yet will ariſe again from time to time, till at laſt they triumph and glorioufly aſcend. The eleventh chapter concludes with the ſounding of the ſeventh trumpet.

In

240 Dr Newton's explication of the prophecies which have been already accomplished.

(1) Diſſertations on the prophecies which have remarkably been fulfilled, and at this time are fulfilling, in the world, Vol. III. 8vo.

ipture, vener.

In the twelfth chapter, by the woman bearing a man child is to be underſtood the Chriſtian church; by the great red dragon, the Heathen Roman empire; by the man child whom the woman bore, Conſtantine the Great; and by the war in heaven, the conteſts between the Chriſtian and Heathen religions.

In the thirteenth chapter, by the beaſt with ſeven heads and ten horns, unto whom the dragon gave his power, ſeat, and great authority, is to be underſtood, not Pagan but Chriſtian, not imperial but papal Rome; in ſubmitting to whoſe religion, the world did in effect ſubmit again to the religion of the dragon. The ten-horned beaſt therefore repreſents the Romiſh church and ſtate in general: but the beaſt with two horns like a lamb is the Roman clergy; and that image of the ten-horned beaſt, which the two-horned beaſt cauſed to be made, and inſpired with life, is the pope; whoſe number is 666, according to the numerical powers of the letters conſtituting the Roman name Λατινος, *Latinus*, or it is equivalent in *Hebrew*, רומיית *Romiith*.

Chapter xiv. By the lamb on Mount Sion is meant Jeſus; by the hundred forty and four thouſand, his church and followers; by the angel preaching the everlaſting goſpel, the firſt principal effort made towards a reformation by that public oppoſition formed againſt the worſhip of ſaints and images by emperors and biſhops in the eighth and ninth centuries; by the angel crying, "Babylon is fallen," the Waldenſes and Albigenſes, who pronounced the church of Rome to be the Apocalyptic Babylon, and denounced her deſtruction; and by the third angel, Martin Luther and his fellow reformers, who proteſted againſt all the corruptions of the church of Rome, as deſtructive to ſalvation. For an account of the doctrines and precepts contained in the Scriptures, See THEOLOGY. For proofs of their divine origin, ſee RELIGION, PROPHECY, and MIRACLES.

SCRIVENER, one who draws contracts, or whoſe buſineſs it is to place money at intereſt. If a ſcrivener is intruſted with a bond, he may receive the intereſt; and if he fails, the obligee ſhall bear the loſs: and ſo it is if he receive the principal and deliver up the bond; for being intruſted with the ſecurity itſelf, it muſt be preſumed that he is truſted with power to receive intereſt or principal; and the giving up the bond on payment of the money ſhall be a diſcharge thereof. But if a ſcrivener ſhall be intruſted with a mortgage deed, he hath only authority to receive the intereſt, not the principal; the giving up the deed in this caſe not being ſufficient to reſtore the eſtate, but there muſt be a reconveyance, &c. It is held, where a ſcrivener puts out his client's money on a bad ſecurity, which upon inquiry might have been eaſily found ſo, yet he cannot in equity be charged to anſwer for the money; for it is here ſaid, no one would venture to put out money of another upon a ſecurity, if he were obliged to warrant and make it good in caſe a loſs ſhould happen, without any fraud in him.

Scrobiculus cordis

Scruple.

SCROBICULUS CORDIS, the ſame as ANTICARDIUM.

SCROFANELLO, in ichthyology, a name by which ſome have called a ſmall fiſh of the Mediterranean, more uſually known by the name of the *ſcorpæna*.

SCROLL, in HERALDRY. See that article, Chap. IV. ſect. 9. When the motto relates to the creſt, the ſcroll is properly placed above the achievement; otherwiſe it ſhould be annexed to the eſcutcheon. Thoſe of the order of knighthood are generally placed round ſhields.

SCROPHULA, the KING'S EVIL. See MEDICINE, N° 349.

SCROPHULARIA, FIGWORT, in botany: A genus of the angioſperma order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 40th order, *Perſonatæ*. The calyx is quinquefid; the corolla almoſt globoſe, and reſupinated; the capſule bilocular. There are ſeveral ſpecies, of which the moſt remarkable are, 1. *Nodoſa*, or the common figwort, which grows in woods and hedges. The root is tuberous; the ſtalks are four or five feet high, and branched towards the top; the leaves are heart-ſhaped, ſerrated, and acute. The flowers are of a dark red colour, ſhaped like a cap or helmet; the lower lip greeniſh: they grow in looſe dichotomous ſpikes or *racemi* at the top of the branches. The leaves have a fetid ſmell and bitter taſte. A decoction of them is ſaid to cure hogs of the meaſles. An ointment made of the root was formerly uſed to cure the piles and ſcrophulous ſores, but is at preſent out of practice. 2. *Aquatica*, water figwort, or betony. The root is fibrous; ſtem erect, ſquare, about four feet high. The leaves are oppoſite, elliptical, pointed, ſlightly ſcalloped, on decurrent footſtalks. Flowers purple, in looſe naked ſpikes. It grows on the ſides of rivulets and other wet places, and has a fetid ſmell, though not ſo ſtrong as the preceding. The leaves are uſed in medicine as a corrector of ſena, and in powder to promote ſneezing. 3. *Scorodonia*, or balm-leaved figwort. The ſtem is erect, ſquare, about two feet high. The leaves are oppoſite, doubly ſerrated. The flowers are duſky purple, in compoſite bunches. It grows on the banks of rivulets, &c. in Cornwall. 4. *Vernalis*, or yellow figwort. The ſtalks are ſquare, hairy, brown, about two feet high. The leaves are heart-ſhaped, roundiſh, hairy, indented, oppoſite. The flowers are yellow, on ſingle forked footſtalks from the alæ of the leaves. It grows in hedges in Surry.

SCROTUM. See ANATOMY, N° 107.

SCRUPI, in natural hiſtory, the name of a claſs of foſſils, formed in detached maſſes, without any cruſts; of no determinate figure or regular ſtructure; and compoſed of a cryſtalline or ſparry matter, debaſed by an admixture of earth in various proportions. Under this claſs are comprehended, 1. The *telangia*. 2. The *patridia*. 3. The *lithoxugia*. 4. The *jaſpides* or jaſpers.

SCRUPLE, SCRUPULUS, or *Scrupulum*, the leaſt of the weights uſed by the ancients, which amongſt the Romans was the 24th part of an ounce, or the 3d part of a drachm. The ſcruple is ſtill a weight among us,

nute, utiny.

us, containing the 3d part of a drachm, or 20 grains. Among goldſmiths it is 24 grains.

SCRUPLE, in Chaldean chronology, is $\frac{1}{1080}$ part of an hour, called by the Hebrews *helakin*. Theſe ſcruples are much uſed by the Jews, Arabs, and other eaſtern people, in computations of time.

Scruples of half Duration, an arch of the moon's orbit, which the moon's centre deſcribes from the beginning of an eclipſe to its middle.

Scruples of Immerſion or *Incidence*, an arch of the moon's orbit, which her centre deſcribes from the beginning of the eclipſe to the time when its centre falls into the ſhadow.

Scruples of Emerſion, an arch of the moon's orbit, which her centre deſcribes in the time from the firſt emerſion of the moon's limb to the end of the eclipſe.

SCRUTINY, *(Scrutinium)*, in the primitive church, an examination or probation practiſed in the laſt week of Lent, on the catechumens, who were to receive baptiſm on the Eaſter day. The ſcrutiny was performed with a great many ceremonies. Exorciſms and prayers were made over the heads of the catechumens; and on Palm Sunday, the Lord's Prayer and Creed were given them, which they were afterwards made to rehearſe. This cuſtom was more in uſe in the church of Rome than anywhere elſe; though it appears, by ſome miſſals, to have been likewiſe uſed, though much later, in the Gallican church. It is ſuppoſed to have ceaſed about the year 860. Some traces of this practice ſtill remain at Vienne in Dauphiné, and at Liege.

SCRUTINY is alſo uſed, in the canon law, for a ticket or little paper billet, wherein at elections the electors write their votes privately, ſo as it may not be known for whom they vote. Among us the term *ſcrutiny* is chiefly uſed for a ſtrict peruſal and examination of the ſeveral votes haſtily taken at an election; in order to find out any irregularities committed therein, by unqualified voters, &c.

SCRUTORE, or SCRUTOIR, (from the French *eſcritoire)*, a kind of cabinet, with a door or lid opening downwards, for conveniency of writing on, &c. Scrutore ‖ Sculponeæ.

SCRY, in falconry, denotes a large flock of fowl.

SCUDDING, the movement by which a ſhip is carried precipitately before a tempeſt. As a ſhip flies with amazing rapidity through the water whenever this expedient is put in practice, it is never attempted in a contrary wind, unleſs when her condition renders her incapable of ſuſtaining the mutual effort of the wind and waves any longer on her ſide, without being expoſed to the moſt imminent danger of being overſet.

A ſhip either ſcuds with a ſail extended on her foremaſt, or, if the ſtorm is exceſſive, without any ſail; which, in the ſea phraſe, is called *ſcudding under bare poles*. In ſloops and ſchooners, and other ſmall veſſels, the ſail employed for this purpoſe is called the *ſquare-ſail*. In large ſhips, it is either the foreſail at large, reefed, or with its gooſe-wings extended, according to the degree of the tempeſt; or it is the fore-top ſail, cloſe reefed, and lowered on the cap; which laſt is particularly uſed when the ſea runs ſo high as to becalm the foreſail occaſionally, a circumſtance which expoſes the ſhip to the danger of broaching-to. The principal hazards incident to ſcudding are generally, a pooping ſea; the difficulty of ſteering, which expoſes the veſſel perpetually to the riſk of broaching-to; and the want of ſufficient ſea room. A ſea ſtriking the ſhip violently on the ſtern may daſh it inwards, by which ſhe muſt inevitably founder. In broaching-to (that is, inclining ſuddenly to windward), ſhe is threatened with being immediately overturned; and, for want of ſea room, ſhe is endangered by ſhipwreck on a lee ſhore, a circumſtance too dreadful to require explanation.

SCULPONEÆ, among the Romans, a kind of ſhoes worn by ſlaves of both ſexes. Theſe ſhoes were only blocks of wood made hollow, like the French ſabots.

SCULPTURE,

fi··ion ſculp- ·e ·gin of

IS the art of carving wood or hewing ſtone into images. It is an art of the moſt remote antiquity, being practiſed, as there is reaſon to believe, before the general deluge. We are induced to aſſign to it this early origin, by conſidering the expedients by which, in the firſt ſtages of ſociety, men have everywhere ſupplied the place of alphabetic characters. Theſe, it is univerſally known, have been picture-writing, ſuch as that of the Mexicans, which, in the progreſs of refinement and knowledge, was gradually improved into the hieroglyphics of the Egyptians and other ancient nations. See HIEROGLYPHICS.

That mankind ſhould have lived near 1700 years, from the creation of the world to the flood of Noah, without falling upon [illegible] method to make their conceptions permanent, or to communicate them to a diſtance, is extremely improbable; eſpecially when we call to mind that ſuch methods of writing have been found, in modern times, among people much leſs enlightened than thoſe muſt have been who were capable of building ſuch a veſſel as the ark. But if the antediluvians were acquainted with any kind of writing, there can be little doubt of its being hieroglyphical writing. Mr Bryant has proved that the Chaldeans were poſſeſſed of that art before the Egyptians; and Beroſus * informs us, that a delineation of all the monſtrous forms which inhabited the chaos, when this earth was in that ſtate, was to be ſeen in the temple of Belus in Babylon. This delineation, as he deſcribes it, muſt have been a hiſtory in hieroglyphical characters; for it conſiſted of human figures with wings, with two heads, and ſome with the horns and legs of goats. This is exactly ſimilar to the hieroglyphical writing of the Egyptians; and it was preſerved, our author ſays, both in drawings and *engravings* in the temple of the god of Babylon. As Chaldea was the firſt peopled region of the earth after the flood, and as it appears from Pliny †, as well as from Beroſus, that the art of engraving upon bricks baked in the ſun was there carried to a conſiderable degree of perfection at a very early period, the probability certainly

* *Apud Syncellum*, p. 37.

† *Hiſt. Nat.* lib. 7. cap. 56.

tainly is, that the Chaldeans derived the art of hieroglyphical writing, and consequently the rudiments of the art of sculpture, from their antediluvian ancestors.

2 Not solely from idolatry.

It is generally thought that sculpture had its origin from idolatry, as it was found necessary to place before the people the images of their gods to enliven the fervour of their devotion: but this is probably a mistake. The worship of the heavenly bodies, as the only gods of the heathen nations, prevailed so long before the deification of dead men was thought of (see POLYTHEISM), that we cannot suppose mankind to have been, during all that time, ignorant of the art of hieroglyphical writing. But the deification of departed heroes undoubtedly gave rise to the almost universal practice of representing the gods by images of a human form; and therefore we must conclude, that the elements of sculpture were known before that art was employed to enliven the devotion of idolatrous worshippers. The pyramids and obelisks of Egypt, which were probably temples, or rather altars, dedicated to the sun (see PYRAMID), were covered from top to bottom with hieroglyphical emblems of men, beasts, birds, fishes, and reptiles, at a period prior to that in which there is any unexceptionable evidence that mere statue worship prevailed even in that nursery of idolatry.

3 Though it probably contributed to carry the art to perfection.

But though it appears thus evident that picture-writing was the first employment of the sculptor, we are far from imagining that idolatrous worship did not contribute to carry his art to that perfection which it attained in some of the nations of antiquity. Even in the dark ages of Europe when the other fine arts were almost extinguished, the mummery of the church of Rome, and the veneration which she taught for her saints and martyrs, preserved among the Italians some vestiges of the sister arts of sculpture and painting; and therefore, as human nature is everywhere the same, it is reasonable to believe that a similar veneration for heroes and demigods would, among the ancient nations, have a similar effect. But if this be so, the presumption is that the Chaldeans were the first who invented the art of hewing blocks of wood and stone into the figures of men and other animals; for the Chaldeans were unquestionably the first idolaters, and their early progress in sculpture is confirmed by the united testimonies of Berosus, Alexander Polyhistor, Apollodorus, and Pliny; not to mention the eastern tradition, that the father of Abraham was a statuary.

4 Mr Bromley's theory, that sculpture was invented by the Scythians.

Against this conclusion Mr Bromley, in his late History of the Fine Arts, has urged some plausible arguments. In stating these he professes not to be original, or to derive his information from the fountain head of antiquity. He adopts, as he tells us, the theory of a French writer, who maintains, that in the year of the world 1949, about 300 years after the deluge, the Scythians under Brouma, a descendant of Magog the son of Japhet, extended their conquest over the greater part of Asia. According to this system, Brouma was not only the civilizer of India, and the author of the braminical doctrines, but also diffused the principles of the Scythian mythology over Egypt, Phœnicia, Greece, and the continent of Asia.

Of these principles Mr Bromley has given us no distinct enumeration: the account which he gives of them is not to be found in one place, but to be collected from a variety of distant passages. In attempting, therefore, to present the substance of his scattered hints in one view, we will not be confident that we have omitted none of them. The ox, says he, was the Scythian emblem of the generator of animal life, and hence it became the principal divinity of the Arabians. The serpent was the symbol of the source of intelligent nature. These were the common points of union in all the first religions of the earth. From Egypt the Israelites carried with them a religious veneration for the ox and the serpent. Their veneration for the ox appeared soon after they marched into the wilderness, when in the absence of Moses they called upon Aaron to make them gods which should go before them. The idea of having an idol to go before them, says our author, was completely Scythian; for so the Scythians acted in all their progress through Asia, with this difference, that their idol was a living animal. The Israelites having gained their favourite god, which was an ox (not a calf as it is rendered in the book of Exodus), next proceeded to hold a festival, which was to be accompanied with dancing; a species of gaiety common in the festivals which are held in adoration of the emblematic *Urotal* or ox in that very part of Arabia near Mount Sinai where this event took place. It is mentioned too as a curious and important fact, that the ox which was revered in Arabia was called *Adonai*. Accordingly Aaron announcing the feast to the ox or golden calf, speaks thus, *to-morrow is a feast to Adonai*, which is in our translation rendered *to the Lord*. In the time of Jeroboam we read of the golden calves set up as objects of worship at Bethel and Dan. Nor was the reverence paid to the ox confined to Scythia, to Egypt, and to Asia; it extended much farther. The ancient Cimbri, as the Scythians did, carried an ox of bronze before them on all their expeditions. Mr Bromley also informs us, that as great respect was paid to the living ox among the Greeks as was offered to its symbol among other nations.

The emblem of the serpent, continues Mr Bromley, was marked yet more decidedly by the express direction of the Almighty. That animal had ever been considered as emblematic of the supreme generating power of intelligent life; [illegible] was that idea, says, he, discouraged, so far as it went to be a sign or symbol of life, when God said to Moses, "Make thee a brazen serpent, and set it upon a pole, and it shall come to pass that every one who is bitten, when he looketh upon it, shall live." In Egypt the serpent surrounded their Isis and Osiris, the diadems of their princes, and the bonnets of their priests. The serpent made a distinguished figure in Grecian sculpture. The fable of Echidne, the mother of the Scythians, gave her figure terminating as a serpent to all the founders of states in Greece; from which their earliest sculptors represented in that form the Titan princes, Cecrops, Draco, and even Erichthonius. Besides the spear of the image of Minerva, which Phidias made for the citadel of Athens, he placed a serpent, which was supposed to guard that goddess.

The serpent was combined with many other figures. It sometimes was coiled round an egg as an emblem of the creation; sometimes round a trident, to show its power over the sea; sometimes it encircled a flambeau, to represent life and death.

In Egypt, as well as in Scythia and India, the divinity

vinity was repreſented on the leaves of the tamara or lotus. Pan was worſhipped as a god in that country, as well as over the eaſt. Their ſphinxes, and all their combined figures of animal creation, took their origin from the mother of the Scythians, who brought forth an offspring that was half a woman and half a ſerpent. Their pyramids and obeliſks aroſe from the idea of flame; the firſt emblem of the ſupreme principle, introduced by the Scythians, and which even the influence of Zoroaſter and the Magi could not remove.

We are told that the Bacchus of the Greeks is derived from the Brouma of the Indians; that both are repreſented as ſeated on a ſwan ſwimming over the waves, to indicate that each was the god of humid nature, not the god of wine, but the god of waters. The mitre of Bacchus was ſhaped like half an egg; an emblem taken from this circumſtance, that at the creation the egg from which all things ſprung was divided in the middle. Pan alſo was revered among the Scythians, and from that people were derived all the emblems by which the Greeks repreſented this divinity.

It would be tedious to follow our author through the whole of this ſubject; and were we to ſubmit to the labour of collecting and arranging his ſcattered materials, we ſhould ſtill view his ſyſtem with ſome degree of ſuſpicion. It is drawn, as he informs us, from the work of M. D'Ancarville, entitled, *Recherches ſur l'Origine, l'Eſprit, et les Progres, des Arts de la Grece.*

5 ounded. To form concluſions concerning the origin of nations, the riſe and progreſs of the arts and ſciences, without the aid of hiſtorical evidence, by analogies which are ſometimes accidental, and often fanciful, is a mode of reaſoning which cannot readily be admitted. There may indeed, we acknowledge, be reſemblances in the religion, language, manners, and cuſtoms, of different nations, ſo ſtriking and ſo numerous, that to doubt of their being deſcended from the ſame ſtock would ſavour of ſcepticiſm. But hiſtorical theories muſt not be adopted raſhly. We muſt be certain that the evidence is credible and ſatisfactory before we proceed to deduce any concluſions. We muſt firſt know whether the Scythian hiſtory itſelf be authentic, before we make any compariſon with the hiſtory of other nations. But what is called the Scythian hiſtory, every man of learning knows to be a collection of fables. Herodotus and Juſtin are the two ancient writers from whom we have the fulleſt account of that warlike nation; but theſe two hiſtorians contradict each other, and both write what cannot be believed of the ſame people at the ſame period of their progreſs. Juſtin tells us, that there was a long and violent conteſt between the Scythians and Egyptians about the antiquity of their reſpective nations; and after ſtating the arguments on each ſide of the queib. II. ſtion, which, as he gives them †, are nothing to the purpoſe, he decides in favour of the claim of the Scythians. Herodotus was too partial to the Egyptians, not to give them the palm of antiquity: and he was probably in the right; for Juſtin deſcribes his moſt ancient of nations, even in the time of Darius Hyſtaſpes, as ignorant of the arts of civil life. "They occupied their land in common (ſays he), and cultivated none of it. They had no houſes nor ſettled habitations, but wandered with their cattle from deſert to deſert. In theſe rambles they carried their wives and children in tumbrels covered with the ſkins of beaſts, which ſerved as houſes to protect them from the ſtorms of winter. They were without laws, governed by the dictates of natural equity. They coveted not gold or ſilver like the reſt of mankind, and lived upon milk and honey. Though they were expoſed to extreme cold, and had abundance of flocks, they knew not how to make garments of wool, but clothed themſelves in the ſkins of wild beaſts *." This is the moſt favourable account which any ancient writer gives of the Scythians. By Strabo † and Herodotus ‖ they are repreſented as the moſt ſavage of mortals, delighting in war and bloodſhed, cutting the throats of all ſtrangers who came among them, eating their fleſh, and making cups and pots of their ſkulls. Is it conceivable that ſuch ſavages could be ſculptors; or that, even ſuppoſing their manners to have been ſuch as Juſtin repreſents them, a people ſo ſimple and ignorant could have impoſed their mythology upon the Chaldeans, Phenicians, and Egyptians, whom we know by the moſt incontrovertible evidence to have been great and poliſhed nations ſo early as in the days of Abraham? No! We could as ſoon admit other novelties of more importance, with which the French of the preſent age pretend to enlighten the world, as this origin aſſigned by Mr Bromley to the art of ſculpture, unleſs ſupported by better authority than that of D'Ancarville.

* Lib. II. cap. 2.
† Lib. VII.
‖ Lib. IV. cap. 62.

The inference of our author from the name of the ſacred ox in Arabia, and from the dancing and gaiety which were common in the religious feſtivals of the Arabians, appears to us to be very haſtily drawn. At the early period of the departure of the Iſraelites from Egypt, the language of the Hebrews, Egyptians, and Arabians, differed not more from each other than do the different dialects of the Greek tongue which are found in the poems of Homer (ſee PHILOLOGY, Sect. III.); and it is certain, that for many years after the formation of the golden-calf, the Hebrews were ſtrangers to every ſpecies of idolatry but that which they had brought with them from their houſe of bondage. See REMPHAN.

Taking for granted therefore that the Scythians did not impoſe their mythology upon the eaſtern nations, and that the art of ſculpture, as well as hieroglyphic writing and idolatrous worſhip, prevailed firſt among the Chaldeans, we ſhall endeavour to trace the progreſs of this art through ſome other nations of antiquity, till we bring it to Greece, where it was carried to the higheſt perfection to which it has yet attained.

The firſt intimation that we have of the art of ſculpture is in the book of Geneſis, where we are informed, that when Jacob, by the divine command, was returning to Canaan, his wife Rachel carried along with her the teraphim or idols of her father. Theſe we are aſſured were ſmall, ſince Rachel found it ſo eaſy to conceal them from her father, notwithſtanding his anxious ſearch. We are ignorant, however, how theſe images were made, or of what materials they were compoſed. The firſt perſon mentioned as an artiſt of eminence is Bezaleel, who formed the cherubims which covered the mercy-ſeat.

6 Egyptian ſculpture. The Egyptians alſo cultivated the art of ſculpture; but there were two circumſtances that obſtructed its progreſs, 1. The perſons of the Egyptians were not poſſeſſed of the graces of form, of elegance, or of ſymmetry; and of conſequence they had no perfect ſtandard

to model their taſte. They reſembled the Chineſe in the caſt of their face, in their great bellies, and in the clumſy rounding of their contours. 2. They were reſtrained by their laws to the principles and practices of their anceſtors, and were not permitted to introduce any innovations. Their ſtatues were always formed in the ſame ſtiff attitude, with the arms hanging perpendicularly down the ſides. What perfection were they capable of who knew no other attitude than that of chairmen? So far were they from attempting any improvements, that in the time of Adrian the art continued in the ſame rude ſtate as at firſt; and when their ſlaviſh adulation for that emperor induced them to place the ſtatue of his favourite Antinous among the objects of their worſhip, the ſame inanimate ſtiffneſs in the attitude of the body and poſition of the arms was obſerved. We believe it will ſcarcely be neceſſary to inform our readers that the Egyptian ſtatue juſt now mentioned is very different from the celebrated ſtatue of Antinous, of which ſo many moulds have been taken that imitations of it are now to be met with almoſt in every cabinet in Europe.

Notwithſtanding the attachment of the Egyptians to ancient uſages, Winkelman thinks he has diſcovered two different ſtyles of ſculpture which prevailed at different periods. The firſt of theſe ends with the conqueſt of Egypt by Cambyſes. The ſecond begins at that time, and extends beyond the reign of Alexander the Great.

7 First ſtyle. In the firſt ſtyle, the lines which form the contour are ſtraight and projecting a little; the poſition is ſtiff and unnatural: In ſitting figures the legs are parallel, the feet ſqueezed together, and the arms fixed to the ſides; but in the figures of women the left arm is folded acroſs the breaſt; the bones and muſcles are faintly diſcernible; the eyes are flat and looking obliquely, and the eyebrows ſunk; features which deſtroy entirely the beauty of the head; the cheek-bones are high, the chin ſmall and peaked; the ears are generally placed higher than in nature, and the feet are too large and flat. In ſhort, if we are to look for any model in the ſtatues of Egypt, it is not for the model of beauty but of deformity. The ſtatues of men are naked, only they have a ſhort apron, and a few folds of drapery ſurrounding their waiſt: The veſtments of women are only diſtinguiſhable by the border, which riſes a little above the ſurface of the ſtatue. In this age it is evident the Egyptians knew little of drapery.

8 Second ſtyle. Of the ſecond ſtyle of ſculpture practiſed among the Egyptians, Winkelman thinks he has found ſpecimens in the two figures of baſaltes in the Capitol, and in another figure at Villa Albani, the head of which has been renewed. The two firſt of theſe, he remarks, bear viſible traces of the former ſtyle, which appear eſpecially in the form of the mouth and ſhortneſs of the chin. The hands poſſeſs more elegance; and the feet are placed at a greater diſtance from one another, than was cuſtomary in more ancient times. In the firſt and third figures the arms hang down cloſe to the ſides: In the ſecond they hang more freely. Winkelman ſuſpects that theſe three ſtatues have been made after the conqueſt of Egypt by the Greeks. They are clothed with a tunic, a robe, and a mantle. The tunic, which is puckered into many folds, deſcends from the neck to the ground. The robe in the firſt and third ſtatues ſeems cloſe to the body, and is only perceptible by ſome little folds. It is tied under the breaſt, and covered by the mantle, the two buttons of which are placed under the epaulet.

The Antinous of the Capitol is compoſed of two pieces, which are joined under the haunches. But as all the Egyptian ſtatues which now remain have been hewn out of one block, we muſt believe that Diodorus, in ſaying the ſtone was divided, and each half finiſhed by a ſeparate artizan, ſpoke only of a coloſſus. The ſame author informs us, that the Egyptians divided the human body into 24¼ parts; but it is to be regretted that he has not given a more minute detail of that diviſion.

The Egyptian ſtatues were not only formed by the chiſel, they were alſo poliſhed with great care. Even thoſe on the ſummit of an obeliſk, which could only be viewed at a diſtance, were finiſhed with as much labour and care as if they had admitted a cloſe inſpection. As they are generally executed in granite or baſaltes, ſtones of a very hard texture, it is impoſſible not to admire the indefatigable patience of the artiſts.

The eye was often of different materials from the reſt of the ſtatue; ſometimes it was compoſed of a precious ſtone or metal. We are aſſured that the valuable diamond of the empreſs of Ruſſia, the largeſt and moſt beautiful hitherto known, formed one of the eyes of the famous ſtatue of Scheringham in the temple of Brama.

Thoſe Egyptian ſtatues which ſtill remain are compoſed of wood or baked earth: and the ſtatues of earth are covered with green enamel.

9 Phenician ſculpture. The Phenicians poſſeſſed both a character and ſituation highly favourable to the cultivation of ſtatuary. They had beautiful models in their own perſons, and their induſtrious character qualified them to attain perfection in every art for which they had a taſte. Their ſituation raiſed a ſpirit of commerce, and commerce induced them to cultivate the arts. Their temples ſhone with ſtatues and columns of gold, and a profuſion of emeralds was everywhere ſcattered. All the great works of the Phenicians have been unfortunately deſtroyed; but many of the Carthaginian medals are ſtill preſerved, ten of which are depoſited in the cabinet of the grand duke of Florence. But though the Carthaginians were a colony of Phenicians, we cannot from their works judge of the merit of their anceſtors.

10 Thisart n cultivated among the Perſians. The Perſians made no diſtinguiſhed figure in the arts of deſign. They were indeed ſenſible to the charms of beauty, but they did not ſtudy to imitate them. Their dreſs, which conſiſted of long flowing robes concealing the whole perſon, prevented them from attending to the beauties of form. Their religion, too, which taught them to worſhip the divinity in the emblem of fire, and that it was impious to repreſent him under a human form, ſeemed almoſt to prohibit the exerciſe of this art, by taking away thoſe motives which alone could give it dignity and value; and as it was not cuſtomary among them to raiſe ſtatues to great men, it was impoſſible that ſtatuary could flouriſh in Perſia.

11 Etrurian ſculpture. The Etrurians or ancient Tuſcans, in the opinion of Winkelman, carried this art to ſome degree of perfection at an earlier period than the Greeks. It is ſaid to have been introduced before the ſiege of Troy by Dedalus, who, in order to eſcape the reſentment of Minos king of Crete, took refuge in Sicily, from whence he paſſed

passed into Italy, where he left many monuments of his art. Pausanias and Diodorus Siculus inform us, that some works ascribed to him were to be seen when they wrote, and that these possessed that character of majesty which afterwards distinguished the labours of Etruria.

A character strongly marked forms the chief distinction in those productions of Etruria which have descended to us. Their style was indeed harsh and overcharged; a fault also committed by Michael Angelo the celebrated painter of modern Etruria; for it is not to be supposed that a people of such rude manners as the Etrurians could communicate to their works that vividness and beauty which the elegance of Grecian manners inspired. On the other hand, there are many of the Tuscan statues which bear so close a resemblance to those of Greece, that antiquarians have thought it probable that they were conveyed from that country or Magna Græcia into Etruria about the time of the Roman conquest, when Italy was adorned with the spoils of Greece.

12 t style. Among the monuments of Etrurian art two different styles have been observed. In the first the lines are straight, the attitude stiff, and no idea of beauty appears in the formation of the head. The contour is not well rounded, and the figure is too slender. The head is oval, the chin peaked, the eyes flat, and looking asquint.

These are the defects of an art in a state of infancy, which an accomplished master could never fall into, and are equally conspicuous in Gothic statues as in the productions of the ancient natives of Florence. They resemble the style of the Egyptians so much, that one is almost induced to suppose that there had once been a communication between these two nations; but others think that this style was introduced by Dedalus.

13 ond le. Winkleman supposes that the second epoch of this art commenced in Etruria, about the time at which it had reached its greatest perfection in Greece, in the age of Phidias: but this conjecture is not supported by any proofs. To describe the second style of sculpture among the Etrurians, is almost the same as to describe the style of Michael Angelo and his numerous imitators. The joints are strongly marked, the muscles raised, the bones distinguishable; but the whole mien harsh. In designing the bone of the leg, and the separation of the muscles of the calf, there is an elevation and strength above life. The statues of the gods are designed with more delicacy. In forming them, the artists were anxious to show that they could exercise their power without that violent distension of the muscles which is necessary in the exertions of beings merely human; but in general their attitudes are unnatural, and the actions strained. If a statue, for instance, hold any thing with its fore fingers, the rest are stretched out in a stiff position.

According to ancient history, the Greeks did not emerge from the savage state till a long time after the Egyptians, Chaldeans, and Indians, had arrived at a considerable degree of civilization. The original rude inhabitants of Greece were civilized by colonies which arrived among them, at different times, from Egypt and Phenicia. These brought along with them the religion, the letters, and the arts of their parent countries; and if sculpture had its origin from the worship of idols, there is reason to believe that it was one of the arts which were thus imported; for that the gods of Greece were of Egyptian and Phenician extraction is a fact incontrovertible. (see MYSTERIES; MYTHOLOGY, PHILOLOGY, Sect. VII. PHILOSOPHY, N° 19, and TITAN.) The original statues of the gods, however, were very rude. The earliest objects of idolatrous worship have everywhere been the heavenly bodies; and the symbols consecrated to them were generally pillars of a conical or pyramidal figure. It was not till hero-worship was engrafted on the planetary, that the sculptor thought of giving to the sacred statue any part of the human form (see POLYTHEISM, N° 19, 23); and it appears to have been about the era of this revolution in idolatry that the art of sculpture was introduced among the Greeks. The first representations of their gods were round stones placed upon cubes or pillars; and these stones they afterwards formed roughly, so as to give them something of the appearance of a head. Agreeable to this description was a Jupiter, which Pausanias saw in Tegeum, in Arcadia. These representations were called *Hermes*; not that they represented Mercury, but from the word *herma*, which signified a rough stone. It is the name which Homer gives to the stones which were used to fix vessels to the shore. Pausanias saw at Pheres 30 deities made of unformed blocks or cubical stones. The Lacedemonians represented Castor and Pollux by two parallel posts; and a transverse beam was added, to express their mutual affection.

If the Greeks derived from foreign nations the rudiments of the arts, it must redound much to their honour, that in a few centuries they carried them to such wonderful perfection as entirely to eclipse the fame of their masters. It is by tracing the progress of sculpture among them that we are to study the history of this art; and we shall see its origin and successive improvements correspond with nature, which always operates slowly and gradually.

VIEW OF GRECIAN SCULPTURE.

14 Causes which promoted the art of sculpture in Greece. The great superiority of the Greeks in the art of sculpture may be ascribed to a variety of causes. The influence of climate over the human body is so striking, that it must have fixed the attention of every thinking man who has reflected on the subject. The violent heats of the torrid zone, and the excessive cold of the polar regions, are unfavourable to beauty. It is only in the mild climates of the temperate regions that it appears in its most attractive charms. Perhaps no country in the world enjoys a more serene air, less tainted with mists and vapours, or possesses in a higher degree that mild and genial warmth which can unfold and expand the human body into all the symmetry of muscular strength, and all the delicacies of female beauty in greater perfection, than the happy climate of Greece; and never was there any people that had a greater taste for beauty, or were more anxious to improve it. Of the four wishes of Simonides, the second was to have a handsome figure. The love of beauty was so great among the Lacedemonian women, that they kept in their chambers the statues of Nereus, of Narcissus, of Hyacinthus,

Hyacinthus, and of Caſtor and Pollux; hoping that by often contemplating them they might have beautiful children.

There was a variety of circumſtances in the noble and virtuous freedom of the Grecian manners that rendered theſe models of beauty peculiarly ſubſervient to the cultivation of the fine arts. There were no tyrannical laws, as among the Egyptians, to check their progreſs. They had the beſt opportunities to ſtudy them in the public places, where the youth, who needed no other veil than chaſtity and purity of manners, performed their various exerciſes quite naked. They had the ſtrongeſt motives to cultivate ſculpture, for a ſtatue was the higheſt honour which public merit could attain. It was an honour ambitiouſly ſought, and granted only to thoſe who had diſtinguiſhed themſelves in the eyes of their fellow citizens. As the Greeks preferred natural qualities to acquired accompliſhments, they decreed the firſt rewards to thoſe who excelled in agility and ſtrength of body. Statues were often raiſed to wreſtlers. Even the moſt eminent men of Greece, in their youth, ſought renown in gymnaſtic exerciſes. Chryſippus and Cleanthes diſtinguiſhed themſelves in the public games before they were known as philoſophers. Plato appeared as a wreſtler both at the Iſthmian and Pythian games; and Pythagoras carried off the prize at Elis, (ſee PYTHAGORAS.) The paſſion by which they were inſpired was the ambition of having their ſtatues erected in the moſt ſacred place of Greece, to be ſeen and admired by the whole people. The number of ſtatues erected on different occaſions was immenſe; of courſe the number of artiſts muſt have been great, their emulation ardent, and their progreſs rapid.

As moſt of their ſtatues were decreed for thoſe who vanquiſhed in the public games, the artiſts had the opportunity of ſeeing excellent models; for thoſe who ſurpaſſed in running, boxing, and wreſtling, muſt in general have been well formed, yet would exhibit different kinds of beauty.

The high eſtimation in which ſculptors were held was very favourable to their art. Socrates declared the artiſts the only wiſe men. An artiſt could be a legiſlator, a commander of armies, and might hope to have his ſtatue placed beſide thoſe of Miltiades and Themiſtocles, or thoſe of the gods themſelves. Beſides, the honour and ſucceſs of an artiſt did not depend on the caprice of pride or of ignorance. The productions of art were eſtimated and rewarded by the greateſt ſages in the general aſſembly of Greece, and the ſculptor who had executed his work with ability and taſte was confident of obtaining immortalit.

It was the opinion of Winkelman, that liberty was highly favourable to this art; but, though liberty is abſolutely neceſſary to the advancement of ſcience, it may be doubted whether the fine arts owe their improvement to it. Sculpture flouriſhed moſt in Greece, when Pericles exerciſed the power of a king; and in the reign of Alexander, when Greece was conquered. It attained no perfection in Rome till Auguſtus had enſlaved the Romans. It revived in Italy under the patronage of the family of Medici, and in France under the deſpotic rule of Louis XIV. It is the love of beauty, luxury, wealth, or the patronage of a powerful individual, that promotes the progreſs of this art.

It will now be proper to give a particular account of the ideas which the Greeks entertained concerning the ſtandard of beauty in the different parts of the human body. And with reſpect to the head, the profile which they chiefly admired is peculiar to dignified beauty. It conſiſts in a line almoſt ſtraight, or marked by ſuch ſlight and gentle inflections as are ſcarcely diſtinguiſhable from a ſtraight line. In the figures of women and young perſons, the forehead and noſe form a line approaching to a perpendicular. 15 Grecian ideas of beauty. 16 The profile.

Ancient writers, as well as artiſts, aſſure us that the Greeks reckoned a ſmall forehead a mark of beauty, and a high forehead a deformity. From the ſame idea, the Circaſſians wore their hair hanging down over their foreheads almoſt to their eyebrows. To give an oval form to the countenance, it is neceſſary that the hair ſhould cover the forehead, and thus make a curve about the temples; otherwiſe the face, which terminates in an oval form in the inferior part, will be angular in the higher part, and the proportion will be deſtroyed. This rounding of the forehead may be ſeen in all handſome perſons, in all the heads of ideal beauty in ancient ſtatues, and eſpecially in thoſe of youth. It has been overlooked, however, by modern ſtatuaries. Bernini, who modelled a ſtatue of Louis XIV. in his youth, turned back the hair from the forehead. 17 The forehead.

It is generally agreed that large eyes are beautiful; but their ſize is of leſs importance in ſculpture than their form, and the manner in which they are enchaſed. In ideal beauty, the eyes are always ſunk deeper than they are in nature, and conſequently the eyebrows have a greater projection. But in large ſtatues, placed at a certain diſtance, the eyes, which are of the ſame colour with the reſt of the head, would have little effect if they were not ſunk. By deepening the cavity of the eye, the ſtatuary increaſes the light and ſhade, and thus gives the head more life and expreſſion. The ſame practice is uſed in ſmall ſtatues. The eye is a characteriſtic feature in the heads of the different deities. In the ſtatues of Apollo, Jupiter, and Juno, the eye is large and round. In thoſe of Pallas they are alſo large; but by lowering the eyelids, the virgin air and expreſſion of modeſty are delicately marked. Venus has ſmall eyes, and the lower eyelid being raiſed a little, gives them a languiſhing look and an enchanting ſweetneſs. It is only neceſſary to ſee the Venus de Medicis to be convinced that large eyes are not eſſential to beauty, eſpecially if we compare her ſmall eyes with thoſe which reſemble them in nature. The beauty of the eyebrows conſiſts in the fineneſs of the hair, and in the ſharpneſs of the bone which covers them; and maſters of the art conſidered the joining of the eyebrows as a deformity, though it is ſometimes to be met with in ancient ſtatues. 18 The eyes.

The beauty of the mouth is peculiarly neceſſary to conſtitute a fine face. The lower lip muſt be fuller than the upper, in order to give an elegant rounding to the chin. The teeth ſeldom appear, except in laughing ſatyrs. In human figures the lips are generally cloſe, and a little opened in the figures of the gods. The lips of Venus are half open. 19 The mou

In figures of ideal beauty, the Grecian artiſts never interrupted the rounding of the chin by introducing a dimple: for this they conſidered not as a mark of beauty, and only to be admitted to diſtinguiſh individuals. The dimple indeed appears in ſome ancient ſtatues, but antiquaries

antiquaries ſuſpect it to be the work of a modern hand. It is ſuſpected alſo, that the dimple which is ſometimes found on the cheeks of ancient ſtatues is a modern innovation.

20 ears.

No part of the head was executed by the ancients with more care than the ears, though little attention has been given to them by modern artiſts. This character is ſo deciſive, that if we obſerve in any ſtatue that the ears are not highly finiſhed, but only roughly marked, we may conclude with certainty that we are examining a modern production. The ancients were very attentive to copy the preciſe form of the ear in taking likeneſſes. Thus, where we meet with a head the ears of which have a very large interior opening, we know it to be the head of Marcus Aurelius.

21 hair.

The manner in which the ancient artiſts formed the hair alſo enables us to diſtinguiſh their works from thoſe of the moderns. On hard and coarſe ſtones the hair was ſhort, and appeared as if it had been combed with a wide comb; for that kind of ſtone was difficult to work, and could not without immenſe labour be formed into curled and flowing hair. But the figures executed in marble in the moſt flouriſhing period of the art have the hair curled and flowing; at leaſt where the head was not intended to be an exact reſemblance, for then the artiſt conformed to his model. In the heads of women, the hair was thrown back, and tied behind in a waving manner, leaving conſiderable intervals; which gives the agreeable variety of light and ſhade, and produces the effects of the claro-obſcuro. The hair of the Amazons is diſpoſed in this manner. Apollo and Bacchus have their hair falling down their ſhoulders; and young perſons, till they arrived at manhood, wore their hair long. The colour of the hair which was reckoned moſt beautiful, was fair; and this they gave without diſtinction to the moſt beautiful of their gods, Apollo and Bacchus, and likewiſe to their moſt illuſtrious heroes.

22 e hands.

Although the ravages of time have preſerved but few of the hands or feet of ancient ſtatues, it is evident from what remains how anxious the Grecian artiſts were to give every perfection to theſe parts. The hands of young perſons were moderately plump, with little cavities or dimples at the joints of the fingers. The fingers tapered very gently from the root to the point, like well proportioned columns, and the joints were ſcarcely perceptible. The terminating joint was not bent, as it commonly appears in modern ſtatues.

23 e legs d feet.

In the figures of young men the joints of the knee are faintly marked. The knee unites the leg to the thigh without making any remarkable projections or cavities. The moſt beautiful legs and beſt turned knees, according to Winkelman, are preſerved in the Apollo Sauroctonos, in the Villa Borgheſe; in the Apollo which has a ſwan at its feet; and in the Bacchus of Villa Medicis. The ſame able connoiſſeur remarks, it is rare to meet with beautiful knees in young perſons, or in the elegant repreſentations of art. As the ancients did not cover the feet as we do, they gave to them the moſt beautiful turning, and ſtudied the form of them with the moſt ſcrupulous attention.

The breaſts of men were large and elevated. The breaſts of women did not poſſeſs much amplitude. The figures of the deities have always the breaſts of a virgin, the beauty of which the ancients made to conſiſt in a gentle elevation. So anxious were the women to reſemble this ſtandard, that they uſed ſeveral arts to reſtrain the growth of their breaſts. The breaſts of the nymphs and goddeſſes were never repreſented ſwelling, becauſe that is peculiar to thoſe women who ſuckle. The paps of Venus contract and end in a point, this being conſidered as an eſſential characteriſtic of perfect beauty. Some of the moderns have tranſgreſſed theſe rules, and have fallen into great improprieties. 24 The breaſt and lower part of the body.

The lower part of the body in the ſtatues of men was formed like that of the living body after a profound ſleep and good digeſtion. The navel was conſiderably ſunk, eſpecially in female ſtatues.

As beauty never appears in equal perfection in every part of the ſame individual, perfect or ideal beauty can only be produced by ſelecting the moſt beautiful parts from different models; but this muſt be done with ſuch judgment and care, that theſe detached beauties when united may form the moſt exact ſymmetry. Yet the ancients ſometimes confined themſelves to one individual, even in the moſt flouriſhing age. Theodorus, whom Socrates and his diſciples viſited, ſerved as a model to the artiſts of his time. Phryne alſo appears to have been a model to the painters and ſculptors. But Socrates, in his converſation with Parrhaſius, ſays, that when a perfect beauty was to be produced, the artiſts joined together the moſt ſtriking beauties which could be collected from the fineſt figures. We know that Zeuxis, when he was going to paint Helen, united in one picture all the beauties of the moſt handſome women of Crotona. 25 Ideal beauty.

26 The drapery of ſtatues.

The Grecian ſculptors, who repreſented with ſuch ſucceſs the moſt perfect beauty of the human form, were not regardleſs of the drapery of their ſtatues. They clothed their figures in the moſt proper ſtuff, which they wrought into that ſhape which was beſt calculated to give effect to their deſign.

The veſtments of women in Greece generally conſiſted of linen cloth, or ſome other light ſtuff, and in latter times of ſilk and ſometimes of woollen cloth. They had alſo garments embroidered with gold. In the works of ſculpture, as well as in thoſe of paintings, one may diſtinguiſh the linen by its tranſparency and ſmall united folds. The other light ſtuffs which were worn by the women (A) were generally of cotton produced in the iſle of Cos; and theſe the art of ſtatuary was able to diſtinguiſh from the linen veſtments. The cotton cloth was ſometimes ſtriped, and ſometimes embelliſhed with a profuſion of flowers. Silk was alſo employed; but whether it was known in Greece before the time of the Roman emperors cannot eaſily be determined. In paintings, it is diſtinguiſhable by changing its colour in different lights to red, violet, and ſky-blue. There were two ſorts of purple; that which the Greeks called the *colour of the ſea*, and Tyrian purple, which reſembled lac. Woollen garments are eaſily known by the

(A) Men ſometimes wore cotton, but all who did ſo were reckoned effeminate.

the amplitude of their folds. Beſides theſe, cloth of gold ſometimes compoſed their drapery: but it was not like the modern fabric, conſiſting of a thread of gold or of ſilver ſpun with a thread of ſilk; it was compoſed of gold or ſilver alone, without any mixture.

The veſtments of the Greeks, which deſerve particular attention, are the tunic, the robe, and the mantle.

27 The tunic. The tunic was that part of the dreſs which was next to the body. It may be ſeen in ſleeping figures, or in thoſe in diſhabille; as in the Flora Farneſe, and in the ſtatues of the Amazons in the Capitol. The youngeſt of the daughters of Niobe, who throws herſelf at her mother's ſide, is clothed only with a tunic. It was of linen, or ſome other light ſtuff, without ſleeves, fixed to the ſhoulders by a button, ſo as to cover the whole breaſt. None but the tunics of the goddeſs Ceres and comedians have long ſtraight ſleeves.

28 The robe. The robes of women commonly conſiſted of two long pieces of woollen cloth, without any particular form, attached to the ſhoulders by a great many buttons, and ſometimes by a claſp. They had ſtraight ſleeves, which came down to the wriſts. The young girls, as well as the women, faſtened their robe to their ſide by a cincture, in the ſame way as the high prieſt of the Jews faſtened his, as it is ſtill done in many parts of Greece. The cincture formed on the ſide a knot of ribbons ſometimes reſembling a roſe in ſhape, which has been particularly remarked in the two beautiful daughters of Niobe. In the younger of theſe the cincture is ſeen paſſing over the ſhoulders and the back. Venus has two cinctures, the one paſſing over the ſhoulder, and the other ſurrounding the waiſt. The latter is called *ceſtus* by the poets.

29 The mantle. The mantle was called *peplon* by the Greeks, which ſignifies properly the mantle of Pallas. The name was afterwards applied to the mantles of the other gods, as well as to thoſe of men. This part of the dreſs was not ſquare, as ſome have imagined, but of a roundiſh form. The ancients indeed ſpeak in general of ſquare mantles, but they received this ſhape from four taſſels which were affixed to them; two of theſe were viſible, and two were concealed under the mantle. The mantle was brought under the right arm, and over the left ſhoulder: ſometimes it was attached to the ſhoulder by two buttons, as may be ſeen in the beautiful ſtatue of Leucothoe at Villa Albani.

30 The colour of the veſtments. The colour of veſtments peculiar to certain ſtatues is too curious to be omitted. To begin with the figures of the gods.—The drapery of Jupiter was red, that of Neptune is ſuppoſed by Winkelman to have been ſea-green. The ſame colour alſo belonged to the Nereids and Nymphs. The mantle of Apollo was blue or violet. Bacchus was dreſſed in white. Martianus Capella aſſigns green to Cybele. Juno's veſtments were ſky-blue, but ſhe ſometimes had a white veil. Pallas was robed in a flame-coloured mantle. In a painting of Herculaneum, Venus is in flowing drapery of a golden yellow. Kings were arrayed in purple; prieſts in white; and conquerors ſometimes in ſea-green.

With reſpect to the head, women generally wore no covering but their hair; when they wiſhed to cover their head, they uſed the corner of their mantle.—Sometimes we meet with veils of a fine tranſparent texture. Old women wore a kind of bonnet upon their head, an example of which may be ſeen in a ſtatue in the Capitol, called the *Praefica*; but Winkelman thinks it is a ſtatue of Hecuba.

The covering of the feet conſiſted of ſhoes or ſandals. The ſandals were generally an inch thick, and compoſed of more than one ſole of cork. Thoſe of Pallas in Villa Albani have two ſoles, and other ſtatues had no leſs than five.

31 Four ſtyles of this art among the Greeks. Winkelman has aſſigned four different ſtyles to this art. The *ancient* ſtyle, which continued until the time of Phidias; the *grand* ſtyle, formed by that celebrated ſtatuary; the *beautiful*, introduced by Praxiteles, Apelles, and Lyſippus; and the *imitative* ſtyle, practiſed by thoſe artiſts who copied the works of the ancient maſters.

32 The ancient ſtyle. The moſt authentic monuments of the ancient ſtyle are medals, containing an inſcription, which leads us back to very diſtant times. The writing is from right to left in the Hebrew manner; a uſage which was abandoned before the time of Herodotus. The ſtatue of Agamemnon at Elis, which was made by Ornatas, has an inſcription from right to left. This artiſan flouriſhed 50 years before Phidias; it is in the intervening period therefore between thoſe two artiſts, that we are to look for the ceſſation of this practice. The ſtatues formed in the ancient ſtyle were neither diſtinguiſhed by beauty of ſhape nor by proportion, but bore a cloſe reſemblance to thoſe of the Egyptians and Etrurians (B); the eyes were long and flat; the ſection of the mouth not horizontal; the chin was pointed; the curls of the hair were ranged in little rings, and reſembled grains encloſed in a heap of raiſins. What was ſtill worſe, it was impoſſible by inſpecting the head to diſtinguiſh the ſex.

The characters of this ancient ſtyle were theſe: The deſigning was energetic, but harſh; it was animated, but without gracefulneſs; and the violence of the expreſſion deprived the whole figure of beauty.

33 The grand ſtyle. The grand ſtyle was brought to perfection by Phidias, Polycletus, Scopas, Alcamenes, Myron, and other illuſtrious artiſts. It is probable, from ſome paſſages of ancient writers, that in this ſtyle were preſerved ſome characters of the ancient manner, ſuch as the ſtraight lines, the ſquares and angles. The ancient maſters, ſuch as Polycletus, being the legiſlators of proportions, ſays Winkelman, and of conſequence thinking they had a right to diſtribute the meaſures and dimenſions of the parts of the human body, have undoubtedly ſacrificed ſome degree of the form of beauty to a grandeur which is harſh, in compariſon of the flowing contours and graceful forms of their ſucceſſors.—The moſt conſiderable monuments of the grand ſtyle are the ſtatues of Niobe and her daughters, and a figure

(B) This is a proof additional to thoſe that will be found in the articles to which we have referred, that the Greeks received the rudiments of the art of ſculpture from the nations to which they were confeſſedly indebted for the elements of ſcience.

gure of Pallas, to be ſeen in Villa Albani; which, however muſt not be confounded with the ſtatue which is modelled according to the firſt ſtyle, and is alſo found in the ſame place. The head poſſeſſes all the characters of dignified beauty, at the ſame time exhibiting the rigidneſs of the ancient ſtyle. The face is defective in graceſulneſs; yet it is evident how eaſy it would have been to give the features more roundneſs and grace. The figures of Niobe and her daughters have not, in the opinion of Winkelman, that auſterity of appearance which marks the age of the ſtatue of Pallas. They are characterized by grandeur and ſimplicity; ſo ſimple are the forms, that they do not appear to be the tedious productions of art, but to have been created by an inſtantaneous effort of nature.

34 gracetyle. The third ſtyle was the graceful or beautiful. Lyſippus was perhaps the artiſt who introduced this ſtyle. Being more converſant than his predeceſſors with the ſweet, the pure, the flowing, and the beautiful lines of nature, he avoided the ſquare forms which the maſters of the ſecond ſtyle had too much employed. He was of opinion that the uſe of the art was rather to pleaſe than to aſtoniſh, and that the aim of the artiſt ſhould be to raiſe admiration by giving delight. The artiſts who cultivated this ſtyle did not, however, neglect to ſtudy the ſublime works of their predeceſſors. They knew that grace is conſiſtent with the moſt dignified beauty, and that it poſſeſſes charms which muſt ever pleaſe: they knew alſo that theſe charms are enhanced by dignity. Grace is infuſed into all the movements and attitudes of their ſtatues, and it appears in the delicate turns of the hair, and even in the adjuſting of the drapery. Every ſort of grace was well known to the ancients; and great as the ravages of time have been amongſt the works of art, ſpecimens are ſtill preſerved, in which can be diſtinguiſhed *dignified* beauty, *attractive* beauty, and a beauty *peculiar to infants*. A ſpecimen of dignified beauty may be ſeen in the ſtatue of one of the muſes in the palace of Barberini at Rome; and in the garden of the pope, on the Quirinal, is a ſtatue of another muſe, which affords a fine inſtance of attractive beauty. Winkelman ſays that the moſt excellent model of infant beauty which antiquity has tranſmitted to us is a ſatyr of a year old, which is preſerved, though a little mutilated, in Villa Albani.

35 e imita- e ſtyle. The great reputation of Praxiteles and Apelles raiſed an ardent emulation in their ſucceſſors, who deſpairing to ſurpaſs ſuch illuſtrious maſters, were ſatisfied with imitating their works. But it is well known that a mere imitator is always inferior to the maſter whom he attempts to copy. When no original genius appears, the art muſt therefore decline.

36 aterials Grecian tues. Clay was the firſt material which was employed in ſtatuary. An inſtance of this may be ſeen in a figure of Alcamenes in bas-relief in Villa Albani. The ancients uſed their fingers, and eſpecially their nails, to render certain parts more delicate and lively: hence aroſe the

37 ay and after. phraſe *ad unguem factus homo*, "an accompliſhed man." It was the opinion of Count Caylus that the ancients did not uſe models in forming their ſtatues. But to diſprove this, it is only neceſſary to mention an engraving on a ſtone in the cabinet of Stoſch, which repreſents Prometheus engraving the figure of a man, with a plummet in his hand to meaſure the proportions of his model. The ancients as well as the moderns made works in plaſter; but no ſpecimens remain except ſome figures in bas-relief, of which the moſt beautiful were found at Baia.

38 Ivory, ſilver, and gold. The works made of ivory and ſilver were generally of a ſmall ſize. Sometimes, however, ſtatues of a prodigious ſize were formed of gold and ivory. The coloſſal Minerva of Phidias, which was compoſed of theſe materials, was 26 cubits high. It is indeed ſcarcely poſſible to believe that ſtatues of ſuch a ſize could entirely conſiſt of gold and ivory. The quantity of ivory neceſſary to a coloſſal ſtatue is beyond conception. M. de Pauw calculates that the ſtatue of Jupiter Olympius, which was 54 feet high, would conſume the teeth of 500 elephants.

39 Marble. The Greeks generally hewed their marble ſtatues out of one block, though they after worked the heads ſeparately, and ſometimes the arms. The heads of the famous group of Niobe and her daughters have been adapted to their bodies after being ſeparately finiſhed. It is proved by a large figure repreſenting a river, which is preſerved in Villa Albani, that the ancients firſt hewed their ſtatues roughly before they attempted to finiſh any part. When the ſtatue had received its perfect figure, they next proceeded to poliſh it with pumice-ſtone, and again carefully retouched every part with the chiſel.

40 Porphyry. The ancients, when they employed porphyry, uſually made the head and extremities of marble. It is true, that at Venice there are four figures entirely compoſed of porphyry; but theſe are the productions of the Greeks of the middle age. They alſo made ſtatues of baſaltes and alabaſter.

41 Expreſſion and attitude. Without expreſſion, geſture, and attitude, no figure can be beautiful, becauſe in theſe the graces always reſide. It was for this reaſon that the graces are always repreſented as the companions of Venus.

The expreſſion of tranquillity was frequent in Grecian ſtatues, becauſe, according to Plato, that was conſidered as the middle ſtate of the ſoul between pleaſure and pain. Experience too ſhows that in general the moſt beautiful perſons are endowed with the ſweeteſt and moſt engaging manner. Without a ſedate tranquillity dignified beauty could not exiſt. It is in this tranquillity, therefore, that we muſt look for the complete diſplay of genius.

42 in the ſtatues of the gods; The moſt elevated ſpecies of tranquillity and repoſe was ſtudied in the figures of the gods. The father of the gods, and even inferior divinities, are repreſented without emotion or reſentment. It is thus that Homer paints Jupiter ſhaking Olympus by the motion of his hair and his eyebrows.

> Shakes his ambroſial curls, and gives the nod,
> The ſtamp of fate and ſanction of the god.

Jupiter is not always exhibited in this tranquil ſtate. In a bas-relief belonging to the marquis Rondini he appears ſeated on an arm chair with a melancholy aſpect. The Apollo of the Vatican repreſents the god in a fit of rage againſt the ſerpent Python, which he kills at a blow. The artiſt, adopting the opinion of the poets, has made the noſe the ſeat of anger, and the lips the ſeat of diſdain.

43 in the ſtatues of heroes; To expreſs the action of a hero, the Grecian ſculptors delineated

delineated the countenance of a noble virtuous character repreſſing his groans, and allowing no expreſſion of pain to appear. In deſcribing the actions of a hero the poet has much more liberty than the artiſt. The poet can paint them ſuch as they were before men were taught to ſubdue their paſſions by the reſtraints of law, or the refined cuſtoms of ſocial life. But the artiſt, obliged to ſelect the moſt beautiful forms, is reduced to the neceſſity of giving ſuch an expreſſion of the paſſions as may not ſhock our feelings and diſguſt us with his production. The truth of theſe remarks will be acknowledged by thoſe who have ſeen two of the moſt beautiful monuments of antiquity; one of which repreſents the fear of death, the other the moſt violent pains and ſufferings. The daughters of Niobe againſt whom Diana has diſcharged her fatal arrows, are exhibited in that ſtate of ſtupefaction which we imagine muſt take place when the certain proſpect of death deprives the ſoul of all ſenſibility. The fable preſents us an image of that ſtupor which Eſchylus deſcribes as ſeizing the Niobe when they were transformed into a rock. The other monument referred to is the image of Laocoon, which exhibits the moſt agonizing pain that can affect the muſcles, the nerves, and the veins. The ſufferings of the body and the elevation of the ſoul are expreſſed in every member with equal energy, and form the moſt ſublime contraſt imaginable. Laocoon appears to ſuffer with ſuch fortitude, that, whilſt his lamentable ſituation pierces the heart, the whole figure fills us with an ambitious deſire of imitating his conſtancy and magnanimity in the pains and ſufferings that may fall to our lot.

Philoctetes is introduced by the poets ſhedding tears, uttering complaints, and rending the air with his groans and cries; but the artiſt exhibits him ſilent and bearing his pains with dignity. The Ajax of the celebrated painter Timomachus is not drawn in the act of deſtroying the ſheep which he took for the Grecian chiefs, but in the moments of reflection which ſucceeded that frenzy. So far did the Greeks carry their love of calmneſs and ſlow movements, that they thought a quick ſtep always announced ruſticity of manners. Demoſthenes reproaches Nicobulus for this very thing; and from the words he makes uſe of, it appears, that to ſpeak with inſolence and to walk haſtily were reckoned ſynonymous.

44 In the ſtatues of women.

In the figures of women, the artiſts have conformed to the principle obſerved in all the ancient tragedies, and recommended by Ariſtotle, never to make women ſhow too much intrepidity or exceſſive cruelty. Conformable to this maxim, Clytemneſtra is repreſented at a little diſtance from the fatal ſpot, watching the murderer, but without taking any part with him. In a painting of Timomachus repreſenting Medea and her children, when Medea lifts up the dagger they ſmile in her face, and her fury is immediately melted into compaſſion for the innocent victims. In another repreſentation of the ſame ſubject, Medea appears heſitating and indeciſive. Guided by the ſame maxims, the artiſts of moſt refined taſte were careful to avoid all deformity, chooſing rather to recede from truth than from their accuſtomed reſpect for beauty, as may be ſeen in ſeveral figures of Hecuba. Sometimes, however, ſhe appears in the decrepitude of age, her face furrowed with wrinkles, and her breaſts hanging down.

In the ſtatues of the Roman emperors.

Illuſtrious men, and thoſe inveſted with offices of dignity, are repreſented with a noble aſſurance and firm aſpect. The ſtatues of the Roman emperors reſemble thoſe of heroes, and are far removed from every ſpecies of flattery, in the geſture, in the attitude, and action. They never appear with haughty looks, or with the ſplendour of royalty; no figure is ever ſeen preſenting any thing to them with bended knee, except captives; and none addreſſes them with an inclination of the head. In modern works too little attention has been paid to the ancient *coſtume*. Winkelman mentions a bas-relief, which was lately executed at Rome for the fountain of Trevi, repreſenting an architect in the act of preſenting the plan of an aqueduct to Marcus Agrippa. The modern ſculptor, not content with giving a long beard to that illuſtrious Roman, contrary to all the ancient marble ſtatues as well as medals which remain, exhibits the architect on his knees.

In general, it was an eſtabliſhed principle to baniſh all violent paſſions from public monuments. This will ſerve as a deciſive mark to diſtinguiſh the true antique from ſuppoſititious works. A medal has been found exhibiting two Aſſyrians, a man and woman tearing their hair, with this inſcription, ASSYRIA. ET. PALAESTINA. IN. POTEST. P. R. REDAC. S. C. The forgery of this medal is manifeſt from the word *Palaeſtina*, which is not to be found in any ancient Roman medal with a Latin inſcription. Beſides, the violent action of tearing the hair does not ſuit any ſymbolical figure. This extravagant ſtyle, which was called by the ancients *Parenthyrſis*, has been imitated by moſt of the modern artiſts. Their figures reſemble comedians on the ancient theatres, who, in order to ſuit the diſtant ſpectators, put on painted maſks, employed exaggerated geſtures, and far overleaped the bounds of nature. This ſtyle has been reduced into a theory in a treatiſe on the paſſions compoſed by Le Brun. The deſigns which accompany that work exhibit the paſſions in the very higheſt degree, approaching even to frenzy: but theſe are calculated to vitiate the taſte, eſpecially of the young; for the ardour of youth prompts them rather to ſeize the extremity than the middle; and it will be difficult for that artiſt who has formed his taſte from ſuch impaſſioned models ever to acquire that noble ſimplicity and ſedate grandeur which diſtinguiſhed the works of ancient taſte.

46 Of proportion.

PROPORTION is the baſis of beauty, and there can be no beauty without it; on the contrary, proportion may exiſt where there is little beauty. Experience every day teaches us that knowledge is diſtinct from taſte; and proportion, therefore, which is founded on knowledge, may be ſtrictly obſerved in any figure, and yet the figure have no pretenſions to beauty. The ancients conſidering ideal beauty as the moſt perfect, have frequently employed it in preference to the beauty of nature.

The body conſiſts of three parts as well as the members. The three parts of the body are the trunk, the thighs, and the legs. The inferior parts of the body are the thighs, the legs, and the feet. The arms alſo conſiſt of three parts. Theſe three parts muſt bear a certain proportion to the whole as well as to one another. In a well formed man the head and body muſt be proportioned to the thighs, the legs, and the feet, in the ſame manner as the thighs are proportioned to the legs and the feet, or the arms to the hands. The face

alſo conſiſts of three parts, that is, three times the length of the noſe; but the head is not four times the length of the noſe, as ſome writers have aſſerted. From the place where the hair begins to the crown of the head are only three-fourths of the length of the noſe, or that part is to the noſe as 9 to 12.

It is probable that the Grecian, as well as Egyptian artiſts, have determined the great and ſmall proportions by fixed rules; that they have eſtabliſhed a poſitive meaſure for the dimenſions of length, breadth, and circumference. This ſuppoſition alone can enable us to account for the great conformity which we meet with in ancient ſtatues. Winkelman thinks that the foot was the meaſure which the ancients uſed in all their great dimenſions, and that it was by the length of it that they regulated the meaſure of their figures, by giving to them ſix times that length. This in fact is the length which Vitruvius aſſigns, *Pes vero altitudinis corporis ſextæ*, l. 3. cap. 1. That celebrated antiquary thinks the foot is a more determinate meaſure than the head or the face, the parts from which modern painters and ſculptors too often take their proportions. This proportion of the foot to the body, which has appeared ſtrange and incomprehenſible to the learned Huetius, and has been entirely rejected by Perrault, is however founded upon experience. After meaſuring with great care a vaſt number of figures, Winkelman found this proportion obſerved not only in Egyptian ſtatues, but alſo in thoſe of Greece. This fact may be determined by an inſpection of thoſe ſtatues the feet of which are perfect. One may be fully convinced of it by examining ſome divine figures, in which the artiſts have made ſome parts beyond their natural dimenſions. In the Apollo Belvidere, which is a little more than ſeven heads high, the foot is three Roman inches longer than the head. The head of the Venus de Medicis is very ſmall, and the height of the ſtatue is ſeven heads and a half: the foot is three inches and a half longer than the head, or preciſely the ſixth part of the length of the whole ſtatue.

Practice of Sculpture.

47 recian ulpture be ſtu- ed by the odern tiſts.

We have been thus minute in our account of the Grecian ſculpture, becauſe it is the opinion of the ableſt critics that modern artiſts have been more or leſs eminent as they have ſtudied with the greater or leſs attention the models left us by that ingenious people: Winkelman goes ſo far as to contend that the moſt finiſhed works of the Grecian maſters ought to be ſtudied in preference even to the works of nature. This appears to be paradoxical; but the reaſon aſſigned by the Abbé for his opinion is, that the faireſt lines of beauty are more eaſily diſcovered, and make a more ſtriking and powerful impreſſion, by their re-union in theſe ſublime copies, than when they are ſcattered far and wide in the original. Allowing, therefore, the ſtudy of nature the high degree of merit it ſo juſtly claims, it muſt nevertheleſs be granted, that it leads to true beauty by a much more tedious, laborious, and difficult path, than the ſtudy of the *antique*, which preſents immediately to the artiſt's view the object of his reſearches, and combines in a clear and ſtrong point of light the various rays of beauty that are diſperſed through the wide domain of nature.

As ſoon as the artiſt has laid this excellent founda-

tion, acquired an intimate degree of familiarity with the beauties of the Grecian ſtatues, and formed his taſte after the admirable models they exhibit, he may then proceed with advantage and aſſurance to the imitation of nature. The ideas he has already formed of the perfection of nature, by obſerving her diſperſed beauties combined and collected in the compoſitions of the ancient artiſts, will enable him to acquire with facility, and to employ with advantage, the detached and partial ideas of beauty which will be exhibited to his view in a ſurvey of nature in her actual ſtate. When he diſcovers theſe partial beauties, he will be capable of combining them with thoſe perfect forms of beauty with which he is already acquainted. In a word, by having always preſent to his mind the noble models already mentioned, he will be in ſome meaſure his own oracle, and will draw rules from his own mind.

48 Two ways of imitating nature.

There are, however, two ways of imitating nature. In the one a ſingle object occupies the artiſt, who endeavours to repreſent it with preciſion and truth; in the other, certain lines and features are taken from a variety of objects, and combined and blended into one regular whole. All kinds of copies belong to the firſt kind of imitation; and productions of this kind muſt be executed neceſſarily in the Dutch manner, that is to ſay, with high finiſhing, and little or no invention. But the ſecond kind of imitation leads directly to the inveſtigation and diſcovery of true beauty, of that beauty whoſe idea is connate with the human mind, and is only to be found there in its higheſt perfection. This is the kind of imitation in which the Greeks excelled, and in which men of genius excite the young artiſts to excel after their example, viz. by ſtudying nature as they did.

After having ſtudied in the productions of the Grecian maſters their choice and expreſſion of ſelect nature, their ſublime and graceful contours, their noble draperies, together with that ſedate grandeur and admirable ſimplicity that conſtitute their chief merit, the curious artiſts will do well to ſtudy the manual and mechanical part of their operations, as this is abſolutely neceſſary to the ſucceſsful imitation of their excellent manner.

49 Models of ſtatues.

It is certain that the ancients almoſt always formed their firſt models in wax: to this modern artiſts have ſubſtituted clay, or ſome ſuch compoſition: they prefer clay before wax in the carnations, on account of the yielding nature of the latter, and its ſticking in ſome meaſure to every thing it touches. We muſt not, however, imagine from hence that the method of forming models of wet clay was either unknown or neglected among the Greeks; on the contrary, it was in Greece that models of this kind were invented. Their author was Dibutades of Sicyon; and it is well known that Arceſilas, the friend of Lucullus, obtained a higher degree of reputation by his clay models than by all his other productions. Indeed, if clay could be made to preſerve its original moiſture, it would undoubtedly be the fitteſt ſubſtance for the models of the ſculptor; but when it is placed either in the fire or left to dry imperceptibly in the air, its ſolid parts grow more compact, and the figure loſing thus a part of its dimenſions, is neceſſarily reduced to a ſmaller volume. This diminution would be of no conſequence did it equally affect the whole figure, ſo as to preſerve its proportions en-

tire. But this is not the caſe: for the ſmaller parts of the figure dry ſooner than the larger; and thus loſing more of their dimenſions in the ſame ſpace of time than the latter do, the ſymmetry and proportions of the figure inevitably ſuffer. This inconvenience does not take place in thoſe models that are made in wax. It is indeed extremely difficult, in the ordinary method of working the wax, to give it that degree of ſmoothneſs that is neceſſary to repreſent the ſoftneſs of the carnations or fleſhy parts of the body. This inconvenience may, however, be remedied, by forming the model firſt in clay, then moulding it in plaſter, and laſtly caſting it in wax. And, indeed, clay is ſeldom uſed but as a mould in which to caſt a figure of plaſter, ſtucco, or wax, to ſerve henceforth for a model by which the meaſures and proportions of the ſtatue are to be adjuſted. In making waxen models, it is common to put half a pound of colophony to a pound of wax; and ſome add turpentine, melting the whole with oil of olives.

50 Method of working the marble, and

So much for the firſt or preparatory ſteps in this procedure. It remains to conſider the manner of working the marble after the model ſo prepared; and the method here followed by the Greeks ſeems to have been extremely different from that which is generally obſerved by modern artiſts. In the ancient ſtatues we find the moſt ſtriking proofs of the freedom and boldneſs that accompanied each ſtroke of the chiſel, and which reſulted from the artiſt's being perfectly ſure of the accuracy of his idea, and the preciſion and ſteadineſs of his hand: the moſt minute parts of the figure carry theſe marks of aſſurance and freedom; no indication of timorouſneſs or diffidence appear; nothing that can induce us to fancy that the artiſt had occaſion to correct any of his ſtrokes. It is difficult to find, even in the ſecond-rate productions of the Grecian artiſts, any mark of a falſe ſtroke or a random touch. This firmneſs and preciſion of the Grecian chiſel were certainly derived from a more determined and perfect ſet of rules than thoſe which are obſerved in modern times.

The method generally obſerved by the modern ſculptor is as follows: Firſt, out of a great block of marble he ſaws another of the ſize required, which is performed with a ſmooth ſteel ſaw, without teeth, caſting water and ſand thereon from time to time; then he faſhions it, by taking off what is ſuperfluous with a ſteel point and a heavy hammer of ſoft iron; after this, bringing it near the meaſure required, he reduces it ſtill nearer with another finer point; he then uſes a flat cutting inſtrument, having notches in its edge; and then a chiſel to take off the ſcratches which the former has left; till, at length, taking raſps of different degrees of fineneſs, by degrees he brings his work into a condition for poliſhing.

After this, having ſtudied his model with all poſſible attention, he draws upon this model horizontal and perpendicular lines which interſect each other at right angles. He afterwards copies theſe lines upon his marble, as the painter makes uſe of ſuch tranſverſal lines to copy a picture, or to reduce it to a ſmaller ſize. Theſe tranſverſal lines or ſquares, drawn in an equal number upon the marble and upon the model, in a manner proportioned to their reſpective dimenſions, exhibit accurate meaſures of the ſurfaces upon which the artiſt is to work; but cannot determine, with equal preciſion, the depths that are proportioned to theſe ſurfaces.—The ſculptor, indeed, may determine theſe depths by obſerving the relation they bear to his model; but as his eye is the only guide he has to follow in this eſtimate, he is always more or leſs expoſed to error, or at leaſt to doubt. He is never ſure that the cavities made by his chiſel are exact; a degree of uncertainty accompanies each ſtroke; nor can he be aſſured that it has carried away neither too much nor too little of his marble. It is equally difficult to determine, by ſuch lines as have already been mentioned, the external and internal contours of the figure, or to tranſfer them from the model to the marble. By the internal contour is underſtood that which is deſcribed by the parts which approach towards the centre, and which are not marked in a ſtriking manner.

It is farther to be noticed, that in a complicated and laborious work, which an artiſt cannot execute without aſſiſtance, he is often obliged to make uſe of foreign hands, that have not the talents or dexterity that are neceſſary to finiſh his plan. A ſingle ſtroke of the chiſel that goes too deep is a defect not to be repaired; and ſuch a ſtroke may eaſily happen, where the depths are ſo imperfectly determined. Defects of this kind are inevitable, if the ſculptor, in clipping his marble, begins by forming the depths that are requiſite in the figure he deſigns to repreſent. Nothing is more liable to error than this manner of proceeding. The cautious artiſt ought, on the contrary, to form theſe depths gradually, by little and little, with the utmoſt circumſpection and care; and the determining of them with preciſion ought to be conſidered as the laſt part of his work, and as the finiſhing touches of his chiſel.

51 of copying ancient ſtatues.

The various inconveniences attending this method determined ſeveral eminent artiſts to look out for one that would be liable to leſs uncertainty, and productive of fewer errors. The French academy of painting at Rome hit upon a method of copying the ancient ſtatues, which ſome ſculptors have employed with ſucceſs, even in the figures which they finiſhed after models in clay or wax. This method is as follows: The ſtatue that is to be copied is encloſed in a frame that fits it exactly. The upper part of this frame is divided into a certain number of equal parts, and to each of theſe parts a thread is fixed with a piece of lead at the end of it. Theſe threads, which hang freely, ſhow what parts of the ſtatue are moſt removed from the centre with much more perſpicuity and preciſion than the lines which are drawn upon its ſurface, and which paſs equally over the higher and hollow parts of the block: they alſo give the artiſt a tolerable rule to meaſure the more ſtriking variations of height and depth, and thus render him more bold and determined in the execution of his plan.

But even this method is not without its defects: for as it is impoſſible, by the means of a ſtraight line, to determine with preciſion the procedure of a curve, the artiſt has, in this method, no certain rule to guide him in his contours; and as often as the line which he is to deſcribe deviates from the direction of the plumb line, which is his main guide, he muſt neceſſarily find himſelf at a loſs, and be obliged to have recourſe to conjecture.

It is alſo evident, that this method affords no certain rule to determine exactly the proportion which the various parts of the figure ought to bear to each other, conſidered in their mutual relation and connexions. The artiſt, indeed, endeavours to ſupply this defect by interſecting

interſecting the plumb lines by horizontal ones. This recourſe has, nevertheleſs, its inconveniences, ſince the ſquares formed by tranſverſal lines, that are at a diſtance from the figure (though they be exactly equal), yet repreſent the parts of the figure as greater or ſmaller, according as they are more or leſs removed from our poſition or point of view. But, notwithſtanding theſe inconveniences, the method now under conſideration is certainly the beſt that has hitherto been employed: it is more practicable and ſure than any other we know, though it appears, from the remarks we have now been making, that it does not exhibit a ſure and univerſal criterion to a ſculptor who executes after a model.

52 Of poliſhing the ſtatue.

To poliſh the ſtatue, or make the parts of it ſmooth and ſleek, they uſe pumice ſtone and ſmelt; then tripoli; and when a ſtill greater luſtre is required, they uſe burnt ſtraw. For the *Caſting of Statues*, ſee FOUNDERY, and *PLASTER of Paris*.

S C U

Scum ‖ Scutage.

SCUM, properly denotes the impurities which a liquor, by boiling, caſts up to the ſurface. The term *ſcum* is alſo uſed for what is more properly called the ſcoria of metals.

SCUPPERS, in a ſhip, are certain channels cut through the water-ways and ſides of a ſhip, at proper diſtances, and lined with plated lead, in order to carry the water off from the deck into the ſea. The ſcuppers of the lower deck of a ſhip of war are uſually furniſhed with a leathern pipe, called the *ſcupper-hoſe*, which hangs downward from the mouth or opening of the ſcupper. The intent of this is to prevent the water from entering when the ſhip inclines under a weight of ſail.

SCURVY, in medicine, ſee that article, N° 351, where we have given an account of the ſymptoms, cauſes, and modes of prevention and cure, according to ſome of the moſt eminent writers in medicine. We have here only to add, that, in the opinion of Dr Beddoes, the mineral acids, eſpecially the nitric and vitriolic, may be employed in the prevention or cure of this dreadful diſeaſe with as much ſucceſs as the vegetable acids.—But of all the ſubſtances that can at once be cheaply procured and long preſerved, he thinks the concrete acid of tartar by far the moſt promiſing. It is very grateful, and comes near to the citric acid. In tropical countries the ſcurvy is ſeldom known.

Scurvy Graſs, in botany. See COCHLEAREA.

The officinalis, or common officinal ſcurvy graſs, grows upon rocks on the ſea coaſt, and on the Highland mountains, abundantly. It has an acrid, bitter, and acid taſte, and is highly recommended for the ſcurvy. There are inſtances of a whole ſhip's crew having been cured of that diſtemper by it; and as it abounds with acid ſalts, there can be no doubt but that it is a great reſiſter of putrefaction. The beſt way of taking it is raw in a ſalad. It is alſo diuretic, and uſeful in dropſies. The Highlanders eſteem it as a good ſtomachic.

The coronopus, another ſpecies, was ſome years ago rendered famous, the aſhes of it being an ingredient in Mrs Joanna Stephens's celebrated medicine for the ſtone and gravel; but, unfortunately for thoſe afflicted with that excruciating complaint, it has not been able to ſupport its credit. It is acrid, and taſtes like garden creſs.

SCUTAGE (*ſcutagium*, Sax. *ſcildpening*), was a tax or contribution raiſed by thoſe that held lands by knights ſervice, towards furniſhing the king's army, at one, two, or three merks for every knight's fee. Henry III. for his voyage to the Holy Land, had a tenth granted by the clergy, and *ſcutage* three merks of every

S C Y

knight's fee by the *laity*. This was alſo levied by Henry II. Richard I. and King John. See *KNIGHT-Service*.

Scute ‖ Scylla.

SCUTE (*ſcutum*), a French gold coin of 3s. 4d. in the reign of King Henry V. Catharine queen of England had an aſſurance made her of ſundry caſtles, manors, lands, &c. valued at the ſum of 40,000 *ſcutes*, every two whereof were worth a noble. *Rot. Parl.* 1. *Hen.* VI.

SCUTELLARIA, SKULL-CAP, in botany: A genus of the gymnoſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 40th order, *Perſonatæ*. The calyx is ſhort, tubulated, has the mouth entire, and cloſe after flowering. There are two ſpecies in Britain, the *galericulata* and *minor*. 1. The *Galericulata*, *Blue Skull-cap*, or *Hooded Willow-herb*. The ſtems are weak, branched, and above a foot high; the leaves are heart-ſhaped, narrow-pointed, on ſhort footſtalks, and ſcalloped; the flowers are blue, in pairs, on pedicles from the alæ of the leaves, and pendulous. It grows on the banks of rivers and lakes, is bitter, and has a garlic ſmell. 2. *Minor*, *little red Skull-cap*, or *Willow-herb*. The ſtalks are about eight inches high; the leaves are heart-ſhaped, oval: the flowers are purple. It grows in fens, and on the ſides of lakes.

SCUTTLES, in a ſhip, ſquare holes cut in the deck, big enough to let down the body of a man, and which ſerve upon ſome occaſions to let the people down into any room below, or from one deck to another.

SCYLAX, a celebrated mathematician and geographer of Caria, flouriſhed under the reign of Darius Hyſtaſpes, about 558 B. C. Some have attributed to him the invention of geographical tables. We have under his name a geographical work publiſhed by Hoeſchelius; but it is written by a much later author, and is perhaps only an abridgment of Scylax's Ancient Geography.

SCYLLA (anc. geog.), a rock in the Fretum Siculum, near the coaſt of Italy, dangerous to ſhipping, oppoſite to Charybdis, a whirlpool on the coaſt of Sicily; both of them famous in mythology.

Scylla and Charybdis have been almoſt ſubdued by the repeated convulſions of this part of the earth, and by the violence of the current, which is continually increaſing the breadth of the ſtraits. If proper allowance be made for theſe circumſtances, we ſhall acquit the ancients of any exaggeration, notwithſtanding the very dreadful colours in which they have painted this paſſage. It is formed by a low peninſula, called *Cape Pelorus*, ſtretching to the eaſtward on the Sicilian ſide, *Sutherland's Tour up the Straits*, Letter xii.

Scylla
||
Scythia.

immediately within which lies the famous whirlpool of Charybdis, and by the rocks of Scylla, which a few miles below on the Calabrian ſhore project towards the weſt. The current runs with ſurpriſing force from one to the other alternately in the direction of the tide, and the tides themſelves are very irregular. Thus veſſels, by ſhunning the one, were in the utmoſt danger of being ſwallowed up by the other.

At preſent, in moderate weather, when the tide is either at ebb or flood, boats paſs all over the whirlpool; but, in general, it is like the meeting of two contending currents, with a number of eddies all around; and, even now, there is ſcarcely a winter in which there are not ſome wrecks.

"At the time when we paſſed the ſtraits (ſays Captain Sutherland, from whom we have obtained this accurate information) the weather was as favourable as we could wiſh; and yet, in ſpite of a ſtrong breeze and the current, which hurried us on with ſurpriſing velocity, the ſhip's head was ſuddenly whirled round near three points; but the wind blowing freſh, in a few ſeconds ſhe daſhed through the eddy that had caught her; for, to avoid Scylla, and ſecure Meſſina, we had kept pretty cloſe to Charybdis."

SCYROS, an iſland in the Ægean ſea, at the diſtance of about 28 miles north-eaſt from Eubœa. It is 60 miles in circumference. It was originally in the poſſeſſion of the Pelaſgians and Carians. Achilles retired there to avoid going to the Trojan war, and became father of Neoptolemus by Deidamia the daughter of King Lycomedes. Scyros was conquered by the Athenians under Cimon. It was very rocky and barren. Now *Scyro*. E. Long. 25. 0. N. Lat. 38. 15.

SCYTALA LACONICA, in antiquity, a ſtratagem or device of the Lacedemonians, for the ſecret writing of letters to their correſpondents, ſo that if they ſhould chance to be intercepted, nobody might be able to read them.—To this end they had two wooden rollers or cylinders, perfectly alike and equal; one whereof was kept in the city, the other by the perſon to whom the letter was directed. For the letter, a ſkin of very thin parchment was wrapped round the roller, and thereon was the matter written; which done, it was taken off, and ſent away to the party, who, upon putting it in the ſame manner upon his roller, found the lines and words in the very ſame diſpoſition as when they were firſt written. This expedient they ſet a very high value on; though, in truth, artleſs and groſs enough: the moderns have improved vaſtly on this method of writing. See CIPHER.

SCYTALIA, in botany: A genus of the monogynia order, belonging to the octandria claſs of plants; and in the natural method ranking with thoſe that are doubtful. The calyx is very ſhort, monophyllous, and ſomewhat quinquedentated; the corolla pentapetalous; the filaments hairy at the baſe; the berry unilocular, with one ſeed of a ſoft pulpy conſiſtence. There is only one ſpecies, viz. the *Sinenſis*, a native of the Eaſt Indies.

SCYTHIA, an ancient name for the northern parts of Aſia, now known by the name of *Tartary*; alſo for ſome of the north-eaſtern parts of Europe.

This vaſt territory, which extends itſelf from the Iſter or Danube, the boundary of the Celts, that is, from about the 25th to almoſt the 110th degree of eaſt longitude, was divided into Scythia in Europe and Scythia in Aſia, including, however, the two Sarmatias; or, as they are called by the Greeks, *Sauromatias*, now the Circaſſian Tartary, which lay between and ſevered the two Scythias from each other. Sauromatia was alſo diſtinguiſhed into European and Aſiatic; and was divided from the European Scythia by the river Don or Tanais, which falls into the Palus Meotis; and from the Aſiatic by the Rha, now Volga, which empties itſelf into the Caſpian ſea. Scythia.

1. The Aſiatic Scythia comprehended, in general, Great Tartary, and Ruſſia in Aſia; and, in particular, the Scythia beyond or without Imaus, contained the regions of Bogdoi or Oſtiacoi, and Tanguti. That within, or on this ſide Imaus, had Turkeſtan and Mongal, the Uſbeck or Zagatai, Kalmuc and Nagaian Tartars; beſides Siberia, the land of the Samoiedes, and Nova Zembla. Theſe three laſt not being ſo ſoon inhabited as the former, as may be reaſonably ſuppoſed, were wholly unknown to the ancients; and the former were peopled by the Bactrians, Sogdians, Gandari, Sacks, and Maſſagetes. As for Sarmatia, it contained Albania, Iberia, and Colchis; which makes now the Circaſſian Tartary, and the province of Georgia.

2. Scythia in Europe reached (towards the ſouth-weſt) to the Po and the Alps, by which it was divided from Celto-Gallia. It was bounded on the ſouth by the Iſter or Danube and the Euxine ſea. Its northern limits have been ſuppoſed to ſtretch to the ſpring-heads of the Boriſthenes or Nieper, and the Rha or Volga, and ſo to that of the Tanais.—The ancients divided this country into Scythia Arimaſpæa, which lay eaſtward, joining to Scythia in Aſia; and Sarmatia Europeana on the weſt. In Scythia, properly ſo called, were the Arimaſpæi on the north; the Getæ or Dacians along the Danube, on the ſouth; and the Neuri between theſe two. So that it contained the European Ruſſia or Muſcovy, and the leſſer Crim Tartary eaſtward; and, on the weſt, Lithuania, Poland, part of Hungary, Tranſylvania, Walachia, Bulgaria, and Moldavia. Sarmatia is ſuppoſed to have reached northward to that part of Swedeland called *Fenningia*, now *Finland*; in which they placed the Oœnes, Panoti, and Hippopodes. This part they divided from northern Germany, now the weſt part of Sweden and Norway, by the *Mare Sarmaticum* or *Scythicum*, which they ſuppoſed ran up into the northern ocean, and, dividing Lapland into two parts, formed the weſtern part of Sweden, with Norway, into one iſland, and Finland into another; ſuppoſing this alſo to be cut off from the continent by the gulf of that name.

Although the ancient Scythians were celebrated as a warlike people, yet their hiſtory is too uncertain and obſcure to enable us to give any detail which would not prove equally tireſome and unintereſting to the reader. Mr Pinkerton, in a diſſertation on their origin endeavours to prove that they were the moſt ancient of nations; and he aſſigns for the place of their firſt habitation the country known by the name of Perſia. From Perſia, he thinks, they proceeded in numerous hordes weſtward, ſurrounded the Euxine, peopled Germany, Italy, Gaul, the countries bordering on the Baltic, with part of Britain and Ireland. That the Scythians were of Aſiatic.

atic origin cannot, we think, be queſtioned; and as Perſia was peopled at a very early period, it may not improbably have been their parent country: but when our author contends that their empire had ſubſiſted for more than 1500 years before Ninus the founder of the Aſſyrian monarchy, and that it extended from Egypt to the Ganges, and from the Perſian gulf and Indian ſea to the Caſpian, we cannot help thinking that his prejudices againſt the Celts, and his deſire to do honour to his favourite Goths, have made him advance a paradox inconſiſtent with the moſt authentic records of antiquity. His diſſertation however is ingenious, and replete with a variety of curious learning.

Scythian Lamb, in natural hiſtory. See *Scythian Lamb*.

SCYTHROPS, a generical name given by Mr Latham to a bird of which hitherto but one ſpecies has been obſerved. It is about the ſize of a crow, and two feet three inches in length. The bill is large, convex, furrowed on the ſides, and bent at the tip; the noſtrils are placed at the baſe of it, and the tongue is cloven at the end. The general colour of the plumage is a browniſh aſh, but the tip of each feather of the back, wings, and tail, is black. The tail has each feather banded with black at the end, and the tip itſelf white; but the inner webs of the feather are marked with black and white bands. The toes are placed two forwards and two backwards, as in the parrot genus. This curious bird is a native of New Holland, and we believe in that part of the world is not uncommon, but its manners are as yet quite unknown. We are happy in being able to preſent our readers with an engraving of it from an excellent drawing with which we were lately favoured. See plate CCCCXLIX.

SEA, in a ſtrict ſenſe, ſignifies a large portion of water almoſt ſurrounded by land, as the Baltic and Mediterranean ſeas; but it is frequently uſed for that vaſt body of water which encompaſſes the whole earth.

What proportion the ſuperficies of the ſea bears to that of the land cannot eaſily be aſcertained. Buffon has ſuppoſed that the ſurface of our globe is equally divided between land and water, and has accordingly calculated the ſuperficies of the ſea to be 85,490,506 ſquare miles. But it is now well known that the ocean covers much more than the half of the earth's ſurface. Buffon believed the exiſtence of a vaſt ſouthern continent, which Captain Cook has ſhown to be viſionary. It was this circumſtance which miſled him. According to the moſt accurate obſervations hitherto made, the ſurface of the ſea is to the land as three to one; the ocean therefore extends over 128,235,759 ſquare miles, ſuppoſing the ſuperficies of the whole globe to be 170,981,012 ſquare miles. To aſcertain the depth of the ſea is ſtill more difficult than its ſuperficies, both on account of the numerous experiments which it would be neceſſary to make, and the want of proper inſtruments for that purpoſe. Beyond a certain depth the ſea has hitherto been found unfathomable; and though ſeveral methods have been contrived to obviate this difficulty, none of them has completely anſwered the purpoſe. We know in general that the depth of the ſea increaſes gradually as we leave the ſhore; but if this continued beyond a certain diſtance, the depth in the middle of the ocean would be prodigious. Indeed the numerous iſlands everywhere ſcattered in the ſea demonſtrate the contrary, by ſhowing us that the bottom of the water is unequal like the land, and that ſo far from uniformly ſinking, it ſometimes riſes into lofty mountains. If the depth of the ſea be in proportion to the elevation of the land, as has generally been ſuppoſed, its greateſt depth will not exceed five or ſix miles, for there is no mountain ſix miles perpendicular above the level of the ſea. The ſea has never been actually ſounded to a greater depth than a mile and 66 feet; every thing beyond that therefore reſts entirely upon conjecture and analogical reaſoning, which ought never to be admitted to determine a ſingle point that can be aſcertained by experiment, becauſe, when admitted, they have too often led to falſe concluſions. Along the coaſts, where the depth of the ſea is generally well known, it has always been found proportioned to the height of the ſhore: when the coaſt is high and mountainous, the ſea that waſhes it is deep; when, on the contrary, the coaſt is low, the water is ſhallow. Whether this analogy holds at a diſtance from the ſhore, experiments alone can determine.

3 Quantity of water which it contains.

To calculate the quantity of water contained in the ſea, while its depth is unknown, is impoſſible. But if we ſuppoſe with Buffon that its medium depth is the fourth part of a mile, the ocean, if its ſuperficies be 128,235,759 ſquare miles, will contain 32,058,939·75 cubic miles of water.

Buffon's Theory of the Earth. art. 10.

Let us now endeavour to compute the quantity of water which is conſtantly diſcharged into the ſea. For this purpoſe let us take a river whoſe velocity and quantity of water is known, the Po, for inſtance, which according to Riccioli is 1000 feet (or 100 perches of Boulogne) broad, 10 feet deep, and runs at the rate of four miles in an hour; conſequently that river diſcharges into the ſea 200,000 cubic perches of water in an hour, or 4,800,000 in a day. A cubic mile contains 125,000,000 cubic perches; the Po, therefore will take 26 days to diſcharge a cubic mile of water into the ſea. Let us now ſuppoſe what is perhaps not very far from the truth, that the quantity of water which the ſea receives from the rivers in any country is proportioned to the extent of that country. The Po from its origin to its mouth traverſes a country 380 miles long, and the rivers which fall into it on every ſide riſe from ſources about ſixty miles diſtant from it. The Po, therefore, and the rivers which it receives, water a country of 45,600 ſquare miles. Now ſince the whole ſuperficies of the dry land is about 42,745,253 ſquare miles, it follows, from our ſuppoſition, that the quantity of water diſcharged by all the rivers in the world, in one day, is 36 cubic miles, and in a year 13,140. If therefore the ſea contains 32,058,939 cubic miles of water, it would take all the rivers in the world 2439 years to diſcharge an equal quantity.

4 Why it does not increaſe.

It may ſeem ſurpriſing that the ſea, ſince it is continually receiving ſuch an immenſe ſupply of water, does not viſibly increaſe, and at laſt cover the whole earth. But our ſurpriſe will ceaſe, if we conſider that the rivers themſelves are ſupplied from the ſea, and that they do nothing more than carry back thoſe waters which the ocean is continually laviſhing upon the earth. Dr Halley has demonſtrated that the vapours raiſed from the ſea and tranſported upon land are ſufficient to maintain all the rivers in the world. The ſimplicity of this great proceſs is aſtoniſhing: the ſea not only connects

diſtant

Sea.

distant countries, and renders it eaſy to tranſport the commodities of one nation to another, but its waters riſing in the air deſcend in ſhowers to fertilize the earth and nouriſh the vegetable kingdom, and collecting into rivers flow onwards, bringing fertility and wealth and commerce along with them, and again return to the ſea to repeat the ſame round.

5 Theories of philoſophers on this ſubject.

The knowledge of this proceſs of nature might, one would think, have convinced philoſophers that the proportion between ſea and land continued always nearly the ſame. Philoſophers however have formed different theories about this as well as moſt other ſubjects, maintaining on the one hand that the ſea is continually encroaching on the land, and on the other that the land is conſtantly gaining on the ſea. Both ſides have ſupported their theories by arguments, demonſtrations, and uncontrovertible facts!

6 Arguments of thoſe who affirm that the ſea is encroaching on the land.

The height of the mountains, ſay the philoſophers who ſupport the encroachments of the ſea, is continually diminiſhing; expoſed to the violence of every ſtorm, the hardeſt rocks muſt at laſt give way and tumble down. The rivers are continually ſweeping along with them particles of earth which they depoſite in the bottom of the ſea. Both the depth of the ocean then and the height of the dry land muſt be always decreaſing; the waters therefore muſt, unleſs a part of them were annihilated, ſpread over a greater extent of ſurface in proportion as theſe cauſes operate. This reaſoning, convincing as it is, might be confirmed by a great number of facts: it will be ſufficient however to mention one or two. In the reign of Auguſtus the iſle of Wight made a part of Britain, ſo that the Engliſh croſſed over to it at low water with cart loads of tin; yet that iſland is at preſent ſeparated from Britain by a channel half a mile wide. The Godwin ſands on the eaſtern ſhore of England were formerly the fertile eſtate of Earl Godwin. Nor are the encroachments of the ſea confined to Britain. In the bay of Baiæ near Naples there are remains of houſes and ſtreets ſtill viſible below the preſent level of the ſea. The ſea therefore is making continued encroachments upon the land; and the time will come, ſay they, when the waters will again cover the ſurface of the earth.

7 Arguments of thoſe who affirm that the land is gaining on the ſea.

Such are the arguments of thoſe philoſophers who maintain the continual encroachments of the ſea. Thoſe who maintain the oppoſite theory, that the land is gradually gaining on the ſea, though they pretend not to deny the facts advanced by their opponents, affirm that they are altogether inſufficient to eſtabliſh the hypotheſis which they were brought forward to ſupport. Though the rivers carry down particles of earth into the ſea, theſe, ſay they, are either accumulated on other ſhores, or collecting in the bottom of the ocean, harden into ſtone, which being poſſeſſed of a vegetative power riſes by degrees above the ſurface of the ſea and forms rocks, and mountains, and iſlands. The vegetative nature of ſtone indeed is ſufficient, of itſelf, to convince us that the quantity of earth muſt be daily accumulating, and conſequently that the ſurface of the ſea is diminiſhing in extent. Celſius, a Swediſh philoſopher (for this diſpute has been carried on in Sweden with the greateſt keenneſs), has endeavoured to build this theory with more ſolid materials than vegetable ſtone. In a curious memoir, publiſhed in 1743, he aſſerts that the Baltic and the Atlantic, at leaſt that part of it which waſhes Norway, is conſtantly diminiſhing; and he proves this by the teſtimony of a great many aged pilots and fiſhermen, who affirmed that the ſea was become much ſhallower in many places than it had been during their youth: that many rocks formerly covered with water were now ſeveral feet above the ſurface of the ſea: that loaded veſſels uſed formerly to ride in many places where pinnaces and barks could now with difficulty ſwim. He produces inſtances of ancient ſea port towns now ſeveral leagues from the ſhore, and of anchors and wrecks of veſſels found far within the country. He mentions a particular rock which 168 years before was at the bottom of the ſea, but was then raiſed eight feet above its ſurface. In another place where the water 50 years before had reached to the knee there was then none. Several rocks, too, which during the infancy of ſome old pilots had been two feet under water, were then three feet above it. From all theſe obſervations M. Celſius concludes, that the water of the Baltic decreaſes in height $4\frac{1}{2}$ lines in a year, 4 inches 5 lines in 18 years, 4 feet 5 inches in a hundred years, and in a thouſand years 45 feet. Conſcious, however, that theſe facts, how concluſive ſoever as far as relates to the Baltic, can never determine the general queſtion, M. Celſius advances another argument in ſupport of his theory. All that quantity of moiſture, ſays he, which is imbibed by plants is loſt to the general maſs of water, being converted into earth by the putrefaction of vegetables. This notion had been mentioned by Newton, and was adopted by Van Helmont: if granted, it follows as a conſequence that the earth is continually increaſing and the water diminiſhing in a very rapid degree.

8 These arguments examined.

Such are the arguments advanced in ſupport of both theories; for it is needleſs to mention a notion of Linnæus that the whole earth was formerly covered with water except a ſingle mountain. When fairly weighed, they amount to nothing more than this, that the ſea has encroached upon the land in ſome places, and retired in others; a concluſion which we are very willing to allow. What was advanced by thoſe philoſophers, who maintain that the ſea is continually encroaching on the land, about the depth of the ſea conſtantly diminiſhing, muſt remain a mere aſſertion till they prove by experiments, either that this is really the caſe, or that nature has no way of reſtoring thoſe particles of earth which are waſhed down by the rivers. Nor have they any good reaſon to affirm that the height of the mountains is decreaſing. Can a ſingle uncontrovertible inſtance be produced of this? Are the Alps or the Apennines, or Taurus, or Caucaſus, leſs lofty now than they were a thouſand years ago? We mean not to deny that the rain actually waſhes down particles of earth from the mountains, nor to affirm that the hardeſt rocks are able to reſiſt continual ſtorms, nor that many mountains have ſuffered, and continue to ſuffer daily, from a thouſand accidents. But the effects produced by all theſe cauſes are ſo trifling as to be altogether imperceptible (A). Nature has aſſiduouſly guarded againſt ſuch accidents; ſhe has formed the mountains of the moſt durable

(A) M. Genſanne pretends that the Pyrenean mountains become an inch lower every ten years. But even according

ble materials; and where they are covered with earth, ſhe has bound it together by a thick and firm matting of graſs, and thus ſecured it from the rains; and ſhould accident deprive it of that covering, ſhe takes care immediately to ſupply the defect. Even ſhould the earth be ſwept away together with its covering, nature has ſtill ſuch reſources left as frequently reſtore things to their former ſtate. Many kinds of moſs, one would be tempted to think, have been created for this very purpoſe: they take root and flouriſh almoſt upon the bare rock, and furniſh as they decay a ſufficient bed for ſeveral of the hardy Alpine plants. Theſe periſh in their turn, and others ſucceed them. The roots of the plants bind faſt the earth as it accumulates, more plants ſpring up and ſpread wider, till by degrees the whole ſurface is covered with a firm coat of graſs. Even the rain, which always contains in it a good deal of earth, contributes ſomething to haſten the proceſs.

As the vegetation of ſtone, an argument advanced by the philoſophers who ſupport the oppoſite theory, is now, we believe, given up by all parties, it is needleſs to take any farther notice of it here, (ſee STONE). The hypotheſis of M. Celſius, that water is converted into earth, has alſo ſhared the ſame fate, becauſe it was unſupported by experiment, and contrary to every thing that we know either about earth or water. It is a little extraordinary that philoſophers have been ſo laviſh of water as to convert it in this manner into ſtone and earth, when they had given it, one would think, ſufficient employment before in making new worlds and in confuting Moſes.

9 Bottom of the ſea. As the ſea covers ſo great a portion of the globe, we ſhould, no doubt, by exploring its bottom, diſcover a vaſt number of intereſting particulars. Unfortunately in the greater part of the ocean this has hitherto been impoſſible. Part, however, has been examined; and the diſcoveries which this examination has produced may enable us to form ſome idea at leaſt of the whole. The bottom of the ſea, as might have been conjectured indeed beforehand, bears a great reſemblance to the ſurface of the dry land, being, like it, full of plains, rocks, caverns, and mountains; ſome of which are abrupt and almoſt perpendicular, while others riſe with a gentle declivity, and ſometimes tower above the water and form iſlands. Neither do the materials differ which compoſe the bottom of the ſea and the baſis of the dry land. If we dig to a conſiderable depth in any part of the earth, we uniformly meet with rock; the ſame thing holds in the ſea. The ſtrata, too, are of the ſame kind, diſpoſed in the ſame manner, and form indeed but one whole. The ſame kind of mineral and bituminous ſubſtances are alſo found interſperſed with theſe ſtrata; and it is to them probably that the ſea is indebted for its bitter taſte. Over theſe natural and original ſtrata an artificial bed has pretty generally been formed, compoſed of different materials in different places. It conſiſts frequently of muddy tartareous ſubſtances firmly cemented together, ſometimes of ſhells or coral reduced to powder, and near the mouths of rivers it is generally compoſed of fine ſand or gravel. The bottom of the ſea reſembles the land likewiſe in another particular: many freſh ſprings and even rivers riſe out of it, which, diſplacing the ſalt water, render the lower part of the ſea wherever they abound quite freſh. An inſtance of this kind occurs near Goa on the weſtern coaſt of Indoſtan *, and another † in the Mediterranean ſea not far from Marſeilles. Theſe facts occaſioned a notion, which later experiments have exploded, that the ſea beyond a certain depth was always freſh.

Sea.

* *Boyle de Fundo Maris.*

† *Marſigli Hiſtoire Phyſique de la Mer*, part. 1.

Subſtances of a very beautiful appearance are frequently brought up by the ſounding line from the bottom of the ſea. The plummet is hollowed below, and this cavity filled with tallow, to which ſome of the ſubſtances adhere which form the bed of the ocean. Theſe are generally ſand, gravel, or mud; but they are ſometimes of the brighteſt ſcarlet, vermilion, purple, and yellow; and ſometimes, though leſs frequently, they are blue, green, or white. Theſe colours are owing to a kind of jelly which envelopes the ſubſtances, and vaniſh entirely as ſoon as this jelly dries. At times, however, they aſſume the appearance of tartareous cruſts, and are then ſo permanent, that they can be received into white wax melted and poured round them, and perhaps by proper care might be converted into valuable paints.

10 Colour of the ſea. Sea water is really, as any one may convince himſelf by pouring it into a glaſs, as clear and tranſparent as river water. The various appearances therefore which it aſſumes are owing to accidental cauſes, and not to any change in the water itſelf. The depth, or the materials which compoſe the bottom of the ſea, occaſions it to aſſume different colours in different places. The Arabian gulf, for inſtance, is ſaid to be red from the colour of the ſands which form its bed. The appearance of the ſea is affected too by the winds and the ſun, while the clouds that paſs over it communicate all their various and fleeting colours. When the ſun ſhines it is green; when the ſun gleams through a fog it is yellow; near the north pole it appears black; while in the torrid zone its colour is often brown. Sometimes the ſea aſſumes a luminous appearance. See LIGHT, N° 37.

11 Saltneſs of the ſea. The ſea contains the greateſt quantity of ſalt in the torrid zone, where otherwiſe from the exceſſive heat it would be in danger of putrefaction: as we advance northward this quantity diminiſhes, till at the pole it nearly vaniſhes altogether. Under the line Lucas found that the ſea contained a ſeventh part of ſolid contents, conſiſting chiefly of ſea ſalt. At Harwich he found it yielded $\frac{1}{17}$th of ſea ſalt. At Carlſcroon in Sweden it contains $\frac{1}{10}$th part (B), and on the coaſt of Greenland a great deal leſs. This deficiency of ſalt near the poles probably contributes a good deal towards the prodigious quantities of ice which are met with in theſe ſeas; for

---

cording to his own calculation, it would require a million of years to level theſe mountains with the plain, though they continued to decreaſe at the ſame rate; and philoſophers tell us that this rate is conſtantly diminiſhing!

(B) This gradual diminution of ſaltneſs from the equator to the pole is not, however, without particular exceptions. The Mediterranean ſea contains $\frac{1}{27}$ of ſea ſalt, which is leſs than the German ſea contains.

Sea. for ſalt water requires a much greater degree of cold to freeze it than freſh water. It was this circumſtance, probably, together with its conſtant motion, which induced the ancients to believe that the ſea never froze. Even among the moderns it has been a generally received opinion, that ſea ice is originally formed in rivers. Buffon has made the great quantities of ice with which the South ſea abounds an argument for the exiſtence of a continent near the Antarctic pole. But it is now well known that great quantities of ice are formed at a diſtance from land. Sea ice is of two kinds; field-ice, which extends along the ſhore, and is only two or three feet thick; and mountain-ice, which abounds in the middle of the ocean. The ſize of theſe mountains is ſometimes prodigious. The ſea ice is always freſh, and has been often of great uſe to navigators.

The weight of ſea water is to that of river water as 73 to 70; that is, a cubic foot of ſea water weighs 73lb. whilethe ſame quantity of river water weighs only 70lb.; but this proportion varies in different places. It is worthy of our attention, too, that the water at the ſurface of the ſea contains leſs ſalt than near the bottom; the difference indeed is inconſiderable, but ſtill it is ſomething. The Compte de Marſigli found the ſame quantity of water, when taken from the bottom of the Mediterranean, to weigh one ounce three pennyweights 51 grains; whereas from the ſurface it weighed only one ounce three pennyweights 49 grains. He repeated the experiment frequently with nearly the ſame reſult.

12 Temperature of the ſea.

The ſea, with reſpective temperature, may be divided into two regions: The firſt begins at the ſurface of the water, and deſcends as far as the influence of the ſun's rays; the ſecond reaches from thence to the bottom of the ſea. In ſummer the lower region is conſiderably colder than the upper: but it is probable that during winter the very reverſe takes place; at leaſt the Compte de Marſigli found it ſo repeatedly in the Mediterranean. This naturally reſults from the ſituation of the water near the bottom of the ſea. Uninfluenced by the changes in the atmoſphere, it retains always nearly the ſame degree of temperature: and this is conſiderably above congelation; for the lower region of the ſea, at leaſt in the temperate parts of the world, was never known to freeze. Captain Ellis let down a ſea gage (ſee GAGE) in latitude 25° 13′ north, and longitude 25° 12′ weſt, to take the degrees of temperature and ſaltneſs of the ſea at different depths. It deſcended 5346 feet, which is a mile and eleven fathoms. He found the ſea ſalter and colder in proportion to its depth till the gage had deſcended 3900 feet, when the mercury in the thermometer came up at 53; but the water never grew colder, though he let down the gage 2446 feet lower. At the ſurface the thermometer ſtood at 84.

Boyle de Temperie Regionum Submarinarum.

Phil. Tranſ. for 1751, p. 213.

13 The ſea has three motions. Motion occaſioned by the wind.

The ſea has three kinds of motion: 1. The firſt is that undulation which is occaſioned by the wind. This motion is entirely confined to the ſurface; the bottom even during the moſt violent ſtorms remains perfectly calm. Mr Boyle has remarked, from the teſtimony of ſeveral divers, that the ſea is affected by the winds only to the depth of ſix feet. It would follow from this, that the height of the waves above the ſurface does not exceed ſix feet; and that this holds in the Mediterranean at leaſt, we are informed by the Compte de Marſigli, though he alſo ſometimes obſerved them, during a very violent tempeſt, riſe two feet higher. It is affirmed by Pliny, and ſeveral other ancient writers, that oil calms the waves of the ſea; and that divers were accuſtomed to carry ſome of it for that purpoſe in their mouths. This account was always conſidered by the moderns as a fable, and treated with ſuch contempt, that they did not even deign to put it to the teſt of experiment, till Dr Franklin accidentally diſcovered its truth. Happening in 1757 to be in the middle of a large fleet, he obſerved that the water round one or two veſſels was quite calm and ſmooth, while everywhere elſe it was very much agitated by the winds. He applied to the captain for an explanation of this phenomenon, who replied, that the cooks, he ſuppoſed, had thrown their greaſy water out at the ſcupper holes, and by that means oiled the ſides of the veſſels in queſtion. This anſwer did not ſatisfy the Doctor at firſt; but recollecting what Pliny had ſaid on the ſubject, he reſolved at leaſt to try the experiment. He did ſo accordingly in 1762, and found that oil actually calmed the waves of the ſea. He repeated the experiment upon Lake Clapham: the oil ſpread itſelf with great rapidity upon the ſurface, but did not produce the deſired effect, becauſe, having been thrown in upon the ſide oppoſite to the wind, it was immediately driven to the edge of the water. But upon throwing in a like quantity upon the other ſide of the lake, it calmed in an inſtant ſeveral yards of the ſurface; and gradually ſpreading, rendered all that part of the lake, to the extent of at leaſt half an acre, as ſmooth as glaſs. The curious effect produced by this liquid may be accounted for by the repulſion which exiſts between oil and water, and between oil and air, which prevents all immediate contact, all rubbing of the one upon the other.

15 Motion towards the weſt--Currents.

2. The ſecond kind of motion is that continual tendency which the whole water in the ſea has towards the weſt. It is greater near the equator than about the poles; and indeed cannot be ſaid to take place at all in the northern hemiſphere beyond the tropic. It begins on the weſt ſide of America, where it is moderate: hence that part of the ocean has been called *Pacific*. As the waters advance weſtward their motion is accelerated; ſo that, after having traverſed the globe, they ſtrike with great violence on the eaſtern ſhore of America. Being ſtopped by that continent, they turn northward, and run with conſiderable impetuoſity into the gulf of Mexico; from thence they proceed along the coaſt of North America, till they come to the ſouth ſide of the great bank at Newfoundland, when they turn off, and run down through the Weſtern Iſles. This current is called the *Gulf Stream*. It was firſt accurately deſcribed by Dr Franklin, who remarked alſo, that the water in it having been originally heated in the torrid zone, cools ſo gradually in its paſſage northward, that even the latitude might be found in any part of the ſtream by means of a thermometer.—This motion of the ſea weſtward has never been explained: it ſeems to have ſome connexion with the trade winds and the diurnal revolution of the earth on its axis.

16 Motion occaſioned by the tide.

3. The third and moſt remarkable motion of the ſea is the tide, which is a regular ſwell of the ocean once every 12 hours, owing, as Newton has demonſtrated, to the attraction of the moon. In the middle of the ſea the tide ſeldom riſes higher than one or two feet, but on the coaſt it frequently reaches the height of 45 feet,

feet, and in ſome places even more. The tide generally riſes higher in the evening than in the morning: on the coaſt of Britain this holds in winter, but in ſummer the morning tides are higheſt. In ſome ſeas it is ſaid that there are no tides. This cannot be owing to their being ſurrounded by land, becauſe there is a tide in the lakes of North America. For an explanation of theſe and other phenomena we refer to the article TIDE.

SEA-Air, that part of the atmoſphere which is above the ſea.

Sea air has been found ſalubrious and remarkably beneficial in ſome diſtempers. This may be owing to its containing a greater portion of oxigenous gas or vital air, and being leſs impregnated with noxious vapours than the land. Dr Ingenhouſz made ſeveral experiments to aſcertain the ſalubrity of ſea-air. By mixing equal meaſures of common air and nitrous air, he found, that at Graveſend, they occupied about 104, or one meaſure, and $\frac{4}{100}$ of a meaſure: whereas on ſea, about three miles from the mouth of the Thames, two meaſures of air (one of common and one of nitrous air) occupied from 0.91 to 0.94. He attempted a ſimilar experiment on the middle of the channel between the Engliſh coaſt and Oſtend; but the motion of the ſhip rendered it impracticable. He found that in rainy and windy weather the ſea air contained a ſmaller quantity of vital air than when the weather was calm. On the ſea-ſhore at Oſtend it occupied from 94½ to 97; at Bruges he found it at 105; and at Antwerp 109½. Dr Ingenhouſz thus concludes his paper:

Phil. Tranſ. 80, p 354

It appears, from theſe experiments, that the air at ſea and cloſe to it is in general purer and fitter for animal life than the air on the land, though it ſeems to be ſubject to the ſame inconſtancy in its degree of purity with that of the land: ſo that we may now with more confidence ſend our patients, labouring under conſumptive diſorders, to the ſea, or at leaſt to places ſituated cloſe to the ſea, which have no marſhes in their neighbourhood. It ſeems alſo probable, that the air will be found in general much purer far from the land than near the ſhore, the former being never ſubject to be mixed with land air.

Dr Damman, an eminent phyſician, and profeſſor royal of midwifery at Ghent, told Dr Ingenhouſz, that when he was formerly a practitioner at Oſtend, during ſeven years, he found the people there remarkably healthy; that nothing was rarer there than to ſee a patient labouring under a conſumption or aſthma, a malignant, putrid, or ſpotted fever; that the diſeaſe to which they are the moſt ſubject, is a regular intermittent fever in autumn, when ſudden tranſitions from hot to cold weather happen.

People are in general very healthy at Gibraltar, though there are very few trees near that place; which Dr Ingenhouſz thinks is owing to the purity of the air, ariſing from the neighbourhood of the ſea.

Moſt ſmall iſlands are very healthy.

At Malta people are little ſubject to diſeaſes, and live to a very advanced age.

SEA-Dragon, a monſter of a very ſingular nature. In the Gentleman's Magazine for the year 1749, we have the account of a ſea-dragon which was ſaid to be taken between Orford and Southwold, on the coaſt of Suffolk, and afterwards carried round the country as a curioſity by the fiſherman who caught it.

"Its head and tail (ſays the writer) reſemble thoſe of an alligator; it has two large fins, which ſerve it both to ſwim and to fly, and though they were ſo dried that I could not extend them, yet they appear, by the folds, to be ſhaped like thoſe which painters have given to dragons and other winged monſters that ſerve as ſupporters to coats of arms. Its body is covered with impenetrable ſcales; its legs have two joints, and its feet are hoofed like thoſe of an aſs: it has five rows of very white and ſharp teeth in each jaw, and is in length about four feet, though it was longer when alive, it having ſhrunk as it became dry.

"It was caught in a net with mackerel; and being dragged on ſhore, was knocked down with a ſtretcher or boat-hook. The net being opened, it ſuddenly ſprung up, and flew above 50 yards; the man who firſt ſeized it had ſeveral of his fingers bitten off; and the wound mortifying, he died. It afterwards faſtened on the man's arm who ſhows it, and lacerated it ſo much, that the muſcles are ſhrunk, and the hand and fingers diſtorted; the wound is not yet healed, and is thought to be incurable. It is ſaid by ſome to have been deſcribed by naturaliſts under the name of the *Sea-dragon.*" See Plate CCCCXLIX.

SEA-Plants, are thoſe vegetables that grow in ſalt-water within the ſhores of the ſea. The old botaniſts divided theſe into three claſſes. 1. The firſt claſs, according to their arrangement, contained the *algæ*, the *fuci*, the *ſea-moſſes* or *conſervas*, and the different ſpecies of ſponges. 2. The ſecond contained ſubſtances of a hard texture, like ſtone or horn, which ſeem to have been of the ſame nature with what we call *zoophyta*, with this difference, that we refer ſponges to this claſs, and not to the firſt. The third claſs was the ſame with our *lithophyta*, comprehending *corals*, *madrepora*, &c. It is now well known that the genera belonging to the

Sea. second and third of these classes, and even some referred to the first, are not vegetables, but animals, or the productions of animals. See CORALLINA, MADREPORA, SPONGIA. Sea plants, then, properly speaking, belong to the class of cryptogamia, and the order of algæ; and, according to Bomare, are all comprehended under the genus of fucus. We may also add several species of the ulva and conferva and the sargazo. The fuci and marine ulvæ are immersed in the sea, are sessile, and without root. The marine confervæ are either sessile or floating. The sargazo grows beyond soundings.

As some species of the fucus, when dried and preserved, are extremely beautiful, the curious, and especially those who prosecute the study of botany, must be anxious to know the best method of preserving them, without destroying their colour and beauty. The following method is recommended by M. Mauduyt: Take a sheet of paper, or rather of pasteboard, and cover it with varnish on both sides; and having rowed in a boat to the rock where the fucus abounds, plunge your varnished paper into the water, and, detaching the fucus, receive it upon the paper. Agitate the paper gently in the water, that the plant may be properly spread over it; and lift them up together softly out of the water: then fix down with pins the strong stalks, that they may not be displaced, and leave the plant lying upon the varnished paper to dry in the open air. When it is fully dry, the different parts will retain their position, and the plant may be preserved within the leaves of a book. If you wish to free it from the slime and salt which adheres to it, it may be washed gently in fresh water, after being removed from the rock on which it grew.

Sea-Serpent, a monstrous creature, said to inhabit the northern seas about Greenland and the coasts of Norway. The following marvellous account of this monster is given by Guthrie. "In 1756, one of them was shot by a master of a ship: its head resembled that of a horse; the mouth was large and black, as were the eyes, a white mane hanging from its neck: it floated on the surface of the water, and held its head at least two feet out of the sea: between the head and neck were seven or eight folds, which were very thick; and the length of this snake was more than 100 yards, some say fathoms. They have a remarkable aversion to the smell of castor; for which reason, ship, boat, and bark masters provide themselves with quantities of that drug, to prevent being overset, the serpent's olfactory nerves being remarkably exquisite. The particularities related of this animal would be incredible, were they not attested upon oath. Egede, a very reputable author, says, that on the 6th day of July 1734, a large and frightful sea monster raised itself so high out of the water that its head reached above the main-top-mast of the ship; that it had a long sharp snout, broad paws, and spouted water like a whale; that the body seemed to be covered with scales; the skin was uneven and wrinkled, and the lower part was formed like a snake. The body of this monster is said to be as thick as a hogshead; his skin is variegated like a tortoise-shell; and his excrement, which floats upon the surface of the water, is corrosive." Notwithstanding the belief of Guthrie, and the testimony which he produces, we cannot help doubting of the existence of the sea-serpent. Its bulk is said to be so disproportionate to all the known animals of our globe, that it requires more than ordinary evidence to render it credible; but the evidence which is offered is so very feeble and unsatisfactory, that no man of sound judgment would think it sufficient to establish the truth of an extraordinary fact.

Sea-Sickness, a disorder incident to most persons on their first going to sea, occasioned by the agitation of the vessel. In voyages, sea-sickness, though it continues in general only for the first day or two, is extremely harassing to some people at intervals, especially on any increased motion of the vessel. Sometimes, by long continuance, it causes fever, headach, quick pulse, thirst, white tongue, and a total deprivation of the retention of the stomach; evils which are always difficult to remove, and frequently terminate only with the voyage. *Moseley's Tropical Diseases*

This indisposition is considerably alleviated by a small tea spoonful of ether, taken now and then in a glass of water, and applying some of it to the temples and nostrils. The ancient writers recommend acid fruits, bread and vegetables soaked in vinegar, after the stomach has been cleansed by vomiting; but not to attempt to suppress the vomiting until that end was obtained. An old remedy for sea-sickness, and a very common one among sailors, is a draught or two of sea water; which, though a disgusting medicine at such a time, yet where the first passages are foul and loaded, generally produces the desired effect when the perturbation it occasions ceases.

Sea-Star. See ASTERIAS.

Sea-Urchin. See ECHINUS.

Sea-Water, the salt water of the sea. The principal salts contained in sea water are, 1st, Common marine or culinary salt, compounded of fossil alkali or soda and marine acid; 2dly, A salt formed by the union of the same acid with magnesian earth; and, lastly, A small quantity of selenite. The quantity of saline matter contained in a pint of sea-water, in the British seas, is, according to Neumann, about one ounce in each pint (A).

The saltness of this water is judged to arise from great multitudes both of mines and mountains of salt dispersed here and there in the depths of the sea. Dr Halley supposes that it is probable the greatest part of the sea salt, and of all salt lakes, as the Caspian sea, the Dead sea, the lake of Mexico, and the Titicaca in

(A) In Sir Torbern Bergman's analysis of sea water taken up in the beginning of June 1776, about the latitude of the Canaries, from the depth of 60 fathoms, the solid contents of a pint of the water were,

in Peru, derived from the water of the rivers which they receive: and ſince this ſort of lakes has no exit or diſcharge but by the exhalation of vapours, and alſo ſince theſe vapours are entirely freſh or devoid of ſuch particles, it is certain that the ſaltneſs of the ſea and of ſuch lakes muſt from time to time increaſe; and therefore the ſaltneſs at this time muſt be greater than at any time heretofore. He further adds, that if, by experiments made in different ages, we could find the different quantity of ſalt which the ſame quantity of water (taken up in the ſame place, and in all other the ſame circumſtances) would afford, it would be eaſy from thence, by rules of proportion, to find the age of the world very nearly, or the time wherein it has been acquiring its preſent ſaltneſs.

This opinion of Dr Halley is ſo improbable, that it is ſurpriſing ſo acute a philoſopher could have adopted it. That freſh water rivers ſhould in the courſe of many thouſand years produce ſaltneſs in the ſea, is quite incredible. If this were the caſe, every ſea or great body of water which receives rivers muſt be ſalt, and muſt poſſeſs a degree of ſaltneſs in proportion to the quantity of water which the rivers diſcharge. But ſo far is this from being true, that the Palus Meotis and the great lakes in America do not contain ſalt but freſh water. It may indeed be objected, that the quantity of ſalt which the rivers carry along with them and depoſite in the ſea, muſt depend on the nature of the ſoil through which they flow, which may in ſome places contain no ſalt at all: and this may be the reaſon why the great lakes in America and the Palus Meotis are freſh. But to this opinion, which is merely hypothetical, there are inſurmountable objections. It is a curious fact that the ſaltneſs of the ſea is greateſt under the line, and diminiſhes gradually as we advance to the poles: We muſt therefore ſuppoſe, if Dr Halley's theory be true, that the earth contains more ſalt in the tropical regions than in the temperate zones, and more in the temperate zones than in the frigid; and conſequently that the rivers in theſe different regions contain a quantity of ſalt proportionable to their diſtance from the equator. This, however, muſt firſt be proved by experiment, and cannot be aſſumed as an eſtabliſhed fact. But there is another circumſtance that entirely deſtroys this theory. If we allow that the ſea receives its ſaltneſs from the rivers, it muſt be equally ſalt or nearly ſo in every part of the earth. For, according to a ſimple and well known principle in chemiſtry, *when any ſubſtance is diſſolved in water with the aſſiſtance of agitation, at whatever part of the water it is introduced, it will be equally diffuſed through the whole liquid.* Now though it were true that a greater quantity of ſalt were introduced into the ſea under the line than towards the poles, from the conſtant agitation occaſioned by the wind and tide, the ſalt muſt ſoon pervade the whole maſs of water. To ſay that the ſuperior degree of heat in the tropical regions may diſſolve a greater quantity of ſalt, will not deſtroy our argument; for it is an eſtabliſhed principle in chemiſtry, that cold water will diſſolve nearly as great a quantity of ſalt as hot water can diſſolve.

The ſaltneſs of the ſea has alſo been aſcribed to the ſolution of ſubterraneous mines of ſalt which is ſuppoſed to abound in the bottom of the ſea and along its ſhores. But this hypotheſis cannot be ſupported. If the ſea were conſtantly diſſolving ſalt, it would ſoon become ſaturated; for it cannot be ſaid that it is deprived of any part of its ſalt by evaporation, ſince rain-water is freſh. If the ſea were to become ſaturated, neither fiſhes nor vegetables could live in it. We muſt therefore deſpair of being able to account for the ſaltneſs of the ſea by ſecond cauſes; and muſt ſuppoſe that it has been ſalt from the creation. It is impoſſible indeed to ſuppoſe that the waters of the ſea were at any period freſh ſince the formation of fiſhes and ſea-plants: for as theſe will not live in water ſaturated with ſalt, neither will they live in water that is freſh; we therefore conclude that the ſaltneſs of the ſea has been nearly the ſame in all ages. This is the ſimpleſt hypotheſis of the three that have been mentioned. It explains beſt the various phenomena, and is involved in feweſt difficulties. We ſhall, however, allow that there may be ſome exceptions; that the ſaltneſs of ſome ſeas, or of particular parts of the ſame ſea, may be increaſed by mines of rock-ſalt diſperſed near its ſhores. Sea.

With regard to the uſe of this ſalt property of ſea-water, it is obſerved, that the ſaltneſs of the ſea preſerves its waters pure and ſweet, which otherwiſe would corrupt and ſtink like a filthy lake, and conſequently that none of the myriads of creatures which now live therein could then have a being. From thence alſo the ſea-water becomes much heavier, and therefore ſhips of greater ſize and quantity may be uſed thereon. Salt water alſo doth not freeze ſo ſoon as freſh water, whence the ſeas are more free for navigation. We have a diſſertation, by Dr Ruſſel, concerning the medical uſes of ſea water in diſeaſes of the glands, &c. wherein the author premiſes ſome obſervations upon the nature of ſea water, conſidered as impregnated with particles of all the bodies it paſſes over, ſuch as ſubmarine plants, fiſh, ſalts, minerals, &c. and ſaturated with their ſeveral effluvia, to curich it and keep it from putrefaction: whence this fluid is ſuppoſed to contract a ſoapineſs; and the whole collection, being pervaded by the ſulphureous ſteams paſſing through it, to conſtitute what we call *ſea water;* the confeſſed diſtinguiſhing characteriſtics of which are ſaltneſs, bitterneſs, nitroſity, and unctuoſity: whence the author concludes, that it may be juſtly expected to contribute ſignally to the improvement of phyſic. The caſes in which our author informs us we are to expect advantage from ſea water are, 1. In all recent obſtructions of the glands of the inteſtines and meſentery. 2. All recent obſtructions of the pulmonary glands, and thoſe of the viſcera, which frequently produce conſumptions. 3. All recent glandular ſwellings of the neck, or other parts. 4. Recent tumours of the joints, if they are not ſuppurated, or become ſchirrous or cancerous, and have not carious bones for their cauſe. 5. Recent deſluxions upon the glands of the eyelids. 6. All defœdations of the ſkin, from an eryſipelas to a lepra. 7. Diſeaſes of the glands of the noſe, with their uſual companion a thickneſs of the lip. 8. Obſtructions of the kidneys, where there is no inflammation, and the ſtone not large. 9. In recent obſtructions of the liver, this method will be proper, where it prevents conſtipations of the belly, and aſſiſts other medicines directed in icterical caſes. The ſame remedy is ſaid to be of ſignal ſervice in the bronchocele; and is likewiſe recommended for the prevention of

Sea. the bilious colics that ſo frequently affect our mariners.

Preſervation of Sea-Water from Putrefaction. As it is ſometimes neceſſary to preſerve ſea-water in caſks for bathing and other purpoſes, it is of importance to know how to keep it from putrefaction. Many experiments were made to determine this point by Mr Henry, and are recorded in the firſt volume of the Memoirs of the Literary and Philoſophical Society of Mancheſter. His firſt experiment we ſhall here preſent to our readers. To one quart of ſea-water were added two ſcruples of freſh quicklime; to another, half an ounce of common culinary ſalt; and a third was kept as a ſtandard without any addition. The mouths of the bottles being looſely covered with paper, they were expoſed to the action of the ſun in ſome of the hotteſt weather in ſummer. In about a week the ſtandard became very offenſive; and the water, with the additional quantity of ſalt, did not continue ſweet many hours longer; whereas that with lime continued many months without ever exhibiting the leaſt marks of putridity." When he added a dram more of quicklime, the whole of the magneſia contained in the water was ſeparated; and when a further addition was made, a lime-water was immediately formed. He therefore concluded, that two ſcruples of quicklime are ſufficient to preſerve a quart of ſea-water. The proportions, however, may vary a little, according to the ſtrength of the quicklime employed.

1 Different methods of freſhening ſea-water.

Freſhening of Sea-Water. The method of making ſea-water freſh was long a deſideratum in navigation. Many methods have been propoſed for this purpoſe. Mr Appleby publiſhed an account of a proceſs which he had inſtituted in the year 1734. He diſtilled ſea-water with a quantity of *lapis infernalis*, and calcined bones; but this proceſs was ſoon laid aſide, as it was not only difficult in itſelf, but rendered the water unpalatable. Dr Butler propoſed ſoap leys in place of Mr Appleby's ingredients; but the water was ſtill liable to the ſame objection. Dr Stephen Hales recommended powdered chalk; but his method was expenſive, and did not improve the taſte of the water. Dr Lind of Portſmouth diſtilled ſea-water without any ingredient; but as the experiment he made was performed in a veſſel containing only two quarts, with a glaſs receiver in his ſtudy, nothing concluſive can be drawn from it for the uſe of ſailors. At length Dr Irving brought the proceſs to a very high degree of ſimplicity and perfection, by which the water is obtained pure, without much expence of fuel or a complicated apparatus. For this valuable diſcovery he received a reward of 5000l. The advantages of his method remain to be ſtated, which may be reduced to the following: 1. The abolithing all ſtills, ſtill-heads, worm-pipes, and their tubes, which occupy ſo much ſpace as to render them totally incompatible with the neceſſary buſineſs of the ſhip; and uſing in the room of theſe the ſhip's kettle or boiler, to the top whereof may occaſionally be applied a ſimple tube, which can be eaſily made on board a veſſel at ſea, of iron plate, ſtove funnel, or tin ſheet; ſo that no ſituation can prevent a ſhip from being completely ſupplied with the means of diſtilling ſea-water. 2. In conſequence of the principles of diſtillation being fully aſcertained, the contrivance of the ſimpleſt means of obtaining the greateſt quantity of diſtilled water, by making the tube ſufficiently large to receive the whole column of vapour, and placing it nearly in a horizontal direction, to prevent any compreſſion of the fluid, which takes place ſo much with the common worm. 3. The adopting of the ſimpleſt and moſt efficacious means of condenſing vapour; for nothing more is required in the diſtillation but keeping the ſurface of the tube always wet, which is done by having ſome ſea-water at hand, and a perſon to dip a mop or ſwab into this water, and paſs it along the upper ſurface of the tube. By this operation the vapour contained in the tube will be entirely condenſed with the greateſt rapidity imaginable; for by the application of the wet mop thin ſheets of water are uniformly ſpread, and mechanically preſſed upon the ſurface of the hot tube; which being converted into vapour make way for a ſucceſſion of freſh ſheets; and thus, both by the evaporation and cloſe contact of the cold water conſtantly repeated, the heat is carried off more effectually than by any other method yet known. 4. The carrying on the diſtillation without any addition, a correct chemical analyſis of ſea-water having evinced the futility of mixing ingredients with it, either to prevent an acid from riſing with the vapour, or to deſtroy any bituminous oil ſuppoſed to exiſt in ſea-water, and to contaminate the diſtilled water, giving it that fiery unpalatable taſte inſeparable from the former proceſſes. 5. The aſcertaining the proper quantity of ſea water that ought to be diſtilled, whereby the freſh water is prevented from contracting a noxious impregnation of metallic ſalts, and the veſſel from being corroded and otherwiſe damaged by the ſalts caking on the bottom of it. 6. The producing a quantity of ſweet and wholeſome water, perfectly agreeable to the taſte, and ſufficient for all the purpoſes of ſhipping. 7. The taking advantage of the dreſſing the ſhip's proviſions, ſo as to diſtil a very conſiderable quantity of water from the vapour, which would otherwiſe be loſt, without any addition of fuel. To ſum up the merits of this method in a few words: the uſe of a ſimple tube, of the moſt eaſy conſtruction, applicable to any ſhip's kettle. The rejecting all ingredients; aſcertaining the proportion of water to be diſtilled, with every advantage of quality, ſaving of fuel, and preſervation of boilers. The obtaining freſh water, wholeſome, palatable, and in ſufficient quantities. Taking advantage of the vapour which aſcends in the kettle while the ſhip's proviſions are boiling. All theſe advantages are obtained by the above mentioned ſimple addition to the common ſhip's kettles. But Dr Irving propoſes to introduce two further improvements. The firſt is a hearth, or ſtove, ſo conſtructed that the fire which is kept up the whole day for the common buſineſs of the ſhip ſerves likewiſe for diſtillation; whereby a ſufficient quantity of water for the economical purpoſes of the ſhip may be obtained, with a very inconſiderable addition to the expence of fuel. The other improvement is that of ſubſtituting, even in the largeſt ſhips, caſt-iron boilers, of a new conſtruction, in the place of coppers.

2 Dr Irving's.

3 Directions for diſtilling ſea-water.

As ſoon as ſea-water is put into the boiler, the tube is to be fitted either in the top or lid, round which, if neceſſary, a bit of wet linen may be applied, to make it fit cloſe to the mouth of the veſſel; there will be no occaſion for luting, as the tube acts like a funnel in carrying

Sea. rying off the vapour. When the water begins to boil, the vapour ſhould be allowed to paſs freely for a minute, which will effectually clean the tube and upper part of the boiler. The tube is afterwards to be kept conſtantly wet, by paſſing a mop or ſwab, dipped in ſea water, along its upper ſurface. The waſte water running from the mop may be carried off by means of a board made like a ſpout, and placed beneath the tube. The diſtillation may be continued till three-fourths of the water be drawn off, and no further. This may be aſcertained either by a guage-rod put into the boiler, or by meaſuring the water diſtilled. The brine is then to be let out. Water may be diſtilled in the ſame manner while the proviſions are boiling. When the tube is made on ſhore, the beſt ſubſtance for the purpoſe is thin copper well tinned, this being more durable in long voyages than tin-plates. Inſtead of mopping, the tube, if required, may have a caſe made alſo of copper, ſo much larger in diameter as to admit a thin ſheet of water to circulate between them by means of a ſpiral copper thread, with a pipe of an inch diameter at each end of the caſe; the lower for receiving cold water, and the upper for carrying it off when heated.

Plate CCCCXLVIII

When only a very ſmall portion of room can be conveniently allowed for diſtillation, the machine (N° 2.), which is only 27 inches long, may be ſubſtituted, as was done in this voyage. The principal intention of this machine, however, is to diſtil rum and other liquors; for which purpoſe it has been employed with extraordinary ſucceſs, in preventing an *empyreuma*, or fiery taſte.

Figure 1. repreſents in perſpective a ſection of the two boilers taken out of the frame. In the back part at D, E, are ſeen openings for the cocks. On the top is a diſtilling tube A, B, C, five inches diameter at A, and decreaſing in ſize to three inches at C; the length from B to C is five feet. Near C is a ring to prevent the water which is applied to the ſurface from mixing with the diſtilled water. In the inſide of the tube, below B, is a ſmall lip or ledging, to hinder the diſtilled water from returning into the boiler by the rolling of the ſhip.

In figure 2. A, B, C, D, repreſent a vertical ſection of a copper box, 27 inches long, ſeven inches wide, and 11 in height, tinned on the inſide. In the bottom F is an aperture about ſix inches in diameter, having a ring to fit on the ſtill or boiler. The dotted lines which run nearly horizontal, are veſſels of thin copper, tinned on the outſide, two feet long, ſeven inches wide, and three quarters of an inch deep. At G is a funnel to receive cold water, which is conveyed into the veſſels by communicating pipes, contrived in ſuch a manner as to form a complete and quick circulation of the water through their whole extent. When the water is become hot by the action of the ſteam, it is diſcharged by the horizontal pipe at A. E is a pipe from which the diſtilled water or ſpirits run, and is bent in ſuch a form that the liquor running from it acts as a valve, and hinders any ſteam from eſcaping that way. On the top of the box, at H, is a ſafety-valve, which prevents any danger from a great accumulation of vapour not condenſed for want of a proper ſupply of cold water.

4 Lorgna's method of freſhening it by congelation.

We ſhall now mention a different method, diſcovered by the Chevalier Lorgna, by congelation of ſea-water. Sea-water requires a very great degree of cold in order to become ice. Our author found that a freezing mixture, made by mixing three parts of pounded ice with two parts of common ſalt, was quite ſufficient to freeze it. The cold produced by this mixture is equal to about 4° below nought of Fahrenheit's thermometer. Sea ‖ Seal.

A quantity of ſea water is never entirely congealed, a portion of it always remaining fluid; and, what is very remarkable, this fluid part is incomparably more full of ſalt and more nauſeous than the reſt: hence, if this be ſeparated from the congealed part, the latter on being melted will be found to contain much leſs ſalt than it did before congelation. This we ſhall call *the water of the firſt purification.*

If the water of the firſt purification be again congealed, a part of it will remain fluid as in the firſt operation. This fluid portion will contain a greater proportion of ſalt than the reſt, which is of courſe more pure, and, being melted, forms the water of the ſecond purification. Thus, by repeatedly freezing the ſame ſea water, and ſeparating the fluid from the congealed part in every operation, it is at laſt perfectly purified, ſo as to be entirely diveſted of ſalt, and as fit for drink and other purpoſes as the pureſt water that is uſed.

At firſt the ſea water, in order to be congealed, requires a very great degree of cold, as mentioned above, the ice formed in it conſiſts rather of ſcales or filaments than of a compact body, and the quantity of the fluid parts bears a conſiderable proportion to the quantity of ice. But as the water, by undergoing the ſucceſſive congelations, becomes more and more pure, ſo it becomes capable of being congealed by a ſmaller and ſmaller degree of cold; the ice is at the ſame time more compact, and in greater quantity; the fluid part at laſt becoming very inconſiderable.

Sea-Weed, or *Alga Marina*, is commonly uſed as a manure on the ſea coaſt, where it can be procured in abundance. The beſt ſort grows on rocks, and is that from which kelp is made. The next to this is called the *peaſy ſea-weed*; and the worſt is that with a long ſtalk. In the neighbourhood of Berwick, the farmers mix it with ſtable dung and earth, and thus obtain a great quantity of excellent manure. Sea-weed is found alſo to be a very fit manure for gardens, as it not only enriches them, but deſtroys the vermine by which they are uſually infeſted.

Saltneſs of the Sea. See *Sea-Water.*

South Sea. See *Pacific Ocean*, and *South Sea.*

SEAL, a puncheon, piece of metal, or other matter, uſually either round or oval; whereon are engraven the arms, device, &c. of ſome prince, ſtate, community, magiſtrate, or private perſon, often with a legend or inſcription; the impreſſion whereof in wax ſerves to make acts, inſtruments, &c. authentic.

The uſe of ſeals, as a mark of authenticity to letters and other inſtruments in writing, is extremely ancient. We read of it among the Jews and Perſians in the earlieſt and moſt ſacred records of hiſtory. And in the book of Jeremiah there is a very remarkable inſtance, not only of an atteſtation by ſeal, but alſo of the other uſual formalities attending a Jewiſh purchaſe. In the civil law alſo, ſeals were the evidence of truth, and were required, on the part of the witneſſes at leaſt, at the atteſtation of every teſtament. But in the times of our Saxon anceſtors, they were not much in uſe in England. For though Sir Edward Coke relies on an inſtance

Seal. inſtance of King Edwyn's making uſe of a ſeal about 100 years before the Conqueſt, yet it does not follow that this was the uſage among the whole nation: and perhaps the charter he mentions may be of doubtful authority, from this very circumſtance of its being ſealed; ſince we are aſſured by all our ancient hiſtorians that ſealing was not then in common uſe. The method of the Saxons was, for ſuch as could write to ſubſcribe their names, and, whether they could write or not, to affix the ſign of the croſs: which cuſtom our illiterate vulgar do for the moſt part to this day keep up, by ſinging a croſs for their mark when unable to write their names. And indeed this inability to write, and therefore making a croſs in its ſtead, is honeſtly avowed by Cædwalla, a Saxon king, at the end of one of his charters. In like manner, and for the ſame unſurmountable reaſon, the Normans, a brave but illiterate nation, at their firſt ſettlement in France uſed the practice of ſealing only, without writing their names; which cuſtom continued when learning made its way among them, though the reaſon for doing it had ceaſed; and hence the charter of Edward the Confeſſor to Weſtminſter-abbey, himſelf being brought up in Normandy, was witneſſed only by his ſeal, and is generally thought to be the oldeſt ſealed charter of any authenticity in England. At the Conqueſt, the Norman lords brought over into this kingdom their own faſhions; and introduced waxen ſeals only, inſtead of the Engliſh method of writing their names, and ſigning with the ſign of the croſs. The impreſſions of theſe ſeals were ſometimes a knight on horſeback, ſometimes other devices; but coats of arms were not introduced into ſeals, nor indeed uſed at all till about the reign of Richard I. who brought them from the croiſade in the Holy Land, where they were firſt invented and painted on the ſhields of the knights, to diſtinguiſh the variety of perſons of every Chriſtian nation who reſorted thither, and who could not, when clad in complete ſteel, be otherwiſe known or aſcertained.

This neglect of ſigning, and reſting only upon the authenticity of ſeals, remained very long among us; for it was held in all our books, that ſealing alone was ſufficient to authenticate a deed: and ſo the common form of atteſting deeds, "ſealed and delivered," continues to this day, notwithſtanding the ſtatute 29 Car. II. c. 3. revives the Saxon cuſtom, and expreſsly directs the ſigning in all grants of lands and many other ſpecies of deeds: in which, therefore, ſigning ſeems to be now as neceſſary as ſealing, though it hath been ſometimes held that the one includes the other. Sea ‖ Seam.

The king's *great-ſeal* is that whereby all patents, commiſſions, warrants, &c. coming down from the king are ſealed; the keeping whereof is in the hands of the lord chancellor. The king's *privy-ſeal* is a ſeal that is uſually firſt ſet to grants that are to paſs the great ſeal.

SEAL. See *KEEPER of the Privy-Seal.*

SEAL is alſo uſed for the wax or lead, and the impreſſion thereon affixed to the thing ſealed.

An amalgam of mercury with gold, reduced to the conſiſtence of butter, by ſtraining off part of the mercury through leather, has been recommended as a proper material for taking off the impreſſion of ſeals in wax. In this ſtate, the compound ſcarcely contains one part of mercury to two of gold; yet is of a ſilver whiteneſs, as if there was none of the precious metal in it. In this ſtate it grows ſoft on being warmed or worked between the fingers; and is therefore proper for the purpoſe above-mentioned, but is not ſuperior to ſome amalgams made with the inferior metals, as is well known to ſome impoſtors, who have ſold for this uſe amalgams of the baſe metals as curious preparations of gold.

SEAL, in zoology. See PHOCA.

SEALER, an officer in chancery appointed by the lord chancellor or keeper of the great ſeal to ſeal the writs and inſtruments there made in his preſence.

SEALING, in architecture, the fixing a piece of wood or iron in a wall with plaſter, mortar, cement, lead, or other ſolid binding. For ſtaples, hinges, and joints, plaſter is very proper.

SEALING WAX. See WAX.

SEAM, or SEME of corn, a meaſure of eight buſhels.

SEAM of Glaſs, the quantity of 120 pounds, or 24 ſtones, each five pounds weight. The ſeam of wood is a horſe load.

SEAM, in mines, the ſame with a vein or ſtratum of metal.

SEAMANSHIP.

1 Definition. BY this word we expreſs that noble art, or, more purely, the qualifications which enable a man to exerciſe the noble art of working a ſhip. A SEAMAN, in the language of the profeſſion, is not merely a mariner or labourer on board a ſhip, but a man who underſtands the ſtructure of this wonderful machine, and every ſubordinate part of its mechaniſm, ſo as to enable him to employ it to the beſt advantage for puſhing her forward in a particular direction, and for avoiding the numberleſs dangers to which ſhe is expoſed by the violence of the winds and waves. He alſo knows what courſes can be held by the ſhip, according to the wind that blows, and what can not, and which of theſe is moſt conducive to her progreſs in her intended voyage; and he muſt be able to perform every part of the neceſſary operation with his own hands. As the ſeamen expreſs it, he muſt be able "to hand, reef, and ſteer."

2 Importance and

We are juſtified in calling it a *noble art*, not only by its importance, which it is quite needleſs to amplify or embelliſh, but by its immenſe extent and difficulty, and the prodigious number and variety of principles on which it is founded—all of which muſt be poſſeſſed in ſuch a manner that they ſhall offer themſelves without reflection in an inſtant, otherwiſe the pretended ſeaman is but a lubber, and cannot be truſted on his watch.

The art is practiſed by perſons without what we call *education*, and in the humbler walks of life, and therefore it ſuffers in the eſtimation of the careleſs ſpectator. It is thought little of, becauſe little attention is paid

paid to it. But if multiplicity, variety, and intricacy of principles, and a ſyſtematic knowledge of theſe principles, entitle any art to the appellation of *ſcientific* and *liberal*, ſeamanſhip claims theſe epithets in an eminent degree. We are amuſed with the pedantry of the ſeaman, which appears in his whole language. Indeed it is the only pedantry that amuſes. A ſcholar, a ſoldier, a lawyer, nay, even the elegant courtier, would diſguſt us, were he to make the thouſandth part of the alluſions to his profeſſion that is well received from the jolly ſeaman; and we do the ſeaman no more than juſtice. His profeſſion *muſt* engroſs his whole mind, otherwiſe he can never learn it. He poſſeſſes a prodigious deal of knowledge; but the honeſt tar cannot tell what he knows, or rather what he feels, for his ſcience is really at his finger ends. We can ſay with confidence, that if a perſon of education, verſed in mechanics, and acquainted with the ſtructure of a ſhip, were to obſerve with attention the movements which are made on board a firſt or ſecond rate ſhip of war during a ſhifting ſtorm, under the direction of an intelligent officer, he would be rapt in admiration.

3 difficulty of the art,

What a pity it is that an art ſo important, ſo difficult, and ſo intimately connected with the invariable laws of mechanical nature, ſhould be ſo held by its poſſeſſors, that it cannot improve, but muſt die with each individual. Having no advantages of previous education, they cannot arrange their thoughts; they can hardly be ſaid to think. They can far leſs expreſs or communicate to others the intuitive knowledge which they poſſeſs; and their art, acquired by habit alone, is little different from an inſtinct. We are as little entitled to expect improvement here as in the architecture of the bee or the beaver. The ſpecies (pardon the alluſion ye generous hearts of oak) cannot improve. Yet a ſhip is a machine. We know the forces which act on it, and we know the reſults of its conſtruction—all theſe are as fixed as the laws of motion. What hinders this to be reduced to a ſet of practical maxims, as well founded and as logically deduced as the working of a ſteam engine or a cotton mill? The ſtocker or the ſpinner acts only with his hands, and may "whiſtle as he works for want of thought;" but the mechaniſt, the engineer, thinks for him, improves his machine, and directs him to a better practice. May not the rough ſeaman look for the ſame aſſiſtance; and may not the ingenious ſpeculatiſt in his cloſet unravel the intricate thread of mechaniſm which connects all the manual operations with the unchangeable laws of nature, and both furniſh the ſeaman with a better machine and direct him to a more dexterous uſe of it?

4 which has been zealouſly cultivated by the French philoſophers.

We cannot help thinking that much may be done; nay, we may ſay that much has been done. We think highly of the progreſſive labours of Renaud, Pitot, Bouguer, Du Hamul, Groignard, Bernoulli, Euler, Romme, and others; and are both ſurpriſed and ſorry that Britain has contributed ſo little in theſe attempts. Gordon is the only one of our countrymen who has given a profeſſedly ſcientific treatiſe on a ſmall branch of the ſubject. The government of France has always been ſtrongly impreſſed with the notion of great improvements being attainable by ſyſtematic ſtudy of this art; and we are indebted to the endeavours of that ingenious nation for any thing of practical importance that has been obtained. M. Bouguer was profeſſor of hydrology at one of the marine academies of France, and was enjoined, as part of his duty, to compoſe diſſertations both on the conſtruction and the working of ſhips. His *Traité du Navire*, and his *Manœuvre des Vaiſſeaux*, are undoubtedly very valuable performances: So are thoſe of Euler and Bernoulli, conſidered as mathematical diſſertations, and they are wonderful works of genius, conſidered as the productions of perſons who hardly ever ſaw a ſhip, and were totally unacquainted with the profeſſion of a ſeaman. In this reſpect Bouguer had great ſuperiority, having always lived at a ſea-port, and having made many very long voyages. His treatiſes therefore are infinitely better accommodated to the demands of the ſeaman, and more directly inſtructive; but ſtill the author is more a mathematician than an artiſt, and his performance is intelligible only to mathematicians. It is true, the academical education of the young gentlemen of the French navy is ſuch, that a great number of them may acquire the preparatory knowledge that is neceſſary; and we are well informed that, in this reſpect, the officers of the Britiſh navy are greatly inferior to them.

5 Argument againſt the utility of their performances;

But this very circumſtance has furniſhed to many perſons an argument againſt the utility of thoſe performances. It is ſaid that, "notwithſtanding this ſuperior mathematical education, and the poſſeſſion of thoſe boaſted performances of M. Bouguer, the French are greatly inferior, in point of ſeamanſhip, to our countrymen, who have not a page in their language to inſtruct them, and who could not peruſe it if they had it." Nay, ſo little do the French themſelves ſeem ſenſible of the advantage of theſe publications, that no perſon among them has attempted to make a familiar abridgement of them, written in a way fitted to attract attention; and they ſtill remain neglected in their original abſtruſe and unintereſting form.

We wiſh that we could give a ſatisfactory anſwer to this obſervation. It is juſt, and it is important. Theſe very ingenious and learned diſſertations are by no means ſo uſeful as we ſhould expect. They are large books, and appear to contain much; and as their plan is logical, it ſeems to occupy the whole ſubject, and therefore to have done almoſt all that can be done. But, alas! they have only opened the ſubject, and the ſtudy is yet in its infancy. The whole ſcience of the art muſt proceed on the knowledge of the impulſions of the wind and water. Theſe are the forces which act on the machine; and its motions, which are the ultimatum of our reſearch, whether as an end to be obtained or as a thing to be prevented, muſt depend on theſe forces. Now it is with reſpect to this fundamental point that we are as yet almoſt totally in the dark. And, in the performances of M. Bouguer, as alſo in thoſe of the other authors we have named, the theory of theſe forces, by which their quantity and the direction of their action are aſcertained, is altogether erroneous; and its reſults deviate ſo enormouſly from what is obſerved in the motions of a ſhip, that the perſon who ſhould direct the operations on ſhipboard, in conformity to the maxims deducible from M. Bouguer's propoſitions, would be baffled in moſt of his attempts, and be in danger of loſing the ſhip. The whole proceeds on the ſuppoſed truth of that theory which ſtates the impulſe of a fluid

6 which are abſolutely erroneous in their fundamental principles,

10.

to be in the proportion of the ſquare of the ſine of the angle of incidence; and that its action on any ſmall portion, ſuch as a ſquare foot of the ſails or hull, is the ſame as if that portion were detached from the reſt, and were expoſed, ſingle and alone, to the wind or water in the ſame angle. But we have ſhown, in the article *Resistance of Fluids*, both from theory and experience, that both of theſe principles are erroneous, and this to a very great degree, in caſes which occur moſt frequently in practice, that is, in the ſmall angles of inclination. When the wind falls nearly perpendicular on the ſails, theory is not very erroneous: but in theſe caſes, the circumſtances of the ſhip's ſituation are generally ſuch that the practice is eaſy, occuring almoſt without thought; and in this caſe, too, even conſiderable deviations from the very beſt practice are of no great moment. The intereſting caſes, where the intended movement requires or depends upon very oblique actions of the wind on the ſails, and its practicability or impracticability depends on a very ſmall variation of this obliquity; a miſtake of the force, either as to intenſity or direction, produces a mighty effect on the reſulting motion. This is the caſe in ſailing to windward; the moſt important of all the general problems of ſeamanſhip. The trim of the ſails, and the courſe of the ſhip, ſo as to gain moſt on the wind, are very nice things; that is, they are confined within very narrow limits, and a ſmall miſtake produces a very conſiderable effect. The ſame thing obtains in many of the nice problems of tacking, box-hauling, wearing after, lying-to in a ſtorm, &c.

The error in the ſecond aſſertion of the theory is ſtill greater, and the action on one part of the ſail or hull is ſo greatly modified by its action on another adjoining part, that a ſtay-ſail is often ſeen hanging like a looſe rag, altho' there is nothing between it and the wind; and this merely becauſe a great ſail in its neighbourhood ſends off a lateral ſtream of wind, which completely hinders the wind from getting at it. Till the theory of the action of fluids be eſtabliſhed, therefore, we cannot tell what are the forces which are acting on every point of the ſail and hull: Therefore we cannot tell either the mean intenſity or direction of the whole force which acts on any particular ſail, nor the intenſity and mean direction of the reſiſtance to the hull; circumſtances abſolutely neceſſary for enabling us to ſay what will be their energy in producing a rotation round any particular axis. In like manner, we cannot, by ſuch a computation, find the ſpontaneous axis of converſion (ſee Rotation), or the velocity of ſuch converſion. In ſhort, we cannot pronounce with tolerable confidence *à priori* what will be the motions in any caſe, or what diſpoſitions of the ſails will produce the movement we wiſh to perform. The experienced ſeaman learns by habit the general effects of every diſpoſition of the ſails; and though his knowledge is far from being accurate, it ſeldom leads him into any very blundering operation. Perhaps he ſeldom makes the beſt adjuſtment poſſible, but ſeldomer ſtill does he deviate very far from it; and in the moſt general and important problem, ſuch as working to windward, the reſult of much experience and many corrections has ſettled a trim of the ſails, which is certainly not far from the truth, but (it muſt be acknowledged) deviates widely and uniformly from the theories of the mathematician's cloſet. The honeſt tar, therefore, muſt be indulged in his joke on the uſeleſs labours of the mathematician, who can neither hand, reef, nor ſteer.

After this account of the theoretical performances in the art of ſeamanſhip, and what we have ſaid in another place on the ſmall hopes we entertain of ſeeing a perfect theory of the impulſe of fluids, it will not be expected that we enter very minutely on the ſubject in this place; nor is it our intention. But let it be obſerved, that theory is defective in one point only; and although this is a moſt important point, and the errors in it deſtroy the concluſions of the chief propoſitions, the reaſoning remains in full force, and the *modus operandi* is preciſely ſuch as is ſtated in the theory. The *principles* of the art are therefore to be found in theſe treatiſes; but falſe inferences have been drawn, by computing from erroneous quantities. The rules and the practice of the computation, however, are ſtill beyond controverſy: Nay, ſince the proceſs of inveſtigation is legitimate, we may make uſe of it in order to diſcover the very circumſtance in which we are at preſent miſtaken; for by converting the propoſition, inſtead of finding the motions by means of the ſuppoſed forces, combined with the known mechaniſm, we may diſcover the forces by means of this mechaniſm and the obſerved motions.

though uſ may be made of them.

8 Deſign of this articl

We ſhall therefore in this place give a very general view of the movements of a ſhip under ſail, ſhowing how they are produced and modified by the action of the wind on her ſails, the water on her rudder and on her bows. We ſhall not attempt a preciſe determination of any of theſe movements; but we ſhall ſay enough to enable the curious landſman to underſtand how this mighty machine is managed amidſt the fury of the winds and waves; and, what is more to our wiſh, we hope to enable the uninſtructed but thinking ſeaman to generalize that knowledge which he poſſeſſes; to claſs his ideas and give them a ſort of rational ſyſtem; and even to improve his practice, by making him ſenſible of the immediate operation of every thing he does, and in what manner it contributes to produce the movement which he has in view.

9 A ſhip co

A ſhip may be conſidered at preſent as a maſs of inert matter in free ſpace, at liberty to move in every direction, according to the forces which impel or reſiſt her: and when ſhe is in actual motion, in the direction of her courſe, we may ſtill conſider her as at reſt in abſolute ſpace, but expoſed to the impulſe of a current of water moving equally faſt in the oppoſite direction; for in both caſes the preſſure of the water on her bows, is the ſame; and we know that it is poſſible, and frequently happens in currents, that the impulſe of the wind on her ſails, and that of the water on her bows, balance each other ſo preciſely, that ſhe not only does not ſtir from the place, but alſo remains ſteadily in the ſame poſition, with her head directed to the ſame point of the compaſs. This ſtate of things is eaſily conceived by any perſon accuſtomed to conſider mechanical ſubjects, and every ſeaman of experience has obſerved it. It is of importance to conſider it in this point of view, becauſe it gives us the moſt familiar notion of the manner in which theſe forces of the wind and water are ſet in oppoſition, and made to balance or not to balance

fidered as free ſpace impelled and reſiſt by oppoſi forces.

each other by the intervention of the ſhip, in the ſame manner as the goods and the weights balance each other in the ſcales by the intervention of a beam or ſteelyard.

10 Impulſe of the wind on the ſails oppoſite to that of the water on the bows.

When a ſhip proceeds ſteadily in her courſe, without changing her rate of ſailing, or varying the direction of her head, we muſt in the firſt place conceive the accumulated impulſes of the wind on all her ſails as preciſely equal and directly oppoſite to the impulſe of the water on her bows. In the next place, becauſe the ſhip does not change the direction of her keel, ſhe reſembles the balanced ſteelyard, in which the energies of the two weights, which tend to produce rotations in oppoſite directions, and thus to change the poſition of the beam, mutually balance each other round the fulcrum; ſo the energies of the actions of the wind on the different ſails balance the energies of the water on the different parts of the hull.

11 Skill of the ſeaman diſplayed in ſhaping his courſe.

The ſeaman has two principal taſks to perform. The firſt is to keep the ſhip ſteadily in that courſe which will bring her furtheſt on in the line of her intended voyage. This is frequently very different from that line, and the choice of the beſt courſe is ſometimes a matter of conſiderable difficulty. It is ſometimes poſſible to ſhape the courſe preciſely along the line of the voyage; and yet the intelligent ſeaman knows that he will arrive ſooner, or with greater ſafety, at his port, by taking a different courſe; becauſe he will gain more by increaſing his ſpeed than he loſes by increaſing the diſtance. Some principle muſt direct him in the ſelection of this courſe. This we muſt attempt to lay before the reader.

Having choſen ſuch a courſe as he thinks moſt advantageous, he muſt ſet ſuch a quantity of ſail as the ſtrength of the wind will allow him to carry with ſafety and effect, and muſt trim the ſails properly, or ſo adjuſt their poſitions to the direction of the wind, that they may have the greateſt poſſible tendency to impel the ſhip in the line of her courſe, and to keep her ſteadily in that direction.

His other taſk is to produce any deviations which he ſees proper from the preſent courſe of the ſhip; and to produce theſe in the moſt certain, the ſafeſt, and the moſt expeditious manner. It is chiefly in this movement that the mechanical nature of a ſhip comes into view, and it is here that the ſuperior addreſs and reſource of an expert ſeaman is to be perceived.

Under the article SAILING ſome notice has been taken of the firſt taſk of the ſeaman, and it was there ſhown how a ſhip, after having taken up her anchor and fitted her ſails, accelerates her motion, by degrees which continually diminiſh, till the increaſing reſiſtance of the water becomes preciſely equal to the diminiſhed impulſe of the wind, and then the motion continues uniformly the ſame ſo long as the wind continues to blow with the ſame force and in the ſame direction.

It is perfectly conſonant to experience that the impulſe of fluids is in the duplicate ratio of the relative velocity. Let it be ſuppoſed that when water moves one foot per ſecond its perpendicular preſſure or impulſe on a ſquare foot is m pounds. Then, if it be moving with the velocity V eſtimated in feet per ſecond, its perpendicular impulſe on a ſurface S, containing any number of ſquare feet, muſt be $m\,SV^2$.

In like manner, the impulſe of air on the ſame ſurface may be repreſented by $n\,SV^2$; and the proportion of the impulſe of theſe two fluids will be that of m to n. We may expreſs this by the ratio of q to 1, making $\frac{m}{n} = q$.

12 Impulſe of the water computed in ounces on the ſquare foot.

M. Bouguer's computations and tables are on the ſuppoſition that the impulſe of ſea water moving one foot per ſecond is 23 ounces on a ſquare foot, and that the impulſe of the wind is the ſame when it blows at the rate of 24 feet per ſecond. Theſe meaſures are all French. They by no means agree with the experiments of others; and what we have already ſaid, when treating of the *RESISTANCE of Fluids*, is enough to ſhow us that nothing like preciſe meaſures can be expected. It was ſhown as the reſult of a rational inveſtigation, and confirmed by the experiments of Buat and others, that the impulſions and reſiſtances at the ſame ſurface, with the ſame obliquity of incidence and the ſame velocity of motion, are different according to the form and ſituation of the adjoining parts. Thus the total reſiſtance of a thin board is greater than that of a long priſm, having this board for its front or bow, &c.

We are greatly at a loſs what to give as abſolute meaſures of theſe impulſions.

1. With reſpect to water. The experiments of the French academy on a priſm two feet broad and deep and four feet long, indicate a reſiſtance of 0,973 pounds avoirdupois to a ſquare foot, moving with the velocity of one foot per ſecond at the ſurface of ſtill water.

Mr Buat's experiments on a ſquare foot wholly immerſed in a ſtream were as follow:

A ſquare foot as a thin plate -	1,81 pounds.
Ditto as the front of a box one foot long - - -	1,42
Ditto as the front of a box three feet long - - -	1.29

The reſiſtance of ſea water is about $\frac{1}{5}$ greater.

2. With reſpect to air, the varieties are as great.—The reſiſtance of a ſquare foot to air moving with the velocity of one foot per ſecond appears from Mr Robins's experiments on 16 ſquare inches to be on a ſquare foot - - 0,001536 pounds,

Chevalier Borda's on 16 inches	0,001757
——— on 81 inches	0,002042
Mr Rouſe's on large ſurfaces	0,002291

Preciſe meaſures are not to be expected, nor are they neceſſary in this inquiry. Here we are chiefly intereſted in their proportions, as they may be varied by their mode of action in the different circumſtances of obliquity and velocity.

We begin by recurring to the fundamental propoſition concerning the impulſe of fluids, viz. that the abſolute preſſure is always in a direction perpendicular to the impelled ſurface, whatever may be the direction of the ſtream of fluid. We muſt therefore illuſtrate the doctrine, by always ſuppoſing a flat ſurface of ſail ſtretched on a yard, which can be braced about in any direction, and giving this ſail ſuch a poſition and ſuch an extent of ſurface that the impulſe on it may be the ſame both as to direction and intenſity with that on the real ſails. Thus the conſideration is greatly ſimplified. The direction of the impulſe is therefore perpendicular to the yard. Its intenſity depends on the ve-

13 Direct impulſe on the ſail perpendicular to the yard.

locity with which the wind meets the ſail, and the obliquity of its ſtroke. We ſhall adopt the conſtructions founded on the common doctrine, that the impulſe is as the ſquare of the ſine of the inclination, becauſe they are ſimple; whereas, if we are to introduce the values of the oblique impulſes, ſuch as they have been obſerved in the excellent experiments of the Academy of Paris, the conſtructions would be complicated in the extreme, and we could hardly draw any conſequences which would be intelligible to any but expert mathematicians. The concluſions will be erroneous, not in kind but in quantity only; and we ſhall point out the neceſſary corrections, ſo that the final reſults will be found not very different from real obſervation.

14 A ſhip compared to an oblong box.

If a ſhip were a round cylindrical body like a flat tub, floating on its bottom, and fitted with a maſt and ſail in the centre, ſhe would always ſail in a direction perpendicular to the yard. This is evident. But ſhe is an oblong body, and may be compared to a cheſt, whoſe length greatly exceeds its breadth. She is ſo ſhaped, that a moderate force will puſh her through the water with the head or ſtern foremoſt; but it requires a very great force to puſh her ſidewiſe with the ſame velocity. A fine ſailing ſhip of war will require about 12 times as much force to puſh her ſidewiſe as to puſh her head foremoſt. In this reſpect therefore ſhe will very much reſemble a cheſt whoſe length is 12 times its breadth; and whatever be the proportion of theſe reſiſtances in different ſhips, we may always ſubſtitute a box which ſhall have the ſame reſiſtances headwiſe and ſidewiſe.

Let EFGH (fig. 1.) be the horizontal ſection of ſuch a box, and AB its middle line, and C its centre. In whatever direction this box may chance to move, the direction of the whole reſiſtance on its two ſides will paſs through C. For as the whole ſtream has one inclination to the ſide EF, the equivalent of the equal impulſes on every part will be in a line perpendicular to the middle of EF. For the ſame reaſon, it will be in a line perpendicular to the middle of FG. Theſe perpendiculars muſt croſs in C. Suppoſe a maſt erected at C, and YCy to be a yard hoiſted on it carrying a ſail. Let the yard be firſt conceived as braced right athwart at right angles to the keel, as repreſented by Y′y′. Then, whatever be the direction of the wind abaft this ſail, it will impel the veſſel in the direction CB. But if the ſail has the oblique poſition Yy, the impulſe will be in the direction CD perpendicular to CY, and will both puſh the veſſel ahead and ſidewiſe: for the impulſe CD is equivalent to the two impulſes CK and CI (the ſides of the rectangle of which CD is the diagonal). The force CI puſhes the veſſel ahead, and CK puſhes her ſidewiſe. She muſt therefore take ſome intermediate direction *a b*, ſuch that the reſiſtance of the water to the plane FG is to its reſiſtance to the plane EF as CI to CK.

15 Of the leeway when not ſailing directly before the wind.

The angle *b* CB between the real courſe and the direction of the head is called the LEEWAY; and in the courſe of this diſſertation we ſhall expreſs it by the ſymbol *x*. It evidently depends on the ſhape of the veſſel and on the poſition of the yard. An accurate knowledge of the quantity of leeway, correſponding to different circumſtances of obliquity of impulſe, extent of ſurface, &c. is of the utmoſt importance in the practice of navigation; and even an approximation is valuable. The ſubject is ſo very difficult that this muſt content us for the preſent.

16 How to find the quantity of leeway.

Let V be the velocity of the ſhip in the direction C *b*, and let the ſurfaces FG and FE be called A′ and B′. Then the reſiſtance to the lateral motion is $mV^2 \times B' \times \text{ſine}^2, bCB$, and that to the direct motion is $mV^2 \times A' \times \text{ſine}^2, bCK$, or $m V^2 \times A' \times \text{cof.}^2 bCB$. Therefore theſe reſiſtances are in the proportion of $B' \times \text{ſine}^2, x$ to $A' \times \text{cof.}^2, x$ (repreſenting the angle of leeway *b*CB by the ſymbol *x*).

Therefore we have CI : CK, or CI : ID = $A' \cdot \text{cof.}^2 x : B' \cdot \text{ſine}^2, x, = A' : B' \cdot \frac{\text{ſine}^2 x}{\text{cof.}^2 x} = A : B \cdot \text{tangent}^2 x$.

Let the angle YCB, to which the yard is braced up, be called the TRIM of the ſails, and expreſſed by the ſymbol *b*. This is the complement of the angle DCI. Now CI : ID = rad. : tan. DCI; = 1 : tan. DCI, = 1 : cotan. *b*. Therefore we have finally 1 : cotan. $b = A' : B' \cdot \text{tan.}^2 x$, and $A' \cdot \text{cotan.}\ b = B' \cdot \text{tangent}^2 x$, and $\text{tan.}^2 x = \frac{A}{B} \text{cot.}\ b$. This equation evidently aſcertains the mutual relation between the trim of the ſails and the leeway in every caſe where we can tell the proportion between the reſiſtances to the direct and broadſide motions of the ſhip, and where this proportion does not change by the obliquity of the courſe. Thus, ſuppoſe the yard braced up to an angle of 30° with the keel. Then contan. 30° = 1,732 very nearly. Suppoſe alſo that the reſiſtance ſidewiſe is 12 times greater than the reſiſtance headwiſe. This gives A′ = 1 and B′ = 12. Therefore $1{,}732 = 12 \times \text{tangent}^2 x$, and $\text{tangent}^2 x = \frac{1{,}732}{12}, = 0{,}14434$, and tan. $x = 0{,}3799$, and $x = 20° 48'$, very nearly two points of leeway.

This computation, or rather the equation which gives room for it, ſuppoſes the reſiſtances proportional to the ſquares of the ſines of incidence. The experiments of the Academy of Paris, of which an abſtract is given in the article *RESISTANCE of Fluids*, ſhow that this ſuppoſition is not far from the truth when the angle of incidence is great. In this preſent caſe the angle of incidence on the front FG is about 70°, and the experiments juſt now mentioned ſhow that the real reſiſtances exceed the theoretical ones only $\frac{1}{7\text{th}}$. But the angle of incidence on EF is only 20° 48′. Experiment ſhows that in this inclination the reſiſtance is almoſt quadruple of the theoretical reſiſtances. Therefore the lateral reſiſtance is aſſumed much too ſmall in the preſent inſtance. Therefore a much ſmaller leeway will ſuffice for producing a lateral reſiſtance which will balance the lateral impulſe CK, ariſing from the obliquity of the ſail, viz. 30°. The matter of fact is, that a pretty good ſailing ſhip, with her ſails braced to this angle at a medium, will not make above five or ſix degrees leeway in ſmooth water and eaſy weather; and yet in this ſituation the hull and rigging preſent a very great ſurface to the wind, in the moſt improper poſitions, ſo as to have a very great effect in increaſing her leeway. And if we compute the reſiſtances for this leeway of ſix degrees by the actual experiments of the French Academy on that angle, we ſhall find the reſult not far

from

from the truth; that is, the direct and lateral reſiſtances will be nearly in the proportion of CI to ID.

17 hich de- nds on e trim of ſails.

It reſults from this view of the matter, that the leeway is in general much ſmaller than what the uſual theory aſſigns.

We alſo ſee, that according to whatever law the reſiſtances change by a change of inclination, the leeway remains the ſame while the trim of the ſails is the ſame. The leeway depends only on the direction of the impulſe of the wind; and this depends ſolely on the poſition of the ſails with reſpect to the keel, whatever may be the direction of the wind. This is a very important obſervation, and will be frequently referred to in the progreſs of the preſent inveſtigation. Note, however, that we are here conſidering only the action on the ſails, and on the ſame ſails. We are not conſidering the action of the wind on the hull and rigging. This may be very conſiderable; and it is always in a lee direction, and augments the leeway; and its influence muſt be ſo much the more ſenſible as it bears a greater proportion to the impulſe on the ſails. A ſhip under courſes, or cloſe-reefed topſails and courſes, muſt make more leeway than when under all her canvas trimmed to the ſame angle. But to introduce this additional cauſe of deviation here would render the inveſtigation too complicated to be of any uſe.

18 uſed on ding by perients

This doctrine will be conſiderably illuſtrated by attending to the manner in which a lighter is tracked along a canal, or ſwings to its anchor in a ſtream. The track rope is made faſt to ſome ſtaple or bolt E on the deck (fig. 2.), and is paſſed between two of the timberheads of the bow at D, and laid hold of at F on ſhore. The men or cattle walk along the path FG, the rope keeps extended in the direction DF, and the lighter arranges itſelf in an oblique poſition AB, and is thus dragged along in the direction *a b*, parallel to the ſide of the canal. Or, if the canal has a current in the oppoſite direction *b a*, the lighter may be kept ſteady in its place by the rope DF made faſt to a poſt at F. In this caſe, it is always obſerved that the lighter ſwings in a poſition AB, which is oblique to the ſtream *a b*. Now the force which retains it in this poſition, and which preciſely balances the action of the ſtream, is certainly exerted in the direction DF; and the lighter would be held in the ſame manner if the rope were made faſt at C amidſhip, without any dependence on the timberheads at D; and it would ſtill be held in the ſame poſition, if, inſtead of the ſingle rope CF, it were riding by two ropes CG and GH, of which CH is in a direction right athwart, but oblique to the ſtream, and the other CG is perpendicular to CH or AB. And, drawing DI and DK perpendicular to AB and CG, the ſtrain on the rope CH is to that on the rope CG as CI to CK. The action of the rope in theſe caſes is preciſely analogous to that of the ſail *y* Y; and the obliquity of the keel to the direction of the motion, or to the direction of the ſtream, is analogous to the leeway. All this muſt be evident to any perſon accuſtomed to mechanical diſquiſitions.

19 n models d

A moſt important uſe may be made of this illuſtration. If an accurate model be made of a ſhip, and if it be placed in a ſtream of water, and ridden in this manner by a rope made faſt at any point D of the bow, it will arrange itſelf in ſome determined poſition AB. There will be a certain obliquity to the ſtream, meaſured by the angle B *o b*; and there will be a correſponding obliquity of the rope, meaſured by the angle FCB. Let *y* CY be perpendicular to CF. Then CY will be the poſition of the yard, or trim of the ſails correſponding to the leeway *b* CB. Then, if we ſhift the rope to a point of the bow diſtant from D by a ſmall quantity, we ſhall obtain a new poſition of the ſhip, both with reſpect to the ſtream and the rope; and in this way may be obtained the relation between the poſition of the ſails and the leeway, independent of all theory, and ſuſceptible of great accuracy; and this may be done with a variety of models ſuited to the moſt uſual forms of ſhips.

21 on ſhip

In farther thinking on this ſubject, we are perſuaded that theſe experiments, inſtead of being made on models, may with equal eaſe be made on a ſhip of any ſize. Let the ſhip ride in a ſtream at a mooring D (fig. 3.) by means of a ſhort hawſer BCD from her bow, having a ſpring AC on it carried out from her quarter. She will ſwing to her moorings, till ſhe ranges herſelf in a certain poſition AB with reſpect to the direction *a b* of the ſtream; and the direction of the hawſer DC will point to ſome point E of the line of the keel. Now, it is plain to any perſon acquainted with mechanical diſquiſitions, that the deviation BE *b* is preciſely the leeway that the ſhip will make when the average poſition of the ſails is that of the line GEH perpendicular to ED; at leaſt this will give the leeway which is produced by the ſails alone. By heaving on the ſpring, the knot C may be brought into any other poſition we pleaſe; and for every new poſition of the knot the ſhip will take a new poſition with reſpect to the ſtream and to the hawſer. And we perſiſt in ſaying, that more information will be got by this train of experiments than from any mathematical theory: for all theories of the impulſes of fluids muſt proceed on phyſical poſtulates with reſpect to the motions of the filaments, which are exceedingly conjectural.

22 The compariſon of a ſhip to an oblong body is only uſeful to give clear notions on the ſubject.

And it muſt now be farther obſerved, that the ſubſtitution which we have made of an oblong parallelopiped for a ſhip, although well ſuited to give us clear notions of the ſubject, is of ſmall uſe in practice: for it is next to impoſſible (even granting the theory of oblique impulſions) to make this ſubſtitution. A ſhip is of a form which is not reducible to equations; and therefore the action of the water on her bow or broadſide can only be had by a moſt laborious and intricate calculation for almoſt every ſquare foot of its ſurface. (See *Bezout's Cours de Mathem.* Vol. V. p. 72, &c.) And this muſt be different for every ſhip. But, which is more unlucky, when we have got a parallelopiped which will have the ſame proportion of direct and lateral reſiſtance for a particular angle of leeway, it will not anſwer for another leeway of the ſame ſhip; for when the leeway changes, the figure actually expoſed to the action of the water changes alſo. When the leeway is increaſed, more of the lee-quarter is acted on by the water, and a part of the weather-bow is now removed from its action. Another parallelopiped muſt therefore be diſcovered, whoſe reſiſtances ſhall ſuit this new poſition of the keel with reſpect to the real courſe of the ſhip.

We therefore beg leave to recommend this train of experiments to the notice of the ASSOCIATION FOR THE IMPROVEMENT OF NAVAL ARCHITECTURE as a very promiſing method for aſcertaining this important

point. And we proceed, in the next place, to aſcertain the relation between the velocity of the ſhip and that of the wind, modified as they may be by the trim of the ſails and the obliquity of the impulſe.

22 The relation between the velocity of the ſhip and wind aſcertained.

Let AB (fig. 4, 5, and 6.) repreſent the horizontal ſection of a ſhip. In place of all the drawing ſails, that is, the ſails which are ready filled, we can always ſubſtitute one ſail of equal extent, trimmed to the ſame angle with the keel. This being ſuppoſed attached to the yard DCD, let this yard be firſt of all at right angles to the keel, as repreſented in fig. 4. Let the wind blow in the direction WC, and let CE (in the direction WC continued) repreſent the velocity V of the wind. Let CF be the velocity *v* of the ſhip. It muſt alſo be in the direction of the ſhip's motion, becauſe when the ſail is at right angles to the keel, the abſolute impulſe on the ſail is in the direction of the keel, and there is no lateral impulſe, and conſequently no leeway. Draw EF, and complete the parallelogram CFE*e*, producing *e* C through the centre of the yard to *w*. Then *w* C will be the relative or apparent direction of the wind, and C *e* or FE will be its apparent or relative velocity: For if the line C *e* be carried along CF, keeping always parallel to its firſt poſition, and if a particle of air move uniformly along CE (a fixed line in abſolute ſpace) in the ſame time, this particle will always be found in that point of CE where it is interſected at that inſtant by the moving line C *e*; ſo that if C *e* were a tube, the particle of air, which really moves in the line CE, would always be found in the tube C *e*. While CE is the real direction of the wind, C *e* will be the poſition of the vane at the maſt head, which will therefore mark the apparent direction of the wind, or its motion relative to the moving ſhip.

We may conceive this in another way. Suppoſe a cannon-ſhot fired in the direction CE at the paſſing ſhip, and that it paſſes through the maſt at C with the velocity of the wind. It will not paſs through the off-ſide of the ſhip at P, in the line CE: for while the ſhot moves from C to P, the point P has gone forward, and the point *p* is now in the place where P was when the ſhot paſſed through the maſt. The ſhot will therefore paſs through the ſhip's ſide in the point *p*, and a perſon on board ſeeing it paſs through C and *p* will ſay that its motion was in the line C *p*.

23 When a ſhip is in motion the apparent direction of the wind is always ahead of its real direction.

Thus it happens, that when a ſhip is in motion the apparent direction of the wind is always ahead of its real direction. The line *w* C is always found within the angle WCB. It is eaſy to ſee from the conſtruction, that the difference between the real and apparent directions of the wind is ſo much the more remarkable as the velocity of the ſhip is greater: For the angle WC *w* or EC *e* depends on the magnitude of E *e* or CF, in proportion to CE. Perſons not much accuſtomed to attend to theſe matters are apt to think all attention to this difference to be nothing but affectation of nicety. They have no notion that the velocity of a ſhip can have any ſenſible proportion to that of the wind. "Swift as the wind" is a proverbial expreſſion; yet the velocity of a ſhip always bears a very ſenſible proportion to that of the wind, and even very frequently exceeds it. We may form a pretty exact notion of the velocity of the wind by obſerving the ſhadows of the ſummer clouds flying along the face of a country, and it may be very well meaſured by this method. The motion of ſuch clouds cannot be very different from that of the air below; and when the preſſure of the wind on a flat ſurface, while blowing with a velocity meaſured in this way, is compared with its preſſure when its velocity is meaſured by more unexceptionable methods, they are found to agree with all deſirable accuracy. Now obſervations of this kind frequently repeated, ſhow that what we call a pleaſant briſk gale blows at the rate of about 10 miles an hour, or about 15 feet in a ſecond, and exerts a preſſure of half a pound on a ſquare foot. Mr Smeaton has frequently obſerved the ſails of a windmill, driven by ſuch a wind, moving faſter, nay much faſter, towards their extremities, ſo that the ſail, inſtead of being preſſed to the frames on the arms, was taken aback, and fluttering on them. Nay, we know that a good ſhip, with all her ſails ſet and the wind on the beam, will in ſuch a ſituation ſail above 10 knots an hour in ſmooth water. There is an obſervation made by every experienced ſeaman, which ſhows this difference between the real and apparent directions of the wind very diſtinctly. When a ſhip that is ſailing briſkly with the wind on the beam tacks about, and then ſails equally well on the other tack, the wind always appears to have ſhifted and come more ahead. This is familiar to all ſeamen. The ſeaman judges of the direction of the wind by the poſition of the ſhip's vanes. Suppoſe the ſhip ſailing due weſt on the ſtarboard tack, with the wind apparently, N. N. W. the vane pointing S. S. E. If the ſhip puts about, and ſtands due eaſt on the larboard tack, the vane will be found no longer to point S. S. E. but perhaps S. S. W. the wind appearing N. N. E. and the ſhip muſt be nearly cloſe-hauled in order to make an eaſt courſe. The wind appears to have ſhifted four points. If the ſhip tacks again, the wind returns to its old quarter. We have often obſerved a greater difference than this. The celebrated aſtronomer Dr Bradley, taking the amuſement of ſailing in a pinnace on the river Thames, obſerved this, and was ſurpriſed at it, imagining that the change of wind was owing to the approaching to or retiring from the ſhore. The boatmen told him that it always happened at ſea, and explained it to him in the beſt manner they were able. The explanation ſtruck him, and ſet him a muſing on an aſtronomical phenomenon which he had been puzzled by for ſome years, and which he called THE ABERRATION OF THE FIXED STARS. Every ſtar changes its place a ſmall matter for half a year, and returns to it at the completion of the year. He compared the ſtream of light from the ſtar to the wind, and the teleſcope of the aſtronomer to the ſhip's vane, while the earth was like the ſhip, moving in oppoſite directions when in the oppoſite points of its orbit. The teleſcope muſt always be pointed ahead of the real direction of the ſtar, in the ſame manner as the vane is always in a direction ahead of the wind; and thus he aſcertained the progreſſive motion of light, and diſcovered the proportion of its velocity to the velocity of the earth in its orbit, by obſerving the deviation which was neceſſarily given to the teleſcope. Obſerving that the light ſhifted its direction about 40", he concluded its velocity to be about 11,000 times greater than that of the earth; juſt as the intelligent ſeaman would conclude from this apparent ſhifting of the wind, that the velocity of the wind is about triple that of the ſhip. This is indeed the beſt method

24 Obſervation of Bradley this ſub-

for

for discovering the velocity of the wind. Let the direction of the vane at the mast-head be very accurately marked on both tacks, and let the velocity of the ship be also accurately measured. The angle between the directions of the ship's head on these different tacks being halved, will give the real direction of the wind, which must be compared with the position of the vane in order to determine the angle contained between the real and apparent directions of the wind or the angle EC*e*; or half of the observed shifting of the wind will show the inclination of its true and apparent directions. This being found, the proportion of EC to FC (fig. 6.) is easily measured.

We have been very particular on this point, because since the mutual actions of bodies depend on their relative motions only, we should make prodigious mistakes if we estimated the action of the wind by its real direction and velocity, when they differ so much from the relative or apparent.

25 Velocity of ship when its sails are at right angles to the keel.

We now resume the investigation of the velocity of the ship (fig. 4.), having its sail at right angles to the keel, and the wind blowing in the direction and with the velocity CE, while the ship proceeds in the direction of the keel with the velocity CF. Produce E*e*, which is parallel to BC, till it meet the yard in *g*, and draw FG perpendicular to E*g*. Let *a* represent the angle WCD, contained between the sail and the real direction of the wind, and let *b* be the angle of trim DCB. CE the velocity of the wind was expressed by V, and CF the velocity of the ship by *v*.

The absolute impulse on the sail is (by the usual theory) proportional to the square of the relative velocity, and to the square of the sine of the angle of incidence; that is, to $FE^2 \times \text{sin.}^2\ \omega CD$. Now the angle $GFE = \omega CD$, and EG is equal to FE × sin. GFE; and EG is equal to E*g*—*g*G. But E*g* = EC × sin. EC*g*, = V × sin. *a*; and *g*G = CF, = *v*. Therefore EG = V × sin. *a*—*v*, and the impulse is proportional to $\overline{V \times \text{sin. } a - v}^2$. If S represent the surface of the sail, the impulse, in pounds, will be $n\,S\,(V \times \text{sin. } a - v)^2$.

Let A be the surface which, when it meets the water perpendicularly with the velocity *v*, will sustain the same pressure or resistance which the bows of the ship actually meets with. This impulse, in pounds, will be $m\,A\,v^2$. Therefore, because we are considering the ship's motion as in a state of uniformity, the two pressures balance each other; and therefore $m\,A\,v^2 = n\,S\,(V \times \text{sin. } a - v)^2$, and $\frac{m}{n}\,A\,v^2 = S(V \times \text{sin. } a - v^2)$;

therefore $\frac{\sqrt{m}}{n}\sqrt{A} \times v = \sqrt{S} \times V \times \text{sin. } a - v\sqrt{S}$,

and $v = \frac{\sqrt{S} \times v \times \text{sin. } a}{\sqrt{\frac{m}{n}A} + \sqrt{S}} = \frac{V \times \text{sin. } a}{\sqrt{\frac{m}{n}\frac{A}{S}} + 1} = \frac{V \times \text{sin. } a}{\sqrt{\frac{A}{q\,S}} + 1}$.

We see, in the first place, that the velocity of the ship is (*cæteris paribus*) proportional to the velocity of the wind, and to the sine of its incidence on the sail jointly; for while the surface of the sail S and the equivalent surface for the bows remains the same, *v* increases or diminishes at the same rate with V · sin. *a*—. When the wind is right astern, the sine of *a* is unity, and then the ship's velocity is $\frac{V}{\sqrt{\frac{m}{n}\frac{A}{S}} + 1}$.

Note, that the denominator of this fraction is a common number; for *m* and *n* are numbers, and A and S being quantities of one kind, $\frac{A}{S}$ is also a number.

It must also be carefully attended to, that S expresses a quantity of sail actually receiving wind with the inclination *a*. It will not always be true, therefore, that the velocity will increase as the wind is more abaft, because some sails will then becalm others. This observation is not, however, of great importance; for it is very unusual to put a ship in the situation considered hitherto; that is, with the yards square, unless she be right before the wind.

If we would discover the relation between the velocity and the quantity of sail in this simple case of the wind right aft, observe that the equation $v = \frac{V}{\sqrt{\frac{mA}{nS}} + 1}$ gives us $\sqrt{\frac{m}{n}\frac{A}{S}}\,v + v = V$, and $\sqrt{\frac{m}{n}\frac{A}{S}}\,v = V - v$, and $\frac{m}{n}\frac{A}{S}v^2 = \overline{V - v}^2$, and $\frac{n\,S}{m\,A} = \frac{v^2}{(V-v)^2}$; and because *n* and *m* and A are constant quantities, S is proportional to $\frac{v^2}{(V-v)^2}$, or the surface of sail is proportional to the square of the ship's velocity directly, and to the square of the relative velocity inversely. Thus, if a ship be sailing with $\frac{1}{3}$ of the velocity of the wind, and we would have her sail with $\frac{1}{4}$ of it, we must quadruple the sails. This is more easily seen in another way. The velocity of the ship is proportional to the velocity of the wind; and therefore the relative velocity is also proportional to that of the wind, and the impulse of the wind is as the square of the relative velocity. Therefore, in order to increase the relative velocity by an increase of sail only, we must make this increase of sail in the duplicate proportion of the increase of velocity.

Let us, in the next place, consider the motion of a ship whose sails stand oblique to the keel.

Its velocity when the sails stand oblique to the keel.

The construction for this purpose differs a little from the former, because, when the sails are trimmed to any oblique position DCB (fig. 5. and 6.), there must be a deviation from the direction of the keel, or a leeway BC*b*. Call this *x*. Let CF be the velocity of the ship. Draw, as before, E*g* perpendicular to the yard, and FG perpendicular to E*g*; also draw FH perpendicular to the yard: then, as before, EG, which is in the subduplicate ratio of the impulse on the sail, is equal to E*g*—G*g*. Now E*g* is, as before, = V × sin. *a*. and G*g* is equal to FH, which is = CF × sin. FCH, or = *v* × sin. (*b*+*x*). Therefore we have the impulse = $n\,S(V \cdot \text{sin. } a - v \cdot \text{sin. } (b+x))^2$.

This expression of the impulse is perfectly similar to that in the former case, its only difference consisting in the subductive part, which is here *v* × sin. $\overline{b+x}$ instead of *v*. But it expresses the same thing as before, viz. the diminution of the impulse. The impulse being to be reckoned solely in the direction perpendicular to the sail,

it is diminished solely by the sail withdrawing itself *in that direction* from the wind; and as g E may be considered as the real impulsive motion of the wind, G E must be considered as the relative and effective impulsive motion. The impulse would have been the same had the ship been at rest, and had the wind met it perpendicularly with the velocity G E.

27 Connection between the impulse and motion of the ship.

We must now show the connexion between this impulse and the motion of the ship. The sail, and consequently the ship, is pressed by the wind in the direction CI perpendicular to the sail or yard with the force which we have just now determined. This (in the state of uniform motion) must be equal and opposite to the action of water. Draw I L at right angles to the keel. The impulse in the direction CI (which we may measure by CI) is equivalent to the impulses C L and LI. By the first the ship is impelled right forward, and by the second she is driven sidewise. Therefore we must have a leeway, and a lateral as well as a direct resistance. We suppose the form of the ship to be known, and therefore the proportion is known, or discoverable, between the direct and lateral resistances corresponding to every angle x of leeway. Let A be the surface whose perpendicular resistance is equal to the direct resistance of the ship corresponding to the leeway x, that is, whose resistance is equal to the resistance really felt by the ship's bows in the direction of the keel when she is sailing with this leeway; and let B in like manner be the surface whose perpendicular resistance is equal to the actual resistance to the ship's motion in the direction LI, perpendicular to the keel. (*N. B.* This is not equivalent to A′ and B′ adapted to the rectangular box, but to $A' \cdot \text{cos.}^2\, x$ and $B' \cdot \text{sin.}^2\, x$.) We have therefore $A : B = CL : LI$, and $LI = \frac{CL \cdot B}{A}$. Also, because $CI = \sqrt{CL^2 + LI^2}$, we have $A : \sqrt{A^2 + B^2} = CL : CI$, and $CI = \frac{CL \cdot \sqrt{A^2 + B^2}}{A}$. The resistance in the direction LC is properly measured by $m\, A\, v^2$, as has been already observed. Therefore the resistance in the direction I C must be expressed by $m \sqrt{A^2 + B^2}\, v^2$; or (making C the surface which is equal to $\sqrt{A^2 + B^2}$, and which will therefore have the same perpendicular resistance to the water having the velocity v) it may be expressed by $m\, C\, v^2$.

Therefore, because there is an equilibrium between the impulse and resistance, we have $m\, C v^2 = s\, S\, (V \cdot \text{sin. } a - v \cdot \text{sin. } \overline{b + x})^2$ and $\frac{m}{n}\, C\, v^2$, or $q\, C\, v^2 = S\, (V \cdot \text{sin. } a - v \cdot \text{sin. } \overline{b + x})^2$, and $\sqrt{q}\, \sqrt{C}\, v = \sqrt{S}\, (V \cdot \text{sin. } a - v \cdot \text{sin. } \overline{b + x})$.

Therefore $v = \frac{\sqrt{S} \cdot V \cdot \text{sin. } a}{\sqrt{q\, C} + \sqrt{S} \cdot \text{sin. } \overline{b + x}} = \frac{V \cdot \text{sin. } a}{\sqrt{q}\, \frac{\sqrt{C}}{\sqrt{S}} + \text{sin. } \overline{b + x}} = \frac{\text{Sin. } a}{\sqrt{q}\, \frac{\sqrt{C}}{\sqrt{S}} + \text{sin. } \overline{b + x}}$.

Observe that the quantity which is the coefficient of V in this equation is a common number; for sin. a is a number, being a decimal fraction of the radius 1. Sin. $\overline{b + x}$ is also a number, for the same reason. And since m and n were numbers of pounds, $\frac{m}{n}$ or q is a common number. And because C and S are surfaces, or quantities of one kind, $\frac{C}{S}$ is also a common number.

This is the simplest expression that we can think of for the velocity acquired by the ship, though it must be acknowledged to be too complex to be of very prompt use. Its complication arises from the necessity of introducing the leeway x. This affects the whole of the denominator; for the surface C depends on it, because $C =$ is $\sqrt{A^2 + B^2}$, and A and B are analogous to $A' \cdot \text{cos.}^2\, x$ and $B' \cdot \text{sin.}^2\, x$.

28 Important consequences deduced from the foregoing theorem.

But we can deduce some important consequences from this theorem.

1. While the surface S of the sail actually filled by the wind remains the same, and the angle DCB, which in future we shall call the Trim of the sails, also remains the same, both the leeway x and the substituted surface G remain the same. The denominator is therefore constant: and the velocity of the ship is proportional to $\sqrt{S} \cdot V \cdot \text{sin. } a$; that is, directly as the velocity of the wind, directly as the absolute inclination of the wind to the yard, and directly as the square root of the surface of the sails.

We also learn from the construction of the figure, that FG parallel to the yard cuts CE in a given ratio. For CF is in a constant ratio to E g, as has been just now demonstrated. And the angle DCF is constant. Therefore CF $\cdot$ sin. b, or FH or G g, is proportional to E g, and OC to EC, or EC is cut in one proportion, whatever may be the angle ECD, so long as the angle DCF is constant.

We also see that it is very possible for the velocity of the ship on an oblique course to exceed that of the wind. This will be the case when the number $\frac{\text{sin. } a}{\sqrt{q\, \frac{C}{S} + \text{sin. } \overline{b + x}}}$ exceeds unity, or when sin. a is greater than $\sqrt{q\, \frac{C}{S} + \text{sin. } \overline{b + x}}$. Now this may easily be by sufficiently enlarging S and diminishing $b + x$. It is indeed frequently seen in fine sailers with all their sails set and not hauled too near the wind.

We remarked above that the angle of leeway x affects the whole denominator of the fraction which expresses the velocity. Let it be observed that the angle ICL is the complement of L C D, or of b. Therefore CL : LI, or $A : B = 1 : \text{tan. ICL} = 1 : \text{cot. } b$, and $B = A \cdot \text{cotan. } b$. Now A is equivalent to $A' \cdot \text{cos.}^2\, x$, and thus b becomes a function of x. C is evidently so, being $= \sqrt{A^2 + B^2}$. Therefore before the value of this fraction can be obtained, we must be able to compute, by our knowledge of the form of the ship, the value of A for every angle x of leeway. This can be done only by resolving her bows into a great number of elementary planes, and computing the impulse on each and adding them into one sum. The computation is of immense labour, as may be seen by one example given by Bouguer. When the leeway is but small, not exceeding ten degrees, the substitution of the rectangular prism of one determined form is abundantly exact for all leeways contained within this limit; and we shall soon see rea-

fuſt for being contented with this approximation. We may now make uſe of the formula expreſſing the velocity for ſolving the chief problems in this part of the ſeaman's taſk.

29 Problem I. To determine the beſt poſition of the ſail for ſtanding on a given courſe, when the direction and velocity of the wind, and its angle with the courſe are given.

And firſt let it be required to determine the beſt poſition of the ſail for ſtanding on a given courſe $a b$, when CE the direction and velocity of the wind, and its angle with the courſe WCF, are given. This problem has exerciſed the talents of the mathematicians ever ſince the days of Newton. In the article PNEUMATICS we gave the ſolution of one very nearly related to it, namely, to determine the poſition of the ſail which would produce the greateſt impulſe in the direction of the courſe. The ſolution was to place the yard CD in ſuch a poſition that the tangent of the angle FCD may be one half of the tangent of the angle DCW. This will indeed be the beſt poſition of the ſail for beginning the motion; but as ſoon as the ſhip begins to move in the direction CF, the effective impulſe of the wind is diminiſhed, and alſo its inclination to the ſail. The angle DCw diminiſhes continually as the ſhip accelerates; for CF is now accompanied by its equal Ee, and by an angle ECe or WCw. CF increaſes, and the impulſe on the ſail diminiſhes, till an equilibrium obtains between the reſiſtance of the water and the impulſe of the wind. The impulſe is now meaſured by, $\Theta e^2 \times \text{fin.}^2 e\text{CD}$ inſtead of $\text{CE}^2 \times \text{fin.}^2 \text{ECD}$, that is, by EG^2 inſtead of $\text{E}g^2$.

This introduction of the relative motion of the wind renders the actual ſolution of the problem extremely difficult. It is very eaſily expreſſed geometrically: Divide the angle wCF in ſuch a manner that the tangent of DCF may be half of the tangent of DCw, and the problem may be conſtructed geometrically as follows.

Let WCF (fig. 7.) be the angle between the ſail and courſe. Round the centre C deſcribe the circle WDFY; produce WC to Q, ſo that $\text{CQ} = \frac{1}{2}$ WC, and draw QY parallel to CF cutting the circle in Y; biſect the arch WY in D, and draw DC. DC is the proper poſition of the yard.

Draw the chord WY, cutting CD in V and CF in T; draw the tangent PD cutting CF in S and CY in R.

It is evident that WY, PR, are both perpendicular to CD, and are biſected in V and D; therefore (by reaſon of the parallels QY, CF) $4 : 3 = \text{QW} : \text{CW}$, $= \text{VW} : \text{TW}, = \text{RP} : \text{SP}$. Therefore $\text{PD} : \text{PS} = 2 : 3$, and $\text{PD} : \text{DS} = 2 : 1$. *Q. E. D.* But this diviſion cannot be made to the beſt advantage till the ſhip has attained its greateſt velocity, and the angle wCF has been produced.

We muſt conſider all the three angles, a, b, and x as variable in the equation which expreſſes the value of v, and we muſt make the fluxion of this equation $= o$; then, by means of the equation $\text{B} = \text{A} \cdot \text{cotan.} b$, we muſt obtain the value of $\dot{a}$ and of $\dot{b}$ in terms of $\dot{x}$ and $\dot{x}$. With reſpect to $\dot{x}$, obſerve, that if we make the angle $\text{WCF} = p$, we have $\text{fun.}\ a + b + x$; and p being a conſtant quantity, we have $\dot{a} + \dot{b} + \dot{x} = o$. Subſtituting for $\dot{a}$, $\dot{b}$, a, and b their values in terms of x and $\dot{x}$, in the fluxionary equation $= o$, we readily obtain $\dot{x}$, and then a and b, which ſolves the problem.

Let it be required, in the next place, to determine the courſe and the trim of the ſails moſt proper for plying to windward.

30 Problem II. To determine the courſe and trim of the ſails moſt proper for plying to windward.

In fig. 6. draw FP perpendicular to WC. CF is the motion of the ſhip; but it is only by the motion CP that ſhe gains to windward. Now CP is $= \text{CF} \times$ coſin. WCF, or $v \cdot \text{coſin.}\ (a + b + x)$. This muſt be rendered a maximum, as follows:

By means of the equation which expreſſes the value of v and the equation $\text{B} = \text{A} \cdot \text{cotan.} b$, we exterminate the quantities v and b; we then take the fluxion of the quantity into which the expreſſion $v \cdot \text{coſ.}\ (a + b + x)$ is changed by this operation. Making this fluxion $= o$, we get the equation which muſt ſolve the problem. This equation will contain the two variable quantities a and x with their fluxions; then make the coefficient of $\dot{x}$ equal to o, alſo the coefficient of $\dot{a}$ equal to o. This will give two equations which will determine a and x, and from this we get $b = p - a - x$.

31 Problem III. To determine the beſt courſe and trim of the ſails for getting away from a given line of coaſt.

Should it be required, in the third place, to find the beſt courſe and trim of the ſails for getting away from a given line of coaſt CM (fig. 6.), the proceſs perfectly reſembles this laſt, which is in fact getting away from a line of coaſt which makes a right angle with the wind. Therefore, in place of the angle WCF, we muſt ſubſtitute the angle $\text{WCM} = \text{WCF}$. Call this angle e. We muſt make $v \cdot \text{coſ.}\ (e - a - b - x)$ a maximum. The analytical proceſs is the ſame as the former, only e is here a conſtant quantity.

32 Obſervations on the preceding problems.

Theſe are the three principal problems which can be ſolved by means of the knowledge that we have obtained of the motion of the ſhip when impelled by an oblique ſail, and therefore making leeway; and they may be conſidered as an abſtract of this part of M. Bouguer's work. We have only pointed out the proceſs for this ſolution, and have even omitted ſome things taken notice of by M. Bezout in this very elegant compendium. Our reaſons will appear as we go on. The learned reader will readily ſee the extreme difficulty of the ſubject, and the immenſe calculations which are neceſſary even in the ſimpleſt caſes, and will grant that it is out of the power of any but an expert analyſt to derive any uſe from them; but the mathematician can calculate tables for the uſe of the practical ſeaman. Thus he can calculate the beſt poſition of the ſails for advancing in a courſe 90° from the wind, and the velocity in that courſe; then for 85°, 80°, 75°, &c. M. Bouguer has given a table of this kind; but to avoid the immenſe difficulty of the proceſs, he has adapted it to the apparent direction of the wind. We have inſerted a few of his numbers ſuited to ſuch caſes as can be of ſervice, namely, when all the ſails draw, or none ſtand in the way of others. Column 1ſt is the apparent angle of the wind and courſe; column 2d is the correſponding angle of the ſails and keel; and column 3d is the apparent angle of the ſails and wind.

33 M. Bouguer's table for finding the beſt poſition of the ſails for advancing in any courſe.

1 wCF	2 DCB	3 wCD
103° 53′	42° 30′	61° 23′
99 13	40 —	59 13
94 25	37 30	56 55
89 28	35 —	54 28
84 23	32 30	51 53
79 06	30 —	49 06
73 39	27 30	46 09
68 —	25 —	43 —

In

In all theſe numbers we have the tangent of ω CD double of the tangent of DCF.

34 Inutility of theſe calculations.

But this is really doing but little for the ſeaman. The apparent direction of the wind is unknown to him till the ſhip is ſailing with uniform velocity; and he is ſtill uninformed as to the leeway. It is, however, of ſervice to him to know, for inſtance, that when the angle of the vanes and yards is 56 degrees, the yard ſhould be braced up to 37° 30′, &c.

But here occurs a new difficulty. By the conſtruction of a ſquare rigged ſhip it is impoſſible to give the yards that inclination to the keel which the calculation requires. Few ſhips can have their yards braced up to 37° 30′; and yet this is required in order to have an incidence of 56°, and to hold a courſe 94° 25′ from the apparent direction of the wind, that is, with the wind apparently 4° 25′ abaft the beam. A good ſailing ſhip in this poſition may acquire a velocity even exceeding that of the wind. Let us ſuppoſe it only one half of this velocity. We ſhall find that the angle WCω is in this caſe about 29°, and the ſhip is nearly going 123° from the wind, with the wind almoſt perpendicular to the ſail; therefore this utmoſt bracing up of the ſails is only giving them the poſition ſuited to a wind broad on the quarter. It is impoſſible therefore to comply with the demand of the mathematician, and the ſeaman muſt be contented to employ a leſs favourable diſpoſition of his ſails in all caſes where his courſe does not lie at leaſt eleven points from the wind.

Let us ſee whether this reſtriction, ariſing from neceſſity, leaves any thing in our choice, and makes one courſe preferable to another. We ſee that there are a prodigious number of courſes, and theſe the moſt uſual and the moſt important, which we muſt hold with one trim of the ſails; in particular, ſailing with the wind on the beam, and all caſes of plying to windward, muſt be performed with this unfavourable trim of the ſails. We are certain that the ſmaller we make the angle of incidence, real or apparent, the ſmaller will be the velocity of the ſhip; but it may happen that we ſhall gain more to windward, or get ſooner away from a lee coaſt, or any object of danger, by ſailing ſlowly on one courſe than by ſailing quickly on another.

We have ſeen that while the trim of the ſails remains the ſame, the leeway and the angle of the yard and courſe remains the ſame, and that the velocity of the ſhip is as the ſine of the angle of real incidence, that is, as the ſine of the angle of the ſail and the real direction of the wind.

Let the ſhip AB (fig. 8.) hold the courſe CF, with the wind blowing in the direction WC, and having her yards DCD braced up to the ſmalleſt angle BCD which the rigging can admit. Let CF be to CE as the velocity of the ſhip to the velocity of the wind; join FE and draw Cω parallel to EF; it is evident that FE is the relative motion of the wind, and ωCD is the relative incidence on the ſail. Draw FO parallel to the yard DC, and deſcribe a circle through the points CEF; then we ſay that if the ſhip, with the ſame wind and the ſame trim of the ſame drawing ſails, be made to ſail on any other courſe Cf, her velocity along CF is to the velocity along Cf as CF is to Cf; or, in other words, the ſhip will employ the ſame time in going from C to any point of the circumference CFO. Join fO. Then, becauſe the angles CFO, CfO are on the ſame chord CO, they are equal, and fQ is parallel to dCd, the new poſition of the yard correſponding to the new poſition of the keel a b, making the angle dCb = DCB. Alſo, by the nature of the circle, the line CF is to Cf as the ſine of the angle COF to the ſine of the angle COf, that is (on account of the parallels CD, OF and Cd, Of), as the ſine of WCD to the ſine of WCd. But when the trim of the ſails remains the ſame, the velocity of the ſhip is as the ſine of the angle of the ſail with the direction of the wind; therefore CF is to Cf as the velocity on CF to that on Cf, and the propoſition is demonſtrated.

35 To determine the beſt courſe for avoiding a rock

Let it now be required to determine the beſt courſe for avoiding a rock R lying in the direction CR, or for withdrawing as faſt as poſſible from a line of coaſt PQ. Draw CM through R, or parallel to PQ, and let m be the middle of the arch CmM. It is plain that m is the moſt remote from CM of any point of the arch CmM, and therefore the ſhip will recede farther from the coaſt PQ in any given time by holding the courſe Cm than by any other courſe.

This courſe is eaſily determined; for the arch CmM = 360° — (arch CO + arch OM), and the arch CO is the meaſure of twice the angle CFO, or twice the angle DCB, or twice $b+x$, and the arch OM meaſures twice the angle ECM.

Thus, ſuppoſe the ſharpeſt poſſible trim of the ſails to be 35°, and the obſerved angle ECM to be 70°; then CO+OM is 70°+140° or 210°. This being taken from 360°, leaves 150°, of which the half Mm is 75°, and the angle MCm is 37° 30′. This added to ECM makes ECm 107° 30′, leaving WCm = 72° 30′, and the ſhip muſt hold a courſe making an angle of 72° 30′ with the real direction of the wind, and WCD will be 37° 30′.

This ſuppoſes no leeway. But if we know that under all the ſail which the ſhip can carry with ſafety and advantage ſhe makes 5 degrees of leeway, the angle DCm of the ſail and courſe, or $b+x$, is 40°. Then CO+OM = 220°, which being taken from 360° leaves 140°, of which the half is 70°, = Mm, and the angle MCm = 35°, and ECm = 105°, and WCm = 75°, and the ſhip muſt lie with her head 70° from the wind, making 5 degrees of leeway, and the angle WCD is 35°.

The general rule for the poſition of the ſhip is, *that the line on ſkipboard which biſects the angle* b+x *may alſo biſect the angle* WCM, or make the angle between the courſe and the line from which we wiſh to withdraw equal to the angle between the ſail and the real direction of the wind.

36 Corol.

It is plain that this problem includes that of plying to windward. We have only to ſuppoſe ECM to be 90°; then, taking our example in the ſame ſhip, with the ſame trim and the ſame leeway, we have $b+x$ = 40°. This taken from 90° leaves 50° and WCm = 90 — 25 = 65, and the ſhip's head muſt lie 60° from the wind, and the yard muſt be 25° from it.

It muſt be obſerved here, that it is not always eligible to ſelect the courſe which will remove the ſhip faſteſt from the given line CM; it may be more prudent to remove from it more ſecurely though more ſlowly. In ſuch caſes the procedure is very ſimple, viz. to ſhape the courſe as near the wind as is poſſible.

The reader will alſo eaſily ſee that the propriety of theſe practices is confined to thoſe courſes only where the practicable trim of the ſails is not ſufficiently ſharp.

Whenever

Whenever the courſe lies ſo far from the wind that it is poſſible to make the tangent of the apparent angle of the wind and ſail double the tangent of the ſail and courſe, it ſhould be done.

37 The adjuſtment of the ſails ſuppoſed in the theory impracticable.

Theſe are the chief practical conſequences which can be deduced from the theory. But we ſhould conſider how far this adjuſtment of the ſails and courſe can be performed. And here occur difficulties ſo great as to make it almoſt impracticable. We have always ſuppoſed the poſition of the ſurface of the ſail to be diſtinctly obſervable and meaſurable; but this can hardly be affirmed even with reſpect to a ſail ſtretched on a yard. Here we ſuppoſed the ſurface of the ſail to have the ſame inclination to the keel that the yard has. This is by no means the caſe; the ſail aſſumes a concave form, of which it is almoſt impoſſible to aſſign the direction of the mean impulſe. We believe that this is always conſiderably to leeward of a perpendicular to the yard, lying between CI and CE (fig. 6.) This is of ſome advantage, being equivalent to a ſharper trim. We cannot affirm this, however, with any confidence, becauſe it renders the impulſe on the weather-leech of the ſail ſo exceedingly feeble as hardly to have any effect. In ſailing cloſe to the wind the ſhip is kept ſo near that the weather-leech of the ſail is almoſt ready to receive the wind edgewiſe, and to flutter or ſhiver. The moſt effective or drawing ſails with a ſide wind, eſpecially when plying to windward, are the ſtayſails. We believe that it is impoſſible to ſay, with any thing approaching to preciſion, what is the poſition of the general ſurface of a ſtayſail, or to calculate the intenſity and direction of the general impulſe; and we affirm with confidence that no man can pronounce on theſe points with any exactneſs. If we can gueſs within a third or a fourth part of the truth, it is all we can pretend to; and after all, it is but a gueſs. Add to this, the ſails coming in the way of each other, and either becalming them or ſending the wind upon them in a direction widely different from that of its free motion. All theſe points we think beyond our power of calculation, and therefore that it is in vain to give the ſeaman mathematical rules, or even tables of adjuſtment ready calculated; ſince he can neither produce that medium poſition of his ſails that is required, nor tell what is the poſition which he employs.

This is one of the principal reaſons why ſo little advantage has been derived from the very ingenious and promiſing diſquiſitions of Bouguer and other mathematicians, and has made us omit the actual ſolution of the chief problems, contenting ourſelves with pointing out the proceſs to ſuch readers as have a reliſh for theſe analytical operations.

38 The theory itſelf erroneous,

But there is another principal reaſon for the ſmall progreſs which has been made in the theory of ſeamanſhip: This is the error of the theory itſelf, which ſuppoſes the impulſions of a fluid to be in the duplicate ratio of the ſine of incidence. The moſt careful compariſon which has been made between the reſults of this theory and matters of fact is to be ſeen in the experiments made by the members of the Royal Academy of Sciences at Paris, mentioned in the article *Reſistance of Fluids*. We ſubjoin another abſtract of them in the following table; where col. 1ſt gives the angle of incidence: col. 2d gives the impulſions really obſerved; col. 3d the impulſes, had they followed the duplicate ratio of the ſines; and col. 4th the impulſes, if they were in the ſimple ratio of the ſines:—

Angle of Incid	Impulſion obſerved.	Impulſe as Sine ^{2}.	Impulſe as Sine.
90	1000	1000	1000
84	989	989	995
78	958	957	978
72	908	905	951
66	845	835	914
60	771	750	866
54	693	655	809
48	615	552	743
42	543	448	669
36	480	346	587
30	440	250	500
24	424	165	407
18	414	96	309
12	406	43	208
6	400	11	105

Here we ſee an enormous difference in the great obliquities. When the angle of incidence is only ſix degrees, the obſerved impulſe is forty times greater than the theoretical impulſe; at 12° it is ten times greater; at 18° it is more than four times greater; and at 24° it is almoſt three times greater.

39 and the deductions from it uſeleſs.

No wonder then that the deductions from this theory are ſo uſeleſs and ſo unlike what we familiarly obſerve. We took notice of this when we were conſidering the leeway of a rectangular box, and thus ſaw a reaſon for admitting an incomparably ſmaller leeway than what would reſult from the laborious computations neceſſary by the theory. This error in theory has as great an influence on the impulſions of air when acting obliquely on a ſail; and the experiments of Mr Robins and of the chevalier Borda on the oblique impulſions of air are perfectly conformable (as far as they go) to thoſe of the academicians on water. The oblique impulſions of the wind are therefore much more efficacious for preſſing the ſhip in the direction of her courſe than the theory allows us to ſuppoſe; and the progreſs of a ſhip plying to windward is much greater, both becauſe the oblique impulſes of the wind are more effective, and becauſe the leeway is much ſmaller, than we ſuppoſe. Were not this the caſe, it would be impoſſible for a ſquare-rigged ſhip to get to windward. The impulſe on her ſails when cloſe hauled would be ſo trifling that ſhe would not have a third part of the velocity which we ſee her acquire: and this trifling velocity would be waſted in leeway; for we have ſeen that the diminution of the oblique impulſes of the water is accompanied by an increaſe of leeway. But we ſee that in the great obliquities the impulſions continue to be very conſiderable, and that even an incidence of ſix degrees gives an impulſe as great as the theory allows to an incidence of 40. We may therefore, on all occaſions, keep the yards more ſquare; and the loſs which we ſuſtain by the diminution of the very oblique impulſe will be more than compenſated by its more favourable direction with reſpect to the ſhip's keel. Let us take an example of this: Suppoſe the wind about two points before the beam, making an angle of 68° with the keel. The theory aſſigns 43° for the inclination of the wind to

the ſail, and 25° from the trim of the ſail. The perpendicular impulſe being ſuppoſed 1000, the theoretical impulſe for 43° is 465. This reduced in the proportion of radius to the ſine of 25°, gives the impulſe in the direction of the courſe only 197.

But if we eaſe off the lee braces till the yard makes an angle of 50° with the keel, and allows the wind an incidence of no more than 18°, we have the experimented impulſe 414, which, when reduced in the proportion of radius to the ſine of 50°, gives an effective impulſe 317. In like manner, the trim 56°, with the incidence 12°, gives an effective impulſe 337; and the trim 62°, with the incidence only 6°, gives 353.

Hence it would at firſt ſight appear that the angle DCB of 62° and WCD of 6° would be better for holding a courſe within ſix points of the wind than any more oblique poſition of the ſails; but it will only give a greater initial impulſe. As the ſhip accelerates, the wind apparently comes ahead, and we muſt continue to brace up as the ſhip freſhens her way. It is not unuſual for her to acquire half or two thirds of the velocity of the wind; in which caſe the wind comes apparently ahead more than two points, when the yards muſt be braced up to 35°, and this allows an impulſe no greater than about 7°. Now this is very frequently obſerved in good ſhips, which in a briſk gale and ſmooth water will go five or ſix knots cloſe-hauled, the ſhip's head ſix points from the wind, and the ſails no more than juſt full, but ready to ſhiver by the ſmalleſt luff. All this would be impoſſible by the uſual theory; and in this reſpect theſe experiments of the French academy give a fine illuſtration of the ſeaman's practice. They account for what we ſhould otherwiſe be much puzzled to explain; and the great progreſs which is made by a ſhip cloſe-hauled being perfectly agreeable to what we ſhould expect from the law of oblique impulſion deducible from theſe ſo often mentioned experiments, while it is totally incompatible with the common theory, ſhould make us abandon the theory without heſitation, and ſtrenuouſly ſet about the eſtabliſhment of another, founded entirely on experiments. For this purpoſe the experiments ſhould be made on the oblique impulſions of air on as great a ſcale as poſſible, and in as great a variety of circumſtances, ſo as to furniſh a ſeries of impulſions for all angles of obliquity. We have but four or five experiments on this ſubject, viz. two by Mr Robins and two or three by the chevalier Borda. Having thus gotten a ſeries of impulſions, it is very practicable to raiſe on this foundation a practical inſtitute, and to give a table of the velocities of a ſhip ſuited to every angle of inclination and of trim; for nothing is more certain than the reſolution of the impulſe perpendicular to the ſail into a force in the direction of the keel, and a lateral force.

40 Experiments proper for eſtabliſhing another.

We are alſo diſpoſed to think that experiments might be made on a model very nicely rigged with ſails, and trimmed in every different degree, which would point out the mean direction of the impulſe on the ſails, and the comparative force of theſe impulſes in different directions of the wind. The method would be very ſimilar to that for examining the impulſe of the water on the hull. If this can alſo be aſcertained experimentally, the intelligent reader will eaſily ſee that the whole motion of a ſhip under ſail may be determined for every caſe. Tables may then be conſtructed by calculation, or by graphical operations, which will give the velocities of a ſhip in every different courſe, and correſponding to every trim of ſail. And let it be here obſerved, that the trim of the ſail is not to be eſtimated in degrees of inclination of the yards; becauſe, as we have already remarked, we cannot obſerve nor adjuſt the lateen ſails in this way. But, in making the experiments for aſcertaining the impulſe, the exact poſition of the tacks and ſheets of the ſails are to be noted; and this combination of adjuſtments is to paſs by the name of a certain trim. Thus that trim of all the ſails may be called 40, whoſe direction is experimentally found equivalent to a flat ſurface trimmed to the obliquity 40°.

Having done this, we may conſtruct a figure for each trim ſimilar to fig. 8. where, inſtead of a circle, we ſhall have a curve COM'F', whoſe chords CF', *cf'*, &c. are proportional to the velocities in theſe courſes; and by means of this curve we can find the point *m'*, which is moſt remote from any line CM from which we wiſh to withdraw; and thus we may ſolve all the principal problems of the art.

We hope that it will not be accounted preſumption in us to expect more improvement from a theory founded on judicious experiments only, than from a theory of the impulſe of fluids, which is found ſo inconſiſtent with obſervation, and of whoſe fallacy all its authors, from Newton to D'Alembert, entertained ſtrong ſuſpicions. Again, we beg leave to recommend this view of the ſubject to the attention of the SOCIETY FOR THE IMPROVEMENT OF NAVAL ARCHITECTURE. Should theſe patriotic gentlemen entertain a favourable opinion of the plan, and honour us with their correſpondence, we will cheerfully impart to them our notions of the way in which both theſe trains of experiments may be proſecuted with ſucceſs, and reſults obtained in which we may confide; and we content ourſelves at preſent with offering to the public theſe hints, which are not the ſpeculations of a man of mere ſcience, but of one who, with a competent knowledge of the laws of mechanical nature, has the experience of ſeveral years ſervice in the royal navy, where the art of working of ſhips was a favourite object of his ſcientific attention.

41 Recommended the Society for the improvement of Naval Architecture.

With theſe obſervations we conclude our diſcuſſion of the firſt part of the ſeaman's taſk, and now proceed to conſider the means that are employed to prevent or to produce any deviations from the uniform rectilineal courſe which has been ſelected.

42 Means employed to prevent or produce deviations from a courſe.

Here the ſhip is to be conſidered as a body in free ſpace, convertible round her centre of inertia. For whatever may be the point round which ſhe turns, this motion may always be conſidered as compounded of a rotation round an axis paſſing through her centre of gravity or inertia. She is impelled by the wind and by the water acting on many ſurfaces differently inclined to each other, and the impulſe on each is perpendicular to the ſurface. In order therefore that ſhe may continue ſteadily in one courſe, it is not only neceſſary that the impelling forces, eſtimated in their mean direction, be equal and oppoſite to the reſiſting forces eſtimated in their mean direction; but alſo that theſe two directions may paſs through one point, otherwiſe ſhe will be affected as a log of wood is when puſhed in oppoſite directions by two forces, which are equal indeed, but are applied to different parts of the log. A ſhip muſt be

be conſidered as a lever, acted on in different parts by forces in different directions, and the whole balancing each other round that point or axis where the equivalent of all the reſiſting forces paſſes. This may be conſidered as a point ſupported by this reſiſting force, and as a ſort of fulcrum: therefore, in order that the ſhip may maintain her poſition, the energies or *momenta* of all the impelling forces round this point muſt balance each other.

43 When a ſhip ſails right afore the wind, with her yards ſquare, it is evident that the impulſes on each ſide of the keel are equal, as alſo their mechanical *momenta* round any axis paſſing perpendicularly through the keel. So are the actions of the water on her bows. But when ſhe ſails on an oblique courſe, with her yards braced up on either ſide, ſhe ſuſtains a preſſure in the direction CI (fig. 5.) perpendicular to the ſail. This, by giving her a lateral preſſure LI, as well as a preſſure CL ahead, cauſes her to make leeway, and to move in a line C*b* inclined to CB. By this means the balance of action on the two bows is deſtroyed; the general impulſe on the lee-bow is increaſed; and that on the weather bow is diminiſhed. The combined impulſe is therefore no longer in the direction BC, but (in the ſtate of uniform motion) in the direction IC.

Suppoſe that in an inſtant the whole ſails are annihilated and the impelling preſſure CI, which preciſely balanced the reſiſting preſſure on the bows, removed. The ſhip tends, by her inertia, to proceed in the direction C*b*. This tendency produces a continuation of the reſiſtance in the oppoſite direction IC, which is not directly oppoſed to the tendency of the ſhip in the direction C*b*; therefore the ſhip's head would immediately come up to the wind. The experienced ſeaman will recollect ſomething like this when the ſails are ſuddenly lowered when coming to anchor. It does not happen ſolely from the obliquity of the action on the bows: It would happen to the parallelopiped of fig. 2. which was ſuſtaining a lateral impulſion B· ſin.^{2} *x*, and a direct impulſion A· cof.^{2} *x*. Theſe are continued for a moment after the annihilation of the ſail; but being no longer oppoſed by a force in the direction CD, but by a force in the direction C*b*, the force B. ſin.^{2} *x* muſt prevail, and the body is not only retarded in its motion, but its head turns towards the wind. But this effect of the leeway is greatly increaſed by the curved form of the ſhip's bows. This occaſions the centre of effort of all the impulſions of the water on the lee ſide of the ſhip to be very far forward, and this ſo much the more remarkably as ſhe is ſharper afore. It is in general not much abaft the foremaſt. Now the centre of the ſhip's tendency to continue her motion is the ſame with her centre of gravity, and this is generally but a little before the mainmaſt. She is therefore in the ſame condition nearly as if ſhe were puſhed at the mainmaſt in a direction parallel to C*b*, and at the foremaſt by a force parallel to IC. The evident conſequence of this is a tendency to come up to the wind. This is independent of all ſituation of the ſails, provided only that they have been trimmed obliquely.

44 riping. This tendency of the ſhip's head to windward is called GRIPING in the ſeaman's language, and is greateſt in ſhips which are ſharp forward, as we have ſaid already. This circumſtance is eaſily underſtood. Whatever is the direction of the ſhip's motion, the abſolute impulſe on that part of the bow immediately contiguous to B is perpendicular to that very part of the ſurface. The more acute, therefore, that the angle of the bow is, the more will the impulſe on that part be perpendicular to the keel, and the greater will be its energy to turn the head to windward.

45 Propriety of the diſpoſition of the ſails of a ſhip. Thus we are enabled to underſtand or to ſee the propriety of the diſpoſition of the ſails of a ſhip. We ſee her crowded with ſails forward, and even many ſails extended far before her bow, ſuch as the ſpritſail, the bowſprit-topſail, the fore-topmaſt ſtayſail, the jib, and flying jib. The ſails abaft are comparatively ſmaller. The ſails on the mizenmaſt are much ſmaller than thoſe on the foremaſt. All the ſtayſails hoiſted on the mainmaſt may be conſidered as headſails, becauſe their centres of effort are conſiderably before the centre of gravity of the ſhip; and notwithſtanding this diſpoſition, it generally requires a ſmall action of the rudder to counteract the windward tendency of the lee-bow. This is conſidered as a good quality when moderate; becauſe it enables the ſeaman to throw the ſails aback, and ſtop the ſhip's way in a moment, if ſhe be in danger from any thing ahead; and the ſhip which does not carry a little of a weather helm, is always a dull ſailer.

46 Action of the water and the ſails. In order to judge ſomewhat more accurately of the action of the water and ſails, ſuppoſe the ſhip AB (fig. 9.) to have its ſails on the mizenmaſt D, the mainmaſt E, and foremaſt F, braced up or trimmed alike, and that the three lines D*i*, E*e*, F*f*, perpendicular to the ſails, are in the proportion of the impulſes on the ſails. The ſhip is driven ahead and to leeward, and moves in the path *a* C *b*. This path is ſo inclined to the line of the keel that the medium direction of the reſiſtance of the water is parallel to the direction of the impulſe. A line CI may be drawn parallel to the lines D*i*, E*e*, F*f*, and equal to their ſum; and it may be drawn from ſuch a point C, that the actions on all the parts of the hull between C and B may balance the *momenta* of all the actions on the hull between C and A. This point may juſtly be called the *centre of effort*, or the *centre of reſiſtance*. We cannot determine this point for want of a proper theory of the reſiſtance of fluids. Nay, although experiments like thoſe of the Parisian academy ſhould give us the moſt perfect knowledge of the intenſity of the oblique impulſes on a ſquare foot, we ſhould hardly be benefited by them: for the action of the water on a ſquare foot of the hull at *p*, for inſtance, is ſo modified by the intervention of the ſtream of water which has ſtruck the hull about B, and glided along the bow B *o p*, that the preſſure on *p* is totally different from what it would have been were it a ſquare foot of ſurface detached from the reſt, and preſented in the ſame poſition to the water moving in the direction *b* C. For it is found, that the reſiſtances given to planes joined ſo as to form a wedge, or to curved ſurfaces, are widely different from the accumulated reſiſtances, calculated for their ſeparate parts, agreeably to the experiments of the academy on ſingle ſurfaces. We therefore do not attempt to aſcertain the point C by theory; but it may be accurately determined by the experiments which we have ſo ſtrongly recommended; and we offer this as an additional inducement for proſecuting them.

47 Centre of effort

48 to be determined by experiments.

Draw through C a line perpendicular to CI, that is, parallel to the ſails; and let the lines of impulſe of the three

three ſails cut it in the points *i*, *k*, and *m*. This line *i m* may be conſidered as a lever, moveable round C, and acted on at the points *i*, *k*, and *m*, by three forces. The rotatory momentum of the ſails on the mizenmaſt is D *i* × *i* C; that of the ſails on the mainmaſt is E *e* × *k* C; and the momentum of the ſails on the foremaſt is F *f* × *m* C. The two firſt tend to preſs forward the arm C *i*, and then to turn the ſhip's head towards the wind. The action of the ſails on the foremaſt tends to pull the arm C *m* forward, and produce a contrary rotation. If the ſhip under theſe three ſails keeps ſteadily in her courſe, without the aid of the rudder, we muſt have D *i* × *i* C + E *e* × *k* C = F *f* × *m* C. This is very poſſible, and is often ſeen in a ſhip under her mizen topſail, main topſail, and fore-topſail, all parallel to one another, and their ſurfaces duly proportioned by reefing. If more ſails are ſet, we muſt always have a ſimilar equilibrium. A certain number of them will have their efforts directed from the larboard arm of the lever *i m* lying to leeward of CI, and a certain number will have their efforts directed from the ſtarboard arm lying to windward of CI. The ſum of the products of each of the firſt ſet, by their diſtances from C, muſt be equal to the ſum of the ſimilar products of the other ſet. As this equilibrium is all that is neceſſary for preſerving the ſhip's poſition, and the ceſſation of it is immediately followed by a converſion; and as theſe ſtates of the ſhip may be had by means of the three ſquare ſails only, when their ſurfaces are properly proportioned—it is plain that every movement may be executed and explained by their means. This will greatly ſimplify our future diſcuſſions. We ſhall therefore ſuppoſe in future that they are only the three topſails ſet, and that their ſurfaces are ſo adjuſted by reefing, that their actions exactly balance each other round that point C of the middle line AB, where the actions of the water on the different parts of her bottom in like manner balance each other. This point C may be differently ſituated in the ſhip according to the leeway ſhe makes, depending on the trim of the ſails; and therefore although a certain proportion of the three ſurfaces may balance each other in one ſtate of leeway, they may happen not to do ſo in another ſtate. But the equilibrium is evidently attainable in every caſe, and we therefore ſhall always ſuppoſe it.

49 Equilibrium preſerved by the poſition of the ſails

50 Conſequence of deſtroying it.

It muſt now be obſerved, that when this equilibrium is deſtroyed, as, for example, by turning the edge of the mizen-topſail to the wind, which the ſeamen call *ſhivering* the mizen-topſail, and which may be conſidered as equivalent to the removing the mizen-topſail entirely, it does not follow that the ſhip will round the point C, this point remaining fixed. The ſhip muſt be conſidered as a free body, ſtill acted on by a number of forces, which no longer balance each other; and ſhe muſt therefore *begin* to turn round a ſpontaneous axis of converſion, which muſt be determined in the way ſet forth in the article ROTATION. It is of importance to point out in general where this axis is ſituated. Therefore let G (fig. 10.) be the centre of gravity of the ſhip. Draw the line *q* G *v* parallel to the yards, cutting D *d* in *q*, E *e* in *r*, CI in *t*, and F *f* in *v*. While the three ſails are ſet, the line *q v* may be conſidered as a lever acted on by four forces, *viz.* D *d*, impelling the lever forward perpendicularly in the point *q*; E *e*, impelling it forward in the point *r*; F *f*, impelling it forward in the point *v*; and CI, impelling it backward in the point *t*. Theſe forces balance each other both in reſpect of progreſſive motion and of rotatory energy; for CI was taken equal to the ſum of D *d*, E *e*, and F *f*; ſo that no acceleration or retardation of the ſhip's progreſs in her courſe is ſuppoſed.

But by taking away the mizen-topſail, both the equilibriums are deſtroyed. A part D *d* of the accelerating force is taken away; and yet the ſhip, by her inertia or inherent force, tends, for a moment, to proceed in the direction C *p* with her former velocity; and by this tendency exerts for a moment the ſame preſſure CI on the water, and ſuſtains the ſame reſiſtance IC. She muſt therefore be retarded in her motion by the exceſs of the reſiſtance IC over the remaining impelling forces E *e* and F *f*, that is, by a force equal and oppoſite to D *d*. She will therefore be retarded in the ſame manner as if the mizen-topſail were ſtill ſet, and a force equal and oppoſite to its action were applied to G the centre of gravity, and ſhe would ſoon acquire a ſmaller velocity, which would again bring all things into equilibrium; and ſhe would ſtand on in the ſame courſe, without changing either her leeway or the poſition of her head.

But the equilibrium of the lever is alſo deſtroyed. It is now acted on by three forces only, *viz.* E *e* and F *f*, impelling it forward in the points *r* and *v*, and IC impelling it backward in the point *t*. Make *rv* : *ro* = E *e* + F *f* : F *f*, and make *o p* parallel to CI and equal to E *e* + F *f*. Then we know, from the common principles of mechanics, that the force *o p* acting at *o* will have the ſame momentum or energy to turn the lever round *any* point whatever as the two forces E *e* and F *f* applied to *r* and *v*; and now the lever is acted on by two forces, *viz.* IC, urging it backwards in the point *t* and *o p* urging it forwards in the point *o*. It muſt therefore turn round like a floating log, which gets two blows in oppoſite directions. If we now make IC—*o p* : *o p* = *t o* : *t x*, or IC—*o p* : IC = *t o* : *o x*, and apply to the point *x* a force equal to IC—*o p* in the direction IC; we know by the common principles of mechanics, that this force IC—*o p* will produce the ſame rotation round any point as the two forces IC and *o p* applied in their proper directions at *t* and *o*. Let us examine the ſituation of the point *x*.

The force IC—*o p* is evidently = D *d*, and *o p* is = E *e* + F *f*. Therefore *o t* : *t x* = D *d* : *o p*. But becauſe, when all the ſails were filled, there was an equilibrium round C, and therefore round *t*, and becauſe the force *o p* acting at *o* is equivalent to E *e* and F *f* acting at *r* and *v*, we muſt ſtill have the equilibrium; and therefore we have the momentum D *d* × *q t* = *o p* × *o t*. Therefore *o t* : *t q* = D *d* : *o p*, and *t q* = *t x*. Therefore the point *x* is the ſame with the point *q*.

51 By ſhivering the mizen-ſail.

Therefore, when we ſhiver the mizen-topſail, the rotation of the ſhip is the ſame as if the ſhip were at reſt, and a force equal and oppoſite to the action of the mizen-topſail were applied at *q* or at D, or at any point in the line D *q*.

This might have been ſhown in another and ſhorter way. Suppoſe all ſails filled, the ſhip is in equilibrio. This will be diſturbed by applying to D a force oppoſite to D *d*; and if the force be alſo equal to D *d*, it is evident that theſe two forces deſtroy each other, and that this application of the force *d* D is equivalent to

the taking away of the mizen-topſail. But we choſe to give the whole mechanical inveſtigation; becauſe it gave us an opportunity of pointing out to the reader, in a caſe of very eaſy comprehenſion, the preciſe manner in which the ſhip is acted on by the different ſails and by the water, and what ſhare each of them has in the motion ultimately produced. We ſhall not repeat this manner of procedure in other caſes, becauſe a little reflection on the part of the reader will now enable him to trace the *modus operandi* through all its ſteps.

We now ſee that, in reſpect both of progreſſive motion and of converſion, the ſhip is affected by ſhivering the ſail D, in the ſame manner as if a force equal and oppoſite to D *d* were applied at D, or at any point in the line D *d*. We muſt now have recourſe to the principles eſtabliſhed under the article ROTATION.

Let *p* repreſent a particle of matter, *r* its radius vector, or its diſtance *p* G from an axis paſſing through the centre of gravity G, and let M repreſent the whole quantity of matter of the ſhip. Then its momentum of inertia is $= \int p \cdot r^2$ (ſee ROTATION, N° 18.) The ſhip, impelled in the point D by a force in the direction *d* D, will begin to turn round a ſpontaneous vertical axis, paſſing through a point S of the line *q* G, which is drawn through the centre of gravity G, perpendicular to the direction *d* D of the external force, and the diſtance GS of this axis from the centre of gravity is $= \frac{\int p \cdot r^2}{M \cdot Gq}$ (ſee ROTATION, N° 96.), and it is taken on the oppoſite ſide of G from *q*, that is, S and *q* are on oppoſite ſides of G.

Let us expreſs the external force by the ſymbol F. It is equivalent to a certain number of pounds, being the preſſure of the wind moving with the velocity V and inclination *a* on the ſurface of the ſail D; and may therefore be computed either by the theoretical or experimental law of oblique impulſes. Having obtained this, we can aſcertain the angular velocity of the rotation and the abſolute velocity of any given point of the ſhip by means of the theorems eſtabliſhed in the article ROTATION.

52 Action of the rudder.

But before we proceed to this inveſtigation, we ſhall conſider the action of the rudder, which operates preciſely in the ſame manner. Let the ſhip AB (fig. 11.) have her rudder in the poſition AD, the helm being hard a-ſtarboard, while the ſhip ſailing on the ſtarboard tack, and making leeway, keeps on the courſe *a b*. The lee ſurface of the rudder meets the water obliquely. The very foot of the rudder meets it in the direction DE prrallel to *a b*. The parts farther up meet it with various obliquities, and with various velocities, as it glides round the bottom of the ſhip and falls into the wake. It is abſolutely impoſſible to calculate the accumulated impulſe. We ſhall not be far miſtaken in the deflection of each contiguous filament, as it quits the bottom and glides along the rudder; but we neither know the velocity of theſe filaments, nor the deflection and velocity of the filaments gliding without them. We therefore imagine that all computations on this ſubject are in vain. But it is enough for our purpoſe that we know the direction of the abſolute preſſure which they exert on its ſurface. It is in the direction D *d*, perpendicular to that ſurface. We alſo may be confident that this preſſure is very conſiderable, in proportion to the action of the water on the ſhip's bows, or of the wind on the ſails; and we may ſuppoſe it to be nearly in the proportion of the ſquare of the velocity of the ſhip in her courſe; but we cannot affirm it to be accurately in that proportion, for reaſons that will readily occur to one who conſiders the way in which the water falls in behind the ſhip.

53 Greateſt in a fine ſailer.

It is obſerved, however, that a fine ſailer always ſteers well, and that all movements by means of the rudder are performed with great rapidity when the velocity of the ſhip is great. We ſhall ſee by and by, that the ſpeed with which the ſhip performs the angular movements is in the proportion of her progreſſive velocity: For we ſhall ſee that the ſquares of the times of performing the evolution are as the impulſes inverſely, which are as the ſquares of the velocities. There is perhaps no force which acts on a ſhip that can be more accurately determined by experiment than this. Let the ſhip ride in a ſtream or tideway whoſe velocity is accurately meaſured; and let her ride from two moorings, ſo that her bow may be a fixed point. Let a ſmall tow-line be laid out from her ſtern or quarter at right angles to the keel, and connected with ſome apparatus fitted up on ſhore or on board another ſhip, by which the ſtrain on it may be accurately meaſured; a perſon converſant with mechanics will ſee many ways in which this can be done. Perhaps the following may be as good as any: Let the end of the tow-line be fixed to ſome point as high out of the water as the point of the ſhip from which it is given out, and let this be very high. Let a block with a hook be on the rope, and a conſiderable weight hung on this hook. Things being thus prepared, put down the helm to a certain angle, ſo as to cauſe the ſhip to ſheer off from the point to which the far end of the tow-line is attached. This will ſtretch the rope, and raiſe the weight out of the water. Now heave upon the rope, to bring the ſhip back again to her former poſition, with her keel in the direction of the ſtream. When this poſition is attained, note carefully the form of the rope, that is, the angle which its two parts make with the horizon. Call this angle *a*. Every perſon acquainted with theſe ſubjects knows that the horizontal ſtrain is equal to half the weight multiplied by the co-tangent of *a*, or that 2 is to the co-tangent of *a* as the weight to the horizontal ſtrain. Now it is this ſtrain which balances, and therefore meaſures the action of the rudder, or D *e* in fig. 11. Therefore to have the abſolute impulſe D *d*, we muſt increaſe D *e* in the proportion of radius to the ſecant of the angle *b* which the rudder makes with the keel. In a great ſhip ſailing ſix miles in an hour, the impulſe on the rudder inclined 30° to the keel is not leſs than 3000 pounds. The ſurface of the rudder of ſuch a ſhip contains near 80 ſquare feet. It is not, however, very neceſſary to know this abſolute impulſe D *d*, becauſe it is its part D *e* alone which meaſures the energy of the rudder in producing a converſion. Such experiments, made with various poſitions of the rudder, will give its energies correſponding to theſe poſitions, and will ſettle that long diſputed point which is the beſt poſition for turning a ſhip. On the hypotheſis that the impulſions of fluids are in the duplicate ratio of the ſines of incidence, there can be no doubt that it ſhould make an angle of 54° 44′ with the keel. But the form of a large ſhip will not admit of this, becauſe a tiller of a length ſufficient for managing the rudder in ſailing

54 How to determine it.

with

with great velocity has not room to deviate above 30° from the direction of the keel; and in this position of the rudder the mean obliquity of the filaments of water to its surface cannot exceed 40° or 45°. A greater angle would not be of much service, for it is never for want of a proper obliquity that the rudder fails of producing a conversion.

55 Why a ship miſſes ſtays, &c.

A ſhip miſſes ſtays in rough weather for want of a ſufficient progreſſive velocity, and becauſe her bows are beat off by the waves: and there is ſeldom any difficulty in wearing the ſhip, if ſhe has any progreſſive motion. It is, however, always deſirable to give the rudder as much influence as poſſible. Its ſurface ſhould be enlarged (eſpecially below) as much as can be done conſiſtently with its ſtrength and with the power of the ſteerſmen to manage it; and it ſhould be put in the moſt favourable ſituation for the water to get at it with great velocity; and it ſhould be placed as far from the axis of the ſhip's motion as poſſible. Theſe points are obtained by making the ſtern-poſt very upright, as has always been done in the French dockyards. The Britiſh ſhips have a much greater rake; but our builders are gradually adopting the French forms, experience having taught us that their ſhips, when in our poſſeſſion, are much more obedient to the helm than our own.—In order to aſcertain the motion produced by the action of the rudder, draw from the centre of gravity a line G q perpendicular to D d (D d being drawn thro' the centre of effort of the rudder). Then, as in the conſideration of the action of the ſails, we may conceive the line q G as a lever connected with the ſhip, and impelled by a force D d acting perpendicularly at q. The conſequence of this will be, an incipient converſion of the ſhip about a vertical axis paſſing through ſome point S in the line q G, lying on the other ſide of G from q; and we have, as in the former caſe, $GS = \frac{\int p \cdot r^2}{M \cdot Gq}$.

56 The action of the rudder ſimilar to that of the ſails, and very great.

Thus the action and effects of the ſails and of the rudder are perfectly ſimilar, and are to be conſidered in the ſame manner. We ſee that the action of the rudder, though of a ſmall ſurface in compariſon of the ſails, muſt be very great: For the impulſe of water is many hundred times greater than that of the wind; and the arm q G of the lever, by which it acts, is incomparably greater than that by which any of the impulſions on the ſails produces its effect; accordingly the ſhip yields much more rapidly to its action than ſhe does to the lateral impulſe of a ſail.

Obſerve here, that if G were a fixed or ſupported axis, it would be the ſame thing whether the abſolute force D d of the rudder acts in the direction D d, or its tranſverſe part D e acts in the direction D e, both would produce the ſame rotation; but it is not ſo in a free body. The force D d both tends to retard the ſhip's motion and to produce a rotation: It retards it as much as if the ſame force D d had been immediately applied to the centre. And thus the real motion of the ſhip is compounded of a motion of the centre in a direction parallel to D d, and of a motion round the centre. Theſe two conſtitute the motion round S.

57 Employed as an example of the motions of converſion.

As the effects of the action of the rudder are both more remarkable and ſomewhat more ſimple than thoſe of the ſails, we ſhall employ them as an example of the mechaniſm of the motions of converſion in general; and as we muſt content ourſelves in a work like this with what is very general, we ſhall ſimplify the inveſtigation by attending only to the motion of converſion. We can get an accurate notion of the whole motion, if wanted for any purpoſe, by combining the progreſſive or retrograde motion parallel to D d with the motion of rotation which we are about to determine.

In this caſe, then, we obſerve, in the firſt place, that the angular velocity (ſee ROTATION, N° 22.) is $\frac{D b \cdot qG}{\int p r^2}$; and, as was ſhown in that article, this velocity of rotation increaſes in the proportion of the time of the forces uniform action, and the rotation would be uniformly accelerated if the forces did really act uniformly. This, however cannot be the caſe, becauſe, by the ſhip's change of poſition and change of progreſſive velocity, the direction and intenſity of the impelling force is continually changing. But if two ſhips are performing ſimilar evolutions, it is obvious that the changes of force are ſimilar in ſimilar parts of the evolution. Therefore the conſideration of the momentary evolution is ſufficient for enabling us to compare the motions of ſhips actuated by ſimilar forces, which is all we have in view at preſent.

The velocity v, generated in any time t by the continuance of an invariable momentary acceleration (which is all that we mean by ſaying that it is produced by the action of a conſtant accelerating force), is as the acceleration and the time jointly. Now what we call the *angular velocity* is nothing but this momentary acceleration. Therefore the velocity v generated in the time t is $= \frac{F \cdot qG}{\int p r^2} t$.

58 Angular velocity

The expreſſion of the angular velocity is alſo the expreſſion of the velocity v of a point ſituated at the diſtance 1 from the axis G.

Let z be the ſpace or arch of revolution deſcribed in the time t by this point, whoſe diſtance from G is $= 1$. Then $\dot{z} = v\dot{t} = \frac{F \cdot qG}{\int p r^2} t\dot{t}$, and taking the fluent $z = \frac{F \cdot qG}{\int p r^2} t^2$. This arch meaſures the whole angle of rotation accompliſhed in the time t. Theſe are therefore as the ſquares of the times from the beginning of the rotation.

Thoſe evolutions are equal which are meaſured by equal arches. Thus two motions of 45 degrees each are equal. Therefore becauſe z is the ſame in both, the quantity $\frac{F \cdot qG}{\int p r} t^2$ is a conſtant quantity, and t^2 is reciprocally proportional to $\frac{F \cdot qG}{\int p r^2}$, or is proportional to $\frac{\int p r^2}{F \cdot qG}$, and t is proportional to $\frac{\sqrt{\int p r^2}}{\sqrt{F \cdot qG}}$. That is to ſay, the times of the ſimilar evolutions of two ſhips are as the ſquare root of the momentum of inertia directly, and as the ſquare root of the momentum of the rudder or ſail inverſely. This will enable us to make the compariſon eaſily. Let us ſuppoſe the ſhips perfectly ſimilar in form and rigging, and to differ only in length L and l; $\int P \cdot R^2$ is to $\int p r^2$ as L^5 to l^5.

For

For the ſimilar particles P and p contain quantities of matter which are as the cubes of their lineal dimenſions, that is, as L^3 to l^3. And becauſe the particles are ſimilarly ſituated, R^2 is to r^2 as L^2 to l^2. Therefore $P \cdot R^2 : p \cdot r^2 = L^5 : l^5$. Now F is to f as L^2 to l^2. For the ſurfaces of the ſimilar rudders or ſails are as the ſquares of their lineal dimenſions, that is, as L^2 to l^2. And, laſtly, G q is to $g\,q$ as L to l, and therefore $F \cdot G\,q : f \cdot g\,q = L^3 : l^3$. Therefore we have $T^2 : t^2 = \frac{\int P \cdot R^2}{F \cdot G\,q} : \frac{\int p \cdot r^2}{f \cdot g\,q} = \frac{L^5}{L^3} : \frac{l^5}{l^3} = L^2 : l^2$, and $T : t = L : l$.

Therefore the times of performing ſimilar evolutions with ſimilar ſhips are proportional to the lengths of the ſhips when both are ſailing equally faſt; and ſince the evolutions are ſimilar, and the forces vary ſimilarly in their different parts, what is here demonſtrated of the ſmalleſt incipient evolutions is true of the whole. They therefore not only deſcribe equal angles of revolution, but alſo ſimilar curves.

A ſmall ſhip, therefore, works in leſs time and in leſs room than a great ſhip, and this in the proportion of its length. This is a great advantage in all caſes, particularly in wearing, in order to ſail on the other tack cloſe-hauled. In this caſe ſhe will always be to windward and ahead of the large ſhip, when both are got on the other tack. It would appear at firſt ſight that the large ſhip will have the advantage in tacking. Indeed the large ſhip is farther to windward when again trimmed on the other tack than the ſmall ſhip when ſhe is juſt trimmed on the other tack. But this happened before the large ſhip had completed her evolution, and the ſmall ſhip, in the mean time, has been going forward on the other tack, and going to windward. She will therefore be before the large ſhip's beam, and perhaps as far to windward.

We have ſeen that the velocity of rotation is proportional, *cæteris paribus*, to $F \times G\,q$. F means the abſolute impulſe on the rudder or ſail, and is always perpendicular to its ſurface. This abſolute impulſe on a ſail depends on the obliquity of the wind to its ſurface. The uſual theory ſays, that it is as the ſquare of the ſine of incidence: but we find this not true. We muſt content ourſelves with expreſſing it by ſome as yet unknown function φ of the angle of incidence a, and call it φa; and if S be the ſurface of the ſail, and V the velocity of the wind, the abſolute impulſe is $n\,V^2\,S \times \varphi a$. This acts (in the caſe of the mizen-topſail, fig. 10.) by the lever qG, which is equal to DG $\times$ cof. DG q, and DG q is equal to the angle of the yard and keel; which angle we formerly called b. Therefore its energy in producing a rotation is $n\,V^2\,S \times \varphi a \times DG \times$ cof. b. Leaving out the conſtant quantities n, V^2, S, and DG, its energy is proportional to $\varphi a \times$ cof. b. In order, therefore, that any ſail may have the greateſt power to produce a rotation round G, it muſt be ſo trimmed that $\varphi a \times$ cof. b may be a maximum. Thus, if we would trim the ſails on the foremaſt, ſo as to pay the ſhip off from the wind right ahead with the greateſt effect, and if we take the experiments of the French academicians as proper meaſures of the oblique impulſes of the wind on the ſail, we will brace up the yard to an angle of 48 degrees with the keel. The impulſe correſponding to 48° is 615, and the coſine of 48° is 669. Theſe give a product of 411435. If we brace the ſail to 54.44, the angle aſſigned by the theory, the effective impulſe is 405274. If we make the angle 45°, the impulſe is 408774. It appears then that 48° is preferable to either of the others. But the difference is inconſiderable, as in all caſes of maximum a ſmall deviation from the beſt poſition is not very detrimental. But the difference between the theory and this experimental meaſure will be very great when the impulſes of the wind are of neceſſity very oblique. Thus, in tacking ſhip, as ſoon as the headſails are taken aback, they ſerve to aid the evolution, as is evident: But if we were now to adopt the maxim inculcated by the theory, we ſhould immediately round in the weather-braces, ſo as to increaſe the impulſe on the ſail, becauſe it is then very ſmall; and although we by this means make yard more ſquare, and therefore diminiſh the rotatory momentum of this impulſe, yet the impulſe is more increaſed (by the theory) than its vertical lever is diminiſhed.— Let us examine this a little more particularly, becauſe it is reckoned one of the niceſt points of ſeamanſhip to aid the ſhip's coming round by means of the headſails; and experienced ſeamen differ in their practice, in this manœuvre. Suppoſe the yard braced up to 40°, which is as much as can be uſually done, and that the ſail ſhivers (the bowlines are uſually let go when the helm is put down), the ſail immediately takes aback, and in a moment we may ſuppoſe an incidence of 6 degrees. The impulſe correſponding to this is 400 (by experiment), and the coſine of 40° is 766. This gives 306400 for the effective impulſe. To proceed according to the theory, we ſhould brace the yard to 70°, which would give the wind (now 34° on the weather-bow) an incidence of nearly 36°, and the ſail an inclination of 20° to the intended motion, which is perpendicular to the keel. For the tangent of 20° is about $\frac{1}{2}$ of the tangent of 36°. Let us now ſee what effective impulſe the experimental law of oblique impulſions will give for this adjuſtment of the ſails. The experimental impulſe for 36° is 480; the coſine of 70° is 342; the product is 164160, not much exceeding the half of the former. Nay, the impulſe for 36°, calculated by the theory, would have been only 346, and the effective impulſe only 118332. And it muſt be farther obſerved, that this theoretical adjuſtment would tend greatly to check the evolution, and in moſt caſes would entirely mar it, by checking the ſhip's motion ahead, and conſequently the action of the rudder, which is the moſt powerful agent in the evolution; for here would be a great impulſe directed almoſt aſtern.

We were juſtifiable, therefore, in ſaying, in the beginning of this article, that a ſeaman would frequently find himſelf baffled if he were to work a ſhip according to the rules deduced from M. Bouguer's work; and we ſee by this inſtance of what importance it is to have the oblique impulſions of fluids aſcertained experimentally. The practice of the moſt experienced ſeamen is directly the oppoſite to this theoretical maxim, and its ſucceſs greatly confirms the uſefulneſs of theſe experiments of the academicians ſo often praiſed by us.

We return again to the general conſideration of the rotatory motion. We found the velocity $v = \frac{F \cdot q\,G}{\int p\,r^2}$. It is therefore proportional *cæteris paribus*, to q G. We have ſeen in what manner q G depends on the poſi-

tion

tion and ſituation of the ſail or rudder when the point G is fixed. But it alſo depends on the poſition of G. With reſpect to the action of the rudder, it is evident that it is ſo much the more powerful as it is more remote from G. The diſtance from G may be increaſed either by moving the rudder farther aft or G farther forward. And as it is of the utmoſt importance that a ſhip anſwer her helm with the greateſt promptitude, thoſe circumſtances have been attended to which diſtinguiſhed fine ſteering ſhips from ſuch as had not this quality; and it is in a great meaſure to be aſcribed to this, that, in the gradual improvement of naval architecture, the centre of gravity has been placed far forward. Perhaps the notion of a centre of gravity did not come into the thoughts of the rude builders in early times; but they obſerved that thoſe boats and ſhips ſteered beſt which had their extreme breadth before the middle point, and conſequently the bows not ſo acute as the ſtern. This is ſo contrary to what one would expect, that it attracted attention more forcibly; and, being ſomewhat myſterious, it might prompt to attempts of improvement, by exceeding in this ſingular maxim. We believe that it has been carried as far as is compatible with other eſſential requiſites in a ſhip.

61 Of importance to determine the beſt place for a ſhip's centre of gravity.

We believe that this is the chief circumſtance in what is called the trim of a ſhip; and it were greatly to be wiſhed that the beſt place for the centre of gravity could be accurately aſcertained. A practice prevails, which is the oppoſite of what we are now advancing. It is uſual to load a ſhip ſo that her keel is not horizontal, but lower abaft. This is found to improve her ſteerage. The reaſon of this is obvious. It increaſes the acting ſurface of the rudder, and allows the water to come at it with much greater freedom and regularity; and it generally diminiſhes the griping of the ſhip forward, by removing a part of the bows out of the water. It has not always this effect; for the form of the harping aloft is frequently ſuch, that the tendency to gripe is diminiſhed by immerſing more of the bow in the water.

But waving theſe circumſtances, and attending only to the rotatory energy of the rudder, we ſee that it is of advantage to carry the centre of gravity forward. The ſame advantage is gained to the action of the after ſails. But, on the other hand, the action of the head ſails is diminiſhed by it; and we may call every ſail a headſail whoſe centre of gravity is before the centre of gravity of the ſhip; that is, all the ſails hoiſted on the bowſprit and foremoſt, and the ſtayſails hoiſted on the mainmaſt; for the centre of gravity is ſeldom far before the mainmaſt.

Suppoſe that when the rudder is put into the poſition AD (fig. 11.), the centre of gravity could be ſhifted to g, ſo as to increaſe q G, and that this is done without increaſing the ſum of the products $p r^2$. It is obvious that the velocity of converſion will be increaſed in the proportion of q G to $q g$. This is very poſſible, by bringing to that ſide of the ſhip parts of her loading which were ſituated at a diſtance from G on the other ſide. Nay, we can make this change in ſuch a manner that $\int p r^2$ ſhall even be leſs than it was before, by taking care that every thing which we ſhift ſhall be nearer to g than it was formerly to G. Suppoſe it all placed in on ſpot m, and that m is the quantity of matter ſo ſhifted, while M is the quantity of matter in the whole ſhip

It is only neceſſary that $m \cdot g\,G^2$ ſhall be leſs than the ſum of the products $p r^2$ correſponding to the matter which has been ſhifted. Now, although the matter which is eaſily moveable is generally very ſmall in compariſon to the whole matter of the ſhip, and therefore can make but a ſmall change in the place of the centre of gravity, it may frequently be brought from places ſo remote, that it may occaſion a very ſenſible diminution of the quantity $\int p r^2$, which expreſſes the whole momentum of inertia.

62 A practice of ſeamen in putting about explained.

This explains a practice of the ſeamen in ſmall wherries or ſkiffs, who in putting about are accuſtomed to place themſelves to leeward of the maſt. They even find that they can aid the quick motions of theſe light boats by the way in which they reſt on their two feet, ſometimes leaning all on one foot, and ſometimes on the other. And we have often ſeen this evolution very ſenſibly accelerated in a ſhip of war, by the crew running ſuddenly, as the helm is put down to the lee-bow. And we have heard it aſſerted by very expert ſeamen, that after all attempts to wear ſhip (after lying-to in a ſtorm) have failed, they have ſucceeded by the crew collecting themſelves near the weather fore-ſhrouds the moment the helm was put down. It muſt be agreeable to the reflecting ſeaman to ſee this practice ſupported by undoubted mechanical principles.

63 The c

It will appear paradoxical to ſay that the evolution may be accelerated even by an addition of matter to the ſhip; and though it is only a piece of curioſity, our readers may wiſh to be made ſenſible of it. Let m be the addition, placed in ſome point m lying beyond G from q. Let S be the ſpontaneous centre of converſion before the addition. Let v be the velocity of rotation round g, that is, the velocity of a point whoſe diſtance from g is 1, and let ϱ be the radius vector, or diſtance of a particle from g. We have (Rotation, N° 22.) $v = \frac{F \cdot qg}{\int p \varrho^2 + m \cdot m g^2}$. But we know (Rotation, N° 23.) that $\int p \varrho^2 = \int p r^2 + M \cdot G g^2$. Therefore $v = \frac{F \cdot qg}{\int p r^2 + M \cdot G g^2 + m \cdot m g^2}$. Let us determine Gg and mg and qg.

tion a rated b dition matter

Let m G be called z. Then, by the nature of the centre of gravity, $M + m : M = G m : g m = z : g m$, and $g m = \frac{M}{M+m} z$, and $m \cdot g m^2 = \frac{m M^2}{M+m^2} z^2$. In like manner, $M \cdot G g^2 = \frac{M m^2}{M+m^2} z^2$. Now $m M^2 + M m^2 = M m \times M + m$. Therefore $M \cdot G g^2 + m \cdot g m^2 = \frac{M m \times (M+m)}{M+m^2} z^2$, $= \frac{M m}{M+m} z^2$. Let n be $= \frac{m}{M+m}$, then $M \cdot G g^2 + m \cdot g m^2 = M n z^2$. Alſo $Gg = n z$, being $= \frac{m}{M+n} z$. Let q G be called c: then $qg = c + n z$. Alſo let SG be called e.

We have now for the expreſſion of the velocity $v = \frac{F (c + n z)}{\int p r^2 + M n z}$, or $v = \frac{F}{M} \times \frac{c + n z}{\frac{\int p r^2}{M} + n z^2}$. But

Rotation,

(Rotation, N° 30) $\frac{\int pr^2}{M} = ce$. Therefore, finally, $v = \frac{F}{M} \times \frac{c + nz}{ce + nz^2}$. Had there been no addition of matter made, we ſhould have had $v = \frac{F}{M} \times \frac{c}{ce}$. It remains to ſhow, that z may be ſo taken that $\frac{c}{ce}$ may be leſs than $\frac{c + nz}{ce + nz^2}$. Now, if c be to z as ce to z^2, that is, if z be taken equal to e, the two fractions will be equal. But if z be leſs than e, that is, if the additional matter is placed anywhere between S and G, the complex fraction will be greater than the fraction $\frac{c}{ce}$, and the velocity of rotation will be increaſed. There is a particular diſtance which will make it the greateſt poſſible; namely, when z is made $= \frac{1}{n}(\sqrt{c^2 + nce} - c)$, as will eaſily be found by treating the fraction $\frac{c + nz}{ce + nz^2}$, with z, conſidered as the variable quantity, for a maximum. In what we have been ſaying on this ſubject, we have conſidered the rotation only in as much as it is performed round the centre of gravity, although in every moment it is really performed round a ſpontaneous axis lying beyond that centre. This was done becauſe it afforded an eaſy inveſtigation, and any angular motion round the centre of gravity is equal to the angular motion round any other point. Therefore the extent and the time of the evolution are accurately defined.—From obſerving that the energy of the force F is proportional to q G, an inattentive reader will be apt to conceive the centre of gravity as the centre of motion. and the rotation as taking place becauſe the momenta of the ſails and rudder, on the oppoſite ſides of the centre of gravity, do not balance each other. But we muſt always keep in mind that this is not the cauſe of the rotation. The cauſe is the want of equilibrium round the point C (fig. 10.), where the actions of the water balance each other. During the evolution, which conſiſts of a rotation combined with a progreſſive motion, this point C is continually ſhifting, and the unbalanced momenta which continue the rotation always reſpect the momentary ſituation of the point C. It is nevertheleſs always true that the energy of a force F is proportional (*cæteris paribus*) to q G, and the rotation is always made in the ſame direction as if the point G were really the centre of converſion. Therefore the mainſail acts always (when oblique) by puſhing the ſtern away from the wind, although it ſhould ſometimes act on a point of the vertical lever through C, which is ahead of C.

64 rotation performed round a diſtance axis.

Theſe obſervations on the effects of the ſails and rudder in producing a converſion, are ſufficient for enabling us to explain any caſe of their action which may occur. We have not conſidered the effects which they tend to produce by inclining the ſhip round a horizontal axis, viz. the motions of rolling and pitching. See Rolling and Pitching. To treat this ſubject properly would lead us into the whole doctrine of the equilibrium of floating bodies, and it would rather lead to maxims of conſtruction than to maxims of manœuvre. M. Bouguer's *Traité du Navire* and Euler's *Scientia Navalis* are excellent performances on this ſubject, and we are not here obliged to have recourſe to any erroneous theory.

65 Different operations of the water on the ſhip and wind on the ſails balance each other.

It is eaſy to ſee that the lateral preſſure both of the wind on the ſails and of the water on the rudder tends to incline the ſhip to one ſide. The ſails alſo tend to preſs the ſhip's bows into the water, and, if ſhe were kept from advancing, would preſs them down conſiderably. But by the ſhip's motion, and the prominent form of her bows, the reſiſtance of the water to the fore part of the ſhip produces a force which is directed upwards. The ſails alſo have a ſmall tendency to raiſe the ſhip, for they conſtitute a ſurface which in general ſeparates from the plumb-line below. This is remarkably the caſe in the ſtayſails, particularly the jib and fore-topmaſt ſtayſail. And this helps greatly to ſoften the plunges of the ſhip's bows into the head ſeas. The upward preſſure alſo of the water on her bows, which we juſt now mentioned, has a great effect in oppoſing the immerſion of the bows which the ſails produce by acting on the long levers furniſhed by the maſts. M. Bouguer gives the name of *point velique* to the point V (fig. 12.) of the maſt, where it is cut by the line CV, which marks the mean place and direction of the whole impulſe of the water on the bows. And he obſerves, that if the mean direction of all the actions of the wind on the ſails be made to paſs alſo through this point there will be a perfect equilibrium, and the ſhip will have no tendency to plunge into the water or to riſe out of it; for the whole action of the water on the bows, in the direction CV, is equivalent to, and may be reſolved into the action CE, by which the progreſſive motion is reſiſted, and the vertical action CD, by which the ſhip is raiſed above the water. The force CE muſt be oppoſed by an equal force VD, exerted by the wind on the ſails, and the force CD is oppoſed by the weight of the ſhip. If the mean effort of the ſails paſſes above the point V, the ſhip's bows will be preſſed into the water; and if it paſs below V, her ſtern will be preſſed down. But, by the union of theſe forces, ſhe will riſe and fall with the ſea, keeping always in a parallel poſition. We apprehend that it is of very little moment to attend to the ſituation of this point. Except when the ſhip is right afore the wind, it is a thouſand chances to one that the line CV of mean reſiſtance does not paſs through any maſt; and the fact is, that the ſhip cannot be in a ſtate of uniform motion on any other condition but the perfect union of the line of mean action of the ſails, and the line of mean action of the reſiſtance. But its place ſhifts by every change of leeway or of trim; and it is impoſſible to keep theſe lines in one conſtant point of interſection for a moment, on account of the inceſſant changes of the ſurface of the water on which ſhe floats. M Bouguer's obſervations on this point, are, however, very ingenious and original.

66 Chief evolutions deſcribed.

We conclude this diſſertation, by deſcribing ſome of the chief movements or evolutions. What we have ſaid hitherto is intended for the inſtruction of the artiſt, by making him ſenſible of the mechanical procedure. The deſcription is rather meant for the amuſement of the landſman, enabling him to underſtand operations that are familiar to the ſeaman. The latter will perhaps ſmile at the awkward account given of his buſineſs by one who cannot hand, reef, nor ſteer.

To tack Ship.

The ſhip muſt firſt of all be kept full, that is, with

a very ſenſible angle of incidence on the ſails, and by no means hugging the wind. For as this evolution is chiefly performed by the rudder, it is neceſſary to give the ſhip a good velocity. When the ſhip is obſerved to luff up of herſelf, that moment is to be catched for beginning the evolution, becauſe ſhe will by her inherent force continue this motion. The helm is then put down. When the officer calls out Helm's a-lee, the fore-ſheet, fore-top bowline, jib, and ſtag ſail ſheets forward are let go. The jib is frequently hauled down. Thus the obſtacles to the ſhip's head coming up to the wind by the action of the rudder are removed. If the mainſail is ſet, it is not unuſual to clue up the weather ſide, which may be conſidered as a headſail, becauſe it is before the centre of gravity. The mizen muſt be hauled out, and even the ſail braced to windward. Its power in paying off the ſtern from the wind conſpires with the action of the rudder. It is really an aerial rudder. The ſails are immediately taken aback. In this ſtate the effect of the mizen-topſail would be to obſtruct the movement, by preſſing the ſtern the contrary way to what it did before. It is therefore either immediately braced about ſharp on the other tack, or lowered. Bracing it about evidently tends to pay round the ſtern from the wind, and thus aſſiſt in bringing the head up to the wind. But in this poſition it checks the progreſſive motion of the ſhip, on which the evolution chiefly depends. For a rapid evolution, therefore, it is as well to lower the mizen-topſail. Meantime, the headſails are all aback, and the action of the wind on them tends greatly to pay the ſhip round. To increaſe this effect, it is not unuſual to haul the fore-top bowline again. The ſails on the mainmaſt are now almoſt becalmed; and therefore when the wind is right ahead, or a little before, the mainſail is hauled round and braced up ſharp on the other tack with all expedition. The ſtayſail ſheets are now ſhifted over to their places for the other tack. The ſhip is now entirely under the power of the headſails and of the rudder, and their actions conſpire to promote the converſion. The ſhip has acquired an angulat motion, and will preſerve it, ſo that now the evolution is ſecured, and ſhe falls off apace from the wind on the other tack. The farther action of the rudder is therefore unneceſſary, and would even be prejudicial, by cauſing the ſhip to fall off too much from the wind before the ſails can be ſhifted and trimmed for ſailing on the other tack. It is therefore proper to right the helm when the wind is right ahead, that is, to bring the rudder into the direction of the keel. The ſhip continues her converſion by her inherent force and the action of the headſails.

When the ſhip has fallen off about four points from the wind, the headſails are hauled round, and trimmed ſharp on the other tack with all expedition; and although this operation was begun with the wind four points on the bow, it will be ſix before the ſails are braced up, and therefore the headſails will immediately fill. The after-ſails have filled already, while the headſails were inactive, and therefore immediately check the farther falling off from the wind. All ſails now draw, for the ſtayſail ſheets have been ſhifted over while they were becalmed or ſhaking in the wind. The ſhip now gathers way, and will obey the ſmalleſt motion of the helm to bring her cloſe to the wind.

We have here ſuppoſed, that during all this operation the ſhip preſerves her progreſſive motion. She muſt therefore have deſcribed a curve line, advancing all the while to windward. Fig. 13. is a repreſentation of this evolution when it is performed in the completeſt manner. The ſhip ſtanding on the courſe E *a*, with the wind blowing in the direction WF, has her helm put hard a-lee when ſhe is in the poſition A. She immediately deviates from her courſe, and deſcribing a curve, comes to the poſition B, with the wind blowing in the direction WF of the yards, and the ſquare-ſails now ſhiver. The mizen-topſail is here repreſented braced ſharp on the other tack, by which its tendency to aid the angular motion (while it checks the progreſſive motion) is diſtinctly ſeen. The main and foreſails are now ſhivering, and immediately after are taken aback. The effect of this on the headſails is diſtinctly ſeen to be favourable to the converſion, by puſhing the point F in the direction F *i*; but for the ſame reaſon it continues to retard the progreſſive motion. When the ſhip has attained to the poſition C, the mainſail is hauled round and trimmed for the other tack. The impulſe in the direction F *i* ſtill aids the converſion and retards the progreſſive motion. When the ſhip has attained a poſition between C and D, ſuch that the main and mizen topſail yards are in the direction of the wind, there is nothing to counteract the force of the headſails to pay the ſhip's head off from the wind. Nay, during the progreſs of the ſhip to this intermediate poſition, if any wind gets at the main or mizen topſails, it acts on their anterior ſurfaces, and impels the after parts of the ſhip away from the curve *a b c d*, and thus aids the revolution. We have therefore ſaid, that when once the ſails are taken fully aback, and particularly when the wind is brought right ahead, it is ſcarce poſſible for the evolution to fail; as ſoon therefore as the main-topſail (trimmed for the other tack) ſhivers, we are certain that the headſails will be filled by the time they are hauled round and trimmed. The ſtayſails are filled before this, becauſe their ſheets have been ſhifted, and they ſtand much ſharper than the ſquare-ſails; and thus every thing tends to check the falling off from the wind on the other tack, and this no ſooner than it ſhould be done. The ſhip immediately gathers way, and holds on in her new courſe *d* G.

But it frequently happens, that in this converſion the ſhip loſes her whole progreſſive motion. This ſometimes happens while the ſails are ſhivering before they are taken fully aback. It is evident, that in this caſe there is little hopes of ſucceſs, for the ſhip now lies like a log, and neither ſails nor rudder have any action. The ſhip drives to leeward like a log, and the water acting on the lee-ſide of the rudder checks a little the driving of the ſtern. The head therefore falls off again, and by and by the ſails fill, and the ſhip continues on her former tack. This is called MISSING STAYS, and it is generally owing to the ſhip's having too little velocity at the beginning of the evolution. Hence the propriety of keeping the ſails well filled for ſome little time before. Rough weather, too, by raiſing a wave which beats violently on the weather-bow, frequently checks the firſt luffing of the ſhip, and beats her off again.

If the ſhip loſes all her motion after the headſails have been fully taken aback, and before we have brought the wind right ahead, the evolution becomes uncertain, but by no means deſperate; for the action

of

of the wind of the headſails will preſently give her ſtern-way. Suppoſe this to happen when the ſhip is in the poſition C. Bring the helm over hard to windward, ſo that the rudder ſhall have the poſition repreſented by the ſmall dotted line *of*. It is evident, that the reſiſtance of the water to the ſtern-way of the rudder acts in a favourable direction, puſhing the ſtern outwards. In the mean time, the action of the wind on the headſails puſhes the head in the oppoſite direction. Theſe actions conſpire therefore in promoting the evolution; and if the wind is right-ahead, it cannot fail, but may even be completed ſpeedily, becauſe the ſhip gathers ſtern-way, and the action of the rudder becomes very powerful; and as ſoon as the wind comes on the formerly lee-bow, the action of the water on the now lee-quarter will greatly accelerate the converſion. When the wind therefore has once been brought nearly right ahead, there is no riſk of being baffled.

But ſhould the ſhip have loſt all her head-way conſiderably before this, the evolution is very uncertain; for the action of the water on the rudder may not be nearly equal to its contrary action on the lee-quarter: in which caſe, the action of the wind on the headſails may not be ſufficient to make up the difference. When this is obſerved, when the ſhip goes aſtern without changing her poſition, we muſt immediately throw the headſails completely aback, and put the helm down again, which will pay off the ſhip's head from the wind enough to enable us to fill the ſails again on the ſame tack, to try our fortune again; or we muſt BOXHAUL the ſhip, in the manner to be deſcribed by and by.

Such is the ordinary proceſs of tacking ſhip; a proceſs in which all the different modes of action of the rudder and ſails are employed. To execute this evolution in the moſt expeditious manner, and ſo as to gain as much on the wind as poſſible, is conſidered as the teſt of an expert ſeaman. We have deſcribed the proceſs which is beſt calculated for *enſuring* the movement. But if the ſhip be ſailing very briſkly in ſmooth water, ſo that there is no danger of miſſing ſtays, we may gain more to windward conſiderably by keeping faſt the fore-top bowline and the jib and ſtay-ſail ſheets till the ſquare-ſails are all ſhivering; For theſe ſails, continuing to draw with conſiderable force, and balancing each other tolerably fore and aft, keep up the ſhip's velocity very much, and thus maintain the power of the rudder. If we now let all fly when the ſquare-ſails are ſhivering, the ſhip may be conſidered as without ſails, but expoſed to the action of the water on the lee-bow; from which ariſes a ſtrong preſſure of the bow to windward, which conſpires with the action of the rudder to aid the converſion. It evidently leaves all that tendency of the bow to windward which ariſes from lee-way, and even what was counteracted by the formerly unbalanced action of theſe head-ſtayſails. This method lengthens the whole time of the evolution, but it advances the ſhip to windward. Obſerve, too, that keeping faſt the fore-top bowline till the ſail ſhivers, and then letting it go, inſures the tacking aback of that ſail, and thus inſtantly produces an action that is favourable to the evolution.

The moſt expert ſeamen, however, differ among themſelves with reſpect to theſe two methods, and the firſt is the moſt generally practiſed in the Britiſh navy, becauſe the leaſt liable to fail. The forces which oppoſe the converſion are ſooner removed, and the production of a favourable action by the backing of the fore-topſail is alſo ſooner obtained, by letting go the fore-top bowline at the firſt.

Having entered ſo minutely into the deſcription and rationale of this evolution, we have ſufficiently turned the reader's attention to the different actions which cooperate in producing the motions of converſion. We ſhall therefore be very brief in our deſcription of the other evolutions.

To wear Ship.

When the ſeaman ſees that his ſhip will not go about head to wind, but will miſs ſtays, he muſt change his tack the other way; that is, by turning her head away from the wind, going a little way before the wind, and then hauling the wind on the other tack. This is called WEARING or VEERING ſhip. It is moſt neceſſary in ſtormy weather with little ſail, or in very faint breezes, or in a diſabled ſhip.

The proceſs is exceedingly ſimple; and the mere narration of the procedure is ſufficient for ſhowing the propriety of every part of it.

Watch for the moment of the ſhip's falling off, and then haul up the mainſail and mizen, and ſhiver the mizen-topſail, and put the helm a-weather. When the ſhip falls off ſenſibly (and not before), let go the bowlines. Eaſe away the fore-ſheet, raiſe the fore-tack, and gather aft the weather fore-ſheet, as the lee-ſheet is eaſed away. Round in the weather-braces of the fore and main-maſts, and keep the yards nearly biſecting the angle of the wind and keel, ſo that when the ſhip is before the wind the yards may be ſquare. It may even be of advantage to round in the weather-braces of the main-topſail more than thoſe of the headſails; for the mainmaſt is abaft the centre of gravity. All this while the mizen-topſail muſt be kept ſhivering, by rounding in the weather-braces as the ſhip pays off from the wind. Then the main-topſail will be braced up for the other tack by the time that we have brought the wind on the weather-quarter. After this it will be full, and will aid the evolution. When the wind is right aft, ſhift the jib and ſtay-ſail ſheets. The evolution now goes on with great rapidity; therefore briſkly haul on board the fore and main tacks, and haul out the mizen, and ſet the mizen-ſtayſail as ſoon as they will take the wind the right way. We muſt now check the great rapidity with which the ſhip comes to the wind on the other tack, by righting the helm before we bring the wind on the beam: and all muſt be trimmed ſharp fore and aft by this time, that the headſails may take and check the coming-to. All being trimmed, ſtand on cloſe by the wind.

We cannot help loſing a great deal of ground in this movement. Therefore, though it be very ſimple, it requires much attention and rapid execution to do it with as little loſs of ground as poſſible. One is apt to imagine at firſt that it would be better to keep the headſails braced up on the former tack, or at leaſt not to round in the weather-braces ſo much as is here directed. When the ſhip is right afore the wind, we ſhould expect aſſiſtance from the obliquity of the headſails; but the rudder being the principal agent in the evolution, it is found that more is gained by increaſing the ſhip's velocity, than by a ſmaller impulſe on the

headſails more favourably directed. Experienced ſeamen differ, however, in their practice in reſpect of this particular.

To loxhaul a Ship.

This is a proceſs performed only in critical ſituations, as when a rock, a ſhip, or ſome danger, is ſuddenly ſeen right ahead, or when a ſhip miſſes ſtays. It requires the moſt rapid execution.

The ſhip being cloſe-hauled on a wind, haul up the mainſail and mizen, and ſhiver the topſails, and put the helm hard a-lee altogether. Raiſe the fore-tack, let go the head bowlines, and brace about the headſails ſharp on the other tack. The ſhip will quickly loſe her way, get ſtern-way, and then fall off, by the joint action of the headſails and of the inverted rudder. When ſhe has fallen off eight points, brace the after-ſails ſquare, which have hitherto been kept ſhivering. This will at firſt increaſe the power of the rudder, by increaſing the ſtern-way, and at the ſame time it makes no oppoſition to the converſion which is going on. The continuation of her circular motion will preſently cauſe them to take the wind on their after ſurfaces. This will check the ſtern-way, ſtop it, and give the ſhip a little head-way. Now ſhift the helm, ſo that the rudder may again act in conjunction with the headſails in paying her off from the wind. This is the critical part of the evolution, becauſe the ſhip has little or no way through the water, and will frequently remain long in this poſition. But as there are no counteracting forces, the ſhip continues to fall off. Then the weather-braces of the after-ſails may be gently rounded in, ſo that the wind acting on their hinder ſurfaces may both puſh the ſhip a little ahead and her ſtern laterally in conjunction with the rudder. Thus the wind is brought upon the quarter, and the headſails ſhiver. By this time the ſhip has acquired ſome headway. A continuation of the rotation would now fill the headſails, and their action would be contrary to the intended evolution. They are therefore immediately braced the other way, nearly ſquare, and the evolution is now completed in the ſame manner with wearing ſhip.

Some ſeamen brace all the ſails aback the moment that the helm is put hard a-lee, but the after-ſails no more aback than juſt to ſquare the yards. This quickly gives the ſhip ſtern-way, and brings the rudder into action in its inverted direction; and they think that the evolution is accelerated by this method.

There is another problem of ſeamanſhip deſerving of our attention, which cannot properly be called an evolution. This is lying-to. This is done in general by laying ſome ſails aback, ſo as to ſtop the head-way produced by others. But there is a conſiderable addreſs neceſſary for doing this in ſuch a way that the ſhip ſhall lie eaſily, and under command, ready to proceed in her courſe, and eaſily brought under weigh.

To bring-to with the fore or main topſail to the maſt, brace that ſail ſharp aback, haul out the mizen, and clap the helm hard a-lee.

Suppoſe the fore-topſail to be aback; the other ſails ſhoot the ſhip ahead, and the lee-helm makes the ſhip come up to the wind, which makes it come more perpendicularly on the ſail which is aback. Then its impulſe ſoon exceeds thoſe on the other ſails, which are now ſhivering, or almoſt ſhivering. The ſhip ſtands ſtill a while, and then falls off, ſo as to fill the after-ſails, which again ſhoot her ahead, and the proceſs is thus repeated. A ſhip lying-to in this way goes a good deal ahead and alſo to leeward. If the main-topſail be aback, the ſhip ſhoots ahead, and comes up till the diminiſhing impulſe of the drawing ſails in the direction of the keel is balanced by the increaſed impulſe on the main-topſail. She lies a-long while in this poſition, driving ſlowly to leeward; and ſhe at laſt falls off by the beating of the water on her weather-bow. She falls off but little, and ſoon comes up again.

Thus a ſhip lying-to is not like a mere log, but has a certain motion which keeps her under command. To get under weigh again, we muſt watch the time of falling off; and when this is juſt about to finiſh, brace about briſkly, and fill the ſail which was aback. To aid this operation, the jib and fore-topmaſt ſtayſail may be hoiſted, and the mizen brailed up: or, when the intended courſe is before the wind or large, back the fore-topſail ſharp, ſhiver the main and mizen topſail, brail up the mizen, and hoiſt the jib and fore-topmaſt ſtayſails altogether.

In a ſtorm with a contrary wind, or on a lee ſhore, a ſhip is obliged to lie-to under a very low ſail. Some ſail is abſolutely neceſſary, in order to keep the ſhip ſteadily down, otherwiſe ſhe would kick about like a cork, and roll ſo deep as to ſtrain and work herſelf to pieces. Different ſhips behave beſt under different ſails. In a very violent gale, the three lower ſtayſails are in general well adapted for keeping her ſteady, and diſtributing the ſtrain. This mode ſeems alſo well adapted for wearing, which may be done by hauling down the mizen-ſtayſail. Under whatever ſail the ſhip is brought-to in a ſtorm, it is always with a fitted ſail, and never with one laid aback. The helm is laſhed down hard a-lee; therefore the ſhip ſhoots ahead, and comes up till the ſea on her weather-bow beats her off again. Getting under weigh is generally difficult: becauſe the ſhip and rigging are lofty abaft, and hinder her from falling off readily when the helm is put hard a-weather. We muſt watch the falling off, and aſſiſt the ſhip by ſome ſmall headſail. Sometimes the crew get up on the weather fore-ſhrouds in a crowd, and thus preſent a ſurface to the wind.

These examples of the three chief evolutions will enable thoſe who are not ſeamen to underſtand the propriety of the different ſteps, and alſo to underſtand the other evolutions as they are deſcribed by practical authors. We are not acquainted with any performance in our language where the whole are conſidered in a connected and ſyſtematical manner. There is a book on this ſubject in French, called *La Manœuvrier*, by M. Bourdé de Ville-Huet, which is in great reputation in France. A tranſlation into Engliſh was publiſhed ſome years ago, ſaid to be the performance of the Chevalier de Sauſeuil a French officer. But this appears to be a bookſeller's puff; for it is undoubtedly the work of ſome perſon who did not underſtand either the French language, or the ſubject, or the mathematical principles which are employed in the ſcientific part. The blunders are not ſuch as could poſſibly be made by a Frenchman not verſant in the Engliſh language, but natural for an Engliſhman ignorant of French. No French gentlemen or officer would have tranſlated a work of this

this kind (which he profeſſes to think ſo highly of) to ſerve the rivals and foes of his country. But indeed it can do no great harm in this way; for the ſcientific part of it is abſolutely unintelligible for want of ſcience in the tranſlator; and the practical part is full of blunders for want of knowledge of the French language.

We offer this account of the ſubject with all proper reſpect and diffidence. We do not profeſs to teach: but by pointing out the defects of the celebrated works of M. Bouguer, and the courſe which may be taken to remove them, while we preſerve much valuable knowledge which they contain, we may perhaps excite ſome perſons to apply to this ſubject, who, by a combination of what is juſt in M. Bouguer's theory, with an experimental doctrine of the impulſes of fluids, may produce a treatiſe of ſeamanſhip which will not be confined to the libraries of mathematicians, but become a manual for ſeamen by profeſſion.

SEA

men. SEAMEN, ſuch perſons as ſerve the king or others at ſea by navigating and fighting ſhips, &c. See *MARITIME State*.

Seamen fighting, quarrelling, or making any diſturbance, may be puniſhed by the commiſſioners of the navy with fine and impriſonment. Regiſtered ſeamen are exempted from ſerving in any pariſh office, &c. and are allowed bounty-money beſide their pay. By the law of merchants, the ſeamen of a veſſel are accountable to the maſter or commander, the maſter to the owners, and the owners to the merchants, for damage ſuſtained either by negligence or otherwiſe. Where a ſeaman is hired for a voyage, and he deſerts before it is ended, he ſhall loſe his wages; and in caſe a ſhip be loſt in a ſtorm, the ſeamen loſe their wages, as well as the owners their freight.

Means of Preſerving the Health of SEAMEN. See MEDICINE, N°. 351.

In addition to what has been ſaid on this ſubject in the place referred to, we ſhall ſubjoin ſome valuable obſervations which we have met with in the ſixth volume of the Memoirs of the Royal Society of Medicine at Paris for the years 1784 and 1785.

In 1783, the marſhal de Caſtries, intending to make ſome changes in the regulations of the navy, particularly with regard to diet, propoſed to the ſociety the two following queſtions: 1. "What are the moſt wholeſome aliments for ſeamen, conſidering the impoſſibility of procuring them freſh meat? And what kinds of ſalt meat, or fiſh, of pulſe, and of drink, are moſt proper for them, and in what quantity, not omitting to inquire into the regimens in uſe amongſt other maritime nations for what may be adopted by us, and into what experience has evinced the utility of, from the accounts of the moſt celebrated navigators?" 2. "A number of patients labouring under different diſeaſes being aſſembled in naval hoſpitals, and different conſtitutions affected by the ſame diſeaſe requiring difference of diet, what general dietetic rules for an hoſpital would be beſt adapted to every exigence, dividing the patients into three claſſes; the firſt in which liquids alone are proper, the ſecond in which we begin to give ſolids in ſmall quantities, and the ſtate of convaleſcence in which a fuller diet is neceſſary?" A committee was appointed to draw up an anſwer to theſe, who inveſtigated the ſubject very minutely. The reſult of their labours is there given at large. The obſervations moſt worthy of notice are, that the ſcurvy of the Engliſh ſeamen, who live chiefly on ſalt meat, is a putrid diſeaſe; whilſt that of the Dutch, who uſe farinaceous vegetables and dried pulſe in large quantities, has more of an hydropical tendency. A mixture of both, even at the ſame meal,

SEA

is recommended. This is ſupported by philoſophical reaſoning, and the example of Captain Cook, who was partly indebted to this mixed regimen for the preſervation of his crew. Salt fiſh ſhould never be uſed: ſalt beef grows hard, and after boiling its fibrous parts only remain, which are more calculated to load the ſtomach than recruit the ſtrength. Salt bacon may be kept at ſea 18 months; it does not loſe its moiſt and nutrimental parts, and unites better with pulſe, but ſhould not be uſed when rancid. Live animals kept on board ſhips tend to produce diſeaſes amongſt the crew. Rice ſhould be uſed largely. Our puddings are bad food: the flour would be much better made into bread, which might be done at ſea with no great trouble. Sour krout ſhould be uſed freely. Muſtard, vinegar, ſugar, melaſſes and honey, are good antiſcorbutics. Of drinks, wine is the beſt: wort, ſpruce-beer, or the Ruſſian *quas*, are good ſubſtitutes. Spirits are only to be uſed in cold climates, and in ſmall quantity. The greater part of the excellent memoir in anſwer to the ſecond queſtion, perfectly coincides with M. Duhamel du Monceaux's "Means of Preſerving the Health of Seamen," and M. Poiſſonnier des Perrieres's treatiſes "On the Diſeaſes of Seamen," and "On the advantages of changing the Diet of Seamen," and his "Examination of Pringle's Diſſertation." Seamen, Seapoys.

SEAPOYS, or SEPOYS, natives of Indoſtan ſerving in a military capacity under the European powers, and diſciplined after the European manner.

The Seapoys of the Engliſh Eaſt India Company compoſe perhaps the moſt numerous, regular, and beſt diſciplined body of black troops in the world. They are raiſed from among the natives of the country, and conſiſt of Moors or Mahometans, Raja-poots, Hindoos, Pariars, beſides many intermediate caſts peculiar to themſelves; the whole modelled in all correſponding particulars, and diſciplined in every reſpect, as the army of Great Britain.

The military eſtabliſhments of Bengal, Madras, and Bombay, have each their reſpective numbers, that of Bengal exceeding the reſt. The Seapoys are formed into complete, uniform, and regular battalions, as our marching regiments at home, being intended to repreſent and anſwer fully to every purpoſe in India to the like troops in Europe. A battalion conſiſts of 700 men, of complete effective ſtrength. In each there are eight companies, including two flank ones or grenadiers. They are reſpectively commanded by their own black and European officers; to each company there is attached a ſubaltern, who takes the command, under whom are two native commiſſioned officers, bearing the rank of ſubidar and jimindar; of eight ſubalterns, ſix

are

Seapoys. are lieutenants, the other enſigns; excluſive is a ſtaff, of adjutant and ſurgeon. The black non-commiſſioned officers anſwer to our ſerjeants and corporals, and are called *havildars* and *naigues*. There is alſo to each corps an Engliſh ſerjeant-major, drill and ſtore ſerjeant; to each battalion is a band of drums and fifes, and to each a pair of colours. A captain commands the whole.

Their jackets, which are made entirely after the European faſhion, are of a red colour with yellow facings (as worn by all the infantry of the Company on the Coromandel coaſt). The remaining part of their attire reſembles more the country or Indian habit, and conſiſts of a dark blue turban, broad and round at top, deſcending deep to the bottom, the ſides of which, of a concave form, are croſſed by a white band, running in front, faſtened under a roſe above. As an under garment, they have a jacket of linen. A dark blue ſaſh girding, to anſwer the turban, goes round their middle. On the thighs they have ſhort drawers, faſtened by a ſcolloped band. Their legs are bare, which renders them more ready for action or ſervice. Their arms are a firelock and bayonet; their accoutrements or croſs belts black leather, with pouches the ſame.

A battalion drawn out cannot but ſtrike the ſpectators with a lively and fanciful military impreſſion, as they unite in their exterior traits reſpectively Indian and European.

They are brought to the utmoſt exactneſs of diſcipline; go through their evolutions and manœuvres with a regularity and preciſion equal to, and not ſurpaſſed by, European troops. In action they are brave and ſteady, and have been known to ſtand where Europeans have given way.

Their diſcipline puts them on a footing with European troops, with whom they are always ready to act in concert.

Their utility and ſervices are evident: they ſecure to the Company the internal good order and preſervation of their territorial diſtricts, which, though poſſible to be enforced with a ſtrong hand by Europeans, requires numbers, and can only be conducted with that eaſe and addreſs peculiar to the native forces of the country.

They are conſidered with reſpect in the eyes of the other natives, though they ſufficiently, and with a good grace, feel and aſſert their own conſequence. In large garriſons, where the duty is great, as Madras, Pondicherry, Trichinopoly, Vellore, &c. two or three battalions might be preſent together, excluſive of Europeans. If ſent ſingly up the country, they are liable to be detached, ſometimes by one or more companies being ſent to a ſtation dependent on the chief garriſon or headquarters, otherwiſe they are diſperſed through the diſtricts, four or five together, with a non-commiſſioned officer (this is a part of the ſervice which is called *going on command*), on hills, or in villages, to preſerve order, convey intelligence, and aſſiſt the taſildar, renter, or cutwall of the place, in caſes of emergency. They alſo enforce the police, and prevent in ſuch caſes the country from being infeſted with thieves, which otherwiſe have combined, forming a banditti, to rob paſſengers and plunder cattle, of which there are ſo many inſtances upon record. As for ſuch Britiſh officers in the Company's ſervice as are attached to battalions, they are obliged to follow the fortunes and deſtinations of their men, with their reſpective corps, leading a life often replete with adventures of a peculiar nature. An individual in ſuch caſes is frequently ſecluded from thoſe of his own colour when up the country, or detached upon command, where in a frontier garriſon or hill fort in the interior parts of India none but natives are to be found. Here he might live as he pleaſes, being perfectly abſolute within his juriſdiction. Such ſtations being lucrative, with management may produce great fortunes. Neither is the condition hard to a perſon converſant in the language of the country, or that of the Seapoys called *Moors* (which moſt officers in the Company's ſervice acquire); otherwiſe the loſs of ſociety is not recompenſed by other advantages, as you forget your own language, grow melancholy, and paſs your days without comfort.

The peace eſtabliſhment at Madras conſiſts of 30 Seapoy battalions, but in time of war is augmented as occaſion requires; or frequently each corps is ſtrengthened by the addition of two companies, which are reduced again in time of peace, the officers remaining ſupernumeraries in the ſervice. In garriſon they are quartered in barracks: they live agreeably to the uſage of the country, ſleep on the ground on a mat or thin carpet. In their perſons they are cleanly, but appear to beſt advantage in their uniform. Off duty they go as the other natives in poor circumſtances; and have only a cloth round their middle and over their ſhoulders. As to the different caſts, the Moormen or Muſſelmen aſſert pre-eminence, as coming into the country by conqueſt. In their perſons they are rather robuſt, and in their tempers vindictive. Their religion and dreſs is diſtinct from the Hindoos, who are mild and paſſive in their temper, faithful, ſteady, and good ſoldiers. The Pariars are inferior to the others, live under different circumſtances, dwell in huts, and aſſociate not on equal terms with the reſt; they do all menial offices, are ſervants to Europeans, and think themſelves happy when by them employed, though they are equally good Seapoys.

Having thus treated of the Company's Seapoys, we ſhall obſerve that they are kindly attentive to their officers when often in circumſtances requiring their aſſiſtance; are guilty of few vices; and have a ſtrong attachment for thoſe who have commanded them. That acute hiſtorian Dr Robertſon has remarked, as a proof that the ingenuity of man has recourſe in ſimilar ſituations to the ſame expedients, that the European powers have, in forming the eſtabliſhment of theſe native troops, adopted the ſame maxims, and, probably without knowing it, have modelled their battalions of Seapoys upon the ſame principles as Alexander the Great did his phalanx of Perſians.

SEARCH-WARRANT, in law, a kind of general warrant iſſued by juſtices of peace or magiſtrates of towns for ſearching all ſuſpected places for ſtolen goods. In Scotland this was often done formerly; and in ſome Engliſh law-books there are precedents requiring the conſtable to ſearch all ſuch ſuſpected places as he and the party complaining ſhall think convenient; but ſuch practice is condemned by Lord Hale, Mr Hawkins, and the beſt authorities both among the Engliſh and Scotch lawyers. However, in caſe of a complaint, and oath made of goods ſtolen, and that the party ſuſpects that thoſe goods are in a particular houſe, and ſhows the

cher ning.

cauſe of ſuch ſuſpicion, the juſtice may grant a warrant to ſearch not only that houſe but other ſuſpected places; and to attach the goods, and the party in whoſe cuſtody they are found, and bring them before him or ſome other juſtice, to give an account how he came by them, and to abide ſuch order as to law ſhall appertain; which warrant ſhould be directed to the conſtable or other public officer, who may enter a ſuſpected houſe and make ſearch.

SEARCHER, an officer in the cuſtoms, whoſe buſineſs it is to ſearch and examine ſhips outward bound, if they have any prohibited goods on board, &c. (12 Car. II.) There are alſo ſearchers of leather, &c. See ALNAGER.

SEARCHER, in ordnance, is an iron ſocket with branches, from four to eight in number, a little bent outwards, with ſmall points at their ends; to this ſocket is fixed a wooden handle, from eight to twelve feet long, of about an inch and a quarter diameter. After the gun has been fired, this ſearcher is introduced into it, and turned round, in order to diſcover the cavities within. The diſtances of theſe cavities, if any be found, are then marked on the outſide with chalk, when another ſearcher that has only one point, about which a mixture of wax and tallow is put, is introduced to take the impreſſion of the holes; and if there be any hole, a quarter of an inch deep, or of any conſiderable length, the gun is rejected as unſerviceable.

SEARCLOTH, or CERECLOTH, in ſurgery, a form of external remedy ſomewhat harder than an unguent, yet ſofter than an emplaſter, though it is frequently uſed both for the one and the other. The cerecloth is always ſuppoſed to have wax in its compoſition, which diſtinguiſhes and even denominates it. In effect, when a liniment or unguent has wax enough in it, it does not differ from a cerecloth.

SEASIN, in a ſhip, the name of a rope by which the boat rides by the ſhip's ſide when in harbour, &c.

SEASONING, the firſt illneſs to which perſons habituated to colder climates are ſubject on their arrival in the Weſt Indies. This ſeaſoning, unleſs they live very temperately, or are in a proper habit of body (tho' ſome people are unmoleſted for many months), ſeldom ſuffers them to remain long before it makes its appearance in ſome mode or other; particularly if at firſt they expoſe themſelves in a ſhower of rain, or too long in the ſun, or in the night air; or when the body is much heated, if they drink large draughts of cold liquors, or bathe in cold water; or uſe much exerciſe; or commit exceſs in drinking wine or ſpirits; or by heating the body and inflaming the blood; or by ſubjecting themſelves to any cauſe that may ſuddenly check perſpiration, which at firſt is generally exceſſive.

ley on cal ſes.

Some people, from a favourable ſtate of body, have no ſeaſoning. Thin people, and very young people, are moſt likely to eſcape it. Women generally do from their temperance, and perhaps their menſtruation contributes to their ſecurity; indeed hot climates are favourable to the delicacy of their habits, and ſuitable to their modes of life. Some eſcape by great regularity of living; ſome, by the breaking out of the raſh, called the *prickly heat*; ſome by a great degree of perſpiration; and ſome by obſerving a cooling regimen. The diſorders are various that conſtitute this ſeaſoning of *new comers* as they are called; depending on age, conſtitution, and habit of body. But all ſeaſoning diſeaſes are of the inflammatory kind; and yield to antiphlogiſtic treatment proportioned to their violence. When all precaution to guard againſt ſickneſs has failed, and prudence proved abortive to new comers, they will have this comfort at leaſt for their pains, that their diſorders will ſeldom be ſevere or expenſive, and will generally have a ſpeedy termination; and that their ſeaſoning, as it is emphatically called, will be removed by bleeding, a doſe of ſalts, reſt, and a cooling regimen.

Seaſoning ‖ St Sebaſtian.

SEASONING of Timber. See TIMBER.

SEASONS, in coſmography, certain portions or quarters of the year, diſtinguiſhed by the ſigns which the ſun then enters, or by the meridian altitudes of the ſun; conſequent on which are different temperatures of the air, different works in tillage, &c. See WEATHER.

The year is divided into four ſeaſons, ſpring, ſummer, autumn, and winter. The beginnings and endings of each whereof, ſee under its proper article. It is to be obſerved, the ſeaſons anciently began differently from what they now do: witneſs the old verſes,

Dat Clemens hyemem; dat Petrus ver cathedratus;
Æſtuat Urbanus; autumnat Bartholomæus.

SEAT, in the manege, is the poſture or ſituation of a horſeman upon the ſaddle.

SEATON, a ſmall fiſhing town on the ſouth coaſt of Devon, between Lyme and Sidmouth. Riſdon ſays "our learned antiquarians would have it to be that *Maridunum* whereof Antonine ſpake, placed between Dunnovaria and Iſca; for *Maridunum* in Britiſh is the ſame with *Seaton* in Engliſh, 'a town upon a hill by the ſea ſide.'" This place is memorable for the Daniſh princes landing there in the year 937.

SEBACIC ACID, the acid procured from fat. To obtain it, let ſome ſuet be melted in a ſkillet over the fire, along with ſome quicklime in fine powder, and conſtantly ſtirred, raiſing the fire towards the end of the operation, and taking care to avoid the vapours, which are very offenſive. By this proceſs the ſebacic acid unites with the lime into a ſebat of lime, which is difficultly ſoluble in water; it is, however, ſeparated from the fatty matters with which it is mixed by ſolution in a large quantity of boiling water. From this the neutral ſalt is ſeparated by evaporation; and, to render it pure, is calcined, rediſſolved, and again cryſtallized. After this we pour on a proper quantity of ſulphuric acid, and the ſebacic acid paſſes over by diſtillation. See FAT, and CHEMISTRY, *Index*.

ST SEBASTIAN, a handſome, populous, and ſtrong town of Spain, in the province of Guipuſcoa, with a good and well frequented harbour. It is ſeated at the foot of a mountain; and the harbour ſecured by two moles, and a narrow entrance for the ſhips. The town is ſurrounded with a double wall, and to the ſea-ſide is fortified with baſtions and half moons. The ſtreets are long, broad, and ſtraight, and paved with white flag-ſtones. At the top of the mountain is a citadel, with a garriſon well furniſhed with cannon. The town carries on a conſiderable trade, the greateſt part of which conſiſts of iron and ſteel, which ſome reckon to be the beſt in Europe. They alſo deal in wool, which comes from

Sebaſtiano Scale. from Old Caſtile. W. Long. 1. 59. N. Lat. 43. 23.—The capital of Braſil in South America is likewiſe called *Sebaſtian*.

SEBASTIANO, called *Del Piombo*, from an office in the lead mines given him by Pope Clement VII. was an eminent Venetian painter, born in 1485. He was firſt a diſciple of old Giovanni Bellino; continued his ſtudies under Giorgione; and having attained an excellent manner of colouring, went to Rome, where he inſinuated himſelf into the favour of Michael Angelo. He has the name of being the firſt who invented the art of preparing plaſter-walls for oil-painting; but was ſo ſlow and lazy in his work, that other hands were often employed to finiſh what he began. He died in 1547.

SEBESTEN, in botany. See CORDIA.

SEBUÆI, a ſect among the ancient Samaritans, whom St Epiphanius accuſed of changing the time expreſſed in the law, for the celebration of the great annual feaſt of the Jews.

SEBURAI, SEBURÆI, a name which the Jews give to ſuch of their rabbins or doctors as lived and taught ſome time after the finiſhing of the Talmud.

SECACUL, in the materia medica of the ancients, a name given by Avicenna, Serapion, and others, to a root which was like ginger, and was brought from the Eaſt Indies, and uſed as a provocative to venery. The interpreters of their works have rendered this word *iringo*; and hence ſome have ſuppoſed that our *eryngium* or *eryngo* was the root meant by it: but this does not appear to be the caſe on a ſtrict inquiry, and there is ſome reaſon to believe that the famous root, at this time called *ginſeng*, was what they meant.

SECALE, RYE, in botany: A genus of the digynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is a glume of two leaves, which are oppoſite to one another, erect, linear, pointed, and leſs than the corolla. The corolla conſiſts of two valves, the exterior of which ends in a beard. There are four ſpecies, the *villoſum*, *orientale*, *creticum*, and *cereale*. The *villoſum*, or wood rye-graſs, is diſtinguiſhed by a calyx with wedge-ſhaped ſcales, and by the fringe of the glume being woolly. The glumes of the *orientale* are ſhaggy, and the ſcales of the calyx ſhaped like an awl. The glumes of the *creticum* are fringed on the outſide. The *cereale*, or common rye, has glumes with rough fringes. It is a native of the iſland of Candia, was introduced into England many ages ago, and is the only ſpecies of rye cultivated in this kingdom. There are, however, two varieties, the winter and ſpring rye.

The winter rye, which is larger in the grain than the ſpring rye, is ſown in autumn at the ſame time with the wheat, and ſometimes mixed with it; but as the rye ripens ſooner than the wheat, this method muſt be very exceptionable. The ſpring rye is ſown along with the oats, and uſually ripens as ſoon as the winter rye; but the grain produced is lighter, and it is therefore ſeldom ſown except where the autumnal crop has failed.

Rye is commonly ſown on poor, dry, limeſtone, or ſandy ſoils, where wheat will not thrive. By continuing to ſow it on ſuch a ſoil for two or three years, it will at length ripen a month earlier than that which has been raiſed for years on ſtrong cold ground. Sece

Rye is commonly uſed for bread either alone or mixed with wheat. This mixture is called *meſlin*, and was formerly a very common crop in ſome parts of Britain. Mr Marſhall tells us, that the farmers in Yorkſhire believe that this mixed crop is never affected by mildew, and that a ſmall quantity of rye ſown among wheat will prevent this deſtructive diſeaſe. Rye is much uſed for bread in ſome parts of Sweden and Norway by the poor people. About a century ago rye-bread was alſo much uſed in England; but being made of a black kind of rye, it was of the ſame colour, clammy, very detergent, and conſequently not ſo nouriſhing as wheat.

Rye is ſubject to a diſeaſe which the French call *ergot*, and the Engliſh *horned rye*; which ſometimes happens when a very hot ſummer ſucceeds a rainy ſpring. According to Tiſſot, horned rye is ſuch as ſuffers an irregular vegetation in the middle ſubſtance between the grain and the leaf, producing an exceſcence of a browniſh colour, about an inch and half long, and two-tenths of an inch broad. Bread made of this kind of rye has a nauſeous acrid taſte, and produces ſpaſmodic and gangrenous diſorders. In 1596 an epidemic diſeaſe prevailed in Heſſe, which the phyſicians aſcribed to bread made of horned rye. Some, we are told, were ſeized with an epilepſy, and theſe ſeldom ever recovered; others became lunatic, and continued ſtupid the reſt of their lives: thoſe who apparently recovered had annual returns of their diſorder in January and February; and the diſeaſe was ſaid to be contagious at leaſt in a certain degree. The facts which we have now mentioned are taken from a work of Tiſſot, which was never printed. The ſame diſeaſe was occaſioned by the uſe of this bread in ſeveral parts of the continent in the years 1648, 1675, 1702, 1716, 1722, and 1736; and has been very minutely deſcribed by Hoffman, A. O. Goelicke, Vater Burghart, and J. A. Srink.

In the year 1709, one fourth part of all the rye raiſed in the province of Salonia in France was horned, and the ſurgeon to the hoſpital of Orleans had no leſs than 500 patients under his care that were diſtempered by eating it: They were called *ergots*, from *ergot* (A), the French name for horned rye; they conſiſted chiefly of men and boys, the number of women and girls being very ſmall. The firſt ſymptom was a kind of drunkenneſs, then the local diſorder began in the toes, and thence extended ſometimes to the thigh, and the trunk itſelf, even after amputation, which is a good argument againſt that operation before the gangrene is ſtopped.

In the year 1710, the celebrated Fontenelle deſcribes a caſe in the Hiſtory of the Academy of Sciences of France, which exactly reſembles that of the poor family at Wattiſham. A peaſant at Blois, who had eaten horned rye in bread, was ſeized with a mortification, which firſt cauſed all the toes of one foot to fall off, then

(A) *Ergot* is French for a cock's ſpur, and horned rye was called *ergot* from the reſemblance of its excreſcence to that part.

ecant, ceders.

then the toes of the other, afterwards the remainder of the feet, and, laſtly, it ate off the fleſh of both his legs and thighs, leaving the bones bare.

Horned rye is not only hurtful to man, but to other animals; it has been known to deſtroy even the flies that ſettled upon it; ſheep, dogs, deer, geeſe, ducks, ſwine, and poultry, that were fed with it for experiment, died miſerably, ſome convulſed, others mortified and ulcerated.

SECANT, in geometry, a line that cuts another or divides it into parts. The ſecant of a circle is a line drawn from the circumference on one ſide to a point without the circumference on the other; and it is demonſtrated by geometers, that of ſeveral ſecants drawn to the ſame point, that is the longeſt which paſſes through the centre of the circle. The portions, however, of theſe ſeveral ſecants that are without the circle are ſo much the greater as they recede from the centre, and the leaſt external portion is of that ſecant which paſſes through it.

SECANT, in trigonometry, denotes a right line drawn from the centre of a circle, which, cutting the circumference, proceeds till it meets with a tangent to the ſame circle. See GEOMETRY, N° 24—28.

Line of SECANTS, one of thoſe lines or ſcales which are uſually put upon ſectors. How ſuch a ſcale is formed will be ſeen by a bare inſpection of fig. 53. Plate CCXV.; for C 10, C 20, C 30, &c. drawn from the centre C to the line of tangents BE, being the real ſecants of the arches B 10, B 20, B 30, it is obvious that by marking off the diſtances B 10, B 20, B 30, upon any other line, we make that line a ſcale of ſecants.

1 ceders.

SECEDERS, a numerous body of Preſbyterians in Scotland, who have withdrawn from the communion of the eſtabliſhed church. As they take up their ground upon the eſtabliſhment of religion from 1638 to 1650, which they hold to be the pureſt period of the Scottiſh church, we ſhall introduce our account of them by a ſhort review of eccleſiaſtical hiſtory from that period to the era of their ſeceſſion. With our uſual candour and impartiality we mean to give a fair ſtatement of thoſe events with which, as they ſay, their ſeceſſion is connected.

James I. having for ſome time previous to his death entertained a wiſh to form the church of Scotland as much as poſſible upon the model of that in England, his ſon Charles, with the aſſiſtance of Archbiſhop Laud, endeavoured to carry the deſign into execution, by eſtabliſhing canons for eccleſiaſtical diſcipline, and introducing a liturgy into the public ſervice of the church.—Numbers of the clergy and laity of all ranks took the alarm at what they conſidered to be a bold and dangerous innovation; and after frequent applications to the throne, they at laſt obtained the royal proclamation for a free parliament and general aſſembly. The aſſembly met in 1638, and began their labours with a repeal of all the acts of the ſix preceding parliaments, which had favoured the deſigns of James. They condemned the liturgy, together with every branch of the hierarchy. They cited all the Scottiſh biſhops to their bar; and after having excommunicated nine of them, and depoſed five from their epiſcopal office, they reſtored kirk-ſeſſions, preſbyteries, and ſynods provincial as well as national. See PRESBYTERIANS.

These proceedings were ratified by the parliament which met in 1640. The law of patronage was in full force for ſeveral years after this period; yet great care was taken that no miniſter ſhould be obtruded on the Chriſtian people contrary to their inclinations; and in 1649 it was aboliſhed as an oppreſſive grievance. Seceders.

The Reſtoration of Charles II. in 1660 changed the face of affairs in the church of Scotland. All that the general aſſembly had done from 1638 to 1650 was rendered null and void, their covenants were pronounced to be unlawful, epiſcopacy was reſtored, and the king was declared to be the ſupreme head of the church in all cauſes civil and eccleſiaſtical. During this period the Preſbyterians were ſubjected to fines and impriſonment, while numbers of them were publicly executed for their adherence to their political and religious tenets.

The Revolution in 1688 gave a different turn to the affairs of the church. The firſt parliament which met after that event, aboliſhed prelacy and the king's ſupremacy in eccleſiaſtical affairs. They ratified the Weſtminſter Confeſſion of Faith, together with the Preſbyterian form of church-government and diſcipline, "as agreeable to the word of God, and moſt conducive to the advancement of true piety and godlineſs, and the eſtabliſhment of peace and tranquillity within theſe realms." That ſame parliament aboliſhed patronage, and lodged the election of miniſters in the hands of heritors and elders, with the conſent of the congregation.

In the reign of Q. Anne the true Proteſtant religion was ratified and eſtabliſhed, together with the Preſbyterian form of church-government and diſcipline; and the unalterable continuance of both was declared to be an eſſential condition of the union of the two kingdoms in all time coming. In 1712 the law reſpecting patronage was revived, in reſentment, it has been ſaid, of that warm attachment which the church of Scotland diſcovered to the family of Hanover; but the ſeverity of that law was greatly mitigated by the firſt parliament of George I. ſtat. 50. by which it is enacted, that if the preſentee do not ſignify his acceptance, the preſentation ſhall become void and null in law. The church, however, did not avail herſelf of this ſtatute; and an event which happened not many years afterwards gave riſe to the *ſeceſſion*.

2 Origin of.

In 1732 more than 40 miniſters preſented an addreſs to the general aſſembly, ſpecifying in a variety of inſtances what they conſidered to be great defections from the eſtabliſhed conſtitution of the church, and craving a redreſs of theſe grievances. A petition to the ſame effect, ſubſcribed by ſeveral hundreds of elders and private Chriſtians, was offered at the ſame time; but the aſſembly refuſed a hearing to both, and enacted, that the election of miniſters to vacant charges, where an accepted preſentation did not take place, ſhould be competent only to a conjunct meeting of elders and heritors, being Proteſtants. To this act many objections were made by numbers of miniſters and private Chriſtians. They aſſerted that more than 30 to one in every pariſh were not poſſeſſed of landed property, and were on that account deprived of what they deemed their natural right to chooſe their own paſtors. It was alſo ſaid, that this act was extremely prejudical to the honour and intereſt of the church, as well as to the edification of the people; and in fine, that it was directly

Seceders.

contrary to the appointment of Jeſus Chriſt, and the practice of the apoſtles, when they filled up the firſt vacancy in the apoſtolic college, and appointed the election of deacons and elders in the primitive church.—Many of thoſe alſo who were thought to be the beſt friends of the church, expreſſed their fears that this act would have a tendency to overturn the eccleſiaſtical conſtitution which was eſtabliſhed at the Revolution.

3 They oppoſe the meaſures of the general aſſembly;

Mr Ebenezer Erſkine miniſter at Stirling diſtinguiſhed himſelf by a bold and determined oppoſition to the meaſures of the aſſembly in 1732. Being at that time moderator of the ſynod of Perth and Stirling, he opened the meeting at Perth with a ſermon from Pſalm cxviii. 22. "The ſtone which the builders rejected is become the head ſtone of the corner." In the courſe of his ſermon he remonſtrated with no ſmall degree of freedom againſt the act of the preceding aſſembly with regard to the ſettlement of miniſters, and alleged that it was contrary to the word of God and the eſtabliſhed conſtitution of the church. A formal complaint was lodged againſt him for uttering ſeveral offenſive expreſſions in his ſermon before the ſynod. Many of the members declared that they heard him utter nothing but ſound and reaſonable doctrine; but his accuſers inſiſting on their complaint, obtained an appointment of a committee of ſynod to collect what were called the offenſive expreſſions, and to lay them before the next diet in writing. This was done accordingly; and Mr Erſkine gave in his anſwers to every article of the complaint. After three days warm reaſoning on this affair, the ſynod by a majority of ſix found him cenſurable; againſt which ſentence he proteſted, and appealed to the next general aſſembly. When the aſſembly met in May 1733, it affirmed the ſentence of the ſynod, and appointed Mr Erſkine to be rebuked and admoniſhed from the chair. Upon which he proteſted, that, as the aſſembly had found him cenſurable, and had rebuked him for doing what he conceived to be agreeable to the word of God and the ſtandards of the church, he ſhould be at liberty to preach the ſame truths, and to teſtify againſt the ſame or ſimilar evils, on every proper occaſion. To this proteſt Meſſrs William Wilſon miniſter at Perth, Alexander Moncrief miniſter at Abernethy, and James Fiſher miniſter at Kinclaven, gave in a written adherence, under the form of inſtrument; and theſe four withdrew, intending to return to their reſpective charges, and act agreeably to their proteſt whenever they ſhould have an opportunity. Had the affair reſted here, there never would have been a ſeceſſion; but the aſſembly reſolving to carry on the proceſs, cited them by their officer to compear next day. They obeyed the citation; and a committee was appointed to retire with them, in order to perſuade them to withdraw their proteſt. The committee having reported that they ſtill adhered to their proteſt, the aſſembly ordered them to appear before the commiſſion in Auguſt following and retract their proteſt; and if they ſhould not comply and teſtify their ſorrow for their conduct, the commiſſion was empowered to ſuſpend them from the exerciſe of their miniſtry, with certification that if they ſhould act contrary to ſaid ſentence, the commiſſion ſhould proceed to a higher cenſure.

4 for which their miniſters are cenſured.

The commiſſion met in Auguſt accordingly; and the four miniſters ſtill adhering to their proteſts, were ſuſpended from the exerciſe of their office, and cited to the next meeting of the commiſſion in November following. From this ſentence ſeveral miniſters and elders, members of the commiſſion, diſſented. The commiſſion met in November, and the ſuſpended miniſters compeared. Addreſſes, repreſentations, and letters from ſeveral ſynods and preſbyteries, relative to the buſineſs now before the commiſſion, were received and read. The ſynods of Dumfries, Murray, Roſs, Angus and Mearns, Perth and Stirling, craved that the commiſſion would delay proceeding to a higher cenſure. The ſynods of Galloway and Fife, as alſo the preſbytery of Dornoch, addreſſed the commiſſion for lenity, tenderneſs, and forbearance, towards the ſuſpended miniſters; and the preſbytery of Aberdeen repreſented, that, in their judgment, the ſentence of ſuſpenſion inflicted on the foreſaid miniſters was too high, and that it was a ſtretch of eccleſiaſtical authority. Many members of the commiſſion reaſoned in the ſame manner, and alleged that the act and ſentence of laſt aſſembly did not oblige them to proceed to a higher cenſure at this meeting of the commiſſion. The queſtion, however, was put, Proceed to an higher cenſure, or not? and the votes being numbered, were found equal on both ſides: upon which Mr John Goldie the moderator gave his caſting vote to proceed to an higher cenſure; which ſtands in their minutes in theſe words: "The commiſſion did and hereby do looſe the relation of Mr Ebenezer Erſkine miniſter at Stirling, Mr William Wilſon miniſter at Perth, Mr Alexander Moncrief miniſter at Abernethy, and Mr James Fiſher miniſter at Kinclaven, to their reſpective charges, and declare them no longer miniſters of this church; and do hereby prohibit all miniſters of this church to employ them, or any of them, in any miniſterial function. And the commiſſion do declare the churches of the ſaid miniſters vacant from and after the date of this ſentence.

5 Suſpend from the exerciſe of their office.

6 Deprived of their livings.

This ſentence being intimated to them, they proteſted, that their miniſterial office and relation to their reſpective charges ſhould be held *as* valid as if no ſuch ſentence had paſſed; and that they were now obliged to make a *ſeceſſion* from the prevailing party in the eccleſiaſtical courts; and that it ſhall be lawful and warrantable for them to preach the goſpel, and diſcharge every branch of the paſtoral office, according to the word of God and the eſtabliſhed principles of the church of Scotland. Mr Ralph Erſkine miniſter at Dunfermline, Mr Thomas Mair miniſter at Orwel, Mr John M'Laren miniſter at Edinburgh, Mr John Currie miniſter at Kinglaſſie, Mr James Wardlaw miniſter at Dunfermline, and Mr Thomas Nairn miniſter at Abbotſhal, proteſted againſt the ſentence of the commiſſion, and that it ſhould be lawful for them to complain of it to any ſubſequent general aſſembly of the church.

The ſeceſſion properly commenced at this date. And accordingly the ejected miniſters declared in their proteſt that they were laid under the diſagreeable neceſſity of ſeceding, not from the principles and conſtitution of the church of Scotland, to which, they ſaid, they ſtedfaſtly adhered, but from the preſent church courts, which had thrown them out from miniſterial communion. The aſſembly, however, which met in May 1734 did ſo far modify the above ſentence, that they empowered the ſynod of Perth and Stirling to receive the ejected

Seceders.

ministers into the communion of the church, and restore them to their respective charges; but with this express direction, "that the said synod should not take upon them to judge of the legality or formality of the former procedure of the church judicatories in relation to this affair, or either approve or censure the same." As this appointment neither condemned the act of the preceding assembly nor the conduct of the commission, the seceding ministers considered it to be rather an act of grace than of justice, and therefore they said they could not return to the church-courts upon this ground; and they published to the world the reasons of their refusal, and the terms upon which they were willing to return to the communion of the established church. They now erected themselves into an ecclesiastical court, which they called the *Associated Presbytery*, and preached occasionally to numbers of the people who joined them in different parts of the country. They also published what they called an *Act, Declaration, and Testimony* to the doctrine, worship, government, and discipline of the church of Scotland, and against several instances, as they said, of defection from these, both in former and in the present times. Some time after this several ministers of the established church joined them, and the Associated Presbytery now consisted of eight ministers. But the general assembly which met in 1738 finding that the number of Seceders was much increased, ordered the eight ministers to be served with a libel, and to be cited to the next meeting of the assembly in 1739. They now appeared at the bar as a constituted presbytery, and having formally declined the assembly's authority, they immediately withdrew. The assembly which met next year deposed them from the office of the ministry; which, however, they continued to exercise in their respective congregations, who still adhered to them, and erected meeting-houses, where they preached till their death. Mr James Fisher, the last survivor of them, was, by an unanimous call in 1741, translated from Kinclaven to Glasgow, where he continued in the exercise of his ministry among a numerous congregation, respected by all ranks in that large city, and died in 1775 much regretted by his people and friends. In 1745 the seceding ministers were become so numerous, that they were erected into three different presbyteries, under one synod, when a very unprofitable dispute divided them into two parties.

The burgess oath in some of the royal boroughs of Scotland contains the following clause: "I profess and allow with my heart the true religion presently professed within this realm, and authorized by the laws thereof. I will abide at and defend the same to my life's end, renouncing the Romish religion called *Papistry*." Messrs Ebenezer and Ralph Erskine, James Fisher, and others, affirmed that this clause was no way contrary to the principles upon which the secession was formed, and that therefore every Seceder might lawfully swear it. Messrs Alexander Moncrief, Thomas Mair, Adam Gib, and others, contended on the other hand that the swearing of the above clause was a virtual renunciation of their testimony. And this controversy was so keenly agitated, that they split into two different parties, and now meet in different synods. Those of them who assert the lawfulness of swearing the burgess oath are called *Burghers*, and the other party who condemn it are called *Antiburgher Seceders*. Each party claiming to itself the lawful constitution of the *Associate Synod*, the Antiburghers, after several previous steps, excommunicated the Burghers on the ground of their sin and of their contumacy in it. This rupture took place in 1747, since which period no attempts to effect a reunion have been successful. They remain under the jurisdiction of different synods, and hold separate communion, although much of their former hostility has been laid aside. The Antiburghers consider the Burghers as too lax and not sufficiently stedfast to their testimony. The Burghers on the other hand contend that the Antiburghers are too rigid, in that they have introduced new terms of communion into the society. The Antiburghers having adopted ideas with regard to what they call *covenanting*, which the Burghers never approved (A), have been in use of renewing in their several congregations the Scottish Covenant, by causing their people formally swear to maintain it. In other respects the differences between the two parties are not material. The Antiburghers are most numerous on the north of the Tay, and the Burghers on the south of it.

9 and form separate communions.

10 History of the Burgher Seceders.

What follows in this article is a further account of those who are commonly called the *Burgher Seceders*. These have a greater number of people in their communion than the Antiburghers, and for some years past they have greatly increased in the southern and western districts of Scotland. As there were among them from the commencement of their secession several students who had been educated at one or other of the universities, they appointed one of their ministers to give lectures in theology, and train up candidates for the ministry. Messrs William Wilson minister at Perth and Alexander Moncrief minister at Abernethy were their professors of theology before their separation from the Antiburghers.

Since that period Mr Ebenezer Erskine minister at Stirling, Mr James Fisher minister at Glasgow, Mr John Swanston minister at Kinross, and Mr John Brown minister at Haddington, have succeeded each other in this office. At present (1794) Mr George Lawson minister at Selkirk is their professor of theology, and there are between thirty and forty students who attend his lectures annually. The number of their ministers is about a hundred, and each of their congregations contains from two hundred and fifty to three thousand persons; and there are among them at present more than twenty vacant charges. Where a congregation is very numerous, as in Stirling, Dunfermline, and Perth, it is formed into a collegiate charge, and provided with two ministers. They are erected into six dif-

(A) This is the account which the Burghers give of their own notions respecting the covenant. One of the most enlightened of their opponents, however, assures us that they acknowledge covenanting to be a *moral duty*, and that the solemn vows of our ancestors are obligatory. But since the breach in the synod they have never engaged in this work; giving, as their reason, that this is not the proper season.

Seceders. ferent preſbyteries, united in one general ſynod, which commonly meets at Edinburgh in May and September (B). They have alſo a ſynod in Ireland compoſed of three or four different preſbyteries. They are legally tolerated in Ireland; and government ſome years ago granted 500l. per annum, and of late an additional 500l. which, when divided among them, affords to each miniſter about 20l. over and above the ſtipend which he receives from his hearers. Theſe have beſides a preſbytery in Nova Scotia; and ſome years ago, it is ſaid, that the Burgher and the Antiburgher miniſters reſiding in the United States formed a coalition, and joined in a general ſynod, which they call the *Synod* of *New York* and *Penſylvania*. They all preach the doctrines contained in the Weſtminſter Confeſſion of Faith and Catechiſms, as they believe theſe to be founded on the ſacred Scriptures. They catechiſe their hearers publicly, and viſit them from houſe to houſe once every year. They will not give the Lord's ſupper to thoſe who are ignorant of the principles of the goſpel, nor to ſuch as are ſcandalous and immoral in their lives. They condemn private baptiſm, nor will they admit thoſe who are groſsly ignorant and profane to be ſponſors for their children. Believing that the people have a natural right to chooſe their own paſtors, the ſettlement of their miniſters always proceeds upon a popular election; and the candidate who is elected by the majority is ordained among them. Convinced that the charge of ſouls is a truſt of the greateſt importance, they carefully watch over the morals of their ſtudents, and direct them to ſuch a courſe of reading and ſtudy as they judge moſt proper to qualify them for the profitable diſcharge of the paſtoral duties. At the ordination of their miniſters they uſe a *formula* of the ſame kind with that of the eſtabliſhed church, which their miniſters are bound to ſubſcribe when called to it; and if any of them teach doctrines contrary to the Scriptures or the Weſtminſter Confeſſion of Faith, they are ſure of being thrown out of their communion. By this means uniformity of ſentiment is preſerved among them; nor has any of their miniſters, excepting one, been proſecuted for error in doctrine ſince the commencement of their ſeceſſion.

11 Their rule of faith,

They believe that the holy Scriptures are the ſole criterion of truth, and the only rule to direct mankind to glorify and enjoy God, the chief and eternal good; and that "the Supreme Judge, by which all controverſies of religion are to be determined, and all the decrees of councils, opinions of ancient writers, doctrines of men and private ſpirits, are to be examined, and in whoſe ſentence we are to reſt, can be no other but the Holy Spirit ſpeaking in the Scriptures." They are fully perſuaded, however, that the ſtandards of public authority in the church of Scotland exhibit a juſt and conſiſtent view of the meaning and deſign of the holy Scriptures with regard to doctrine, worſhip, government, and diſcipline; and they ſo far differ from the diſſenters in England, in that they hold theſe ſtandards to be not only articles of peace and a teſt of orthodoxy, but as a bond of union and fellowſhip. They conſider a ſimple declaration of adherence to the Scriptures as too equivocal a proof of unity in ſentiment, becauſe Arians, Socinians, and Arminians, make ſuch a confeſſion of their faith, while they retain ſentiments which they (the Seceders) apprehend are ſubverſive of the great doctrines of the goſpel. They believe that Jeſus Chriſt is the only King and Head of the Church, which is his body; that it is his ſole prerogative to enact laws for the government of his kingdom, which is not of this world; and that the church is not poſſeſſed of a legiſlative, but only of an executive power, to be exerciſed in explaining and applying to their proper objects and ends thoſe laws which Chriſt hath publiſhed in the Scriptures. Thoſe doctrines which they teach relative to faith and practice are exhibited at great length in an explanation of the Weſtminſter Aſſembly's Shorter Catechiſm, by way of queſtion and anſwer, in two volumes, compoſed chiefly by Mr James Fiſher late of Glaſgow, and publiſhed by deſire of their ſynod. Seceders.

For theſe fifty years paſt, the grounds of their ſeceſſion, they allege, have been greatly enlarged by the public adminiſtrations of the eſtabliſhed church, and particularly by the uniform execution of the law reſpecting patronage, which, they ſay, has obliged many thouſands of private Chriſtians to withdraw from the pariſh-churches and join their ſociety.

It is certain, however, that their number has rapidly increaſed of late, eſpecially in the large cities of the kingdom. They have three different congregations in Edinburgh, two in Glaſgow, and two in London, beſides ſeveral others in the north of England. In moſt of their congregations they celebrate the Lord's ſupper twice in the year, and they catechiſe their young people concerning their knowledge of the principles of religion previouſly to their admiſſion to that ſacrament. When any of them fall into the ſin of fornication or adultery, the ſcandal is regularly purged according to the form of proceſs in the eſtabliſhed church; and thoſe of the delinquents who do not ſubmit to adequate cenſure are publicly declared to be fugitives from diſcipline, and are expelled the ſociety. They never accept a ſum of money as a commutation for the offence. They condemn all clandeſtine and irregular marriages, nor will they marry any perſons unleſs they have been proclaimed in the pariſh-church on two different Lord's days at leaſt.

12 and politi cal princi ples.

When they ſeparated from the eſtabliſhed church, they remained firm in their attachment to the ſtate; and they

(B) The conſtitution of the Antiburgher church differs very little from that of the Burghers. The ſupreme court among them is deſigned *The General Aſſociate Synod*, having under its juriſdiction three provincial ſynods in Scotland and one in Ireland. In the former country there are eleven preſbyteries; in the latter, four. They have a few congregations in England, and a preſbytery in connexion with them in North America. The number of miniſters belonging to the general ſynod is a hundred and thirty ſeven; and in Scotland there are nineteen vacancies. They, as well as the Burgher Seceders, have a profeſſor of theology, whoſe lectures every candidate for the office of a preacher is obliged to attend, we have been told, for no leſs than five or ſix ſeſſions! Surely the ſeſſion muſt be of ſhort duration.

they were not many years formed into a diſtinct ſociety, when they expelled from their communion a Mr Thomas Nairn miniſter at Kirkcaldy, who had taught doctrines inimical to the civil government of the nation. In 1745 there was not one of their number who joined the then pretender to the Britiſh crown. They are ſtill of the ſame ſentiments; and in their public aſſemblies they always pray for our ſovereign King George, with the royal family, and for all who are in authority under them. They are ſo far from wiſhing the overthrow of the preſent civil government, that when the nation was lately in danger of being thrown into a fermentation by the circulation of inflammatory and ſeditious writings, they warmly recommended peace and order in ſociety (c). No legal diſqualifications, as in the caſe of the diſſenters in England, exclude them from any place of public truſt in the municipal government of the country; and ſome of them are frequently in the magiſtracy of the royal boroughs. They are not, however, legally tolerated, but are ſupported by the mildneſs of adminiſtration and the liberal ſpirit of the times. Avowing their adherence to the doctrines contained in the public ſtandards of the church of Scotland, together with the Preſbyterian form of government, from which they never intended to ſecede, they deny that they are either ſchiſmatics or ſectaries, as they have been frequently called: and when they withdrew from the eccleſiaſtical courts, they did not, they ſay, conſtitute a church of their own, different from the national church, but profeſs to be a part of that church, endeavouring to hold by her reformed principles, in oppoſition to thoſe deviations from them which they have ſpecified in their *Act and Teſtimony*. Moſt of them live in habits of friendſhip and intimacy with their brethren of the eſtabliſhment, and they profeſs an affectionate regard for all thoſe of every denomination who love Jeſus Chriſt in ſincerity and truth. In the late re-exhibition of their teſtimony, they have declared to the world, that, were the grounds of their ſeceſſion happily removed, they would account it one of the moſt ſingular felicities of their time to return with pleaſure to the communion of the eſtabliſhed church.

SECHIUM, in botany: A genus of the ſyngeneſia order, belonging to the monœcia claſs of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The male calyx is quinquedentate and monophyllous; the corolla monopetalous; the five filaments are united in an erect tube. In the female flower the piſtillum is cylindrical and erect; the ſtigma large, peltated, and reflected: the pericarpium large, oval, unequal, fleſhy, and unilocular, containing one ſeed, which is ſmooth, compreſſed, and fleſhy. Of this there is only one ſpecies, viz. the *Edulis*, or Chocho vine.—This is cultivated and grows very luxuriantly in many places in Jamaica. The vines run and ſpread very much. The fruit is boiled, and ſerved up at table by way of greens; and the root of the old vine is ſomewhat like a yam (*Dioſcorea*), and on being boiled or roaſted taſtes farinaceous and wholeſome. Seckendorf, Secker.

SECKENDORF (Guy Lewis de), a very learned German, deſcended from an ancient and noble family, was born at Aurach in Franconia in 1626. He was a good linguiſt, learned in law, hiſtory, and divinity; and is ſaid to have been a tolerable painter and engraver. He was honourably employed by ſeveral of the German princes; and died counſellor of ſtate to Frederic III. elector of Brandenburg, and chancellor of the univerſity of Halle, in 1692. He wrote many books, particularly "A hiſtory and defence of the Lutheran religion," 2 vols. folio, Frankfort, 1602, in Latin.

SECKER (Thomas), a learned and reſpectable prelate of the church of England, was born, in 1693, at a village called *Sibthorp*, in the vale of Belvoir, Nottinghamſhire. His father was a Proteſtant diſſenter, a pious, virtuous, and ſenſible man; who having a ſmall paternal fortune, followed no profeſſion. His mother was the daughter of Mr George Brough, a ſubſtantial gentleman farmer of Shelton in the ſame county. He received his education at ſeveral private ſchools and academies in the country, being obliged, by various accidents, to change his maſters frequently.

Notwithſtanding this diſadvantage, he had at the age of 19 not only made a conſiderable progreſs in Greek and Latin, and read the beſt writers in both languages, but had acquired a knowledge of French, Hebrew, Chaldee, and Syriac; had learned geography, logic, algebra, geometry, conic ſections, and gone through a courſe of lectures on Jewiſh antiquities and other points, preparatory to the critical ſtudy of the Bible. He had been deſtined by his father for orders among the Diſſenters. With this view, during the latter years of his education, his ſtudies were chiefly turned towards divinity, in which he had made ſuch quick advances, that by the time he was 23 he had carefully read over a great part of the Scriptures, particularly the New Teſtament, in the original, and the beſt comments upon it; Euſebius's Eccleſiaſtical Hiſtory, The Apoſtolical Fathers, Whiſton's Primitive Chriſtianity, and the principal writers for and againſt Miniſterial and Lay Conformity.—But though the reſult of theſe inquiries was a well-grounded belief of the Chriſtian revelation, yet not being at that time able to decide on ſome abſtruſe ſpeculative doctrines, nor to determine abſolutely what communion he ſhould embrace; he reſolved, like a wiſe and honeſt man, to purſue ſome profeſſion, which ſhould leave him at liberty to weigh thoſe things more maturely in his thoughts, and not oblige him to declare or teach publicly opinions which were not yet thoroughly ſettled in his own mind.

In 1716, therefore, he applied himſelf to the ſtudy of phyſic, and after gaining all the medical knowledge he could,

---

(c) All this is ſaid of the Burgher Seceders; but we hope it is equally true of thoſe who are ſtyled Antiburghers. There are indeed ſome clauſes in the Covenant, which they ſwear to maintain, that ſeem not, at firſt view, very friendly to civil ſubordination; but let not thoſe who entertain any apprehenſion on this account, forget that one of the moſt uſeful defences of the Britiſh conſtitution, occaſioned by the late factious ſpirit of democratic innovation, came from the pen of Dr Young the Antiburgher miniſter at Hawick. See *Young's Eſſays*.

could, by reading the uſual preparatory books, and attending the beſt lectures during that and the following winter in London, in order to improve himſelf farther, in January 1718-19 he went to Paris. There he lodged in the ſame houſe with the famous anatomiſt Mr Winſlow, whoſe lectures he attended, as he did thoſe of the materia medica, chemiſtry, and botany, at the king's gardens. The operations of ſurgery he ſaw at the *Hotel Dieu*, and attended alſo for ſome time M. Gregoire, the accoucheur, but without any deſign of ever practiſing that or any other branch of ſurgery. Here he became acquainted with Mr Martin Benſon, afterwards biſhop of Glouceſter, one of the moſt agreeable and virtuous men of his time; with whom he quickly became much connected, and not many years after was united to him by the ſtricteſt bonds of affinity as well as affection.

During the whole of Mr Secker's continuance at Paris, he kept up a conſtant correſpondence with Mr Joſeph Butler, afterwards biſhop of Durham, with whom he became acquainted at the academy of one Mr Jones, kept firſt at Glouceſter, and afterward at Tewkſbury. Mr Butler having been appointed preacher at the Rolls on the recommendation of Dr Clarke and Mr Edward Talbot, ſon to Biſhop Talbot, he now took occaſion to mention his friend Mr Secker, without Secker's knowledge, to Mr Talbot, who promiſed, in caſe he choſe to take orders in the church of England, to engage the biſhop his father to provide for him. This was communicated to Mr Secker in a letter from Mr Butler about the beginning of May 1720. He had not at that time come to any reſolution of quitting the ſtudy of phyſic; but he began to foreſee many obſtacles to his purſuing that profeſſion; and having never diſcontinued his application to theology, his former difficulties both with regard to conformity and ſome other doubtful points had gradually leſſened, as his judgment became ſtronger, and his reading and knowledge more extenſive. It appears alſo from two of his letters ſtill in being, written from Paris to a friend in England, (both of them prior to the date of Mr Butler's abovementioned), that he was greatly diſſatisfied with the diviſions and diſturbances which at that particular period prevailed among the Diſſenters.

In this ſtate of mind Mr Butler's unexpected propoſal found him; which he was therefore very well diſpoſed to take into conſideration; and after deliberating on the ſubject of ſuch a change for upwards of two months, he reſolved at length to embrace the offer, and for that purpoſe quitted France about the beginning of Auguſt 1720.

On his arrival in England, he was introduced to Mr Talbot, with whom he cultivated a cloſe acquaintance; but it was unfortunately of very ſhort duration; for in the month of December that gentleman died of the ſmallpox. This was a great ſhock to all his friends, who had juſtly conceived the higheſt expectations of him; but eſpecially to an amiable lady whom he had lately married, and who was very near ſinking under ſo ſudden and grievous a ſtroke. Mr Secker, beſide ſharing largely in the common grief, had peculiar reaſon to lament an accident that ſeemed to put an end to all his hopes: but he had taken his reſolution, and he determined to perſevere. It was ſome encouragement to him to find that Mr Talbot had, on his deathbed, recommended him, together with Mr Benſon and Mr Butler, to his father's notice. Thus did that excellent young man (for he was but 29 when he died), by his nice diſcernment of characters, and his conſiderate good nature, provide moſt effectually, in a few ſolemn moments, for the welfare of that church from which he himſelf was ſo prematurely ſnatched away; and at the ſame time raiſed up, when he leaſt thought of it, the trueſt friend and protector to his wife and unborn daughter; who afterwards found in Mr Secker all that tender care and aſſiſtance which they could have hoped for from the neareſt relation. Secker.

It being judged neceſſary by Mr Secker's friends that he ſhould have a degree at Oxford; and having been informed, that if he ſhould previouſly take the degree of Doctor in Phyſic at Leyden, it would probably help him in obtaining the other, he went over and took his degree there in March 1721: and, as part of his exerciſe for it, he compoſed and printed a diſſertation *de Medicina Statica*, which is ſtill extant, and is thought by the gentlemen of that profeſſion to be a ſenſible and learned performance.

In April the ſame year, he entered himſelf a gentleman commoner of Exeter college, Oxford; after which he obtained the degree of Bachelor of Arts, in conſequence of the chancellor's recommendatory letter to the convocation.

He now ſpent a conſiderable part of his time in London, where he quickly gained the eſteem of ſome of the moſt learned and ingenious men of thoſe days, particularly of Dr Clarke, rector of St James's, and the celebrated Dean Berkeley, afterwards Biſhop of Cloyne, with whom he every day became more delighted, and more cloſely connected. He paid frequent viſits of gratitude and friendſhip to Mrs Talbot, widow of Mr Edward Talbot, by whom ſhe had a daughter five months after his deceaſe. With her lived Mrs Catharine Benſon, ſiſter to Biſhop Benſon, whom in many reſpects ſhe greatly reſembled. She had been for ſeveral years Mrs Talbot's inſeparable companion, and was of unſpeakable ſervice to her at the time of her huſband's death, by exerting all her courage, activity, and good ſenſe (of which ſhe poſſeſſed a large ſhare), to ſupport her friend under ſo great an affliction, and by afterwards attending her ſickly infant with the utmoſt care and tenderneſs, to which, under Providence, was owing the preſervation of a very valuable life.

Biſhop Talbot being in 1721 appointed to the ſee of Durham, Mr Secker was in 1722 ordained deacon by him in St James's church, and prieſt not long after in the ſame place, where he preached his firſt ſermon, March 28. 1723. The biſhop's domeſtic chaplain at that time was Dr Rundle, a man of warm fancy and very brilliant converſation, but apt ſometimes to be carried by the vivacity of his wit into indiſcreet and ludicrous expreſſions, which created him enemies, and, on one occaſion, produced diſagreeable conſequences.—With him Mr Secker was ſoon after aſſociated in the biſhop's family, and both taken down by his lordſhip to Durham in July 1723.

In the following year the biſhop gave Mr Secker the rectory of Houghton-le-Spring. This preferment putting it in his power to fix himſelf in the world, in a manner agreeable to his inclinations, he ſoon after made a propoſal of marriage to Mrs Benſon; which being accepted,

cepted, they were married by Biſhop Talbot in 1725. At the earneſt requeſt of both, Mrs Talbot and her daughter conſented to live with them, and the two families from that time became one.

About this time Biſhop Talbot alſo gave preferments to Mr Butler and Mr Benſon, whoſe riſe and progreſs in the church is here interwoven with the hiſtory of Mr Secker. In the winter of 1725-6, Mr Butler firſt publiſhed his incomparable ſermons; on which, as Dr Beilby Porteous and Dr Stinton informs us, Mr Secker took pains to render the ſtyle more familiar, and the author's meaning more obvious: yet they were at laſt by many called obſcure. Mr Secker gave his friend the ſame aſſiſtance in that noble work the Analogy of Religion, &c.

He now gave up all the time he poſſibly could to his reſidence at Houghton, applying himſelf with alacrity to all the duties of a country clergyman, and ſupporting that uſeful and reſpectable character throughout with the ſtricteſt propriety. He omitted nothing which he thought would be of uſe to the ſouls and bodies of the people intruſted to his care. He brought down his converſation and his ſermons to the level of their underſtandings; he viſited them in private, he catechiſed the young and ignorant, he received his country neighbours and tenants very kindly and hoſpitably, and was of great ſervice to the poorer ſort of them by his ſkill in phyſic, which was the only uſe he ever made of it. Though this place was in a very remote part of the world, yet the ſolitude of it perfectly ſuited his ſtudious diſpoſition, and the income ariſing from it bounded his ambition. Here he would have been content to live and die; here, as he has often been heard to declare, he ſpent ſome of the happieſt hours of his life; and it was no thought or choice of his own that removed him to a higher and more public ſphere; but Mrs Secker's health, which now began to be very bad, and was thought to be injured by the dampneſs of the ſituation, obliged him to think of exchanging it for a more healthy one. Accordingly, an exchange was made through the friendly interpoſition of Mr Benſon (who generouſly ſacrificed his own intereſt on this occaſion, by relinquiſhing a prebend of his own to ſerve his friend) with Dr Finney, prebendary of Durham, and rector of Ryton; and Mr Secker was inſtituted to Ryton and the prebend June 3. 1727. For the two following years he lived chiefly at Durham, going every week to officiate at Ryton, and ſpending there two or three months together in the ſummer.

In July 1732 he was appointed chaplain to the king; for which favour he was indebted to Dr Sherlock, who having heard him preach at Bath, had conceived the higheſt opinion of his abilities, and thought them well worthy of being brought forward into public notice. From that time an intimacy commenced between them, and he received from that great prelate many ſolid proofs of eſteem and friendſhip.

His month of waiting at St James's happened to be Auguſt, and on Sunday the 27th of that month he preached before the queen, the king being then abroad. A few days after, her majeſty ſent for him into her cloſet, and held a long and gracious converſation with him; in the courſe of which he took an opportunity of mentioning to her his friend Mr Butler. He alſo not long after this, on Mr Talbot's being made lord chancellor, found means to have Mr Butler effectually recommended to him for his chaplain. The queen alſo appointed him clerk of her cloſet; from whence he roſe, as his talents became more known, to thoſe high dignities which he afterwards attained. Secker.

Mr Secker now began to have a public character, and ſtood high in the eſtimation of thoſe who were allowed to be the beſt judges of merit: he had already given proofs of abilities that plainly indicated the eminence to which he muſt one day riſe, as a preacher and a divine; and it was not long before an opportunity offered of placing him in an advantageous point of view. Dr Tyrrwhit, who ſucceeded Dr Clarke as rector of St James's in 1729, found that preaching in ſo large a church endangered his health. Biſhop Gibſon, therefore, his father-in-law, propoſed to the crown that he ſhould be made reſidentiary of St Paul's, and that Mr Secker ſhould ſucceed him in the rectory. This arrangement was ſo acceptable to thoſe in power, that it took place without any difficulty. Mr Secker was inſtituted rector the 18th of May 1733; and in the beginning of July went to Oxford to take his degree of Doctor of Laws, not being of ſufficient ſtanding for that of divinity. On this occaſion it was that he preached his celebrated Act Sermon, on the advantages and duties of academical education, which was univerſally allowed to be a maſterpiece of ſound reaſoning and juſt compoſition: it was printed at the deſire of the heads of houſes, and quickly paſſed through ſeveral editions. It is now to be found in the ſecond collection of Occaſional Sermons, publiſhed by himſelf in 1766.

It was thought that the reputation he acquired by this ſermon, contributed not a little toward that promotion which very ſoon followed its publication. For in December 1734, he received a very unexpected notice from Biſhop Gibſon, that the king had fixed on him to be biſhop of Briſtol. Dr Benſon was about the ſame time appointed to the ſee of Glouceſter, as was Dr Fleming to that of Carliſle; and the three new biſhops were all conſecrated together in Lambeth Chapel, Jan. 19. 1734-5, the conſecration-ſermon being preached by Dr Thomas, afterwards biſhop of Wincheſter.

The honours to which Dr Secker was thus raiſed in the prime of life did not in the leaſt abate his diligence and attention to buſineſs; for which, indeed, there was now more occaſion than ever. His learned biographers, Meſſrs Porteous and Stinton, now relate the manner in which he ſet about the viſitation of his dioceſe, and the ceremony of confirmation, which he performed in a great number of places; he alſo preached in ſeveral churches, ſometimes twice a-day. The affairs of his pariſh of St James's being likewiſe in great diſorder, he took extraordinary pains to regulate and adjuſt every thing, particularly the management of the poor; and thus became of ſignal ſervice to his pariſhioners, even in a temporal view. But, ſay our authors, "it was their ſpiritual welfare which engaged, as it ought to do, his chief attention. As far as the circumſtances of the times, and the populouſneſs of that part of the metropolis allowed, he omitted not even thoſe private admonitions and perſonal applications which are often attended with the happieſt effects. He allowed out of his own income a ſalary for reading early and late prayers, which had formerly been paid out of the offertory money. He held a confirmation once every year, and examined

ecker. amined the candidates ſeveral weeks before in the veſtry, and gave them religious tracts, which he alſo diſtributed at other times very liberally to thoſe that needed them. He drew up, for the uſe of his pariſhioners, that admirable courſe of *Lectures on the Church Catechiſm* which hath been lately publiſhed, and not only read them once every week on the uſual days, but alſo every Sunday evening, either at the church or one of the chapels belonging to it."

The ſermons which at the ſame time, we are told, he ſet himſelf to compoſe, "were truly excellent and original. His faculties were now in their full vigour, and he had an audience to ſpeak before that rendered the utmoſt exertion of them neceſſary. He did not, however, ſeek to gratify the higher part, by amuſing them with refined ſpeculations, or ingenious eſſays, unintelligible to the lower part, and unprofitable to both; but he laid before them all, with equal freedom and plainneſs, the great Chriſtian duties belonging to their reſpective ſtations, and reproved the follies and vices of every rank among them, without diſtinction or palliation. He ſtudied human nature thoroughly in all its various forms, and knew what ſort of arguments would have moſt weight with each claſs of men. He brought the ſubject home to their boſoms, and did not ſeem to be merely ſaying uſeful things in their preſence, but addreſſing himſelf perſonally to every one of them. Few ever poſſeſſed, in a higher degree, the rare talent of touching on the moſt delicate ſubjects with the niceſt propriety and decorum, of ſaying the moſt familiar things without being low, the plaineſt without being feeble, the boldeſt without giving offence. He could deſcend with ſuch ſingular eaſe and felicity into the minuteſt concerns of common life, could lay open with ſo much addreſs the various workings, artifices, and evaſions of the human mind, that his audience often thought their own particular caſes alluded to, and heard with ſurpriſe their private ſentiments and feelings, their ways of reaſoning and principles of acting, exactly ſtated and deſcribed. His preaching was, at the ſame time, highly rational, and truly evangelical. He explained with perſpicuity, he aſſerted with dignity, the peculiar characteriſtic doctrines of the goſpel. He inculcated the utility, the neceſſity of them, not merely as ſpeculative truths, but as actual inſtruments of moral goodneſs, tending to purify the hearts and regulate the lives of men; and thus, by God's gracious appointment, as well as by the inſeparable connexion between true faith and right practice, leading them to ſalvation.

"Theſe important truths he taught with the authority, the tenderneſs, the familiarity, of a parent inſtructing his children. Though he neither poſſeſſed nor affected the artificial eloquence of an orator who wants to amuſe or to miſlead, yet he had that of an honeſt man who wants to convince, of a Chriſtian preacher who wants to reform and to ſave thoſe that hear him. Solid argument, manly ſenſe, uſeful directions, ſhort nervous, ſtriking ſentences, awakening queſtions, frequent and pertinent applications of ſcripture; all theſe following each other in quick ſucceſſion, and coming evidently from the ſpeaker's heart, enforced by his elocution, his figure, his action, and above all by the correſponding ſanctity of his example, ſtamped conviction on the minds of his hearers, and ſent them home with impreſſions not eaſy to be effaced. It will readily be imagined that with theſe powers he quickly became one of the moſt admired and popular preachers of his time." Secker.

In 1737 he ſucceeded to the ſee of Oxford, on the promotion of Dr Potter to that of Canterbury, then vacant by the death of Archbiſhop Wake.

In the ſpring of 1748, Mrs Secker died of the gout in her ſtomach. She was a woman of great ſenſe and merit, but of a weak and ſickly conſtitution. The biſhop's affection and tenderneſs for her was ſuited to his character. In 1750, he was inſtalled dean of St Paul's, for which he gave in exchange the rectory of St James's and his prebend of Durham. "It was no wonder (ſay our authors) that, after preſiding over ſo extenſive and populous a pariſh for upwards of 17 years, he ſhould willingly conſent to be releaſed from a burden which began now to grow too great for his ſtrength. When he preached his farewell ſermon, the whole audience melted into tears: he was followed with the prayers and good wiſhes of thoſe whom every honeſt man would be moſt ambitious to pleaſe; and there are numbers ſtill living who retain a ſtrong and grateful remembrance of his inceſſant and tender ſolicitude for their welfare. Having now more leiſure both to proſecute his own ſtudies and to encourage thoſe of others, he gave Dr Church conſiderable aſſiſtance in his *Firſt and Second Vindication of the Miraculous Powers*, &c. againſt Dr Middleton, and he was of equal uſe to him in his *Analyſis of Lord Bolingbroke's Works*. About the ſame time began the late Archdeacon Sharp's controverſy with the followers of Mr Hutchinſon, which was carried on to the end of the year 1755." Biſhop Secker, we are told, read over all Dr Sharp's papers, amounting to three volumes 8vo, and corrected and improved them throughout. But the eaſe which this late change of ſituation gave him was ſoon diſturbed by a heavy and unexpected ſtroke, the loſs of his three friends, Biſhops Butler, Benſon, and Berkeley, who were all cut off within the ſpace of one year.

Our authors next give an account of the part which Dr Secker bore, in the Houſe of Lords, in reſpect to the famous repeal of the Jew bill; for which the duke of Newcaſtle moved, and was ſeconded by the Biſhop, in a ſpeech which, we are told, was remarkably well received. At length his diſtinguiſhed merit prevailed over all the political obſtacles to his advancement, and placed him, without any efforts or application of his own, in that important ſtation which he had ſhown himſelf ſo well qualified to adorn. On the death of Archbiſhop Hutton, he was promoted to the ſee of Canterbury, and was confirmed at Bow church, April 21. 1758; on which occaſion our authors obſerve, that in accepting this high and burdenſome ſtation, Dr Secker acted on that principle which influenced him through life; that he ſacrificed his own eaſe and comfort to conſiderations of public utility; that the mere ſecular advantages of grandeur were objects below his ambition; and were, as he knew and felt, but poor compenſations for the anxiety and difficulties attending them. He had never once through his whole life aſked preferment for himſelf, nor ſhown any unbecoming eagerneſs for it; and the uſe he made of his newly acquired dignity very clearly ſhowed, that rank, and wealth, and power, had in no other light any charms for him, than as they enlarged the ſphere of his active and induſtrious benevolence.

He ſought out and encouraged men of real genius or extenſive knowledge; he expended 300l. in arranging and improving the manuſcript library at Lambeth; and obſerving with concern, that the library of printed books in that palace had received no additions ſince the time of Archbiſhop Tenniſon, he made it his buſineſs to collect books in all languages from moſt parts of Europe at a very great expence, with a view of ſupplying that chaſm; which he accordingly did, by leaving them to the library at his death, and thereby rendered that collection one of the nobleſt and moſt uſeful in the kingdom.

All deſigns and inſtitutions which tended to advance good morals and true religion, he patronized with zeal and generoſity: he contributed largely to the maintenance of ſchools for the poor; to rebuilding or repairing parſonage houſes and places of worſhip; and gave no leſs than 600l. towards erecting a chapel in the pariſh of Lambeth. To the ſociety for promoting Chriſtian knowledge he was a liberal benefactor; and to that for propagating the goſpel in foreign parts, of which he was the preſident, he paid much attention; was conſtant at all meetings of its members, even ſometimes when his health would but ill permit, and ſuperintended their deliberations with conſummate prudence and temper.

Whenever any publications came to his knowledge that were manifeſtly calculated to corrupt good morals, or ſubvert the foundations of Chriſtianity, he did his utmoſt to ſtop the circulation of them; yet the wretched authors themſelves he was ſo far from wiſhing to treat with any undue rigour, that he has more than once extended his bounty to them in diſtreſs. And when their writings could not properly be ſuppreſſed (as was too often the caſe) by lawful authority, he engaged men of abilities to anſwer them, and rewarded them for their trouble. His attention was everywhere. Even the falſehoods and miſrepreſentations of writers in the newſpapers, on religious or eccleſiaſtical ſubjects, he generally took care to have contradicted; and when they ſeemed likely to injure, in any material degree, the cauſe of virtue and religion, or the reputation of eminent and worthy men, he would ſometimes take the trouble of anſwering them himſelf. One inſtance of this kind, which does him honour, and deſerves mention, was his defence of Biſhop Butler, who, in a pamphlet publiſhed in 1767, was accuſed of having died a Papiſt. The conduct which he obſerved towards the ſeveral diviſions and denominations of Chriſtians in this kingdom was ſuch as ſhowed his way of thinking to be truly liberal and catholic. The dangerous ſpirit of Popery, indeed, he thought ſhould always be kept under proper legal reſtraints, on account of its natural oppoſition not only to the religious but the civil rights of mankind. He therefore obſerved its movements with care, and exhorted his clergy to do the ſame, eſpecially thoſe who were ſituated in the midſt of Roman Catholic families; againſt whoſe influence they were charged to be upon their guard, and were furniſhed with proper books or inſtructions for that purpoſe. He took all fit opportunities of combating the errors of the church of Rome in his own writings (A); and the beſt anſwers that were publiſhed to ſome of the late bold apologies for Popery were written at his inſtance, and under his direction. Secker.

With the Diſſenters his grace was ſincerely deſirous of cultivating a good underſtanding. He conſidered them, in general, as a conſcientious and valuable claſs of men. With ſome of the moſt eminent of them, Watts, Doddridge, Leland, Chandler, Lardner, he maintained an intercourſe of friendſhip or civility. By the moſt candid and conſiderate part of them he was highly reverenced and eſteemed; and to ſuch among them as needed help he ſhowed no leſs kindneſs and liberality than to thoſe of his own communion.

Nor was his concern for the Proteſtant cauſe confined to his own country. He was well known as the great patron and protector of it in various parts of Europe; from whence he had frequent applications for aſſiſtance, which never failed of being favourably received. To ſeveral foreign Proteſtants he allowed penſions, to others he gave occaſional relief, and to ſome of their univerſities was an actual benefactor.

In public affairs, his grace acted the part of an honeſt citizen, and a worthy member of the Britiſh legiſlature. From his firſt entrance into the Houſe of Peers, his parliamentary conduct was uniformly upright and noble. He kept equally clear from the extremes of factious petulance and ſervile dependence; never wantonly thwarting adminiſtration from motives of party zeal or private pique, or perſonal attachment, or a paſſion for popularity; nor yet going every length with every miniſter from views of intereſt or ambition. He admired and loved the conſtitution of his country, and wiſhed to preſerve it unaltered and unimpaired. So long as a due regard to this was maintained, he thought it his duty to ſupport the meaſures of government; but whenever they were evidently inconſiſtent with the public welfare, he oppoſed them with freedom and firmneſs. Yet his oppoſition was always tempered with the utmoſt fidelity, reſpect, and decency, to the excellent prince upon the throne; and the moſt candid allowances for the unavoidable errors and infirmities even of the very beſt miniſters, and the peculiarly difficult ſituation of thoſe who govern a free and high-ſpirited people. He ſeldom ſpoke in parliament, except where the intereſts of religion and virtue ſeemed to require it; but whenever he did, he ſpoke with propriety and ſtrength, and was heard with attention and deference. Though he never attached himſelf blindly to any ſet of men, yet his chief political connexions were with the late duke of Newcaſtle and Lord Chancellor Hardwicke. To theſe he principally owed his advancement; and he had the good fortune to live long enough to ſhow his gratitude to them or their deſcendants.

During more than ten years that Dr Secker enjoyed the ſee of Canterbury, he reſided conſtantly at his archiepiſcopal houſe at Lambeth. A few months before his death, the dreadful pains he felt had compelled him

(A) See particularly his ſermons on the rebellion in 1745; on the Proteſtant working ſchools in Ireland; on the 5th of November; and a great number of occaſional paſſages to the ſame purpoſe, in various parts of his lectures, ſermons, and other works.

Seeker. him to think of trying the Bath waters; but that deſign was ſtopped by the fatal accident which put an end to his life.

His grace had been for many years ſubject to the gout, which, in the latter part of his life, returned with more frequency and violence, and did not go off in a regular manner, but left the parts affected for a long time very weak, and was ſucceeded by pains in different parts of the body. About a year and a half before he died, after a fit of the gout, he was attacked with a pain in the arm, near the ſhoulder, which having continued about 12 months, a ſimilar pain ſeized the upper and outer part of the oppoſite thigh, and the arm ſoon became eaſier. This was much more grievous than the former, as it quickly diſabled him from walking, and kept him in almoſt continual torment, except when he was in a reclining poſition. During this time he had two or three fits of the gout; but neither the gout nor the medicines alleviated theſe pains, which, with the want of exerciſe, brought him into a general bad habit of body.

On Saturday July 30. 1768, he was ſeized, as he ſat at dinner, with a ſickneſs at his ſtomach. He recovered before night; but the next evening, while his phyſicians were attending, and his ſervants raiſing him on his couch, he ſuddenly cried out that his thigh bone was broken. The ſhock was ſo violent, that the ſervants perceived the couch to ſhake under him, and the pain ſo acute and unexpected, that it overcame the firmneſs he ſo remarkably poſſeſſed. He lay for ſome time in great agonies; but when the ſurgeons arrived, and diſcovered with certainty that the bone was broken, he was perfectly reſigned, and never afterwards aſked a queſtion about the event. A fever ſoon enſued. On Tueſday he became lethargic, and continued ſo till about five o'clock on Wedneſday afternoon, when he expired with great calmneſs, in the 75th year of his age.

On examination, the thigh bone was found to be carious about four inches in length, and at nearly the ſame diſtance from its head. The diſeaſe took its riſe from the internal part of the bone, and had ſo entirely deſtroyed its ſubſtance, that nothing remained at the part where it was broken but a portion of its outward integument; and even this had many perforations, one of which was large enough to admit two fingers, and was filled with a fungous ſubſtance ariſing from within the bone. There was no appearance of matter about the caries, and the ſurrounding parts were in a ſound ſtate. It was apparent that the torture which he underwent during the gradual corroſion of this bone muſt have been inexpreſſibly great. Out of tenderneſs to his family he ſeldom made any complaints to them, but to his phyſicians he frequently declared his pains were ſo excruciating, that unleſs ſome relief could be procured he thought it would be impoſſible for human nature to ſupport them long. Yet he bore them for upwards of ſix months with aſtoniſhing patience and fortitude; ſat up generally the greater part of the day, admitted his particular friends to ſee him, mixed with his family at the uſual hours, ſometimes with his uſual cheerfulneſs; and, except ſome very ſlight defects of memory, retained all his faculties and ſenſes in their full vigour till within a few days of his death. He was buried, purſuant to his own directions, in a covered paſſage, leading from a private door of the palace to the north door of Lambeth church; and he forbade any monument or epitaph to be placed over him. Seeker || Second.

By his will he appointed the Rev. Dr Daniel Burton, canon of Chriſt church, and Mrs Catherine Talbot, already mentioned in the courſe of theſe memoirs, his executors; and left 13,000l. in truſt to the Drs Porteous and Stinton, his chaplains; to pay the intereſt thereof to Mrs Talbot and her daughter during their joint lives, or the life of the ſurvivor; and after the deceaſe of both theſe ladies, 11,000l. of the ſaid 13,000l. are to be tranſferred to charitable purpoſes; amongſt which are 1000l. to the Society for the Propagation of the Goſpel, and 1000l. to the ſame ſociety for a biſhop or biſhops in the king's dominions in America.

The following deſcription is given of his perſon: He was tall and comely; in the early part of his life ſlender, and rather conſumptive; but as he advanced in years his conſtitution gained ſtrength, and his ſize increaſed, yet never to a degree of corpulency that was diſproportionate or troubleſome.

The dignity of his form correſponded with the greatneſs of his mind, and inſpired at all times reſpect and awe; but peculiarly ſo when he was engaged in any of the more ſolemn functions of religion, into which he entered with ſuch devout earneſtneſs and warmth, with ſo juſt a conſciouſneſs of the place he was in, and the buſineſs he was about, as ſeemed to raiſe him above himſelf, and added new life and ſpirit to the natural gracefulneſs of his appearance.

His countenance was open, ingenious, and expreſſive of every thing right. It varied eaſily with his ſpirits and his feelings, ſo as to be a faithful interpreter of his mind, which was incapable of the leaſt diſſimulation. It could ſpeak dejection, and, on occaſion, anger, very ſtrongly; but when it meant to ſhow pleaſure or approbation, it ſoftened into a moſt gracious ſmile, and diffuſed over all his features the moſt benevolent and reviving complacency that can be imagined.

SECOMIÆ, in natural hiſtory, the name of a genus of foſſils of the claſs of ſeptariæ; the characters of which are, That they are bodies of a duſky hue; divided, by ſepta or partitions of a ſparry matter, into ſeveral more or leſs regular portions; of a moderately firm texture; not giving fire with ſteel; but fermenting with acid menſtrua, and eaſily calcining. The ſeptariæ of this genus are of all others the moſt common, and are what have been known by the little expreſſive or miſtaken names of the waxen vein, or ludus Helmontii. We have many ſpecies of theſe bodies common among us. Of the whitiſh or browniſh, we have thirteen; of the yellowiſh five; and of the ferruginous ones four.

SECOND, in geometry, chronology, &c. the 60th part of a prime or minute, whether of a degree or of an hour.

SECOND, in muſic, one of the muſical intervals; being only the difference between any ſound and the next neareſt ſound, whether above or below it.

Second Major, in muſic. See INTERVAL.

Second Minor, in muſic. See INTERVAL.

Second Sight, in Erſe called *Taiſch*, is a mode of ſeeing ſuperadded to that which nature generally beſtows. This gift or faculty, which is neither voluntary nor

econd. nor conſtant, is in general rather troubleſome than agreeable to the poſſeſſors of it, who are chiefly found among the inhabitants of the Highlands of Scotland, thoſe of the Weſtern Iſles, of the Iſle of Man, and of Ireland. It is an impreſſion made either by the mind upon the eye, or by the eye upon the mind, by which things diſtant or future are perceived, and ſeen as if they were preſent. A man on a journey far from home falls from his horſe; another, who is perhaps at work about the houſe, ſees him bleeding on the ground, commonly with a landſcape of the place where the accident befals him. Another ſeer, driving home his cattle, or wandering in idleneſs, or muſing in the ſunſhine, is ſuddenly ſurpriſed by the appearance of a bridal ceremony, or funeral proceſſion, and counts the mourners or attendants, of whom, if he knows them, he relates the names; if he knows them not, he can deſcribe the dreſſes. Things diſtant are ſeen at the inſtant when they happen.

Of things future, Johnſon ſays that he knows no rule pretended to for determining the time between the ſight and the event; but we are informed by Mr Groſe, that in general the time of accompliſhment bears ſome relation to the time of the day in which the impreſſions are received. Thus viſions ſeen early in the morning (which ſeldom happens) will be much ſooner accompliſhed than thoſe appearing at noon; and thoſe ſeen at noon will take place in a much ſhorter time than thoſe happening at night; ſometimes the accompliſhment of the laſt does not fall out within a year or more.

Theſe viſions are not confined to ſolemn or important events; nor is it true, as is commonly reported, that to the ſecond ſight nothing is preſented but phantoms of evil. The future viſit of a mountebank, or piper; a plentiful draught of fiſh; the arrival of common travellers; or, if poſſible, ſtill more trifling matters than theſe, —are foreſeen by the ſeers. A gentleman told Dr Johnſon, that when he had once gone far from his own iſland one of his labouring ſervants predicted his return, and deſcribed the livery of his attendant, which he had never worn at home; and which had been, without any previous deſign, occaſionally given him.

As many men eminent for ſcience and literature have admitted the reality of this apparently uſeleſs gift, we ſhall, without interpoſing our own opinion, give the reflections of two of the firſt characters of the age upon it, and leave our readers to form their own judgment. By Dr Beattie of Aberdeen it is thus accounted for:—

The Highlands of Scotland are a pictureſque but a melancholy country. Long tracts of mountainous deſert, covered with dark heath, and often obſcured by miſty weather; narrow valleys, thinly inhabited, and bounded by precipices reſounding with the fall of torrents: a ſoil ſo rugged, and a climate ſo dreary, as in many parts to admit neither the amuſements of paſturage nor the labours of agriculture; the mournful daſhing of waves along the friths and lakes that interſect the country; the portentous noiſes which every change of the wind and every increaſed diminution of the waters is apt to raiſe in a lonely region full of echoes and rocks and caverns; the groteſque and ghaſtly appearance of ſuch a landſcape by the light of the moon: objects like theſe diffuſe a gloom over the fancy, which may be compatible enough with occaſional and ſocial merriment, but cannot fail to tincture the thoughts of a native in the hour of ſilence and ſolitude. If theſe people, notwithſtanding the reformation in religion, and more frequent intercourſe with ſtrangers, do ſtill retain many of their old ſuperſtitions, we need not doubt but in former times they muſt have been much more enſlaved to the horrors of imagination, when befet with the bugbears of Popery and Paganiſm. Moſt of their ſuperſtitions are of a melancholy caſt. That of *ſecond ſight*, by which ſome are ſtill ſuppoſed to be haunted, is conſidered by themſelves as a misfortune, on account of the many dreadful images it is ſaid to obtrude upon the fancy. It is ſaid that ſome of the Alpine regions do likewiſe lay claim to a ſort of ſecond ſight. Nor is it wonderful, that perſons of a lively imagination, immured in deep ſolitude, and ſurrounded with the ſtupendous ſcenery of clouds, precipices, and torrents, ſhould dream (even when they think themſelves awake) of thoſe few ſtriking ideas with which their lonely lives are diverſified: of corpſes, funeral proceſſions, and other ſubjects of terror; or of marriages, and the arrival of ſtrangers, and ſuch like matters of more agreeable curioſity. Second.

Let it be obſerved alſo, that the ancient Highlanders of Scotland had hardly any other way of ſupporting themſelves than by hunting, fiſhing, or war; profeſſions that are continually expoſed to fatal accidents. And hence, no doubt, additional horrors would often haunt their ſolitude, and a deeper gloom overſhadow the imagination even of the hardieſt native.

A ſufficient evidence can hardly be found for the reality of the *ſecond ſight*, or at leaſt of what is commonly underſtood by that term. A treatiſe on the ſubject was publiſhed in the year 1762, in which many tales were told of perſons whom the author believed to have been favoured, or haunted, with theſe illuminations; but moſt of the tales were trifling and ridiculous: and the whole work betrayed, on the part of the compiler, ſuch extreme credulity, as could not fail to prejudice many readers againſt his ſyſtem.

That any of theſe viſionaries are apt to be ſwayed in their declarations by ſiniſter views, we ſhall not ſay; but this may be ſaid with confidence, that none but ignorant people pretend to be gifted in this way. And in them it may be nothing more, perhaps, than ſhort fits of ſudden ſleep or drowſineſs, attended with lively dreams, and ariſing from ſome bodily diſorder, the effect of idleneſs, low ſpirits, or a gloomy imagination. For it is admitted, even by the moſt credulous Highlanders, that as knowledge and induſtry are propagated in their country, the ſecond ſight diſappears in proportion; and nobody ever laid claim to the faculty who was much employed in the intercourſe of ſocial life (A).

(A) This, however, is denied by Johnſon, who affirms that the iſlanders of all degrees, whether of rank or underſtanding, univerſally admit it except the miniſters, who, according to him, reject it, in conſequence of a ſyſtem, againſt conviction. He affirms, too, that in 1773 there was in the Hebrides a ſecond-ſighted gentleman, who complained of the terrors to which he was expoſed.

Second

Nor is it at all extraordinary, that one ſhould have the appearance of being awake, and ſhould even think one's ſelf ſo, during thoſe fits of doſing; that they ſhould come on ſuddenly, and while one is engaged in ſome buſineſs. The ſame thing happens to perſons much fatigued, or long kept awake, who frequently fall aſleep for a moment, or for a long ſpace, while they are ſtanding, or walking, or riding on horſeback. Add but a lively dream to this ſlumber, and (which is the frequent effect of diſeaſe) take away the conſciouſneſs of having been aſleep, and a ſuperſtitious man may eaſily miſtake his dream for a waking viſion; which, however, is ſoon forgotten when no ſubſequent occurrence recals it to his memory; but which, if it ſhall be thought to reſemble any future event, exalts the poor dreamer into a Highland prophet. This conceit makes him more recluſe and more melancholy than ever: and ſo feeds his diſeaſe, and multiplies his viſions: which, if they are not diſſipated by buſineſs or ſociety, may continue to haunt him as long as he lives; and which, in their progreſs through the neighbourhood, receive ſome new tinctures of the marvellous from every mouth that promotes their circulation. As to the prophetical nature of this ſecond ſight, it cannot be admitted at all. That the Deity ſhould work a miracle in order to give intimation of the frivolous things that theſe tales are made up of, the arrival of a ſtranger, the nailing of a coffin, or the colour of a ſuit of clothes; and that theſe intimations ſhould be given for no end, and to thoſe perſons only who are idle and ſolitary, who ſpeak Gaelic, or who live among mountains and deſerts—is like nothing in nature or providence that we are acquainted with; and muſt therefore, unleſs it were confirmed by ſatisfactory proof (which is not the caſe), be rejected as abſurd and incredible.

Theſe viſions, ſuch as they are, may reaſonably enough be aſcribed to a diſtempered fancy. And that in them, as well as in our ordinary dreams, certain appearances ſhould, on ſome rare occaſions, reſemble certain events, is to be expected from the laws of chance; and ſeems to have in it nothing more marvellous or ſupernatural, than that the parrot, who deals out his ſcurrilities at random, ſhould ſometimes happen to ſalute the paſſenger by his right appellation.

To the confidence of theſe objections Dr Johnſon replies, that by preſuming to determine what is fit, and what is beneficial, they preſuppoſe more knowledge of the univerſal ſyſtem than man has attained; and therefore depend upon principles too complicated and extenſive for our comprehenſion; and that there can be no ſecurity in the conſequence when the premiſes are not underſtood; that the ſecond ſight is only wonderful becauſe it is rare, for, conſidered in itſelf, it involves no more difficulty than dreams, or perhaps than the regular exerciſe of the cogitative faculty; that a general opinion of communicative impulſes, or viſionary repreſentations, has prevailed in all ages and all nations; that particular inſtances have been given with ſuch evidence, as neither Bacon nor Bayle has been able to reſiſt; that ſudden impreſſions, which the event has verified, have been felt by more than own or publiſh them; that the ſecond ſight of the Hebrides implies only the local frequency of a power, which is nowhere totally unknown; and that where we are unable to decide by antecedent reaſon, we muſt be content to yield to the force of teſtimony. By pretenſion to ſecond ſight, no profit was ever ſought or gained. It is an involuntary affection, in which neither hope nor fear are known to have any part. Thoſe who profeſs to feel it do not boaſt of it as a privilege, nor are conſidered by others as advantageouſly diſtinguiſhed. They have no temptation to feign, and their hearers have no motive to encourage the impoſture.

Second ‖ Secretary

Second Terms, in algebra, thoſe where the unknown quantity has a degree of power leſs than it has in the term where it is raiſed to the higheſt. The art of throwing thoſe ſecond terms out of an equation, that is, of forming a new equation where they have no place, is one of the moſt ingenious and uſeful inventions in all algebra.

SECONDARY, in general, ſomething that acts as ſecond or in ſubordination to another.

Secondary or *Secundary*, an officer who acts as ſecond or next to the chief officer. Such are the ſecondaries of the courts of king's bench and common pleas; the ſecondaries of the compters, who are next the ſheriffs of London in each of the two compters; two ſecondaries of the pipe; ſecondaries to the remembrancers, &c.

Secondary Circles of the Ecliptic are circles of longitude of the ſtars; or circles which, paſſing through the poles of the ecliptic, are at right angles to the ecliptic. See *Circles of Latitude*.

Secondary Qualities of Bodies. See METAPHYSICS, N° 153.

SECONDAT. See MONTESQUIEU.

SECRETARIES BIRD, the falco ſerpentarius and ſagittarius of Linnæus, but claſſed by Latham under the genus VULTUR; which ſee.

SECRETARY, an officer who, by his maſter's orders, writes letters, deſpatches, and other inſtruments, which he renders authentic by his ſignet. Of theſe there are ſeveral kinds: as, 1. Secretaries of ſtate, who are officers that have under their management and direction the moſt important affairs of the kingdom, and are obliged conſtantly to attend on the king: they receive and deſpatch whatever comes to their hands, either from the crown, the church, the army, private grants, pardons, diſpenſations, &c. as likewiſe petitions to the ſovereign, which, when read, are returned to them; all which they deſpatch according to the king's direction. They have authority to commit perſons for treaſon, and other offences againſt the ſtate, as conſervators of the peace at common law, or as juſtices of the peace throughout the kingdom. They are members of the privy-council, which is ſeldom or never held without one of them being preſent. As to the buſineſs and correſpondence in all parts of this kingdom, it is managed by either of the ſecretaries without any diſtinction; but with reſpect to foreign affairs, the buſineſs is divided into two provinces or departments, the ſouthern and the northern, comprehending all the kingdoms and ſtates that have any intercourſe with Great Britain; each ſecretary receiving all letters and addreſſes from, and making all deſpatches to, the ſeveral princes and ſtates comprehended in his province. Ireland and the plantations are under the direction of the elder ſecretary, who has the ſouthern province, which alſo compreheuds France, Italy, Switzerland, Spain, Portugal, and Turkey; the northern province includes the Low Countries,

tries, Germany, Denmark, Sweden, Poland, and Muſcovy. Each of the ſecretaries has an apartment in all the royal houſes, both for their own accommodation and their officers; they have alſo a table at the king's charge, or elſe board wages. The two ſecretaries for Britain have each two under ſecretaries, and one chief clerk; with an uncertain number of other clerks and tranſlators, all wholly depending on them. To the ſecretaries of ſtate belong the cuſtody of that ſeal properly called the *ſignet*, and the direction of two other offices, one called the *paper office*, and the other the *ſignet office*. In addition to theſe, there is at preſent (1795) a ſecretary for the war department, whoſe office muſt be temporary. 2. Secretary of an embaſſy, a perſon attending an ambaſſador, for writing deſpatches relating to the negotiation. There is a great difference between the ſecretary of an embaſſy and the ambaſſador's ſecretary; the laſt being a domeſtic or menial of the ambaſſador, and the firſt a ſervant or miniſter of the prince. 3. The ſecretary of war, an officer of the war office, who has two chief clerks under him, the laſt of which is the ſecretary's meſſenger. There are alſo ſecretaries in moſt of the other offices.

SECRETION, in the animal economy. See PHYSIOLOGY, Sect. VI.

SECT, a collective term, comprehending all ſuch as follow the doctrines and opinions of ſome famous divine, philoſopher, &c.

SECTION, in general, denotes a part of a divided thing, or the diviſion itſelf. Such, particularly, are the ſubdiviſions of a chapter; called alſo *paragraphs* and *articles*: the mark of a ſection is §.

SECTION, in geometry, denotes a ſide or ſurface of a body or figure cut off by another; or the place where lines, planes, &c. cut each other.

SECTOR, in geometry, is a part of a circle comprehended between two radii and the arch; or it is a mixed triangle, formed by two radii and the arch of a circle.

or SECTOR, is alſo a mathematical inſtrument, of great uſe in finding the proportion between quantities of the ſame kind: as between lines and lines, ſurfaces and ſurfaces, &c. whence the French call it the *compaſs of proportion*. The great advantage of the ſector above the common ſcales, &c. is, that it is made ſo as to fit all radii and all ſcales. By the lines of chords, ſines, &c. on the ſector, we have lines of chords, ſines, &c. to any radius betwixt the length and breadth of the ſector when open.

The real inventor of this valuable inſtrument is unknown; yet of ſo much merit has the invention appeared, that it was claimed by Galileo, and diſputed by nations.

The ſector is founded on the fourth propoſition of the ſixth book of Euclid; where it is demonſtrated that ſimilar triangles have their homologous ſides proportional. An idea of the theory of its conſtruction may be conceived thus: Let the lines AB, AC (Plate CCCCXLVIII. fig. 5.) repreſent the legs of the ſector; and AD, AE, two equal ſections from the centre: if, now the points CB and DE be connected, the lines CB and DE will be parallel; therefore the triangles ADE, ACB will be ſimilar; and conſequently the ſides AD, DE, AB, and BC, proportional; that is, as AD: DE:: AB: BC: whence, if AD be the half, third, or fourth part of AB; DE will be a half, third, or fourth part of CB: and the ſame holds of all the reſt. If, therefore, AD be the chord, ſine, or tangent, of any number of degrees to the radius AB; DE will be the ſame to the radius BC. Sector.

Deſcription of the Sector. The inſtrument conſiſts of two rulers or legs, of braſs or ivory, or any other matter, repreſenting the radii, moveable round an axis or joint, the middle of which expreſſes the centre; whence are drawn on the faces of the rulers ſeveral ſcales, which may be diſtinguiſhed into ſingle and double. 2 Deſcribed.

The double ſcales, or lines graduated upon the faces of the inſtrument, and which are to be uſed as ſectoral lines, proceed from the centre; and are, 1. Two ſcales of equal parts, one on each leg, marked LIN. or L. each of theſe ſcales, from the great extenſiveneſs of its uſe, is called the *line of lines*. 2. Two lines of chords marked CHO. or C. 3. Two lines of ſecants marked SEC. or S. A line of polygons marked POL. Upon the other face the ſectoral lines are, 1. Two lines of ſines marked SIN. or S. 2. Two lines of tangents marked TAN. or T. 3. Between the line of tangents and ſines there is another line of tangents to a leſſer radius, to ſupply the defect of the former, and extending from 45° to 75°, marked *t*.

Each pair of theſe lines (except the line of polygons) is ſo adjuſted as to make equal angles at the centre; and conſequently at whatever diſtance the ſector be opened, the angles will be always reſpectively equal. That is, the diſtance between 10 and 10 on the line of lines, will be equal to 60 and 60 on the line of chords, 90 and 90 on the line of ſines, and 45 and 45 on the line of tangents.

Beſides the ſectoral ſcales, there are others on each face, placed parallel to the outward edges, and uſed as thoſe of the common plane ſcale. 1. Theſe are a line of inches. 2. A line of latitudes. 3. A line of hours. 4. A line of inclination of meridians. 5. A line of chords. Three logarithmic ſcales, namely, one of numbers, one of ſines, and one of tangents; theſe are uſed when the ſector is fully opened, the legs forming one line (A).

3 To read and eſtimate the diviſions on the ſector and lines.

The value of the diviſions on moſt of the lines is determined by the figures adjacent to them; theſe proceed by tens, which conſtitute the diviſions of the firſt order, and are numbered accordingly; but the value of the diviſions on the line of lines, that are diſtinguiſhed by figures, is entirely arbitrary, and may repreſent any value that is given to them; hence the figures 1, 2, 3, 4, &c. may denote either 10, 20, 30, 40, or 100, 200, 300, 400, and ſo on.

The line of lines is divided into ten equal parts, numbered 1, 2, 3, to 10; theſe may be called *diviſions of the firſt order*; each of theſe are again ſubdivided into 10 other equal parts, which may be called *diviſions of the ſecond order*; each of theſe is divided into two equal parts, forming *diviſions of the third order*. The diviſions on all the ſcales are contained between four parallel lines; thoſe

(A) The lines are placed in different orders on different ſectors, but they may eaſily be found by theſe general directions.

Sector. those of the firſt order extend to the moſt diſtant; thoſe of the third to the leaſt; thoſe of the ſecond to the intermediate parallel.

When the whole line of lines repreſents 100, the diviſions of the firſt order, or thoſe to which the figures are annexed, repreſent tens; thoſe of the ſecond order units; thoſe of the third order the halves of theſe units. If the whole line repreſent ten, then the diviſions of the firſt order are units; thoſe of the ſecond tenths; the thirds twentieths.

In the line of tangents, the diviſions to which the numbers are affixed, are the degrees expreſſed by thoſe numbers. Every fifth degree is denoted by a line ſomewhat longer than the reſt; between every number and each fifth degree, there are four diviſions, longer than the intermediate adjacent ones, theſe are whole degrees; the ſhorter ones, or thoſe of the third order, are 30 minutes.

From the centre, to 60 degrees, the line of ſines is divided like the line of tangents, from 60 to 70; it is divided only to every degree, from 70 to 80, to every two degrees, from 80 to 90; the diviſion muſt be eſtimated by the eye.

The diviſions on the line of chords are to be eſtimated in the ſame manner as the tangents.

The leſſer line of tangents is graduated every two degrees, from 45 to 50; but from 50 to 60 to every degree; from 60 to the end, to half degrees.

The line of ſecants from 0 to 10 is to be eſtimated by the eye; from 20 to 50, it is divided to every two degrees; from 50 to 60, to every degree; from 60 to the end, to every half degree.

4 Diviſion of a given line by the line of equal parts.

Uſe of the Line of Equal Parts on the SECTOR. 1. To divide a given line into any number of equal parts, ſuppoſe ſeven. Take the given line in your compaſſes; and ſetting one foot in a diviſion of equal parts, that may be divided by ſeven, for example 70, whoſe ſeventh part is 10, open the ſector till the other point fall exactly on 70, in the ſame line on the other leg. In this diſpoſition, applying one point of the compaſſes to 10 in the ſame line; ſhut them till the other fall in 10 in the ſame line on the other leg, and this opening will be the ſeventh part of the given line. Note, If the line to be divided be too long to be applied to the legs of the ſector, divide only one half or one fourth by ſeven, and the double or quadruple thereof will be the ſeventh part of the whole.

5 To meaſure the perimeter of a polygon.

2. To meaſure the lines of the perimeter of a polygon, one of which contains a great number of equal parts. Take the given line in your compaſſes, and ſet it parallel, upon the line of equal parts, to the number on each leg expreſſing its length. The ſector remaining thus, ſet off the length of each of the other lines parallel to the former, and the number each of them falls on will expreſs its length.

6 Subtraction.

3. A right line being given, and the number of parts it contains, ſuppoſe 120, to take from it a ſhorter line, containing any number of the ſame parts, ſuppoſe 25. Take the given line in your compaſſes, open the ſector till the two feet fall on 120 on each leg; then will the diſtance between 25 on one leg, and the ſame number on the other, give the line required.

7 Multiplication.

4. To multiply by the line of equal parts on the ſector. Take the lateral diſtance from the centre of the line to the given multiplication; open the ſector till you fit that lateral diſtance to the parallel of 1 and 1, or 10 and 10, and keep the ſector in that poſition; then take in the compaſſes the parallal diſtance of the multiplicand, which diſtance, meaſured laterally on the ſame line, will give the product required. Thus, ſuppoſe it were required to find the product of 8 multiplied by 4: take the lateral diſtance from the centre of the line to 4 in your compaſſes, i. e. place one foot of the compaſſes in the beginning of the diviſions, and extend the other along the line to 4. Open the ſector till you fit this lateral diſtance to the parallel of 1 and 1, or 10 and 10. Then take the parallel diſtance of 8, the multiplicand; i. e. extend the compaſſes from 8, in this line, on one leg, to 8 in the ſame line on the other; and that extent, meaſured laterally, will give the product required.

8 Diviſion in general.

5. To divide by the line of equal parts on the ſector. Extend the compaſſes laterally from the beginning of the line to 1, and upon the ſector till you fit that extent to the parallel of the diviſor; then take the parallel diſtance of the dividend, which extent, meaſured in a lateral direction, will give the quotient required. Thus, ſuppoſe it was required to divide 36 by 4; extend the compaſſes laterally, the beginning of the line to 1, and fit to that extent the parallel, of 4 the diviſor; then extend the compaſſes parallel, from 36 on one leg to 36 on the other, and that extent, meaſured laterally, will give 9, the quotient required.

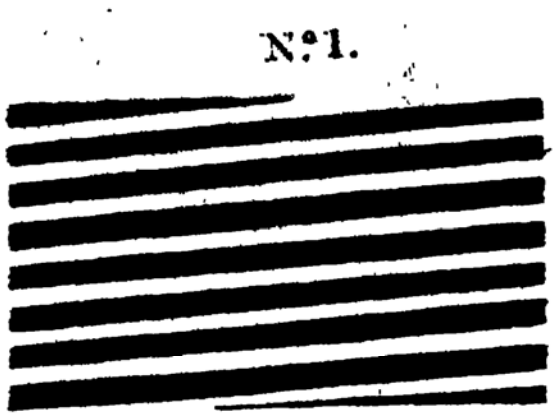
9 Proportion.

6. Proportion by the line of equal parts. Make the lateral diſtance of the ſecond term the parallel diſtance of the firſt term, the parallel diſtance of the third term is the fourth proportional. *Example.* To find a fourth proportional to 8, 4, and 6, take the lateral diſtance of 4, and make it the parallel diſtance of 8; then the parallel diſtance of 6, extended from the centre, ſhall reach to the fourth proportional 3.

In the ſame manner, a third proportional is found to two numbers. Thus, to find a third proportional to 8 and 4, the ſector remaining as in the former example, the parallel diſtance of 4, extended from the centre, ſhall reach to the third proportional 2. In all theſe caſes, if the number to be made a parallel diſtance be too great for the ſector, ſome aliquot part of it is to be taken, and the anſwer is to be multiplied by the number by which the firſt number was divided.

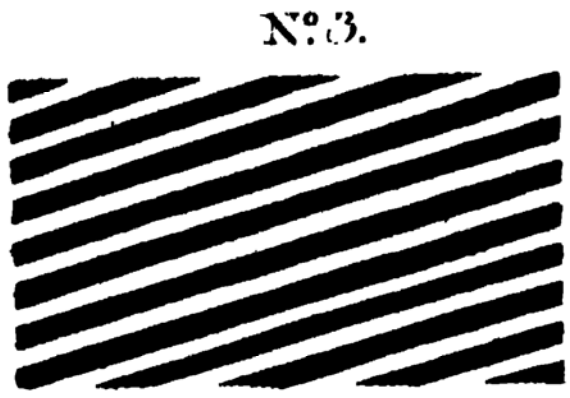
10 Line of chords.

Uſe of the Line of Chords on the SECTOR. 1. To open the ſector ſo as the two lines of chords may make an angle or number of degrees, ſuppoſe 40. Take the diſtance from the joint to 40, the number of the degrees propoſed, on the line of chords; open the ſector till the diſtance from 60 to 60, on each leg, be equal to the given diſtance of 40: then will the two lines on the ſector form an angle of 40 degrees, as was required.



2. The ſector being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre: the number whereon it terminates will ſhow the degrees, &c. required.

3. To lay off any number of degrees upon the circumference of a circle. Open the ſector till the diſtance between 60 and 60 be equal to the radius of the given circle; then take the parallel extent of the chord of the number of degrees on each leg of the ſector, and



lay

lay it off on the circumference of the given circle.—Hence any regular polygon may be eaſily inſcribed in a given circle.

Uſe of the Line of Polygons on the SECTOR. 1. To inſcribe a regular polygon in a given circle. Take the ſemidiameter of the given circle in the compaſſes, and adjuſt it to the number 6, on the line of polygons, on each leg of the ſector: then, the ſector remaining thus opened, take the diſtance of the two equal numbers, expreſſing the number of ſides the polygon is to have; *e. gr.* the diſtance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. Theſe diſtances carried about the circumference of the circle, will divide it into ſo many equal parts.

2. To deſcribe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compaſſes, and apply it to the extent of the number 5, 5, on the lines of polygons. The ſector thus opened, upon the ſame lines take the extent from 6 to 6; this will be the ſemidiameter of the circle the polygon is to be inſcribed in. If then, with this diſtance, from the ends of the given line, you deſcribe two arches of the circle, their interſection will be the centre of the circle.

3. On a right line, to deſcribe an iſoſceles triangle, having the angles at the baſe double that at the vertex. Open the ſector, till the ends of the given line fall on 10 and 10 on each leg; then take the diſtance from 6 to 6. This will be the length of the two equal ſides of the triangle.

Uſe of the Lines of Sines, Tangents, and Secants, on the SECTOR. By the ſeveral lines diſpoſed on the ſector, we have ſcales to ſeveral radii; ſo that having a length or radius given, not exceeding the length of the ſector when opened, we find the chord, ſine, &c. thereto: *e. gr.* Suppoſe the chord, ſine, or tangent, of 10 degrees, to a radius of 3 inches required; make 3 inches the aperture, between 60 and 60, on the lines of chords of the two legs; then will the ſame extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of the ſines on the other ſide; ſo that to whatever radius the line of chords is ſet, to the ſame are all the others ſet. In this diſpoſition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compaſſes, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of ſines, it will be the ſine of 10 degrees. Laſtly, If the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, viz. 35, muſt be taken, as before; which diſtance, repeated twice, gives the chord of 70 degrees. To find the tangent of 70 degrees to the ſame radius, the ſmall line of tangents muſt be uſed, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the ſmall line; the extent between 70 and 70 degrees on the ſame, will be the tangent of 70 degrees to 3 inches radius.

To find the ſecant of an arch, make the given radius the aperture between 0 and 0 on the lines of ſecants: then will the aperture of 10 and 10, or 70 and 70, on the ſaid lines, give the tangent of 10° or 70°.

If the converſe of any of theſe things were required, that is, if the radius be required, to which a given line is the ſine, tangent, or ſecant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the ſector will ſtand at the radius required; that is, the aperture between 60 and 60 on the ſaid line is the radius. If the given line were a ſine, tangent, or ſecant, it is but making it the aperture of the given number of degrees; then will the diſtance of 90 and 90 on the ſines, of 45 and 45 on the tangents, of 0 and 0 on the ſecants, be the radius.

Sector, Secular.

Aſtronomical SECTOR. See *Astronomical Sector.*

Dialing SECTOR. See *Dialing.*

SECULAR, that which relates to affairs of the preſent world, in which ſenſe the word ſtands oppoſed to *ſpiritual, eccleſiaſtical:* thus we ſay ſecular power, &c.

SECULAR, is more peculiarly uſed for a perſon who lives at liberty in the world, not ſhut up in a monaſtery, nor bound by vows, or ſubjected to the particular rules of any religious community; in which ſenſe it ſtands oppoſed to *regular.* The Romiſh clergy are divided into ſecular and regular, of which the latter are bound by monaſtic rules, the former not.

Secular Games, in antiquity, ſolemn games held among the Romans once in an age. Theſe games laſted three days and as many nights; during which time ſacrifices were performed, theatrical ſhows exhibited, with combats, ſports, &c. in the circus. The occaſion of theſe games, according to Valerius Maximus, was to ſtop the progreſs of a plague. Valerius Publicola was the firſt who celebrated them at Rome in the year of the city 245. The ſolemnity was as follows: The whole world was invited by a herald to a feaſt which they had never ſeen already, nor ever ſhould ſee again. Some days before the games began, the quindecemviri in the Capitol and the Palatine temple, diſtributed to the people purifying compoſitions, of various kinds, as flambeaus, ſulphur, &c. From hence the populace paſſed to Diana's temple on the Aventine mount, with wheat, barley, and oats, as an offering. After this, whole nights were ſpent in devotion to the Deſtinies. When the time of the games was fully come, the people aſſembled in the Campus Martius, and ſacrificed to Jupiter, Juno, Apollo, Latona, Diana, the Parcæ, Ceres, Pluto, and Proſerpine. On the firſt night of the feaſt the emperor, with the quindecemviri, cauſed three altars to be erected on the banks of the Tiber, which they ſprinkled with the blood of three lambs, and then proceeded to regular ſacrifice. A ſpace was next marked out for a theatre, which was illuminated with innumerable flambeaus and fires. Here they ſung hymns, and celebrated all kinds of ſports. On the day after, having offered victims at the Capitol, they went to the Campus Martius, and celebrated ſports to the honour of Apollo and Diana. Theſe laſted till next day, when the noble matrons, at the hour appointed by the oracle, went to the Capitol to ſing hymns to Jupiter. On the third day, which concluded the ſolemnity, twenty-ſeven boys, and as many girls, ſung in the temple of Palatine Apollo hymns and verſes in Greek and Latin, to recommend the city to the protection of thoſe deities whom they deſigned particularly to honour by their ſacrifices.

The inimitable Carmen Seculare of Horace was compoſed for this laſt day, in the Secular Games held by Auguſtus.

It

Secular
||
Secundus.

It has been much disputed whether these games were held every hundred, or every hundred and ten years. Valerius Antius, Varro, and Livy, are quoted in support of the former opinion: In favour of the latter may be produced the quindecemviral registers, the edicts of Augustus, and the words of Horace in the Secular poem,

Cætus undenos decies per annos.

It was a general belief, that the girls who bore a part in the song should be soonest married; and that the children who did not dance and sing at the coming of Apollo, should die unmarried, and at an early period of life.

Secular Poem, a poem sung or rehearsed at the secular games; of which kind we have a very fine piece among the works of Horace, being a sapphic ode at the end of his epodes.

SECULARIZATION, the act of converting a regular person, place, or benefice, into a secular one. Almost all the cathedral churches were anciently regular, that is, the canons were to be religious; but they have been since secularized. For the secularization of a regular church, there is required the authority of the pope, that of the prince, the bishop of the place, the patron, and even the consent of the people. Religious that want to be released from their vow, obtain briefs of secularization from the pope.

SECUNDINES, in anatomy, the several coats or membranes wherein the fœtus is wrapped up in the mother's womb; as the chorion and amnios, with the placenta, &c.

SECUNDUS (Joannes Nicolaus), an elegant writer of Latin poetry, was born at the Hague in the year 1511. His descent was from an ancient and honourable family in the Netherlands; and his father Nicolaus Everardus, who was born in the neighbourhood of Middleburg, seems to have been high in the favour of the emperor Charles V. as he was employed by that monarch in several stations of considerable importance. We find him first a member of the grand parliament or council of Mechelen, afterwards president of the states of Holland and Zealand at the Hague, and lastly holding a similar office at Mechelen, where he died, August 5. 1532, aged 70.

These various employments did not occupy the whole of Everardus's time. Notwithstanding the multiplicity of his business, he found leisure to cultivate letters with great success, and even to act as preceptor to his own children, who were five sons and three daughters. They all took the name of Nicolaii from their father; but on what account our author was called *Secundus* is not known. It could not be from the order of his birth, for he was the youngest son. Perhaps the name was not given him till he became eminent; and then, according to the fashion of the age, it might have its rise from some pun, such as his being *Poetarum nemini Secundus*. Poetry, however, was by no means the profession which his father wished him to follow. He intended him for the law, and when he could no longer direct his studies himself, placed him under the care of *Jacobus Valeardus*. This man is said to have been every way well qualified to discharge the important trust which was committed to him; and he certainly gained the affection of his pupil, who, in one of his poems, mentions the death of Valeardus with every appearance of unfeigned sorrow. Another tutor was soon provided; but it does not appear that Secundus devoted much of his time to legal pursuits. Poetry and the sister arts of painting and sculpture had engaged his mind at a very early period; and the imagination, on which these have laid hold, can with difficulty submit to the dry study of musty civilians. Secundus is said to have written verses when but ten years old; and from the vast quantity which he left behind him, we have reason to conclude that such writing was his principal employment. He found time, however, to carve figures of all his own family, of his mistresses, of the emperor Charles V. of several eminent personages of those times, and of many of his intimate friends; and in the last edition of his works published by Scriverius at Leyden, 1631, there is a print of one of his mistresses with this inscription round it; VATIS AMATORIS JULIA SCULPTA MANU.

Secundus having nearly attained the age of twenty one, and being determined, as it would seem, to comply as far as possible with the wishes of his father, quitted Mechelen, and went to France, where at *Bourges*, a city in the *Orleanois*, he studied the civil law under the celebrated *Andreas Alciatus*. Alciatus was one of the most learned civilians of that age; but what undoubtedly endeared him much more to our author was his general acquaintance with polite literature, and more particularly his taste in poetry. Having studied a year under this eminent professor, and taken his degrees, Secundus returned to Mechelen, where he remained only a very few months. In 1533 he went into Spain with warm recommendations to the count of Nassau and other persons of high rank; and soon afterwards became secretary to the cardinal archbishop of Toledo in a department of business which required no other qualifications than what he possessed in a very eminent degree, a facility in writing with elegance the Latin language. It was during his residence with this cardinal that he wrote his *Basia*, a series of wanton poems, of which the fifth, seventh, and ninth *carmina* of *Catullus* seem to have given the hint. Secundus was not, however, a servile imitator of Catullus. His expressions seem to be borrowed rather from *Tibullus* and *Propertius*; and in the warmth of his descriptions he surpasses every thing that has been written on similar subjects by *Catullus*, *Tibullus*, *Propertius*, *C. Gallus*, *Ovid*, or *Horace*.

In 1535 he accompanied the emperor Charles V. to the siege of Tunis, but gained no laurels as a soldier. The hardships which were endured at that memorable siege were but little suited to the soft disposition of a votary of Venus and the Muses; and upon an enterprise which might have furnished ample matter for an epic poem, it is remarkable that Secundus wrote nothing which has been deemed worthy of preservation. Having returned from his martial expedition, he was sent by the cardinal to Rome to congratulate the pope upon the success of the emperor's arms; but was taken so ill on the road, that he was not able to complete his journey. He was advised to seek, without a moment's delay, the benefit of his native air; and that happily recovered him.

Having now quitted the service of the archbishop of Toledo, Secundus was employed in the same office of secretary by the bishop of Utrecht; and so much had

Secundus.

he

ndus
tores.

he hitherto diſtinguiſhed himſelf by the claſſical elegance of his compoſitions, that he was ſoon called upon to fill the important poſt of private Latin ſecretary to the emperor, who was then in Italy. This was the moſt honourable office to which our author was ever appointed; but before he could enter upon it death put a ſtop to his career of glory. Having arrived at *Saint Amand* in the diſtrict of *Tournay*, in order to meet, upon buſineſs, with the biſhop of Utrecht, he was on the 8th of October 1536 cut off by a violent fever, in the very flower of his age, not having quite completed his twenty-fifth year. He was interred in the church of the Benedictines, of which his patron, the biſhop, was *abbot* or *pro-abbot*; and his near relations erected to his memory a marble monument, with a plain inſcription.

The works of Secundus have gone though ſeveral editions, of which the beſt and moſt copious is that of Scriverius already mentioned. It conſiſts of JULIA, *Eleg. Lib.* 1.; AMORES, *Eleg. Lib.* 2.; AD DIVERSOS *Eleg. Lib.* 3.; BASIA, ſtyled by the editor *incomparabilis et divinus prorſus liber*; EPIGRAMMATA; ODARUM *liber unus*; EPISTOLARUM *liber unus Elegiaca*; EPISTOLARUM *liber alter, heroico carmine ſcriptus*; FUNERUM *liber unus*; SYLVÆ *et* CARMINUM *fragmenta*; POEMATA *nonnulla fratrum*; ITINERARIA *Secundi tria*, &c.; EPISTOLÆ *totidem, ſoluta oratione*. Of theſe works it would be ſuperfluous in us to give any character after the ample teſtimonies prefixed to them of *Lelius Greg. Gyraldus*, the elder *Scaliger*, *Theodore Beza*, and others equally celebrated in the republic of letters, who all ſpeak of them with rapture. A French critic, indeed, after having affirmed that the genius of Secundus never produced any thing which was not excellent in its kind, adds, with too much truth, *Mais ſa muſe eſt un peu trop laſcive*. For this fault our author makes the following apology in an epigram addreſſed to the grammarians;

Carmina cur ſpargam cunctis laſciva libellis,
  Queritis? Inſulſos arceo grammaticos.
Fortia magnanimi canerem ſi Cæſaris arma,
  Factave DIVORUM religioſa VIRÛM;
Quot miſer exciperemque notas, patererque litûras?
  Quot fierem teneris ſupplicium pueris!
At nunc uda mihi dictant cum BASIA carmen,
  Pruriet et verſu mentula multa meo;
Me leget innuptæ juvenis placiturus amicæ,
  Et placitura nova blanda puella viro:
Et quemcunque juvat lepidorum de grege vatum
  Otia feſtivis ludere deliciis.
Luſibus et lætis procul hinc abſiſtite, SÆVI
  GRAMMATICI, injuſtas et cohibite manus.
Ne puer, ab malleis cæſus lacrymanſque leporis;
  DURAM FORTE MEIS OSSIBUS OPTET HUMUM.

SECURIDACA, a plant belonging to the claſs of diadelphia, and to the order of octandria. The calyx has three leaves, which are ſmall, deciduous, and coloured. The corolla is papilionaceous. The vexillum, conſiſting of two petals, is oblong, ſtraight, and conjoined to the carina at the baſe. The carina is of the ſame length with the alæ. The legumen is ovated, unilocular, monoſpermous, and ending in a ligulated ala. There are two ſpecies, the *erecta* and *volubilis*. The erecta has an upright ſtem: the volubilis or ſcandens is a climbing plant, and is a native of the Weſt Indies.

SECUTORES, a ſpecies of gladiators among the Romans, whoſe arms were a helmet, a ſhield, and a ſword or a leaden bullet. They were armed in this manner, becauſe they had to contend with the retiarii, who were dreſſed in a ſhort tunic, bore a three-pointed lance in their left hand, and a net in their right. The retiarius attempted to caſt his net over the head of the ſecutor; and if he ſucceeded, he drew it together and ſlew him with his trident: but if he miſſed his aim, he immediately betook himſelf to flight till he could find a ſecond opportunity of entangling his adverſary with his net. He was purſued by the ſecutor, who endeavoured to deſpatch him in his flight.

Sedan. Sedition.

Secutores was alſo a name given to ſuch gladiators who took the place of thoſe killed in the combat, or who engaged the conqueror. This poſt was uſually taken by lot.

SEDAN is a town of Champagne in France, in E. Long. 4. 45. N. Lat. 49. 46. This is the capital of a principality of the ſame name, ſituated on the Maeſe, ſix miles from Bouillon, and fifteen from Charleville. Its ſituation on the frontiers of the territory of Liege, Namur, and Limburg, formerly rendered it one of the keys of the kingdom. It is extremely well fortified, and defended by a ſtrong citadel. The caſtle is ſituated on a rock, ſurrounded with large towers and ſtrong walls: here you ſee a moſt beautiful magazine of ancient arms. The governor's palace is oppoſite the caſtle. From the ramparts you have a moſt agreeable proſpect of the Maeſe and the neighbouring country. Though the town is but ſmall, yet it is full of tradeſmen, as tanners, weavers, dyers, &c. the manufacture of fine cloth in this city employing a great number of hands. The principality of Sedan formerly belonged to the duke of Bouillon, who was obliged in the beginning of the laſt century to reſign it to the crown.

SEDAN-CHAIR is a covered vehicle for carrying a ſingle perſon, ſuſpended by two poles, and borne by two men, hence denominated *chairmen*. They were firſt introduced in London in 1634, when Sir Sanders Duncomb obtained the ſole privilege to uſe, let, and hire a number of the ſaid covered chairs for fourteen years.

SEDITION, among civilians, is uſed for a factious commotion of the people, or an aſſembly of a number of citizens without lawful authority, tending to diſturb the peace and order of the ſociety. This offence is of different kinds: ſome ſeditions more immediately threatening the ſupreme power, and the ſubverſion of the preſent conſtitution of the ſtate; others tending only towards the redreſs of private grievances. Among the Romans, therefore, it was variouſly puniſhed, according as its end and tendency threatened greater miſchief. See Lib. I. *Cod. de Seditioſis*, and *Mat. de Crimin.* Lib. II. n. 5. *de Læſa Majeſtate*. In the puniſhment, the authors and ringleaders were juſtly diſtinguiſhed from thoſe who, with leſs wicked intention, joined and made part of the multitude.

The ſame diſtinction holds in the law of England and in that of Scotland. Some kinds of ſedition in England amount to high treaſon, and come within the ſtat. 25 Edw. III. as levying war againſt the king. And ſeveral ſeditions are mentioned in the Scotch acts of parliament as treaſonable. *Bayne's Crim. Law of Scotland*, p. 33, 34. The law of Scotland makes riotous and tumultuous aſſemblies a ſpecies of ſedition. But the law there, as well as in England, is now chiefly

Sedatives ‖ Sedley.

regulated by the riot act, made 1 Geo. I. only it is to be obſerved, that the proper officers in Scotland, to make the proclamation thereby enacted, are ſheriffs, ſtewards and bailies of regalities, or their deputies; magiſtrates of royal boroughs, and all other inferior judges and magiſtrates; high and petty conſtables, or other officers of the peace, in any county, ſtewartry, city, or town. And in that part of the iſland, the puniſhment of the offence is any thing ſhort of death which the judges, in their diſcretion, may appoint.

SEDATIVES, in medicine, a general name for ſuch medicines as weaken the powers of nature, ſuch as blood-letting, cooling ſalts, purgatives, &c.

SE DEFENDENDO, in law, a plea uſed for him that is charged with the death of another, by alleging that he was under a neceſſity of doing what he did in his own defence; as that the other aſſaulted him in ſuch a manner, that if he had not done what he did, he muſt have been in hazard of his own life. See HOMICIDE and MURDER.

SEDIMENT, the ſettlement or dregs of any thing, or that groſs heavy part of a fluid body which ſinks to the bottom of the veſſel when at reſt.

SEDLEY (Sir Charles), an Engliſh poet and wit, the ſon of Sir John Sedley of Aylesford in Kent, was born about the year 1639. At the Reſtoration he came to London to join the general jubilee; and commenced wit, courtier, poet, and gallant. He was ſo much admired, that he became a kind of oracle among the poets; which made King Charles tell him, that Nature had given him a patent to be Apollo's viceroy. The productions of his pen were ſome plays, and ſeveral deheately tender amorous poems, in which the ſoftneſs of the verſes was ſo exquiſite, as to be called by the duke of Buckingham *Sedley's witchcraft*. "There were no marks of genius or true poetry to be deſcried, (ſay the authors of the *Biographia Britannica*); the art wholly conſiſted in raiſing looſe thoughts and lewd deſires, without giving any alarm; and ſo the poiſon worked gently and irreſiſtibly. Our author, we may be ſure, did not eſcape the infection of his own art, or rather was firſt tainted himſelf before he ſpread the infection to others."—A very ingenious writer of the preſent day, however, ſpeaks much more favourably of Sir Charles Sedley's writings. "He ſtudied human nature; and was diſtinguiſhed for the art of making himſelf agreeable, particularly to the ladies; for the verſes of Lord Rocheſter, beginning with, *Sedley has that prevailing gentle art*, &c. ſo often quoted, allude not to his *writings*, but to his *perſonal addreſs*." [*Langhorn's Eſſaſions*, &c.]—But while he was thus in reputation for wit and in favour with the king, he grew poor and debauched: his eſtate was impaired, and his morals were corrupted. One of his frolics, however, being followed by an indictment and a heavy fine, Sir Charles took a more ſerious turn, applied himſelf to buſineſs, and became a member of parliament, in which he was a frequent ſpeaker. We find him in the houſe of commons in the reign of James II. whoſe attempts upon the conſtitution he vigorouſly withſtood; and he was very active in bringing on the Revolution. This was thought more extraordinary, as he had received favours from James. But that prince had taken a fancy to Sir Charles's daughter (though it ſeems ſhe was not very handſome), and, in conſequence of his intrigues with her, he created Miſs Sedley counteſs of Dorcheſter. This honour, ſo far from pleaſing, greatly ſhocked Sir Charles. However libertine he himſelf had been, yet he could not bear the thoughts of his daughter's diſhonour; and with regard to her exaltation, he only conſidered it as rendering her more conſpicuouſly infamous. He therefore conceived a hatred for the king; and from this, as well as other motives, readily joined to diſpoſſeſs him of the throne. A witty ſaying of Sedley's, on this occaſion, is recorded. "I hate ingratitude, (ſaid Sir Charles); and therefore, as the king has made my daughter a counteſs, I will endeavour to make his daughter a queen;" meaning the princeſs Mary, married to the prince of Orange, who diſpoſſeſſed James of the throne at the Revolution. He lived to the beginning of Queen Anne's reign; and his works were printed in 2 vols. 8vo, 1719.

Sedr ‖ Seduction.

SEDR, or SEDRE, the high-prieſt of the ſect of Ali among the Perſians. The ſedre is appointed by the emperor of Perſia, who uſually confers the dignity on his neareſt relation. The juriſdiction of the ſedre extends over all effects deſtined for pious purpoſes, over all moſques, hoſpitals, colleges, ſepulchres, and monaſteries. He diſpoſes of all eccleſiaſtical employments, and nominates all the ſuperiors of religious houſes. His deciſions in matters of religion are received as ſo many infallible oracles; he judges of all criminal matters in his own houſe without appeal. His authority is balanced by that of the mudfitehid, or firſt theologue of the empire.

SEDUCTION, is the act of tempting and drawing aſide from the right path, and comprehends every endeavour to corrupt any individual of the human race. This is the import of the word in its largeſt and moſt general ſenſe; but it is commonly employed to expreſs the act of tempting a virtuous woman to part with her chaſtity.

The *ſeducer* of female innocence practiſes the ſame ſtratagems of fraud to get poſſeſſion of a woman's perſon, that the *ſwindler* employs to get poſſeſſion of his neighbour's goods or money; yet the law of honour, which pretends to abhor *deceit*, and which impels its votaries to *murder* every man who preſumes, however juſtly, to ſuſpect them of fraud, or to queſtion their veracity, applauds the addreſs of a ſucceſsful intrigue, though it be well known that the ſeducer could not have obtained his end without ſwearing to the truth of a thouſand falſehoods, and calling upon God to witneſs promiſes which he never meant to fulfil.

The law of honour is indeed a very capricious rule, which accommodates itſelf to the pleaſures and conveniences of higher life; but the law of the land, which is enacted for the equal protection of high and low, may be ſuppoſed to view the guilt of ſeduction with a more impartial eye. Yet for this offence, even the laws of this kingdom have provided no other puniſhment than a pecuniary ſatisfaction to the injured family; which, in England, can be obtained only by one of the quainteſt fictions in the world, by the father's bringing his action againſt the ſeducer for the loſs of his daughter's ſervice during her pregnancy and nurturing. See Paley's *Moral Philoſophy*, Book III. Part III. Chap. 3.

The moraliſt, however, who eſtimates the merit or demerit of actions, not by laws of human appointment, but by their general conſequences as eſtabliſhed by the laws of nature, muſt conſider the ſeducer as a criminal

of

Seduction. of the deepeſt guilt. In every civilized country, and in many countries where civilization has made but ſmall progreſs, the virtue of women is collected as it were into a ſingle point, which they are to guard above all things, as that on which their happineſs and reputation wholly depend. At firſt ſight this may appear a capricious regulation; but a moment's reflection will convince us of the contrary. In the married ſtate ſo much confidence is neceſſarily repoſed in the fidelity of women to the beds of their huſbands, and evils ſo great reſult from the violation of that fidelity, that whatever contributes in any degree to its preſervation, muſt be agreeable to him who, in eſtabliſhing the laws of nature, intended them to be ſubſervient to the real happineſs of all his creatures. But nothing contributes ſo much to preſerve the fidelity of wives to their huſbands, as the impreſſing upon the minds of women the higheſt veneration for the virtue of chaſtity. She who, when unmarried, has been accuſtomed to grant favours to different men, will not find it eaſy, if indeed poſſible, to reſiſt afterwards the allurements of variety. It is therefore a wiſe inſtitution, and agreeable to the will of Him who made us, to train up women ſo as that they may look upon the loſs of their chaſtity as the moſt diſgraceful of all crimes; as that which ſinks them in the order of ſociety, and robs them of all their value. In this light virtuous women actually look upon the loſs of chaſtity. The importance of that virtue has been ſo deeply impreſſed upon their minds, and is ſo cloſely aſſociated with the principle of honour, that they cannot think but with abhorrence upon the very deed by which it is loſt. He therefore who by fraud and falſehood perſuades the unſuſpecting girl to deviate in one inſtance from the honour of the ſex, weakens in a great degree her moral principle; and if he reconcile her to a repetition of her crime, he deſtroys that principle entirely, as ſhe has been taught to conſider all other virtues as inferior to that of chaſtity. Hence it is that the hearts of proſtitutes are generally ſteeled againſt the miſeries of their fellow-creatures; that they lend their aid to the ſeducer in his practices upon other girls; that they lie and ſwear and ſteal without compunction; and that too many of them heſitate not to commit murder if it can ſerve any ſelfiſh purpoſe of their own.

The loſs of virtue, though the greateſt that man or woman can ſuſtain, is not the only injury which the ſeducer brings upon the girl whom he deceives. She cannot at once reconcile herſelf to proſtitution, or even to the loſs of character; and while a ſenſe of ſhame remains in her mind, the miſery which ſhe ſuffers muſt be exquiſite. She knows that ſhe has forfeited what in the female character is moſt valued by both ſexes; and ſhe muſt be under the perpetual dread of a diſcovery. She cannot even confide in the honour of her ſeducer, who may reveal her ſecret in a fit of drunkenneſs, and thus rob her of her fame as well as of her virtue; and while ſhe is in this ſtate of anxious uncertainty, the agony of her mind muſt be inſupportable. That it is ſo in fact, the many inſtances of child-murder by unmarried women of every rank leave us no room to doubt. The affection of a mother to her new-born child is one of the moſt unequivocal and ſtrongeſt inſtincts in human nature (ſee INSTINCT); and nothing ſhort of the extremity of diſtreſs could prompt any one ſo far to oppoſe her nature as to embrue her hands in the blood of her imploring infant. Seduction.

Even this deed of horror ſeldom prevents a detection of the mother's frailty, which is indeed commonly diſcovered, though no child has been the conſequence of her intrigue. He who can ſeduce is baſe enough to betray; and no woman can part with her honour, and retain any well-grounded hope that her amour ſhall be kept ſecret. The villain to whom ſhe ſurrendered will glory in his victory, if it was with difficulty obtained; and if ſhe ſurrendered at diſcretion, her own behaviour will reveal her ſecret. Her reputation is then irretrievably loſt, and no future circumſpection will be of the ſmalleſt avail to recover it. She will be ſhunned by the virtuous part of her own ſex, and treated as a mere inſtrument of pleaſure by the other. In ſuch circumſtances ſhe cannot expect to be married with advantage. She may perhaps be able to captivate the heart of a heedleſs youth, and prevail upon him to unite his fate to her's before the delirium of his paſſion ſhall give him time for reflection; ſhe may be addreſſed by a man who is a ſtranger to her ſtory, and married while he has no ſuſpicion of her ſecret; or ſhe may be ſolicited by one of a ſtation inferior to her own, who, though acquainted with every thing that has befallen her, can barter the delicacy of wedded love for ſome pecuniary advantage; but from none of theſe marriages can ſhe look for happineſs. The delirium which prompted the firſt will ſoon vaniſh, and leave the huſband to the bitterneſs of his own reflections, which can hardly fail to produce cruelty to the wife. Of the ſecret, to which, in the ſecond caſe, the lover was a ſtranger, the huſband will ſoon make a diſcovery, or at leaſt find room for harbouring ſtrong ſuſpicions; and ſuſpicions of having been deceived in a point ſo delicate have hitherto been uniformly the parents of miſery. In the third caſe, the man married her merely for money, of which having got the poſſeſſion, he has no farther inducement to treat her with reſpect. Such are ſome of the conſequences of ſeduction, even when the perſon ſeduced has the good fortune to get afterwards a huſband; but this is a fortune which few in her circumſtances can reaſonably expect. By far the greater part of thoſe who have been defrauded of their virtue by the arts of the ſeducer ſink deeper and deeper into guilt, till they become at laſt common proſtitutes. The public is then deprived of their ſervice as wives and parents; and inſtead of contributing to the population of the ſtate, and to the ſum of domeſtic felicity, theſe outcaſts of ſociety become ſeducers in their turn, corrupting the morals of every young man whoſe appetites they can inflame, and of every young woman whom they can entice to their own practices.

All this complication of evil is produced at firſt by arts, which, if employed to deprive a man of his property, would ſubject the offender to the execration of his fellow-ſubjects, and to an ignominious death: but while the forger of a bill is purſued with relentleſs rigour by the miniſters of juſtice, and the ſwindler loaded with univerſal reproach, the man who by fraud and forgery has enticed an innocent girl to gratify his deſires at the expence of her virtue, and thus introduced her into a path which muſt infallibly lead to her own ruin, as well as to repeated injuries to the public at

Seduction. Sedum.

large, is not deſpiſed by his own ſex, and is too often careſſed even by the virtuous part of the other. Yet the loſs of property may be eaſily repaired; the loſs of honour is irreparable! It is vain to plead in alleviation of this guilt, that women ſhould be on their guard againſt the arts of the ſeducer. Moſt unqueſtionably they ſhould; but arts have been uſed which hardly any degree of caution would have been ſufficient to counteract. It may as well be ſaid that the trader ſhould be on his guard againſt the arts of the forger, and accept of no bill without previouſly conſulting him in whoſe name it is written. Caſes, indeed, occur in trade, in which this caution would be impoſſible; but he muſt be little acquainted with the workings of the human heart, who does not know that ſituations likewiſe occur in life, in which it is equally impoſſible for a g[illegible] f virtue and tenderneſs to reſiſt the arts of the man w[illegible] has completely gained her affections.

The mentioning of this circumſtance leads us to conſider another ſpecies of ſeduction, which, though not ſo highly criminal as the former, is yet far removed from innocence; we mean the practice which is too prevalent among young men of fortune of employing every art in their power to gain the hearts of headleſs girls whom they reſolve neither to marry nor to rob of their honour. Should a man adhere to the latter part of this reſolution, which is more than common fortitude can always promiſe for itſelf, the injury which he does to the object of his amuſement is yet very great, as he raiſes hopes of the moſt ſanguine kind merely to diſappoint them, and diverts her affections perhaps for ever from ſuch men as, had they been fixed on one of them, might have rendered her completely happy. Diſappointments of this kind have ſometimes been fatal to the unhappy girl; and even when they have neither deprived her of life, nor diſordered her reaſon, they have often kept her wholly from marriage, which, whatever it be to a man, is that from which every woman expects her chief happineſs. We cannot therefore conclude this article more properly than with warning our female readers not to give up their hearts haſtily to men whoſe ſtation in life is much higher than their own; and we beg leave to aſſure every one of them, that the man who ſolicits the laſt favour under the moſt ſolemn promiſe of a ſubſequent marriage, is a baſe ſeducer, who prefers a momentary gratification of his own to her honour and happineſs through life, and has no intention to fulfil his promiſe. Or, if he ſhould by any means be compelled to fulfil it, ſhe may depend upon much ill treatment in return for her premature compliance with his baſe deſires.

SEDUM, ORPINE, in botany: A genus of the pentagynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 13th ordeor, *Succulentæ*. The calyx is quinquefid; the corolla is pentapetalous, pointed, and ſpreading; there are five nectariferous ſquamæ or ſcales at the baſe of the germen. The capſules are five.

The ſpecies are 20 in number. 1. The Verticillatum; 2. Telephium; 3. Anacampſeros; 4. Aizoon; 5. Hybridum; 6. Populifolium; 7. Stellatum; 8. Cepaea; 9. Libanoticum; 10. Daſyphyllum; 11. Reflexum; 12. Rupeſtre; 13. Lineare; 14. Hiſpanicum; 15. Album; 16. Acre; 17. Sexangulare; 18. Annuum; 19. Villoſum; 20. Atratum. The following ſpecies are the moſt remarkable. Sedum.

1. The telephium, common orpine, or live-long, hath a perennial root, compoſed of many knobbed tubercles, ſending up erect, round, ſucculent ſtalks, branching half a yard or two feet high, garniſhed with oblong, plane, ſerrated, ſucculent leaves, and the ſtalks terminated by a leafy corymbus of flowers, of different colours in the varieties. This ſpecies is an inhabitant of woods and dry places in England, &c. but has been long a reſident of gardens for variety and medical uſe. 2. The anacampleros, or decumbent evergreen Italian orpine, hath a fibrous perennial root, decumbent or trailing ſtalks, wedge-ſhaped entire leaves, and the ſtalks terminated by a corymbus of purple flowers. 3. The rupeſtre, rock ſedum, or ſtone-crop of St Vincent's rock, hath ſlender, trailing, purple ſtalks; ſhort, thick, awl-ſhaped, ſucculent, glaucous leaves in cluſters, quinquefariouſly imbricated round the ſtalks, and the ſtalks terminated by roundiſh cymous bunches of bright yellow flowers. It grows naturally on St Vincent's rock near Briſtol, and other rocky places in Europe. 4. The aizoon, or Siberian yellow orpine, hath a tuberculate, fibrous, perennial root; many upright, round, ſucculent ſtalks, a foot high; lanceolated, plane, ſerrated, thickiſh leaves; and the ſtalks terminated by a cloſe-ſitting cymoſe cluſter of bright yellow flowers. 5. The reflexum, reflexed ſmall yellow ſedum, or prick-madam, hath a ſlender fibrous perennial root; ſmall trailing ſucculent ſtalks, garniſhed with thick, awl-ſhaped, ſucculent leaves ſparſedly, the lower ones recurved, and the ſtalks terminated by reflexed ſpikes of bright yellow flowers. It grows naturally on old walls and buildings in England, &c. 6. The acre, acrid ſedum, common ſtone-crop of the wall, or wall-pepper, hath ſmall fibry roots, very ſlender ſucculent ſtalks four or five inches high, very ſmall, ſuboval, gibbous, erect, alternate leaves, cloſe together, and the ſtalks terminated by trifid cymoſe bunches of ſmall yellow flowers. This ſort grows abundantly on rocks, old walls, and tops of buildings, almoſt everywhere, which often appear covered with the flowers in ſummer. 7. The ſexangulare, or ſexangular ſtone-crop, hath a fibry perennial root; thick, ſhort, ſucculent ſtalks; ſmall, ſuboval, gibbous, erect leaves cloſe together, arranged ſix ways imbricatim, and the ſtalks terminated by bunches of yellow flowers. It grows on rocky and other dry places in England, &c. 8. The album, or white ſtone-crop, hath fibry perennial roots; trailing ſlender ſtalks, ſix or eight inches long; oblong, obtuſe, ſeſſile, ſpreading leaves; and the ſtalks terminated by branchy cymoſe bunches of white flowers. This grows on old walls, rocks, and buildings, in England, &c. 9. The hiſpanicum, or Spaniſh ſedum, hath fibrous perennial roots, crowned with cluſters of taper, acute, ſucculent leaves; ſlender ſucculent ſtalks, four or five inches high, garniſhed alſo with taper leaves, and terminated by downy cymoſe cluſters of white flowers.

All theſe ſpecies of ſedum are hardy herbaceous ſucculent perennials, durable in root, but moſtly annual in ſtalk, &c. which, riſing in ſpring, flower in June, July, and Auguſt, in different ſorts; the flowers conſiſting univerſally of five ſpreading petals, generally crowning the ſtalks numerouſly in corymboſe and cymoſe bunches and ſpikes, appearing tolerably conſpicuous, and are

ſucceeded

Seed || Seeks.

succeeded by plenty of seeds in autumn, by which they may be propagated also abundantly by parting the roots, and by slips or cuttings of the stalks in summer; in all of which methods they readily grow and spread very fast with tufted bunches; being all of succulent growth, they consequently delight most in dry soils, or in any dry rubbish earth.

Uses. As flowering plants, they are mostly employed to embellish rock-work, ruins, and the like places, planting either the roots or cuttings of the shoots in a little mud or any moist soil at first, placing it in the crevices, where they will soon root and fix themselves, and spread about very agreeably. For economical purposes, the reflexum and rupestre are cultivated in Holland and Germany, to mix with lettuce in salads. The wall pepper is so acrid, that it blisters the skin when applied externally. Taken inwardly, it excites vomiting. In scorbutic cases and quartan agues, it is said to be an excellent medicine under proper management. Goats eat it: cows, horses, sheep, and swine, refuse it.

SEED, in physiology, a substance prepared by nature for the reproduction and conservation of the species both in animals and plants. See BOTANY, Sect. IV. p. 435.; and PHYSIOLOGY, Sect. XII.

SEEDLINGS, among gardeners, denote such roots of gilliflowers, &c. as come from seed sown. Also the young tender shoots of any plants, that are newly sown.

SEEDY, in the brandy trade, a term used by the dealers to denote a fault that is found in several parcels of French brandy, which renders them unsaleable. The French suppose that these brandies obtain the flavour which they express by this name, from weeds that grow among the vines from whence the wine of which this brandy is pressed was made.

SEEING, the perceiving of external objects by means of the eye. For an account of the organs of sight, and the nature of vision, see ANATOMY, Sect. VI. and OPTICS, page 292, *et seq.*

SEEKS, a religious sect settled at Patna, and so called from a word contained in one of the commandments of their founder, which signifies *learn thou*. In books giving an account of oriental sects and oriental customs, we find mention made both of *Seeks* and *Seiks*; and we are strongly inclined to think that the same tribe is meant to be denominated by both words. If so, different authors write very differently of their principles and manners. We have already related what we then knew of the *Seiks* under the article HINDOOS, p. 530; but in the Asiatic Researches, Mr Wilkins gives a much more amiable account of the *Seeks*, which we lay before our readers with pleasure.

The Seeks are a sect distinguished both from the Mussulmans and the worshippers of Brahma; and, from our author's account of them, must be an amiable people. He asked leave to enter into their chapel: They said it was a place of worship, open to all men, but intimated that he must take off his shoes. On complying with this ceremony, he was politely conducted into the hall, and seated upon a carpet in the midst of the assembly. The whole building forms a square of about 40 feet. The hall is in the centre, divided from four other apartments by wooden arches, upon pillars of the same materials. The walls above the arches were hung with European looking-glasses in gilt frames, and with pictures. On the left hand, as one enters, is the chancel, which is furnished with an altar covered with cloth of gold, raised a little above the ground in a declining position. About it were several flower-pots and rose-water bottles, and three urns to receive the donations of the charitable. On a low desk, near the altar, stood a great book of folio size, from which some portions are daily read in the divine service. When notice was given that it was *noon*, the congregation arranged themselves upon the carpet on each side of the hall. The great book and desk were brought from the altar, and placed at the opposite extremity. An old silver-haired man kneeled down before the desk, with his face towards the altar, and by him sat a man with a drum, and two or three with cymbals. The book was now opened, and the old man began to chant to the time of the instruments, and at the conclusion of every verse most of the congregation joined chorus in a response, with countenances exhibiting great marks of joy. Their tones were not harsh; the time was quick; and Mr Wilkins learned that the subject was a hymn in praise of the unity, omnipresence, and omnipotence of the Deity. The hymn concluded, the whole company got up and presented their faces with joined hands, towards the altar in the attitude of prayer. The prayer was a sort of litany pronounced by a young man in a loud and distinct voice; the people joining, at certain periods, in a general response. This prayer was followed by a short blessing from the old man, and an invitation to the assembly to partake of a friendly feast. A share was offered to Mr Wilkins, who was too polite to refuse it. It was a kind of sweetmeat composed of sugar and flower mixed up with clarified butter. They were next served with a few sugar plums; and thus ended the feast and ceremony. Seeks.

In the course of conversation Mr Wilkins learned that the founder of this sect was *Naneek Sah*, who lived about 400 years ago; who left behind him a book, composed by himself in verse, containing the doctrines he had established; that this book teaches, that there is but one God, filling all space, and pervading all matter; and that there will be a day of retribution, when virtue will be rewarded, and vice punished. (Our author forgot to ask in what manner.) It forbids murder, theft, and such other deeds as are by the majority of mankind esteemed crimes, and inculcates the practice of all the virtues; but, particularly, a universal philanthropy and hospitality to strangers and travellers. It not only commands universal toleration, but forbids disputes with those of another persuasion. If any one show a sincere inclination to be admitted among them, any five or more Seeks being assembled in any place, even on the highway, they send to the first shop where sweetmeats are sold, and procure a very small quantity of a particular kind called *batāsā*. (Mr Wilkins does not tell us of what it is composed), which having diluted in pure water, they sprinkle some of it on the body and eyes of the proselyte, whilst one of the best instructed repeats to him the chief canons of their faith, and exacts from him a solemn promise to abide by them the rest of his life. They offered to admit Mr Wilkins into their society; but he declined the honour, contenting himself with their alphabet, which they told him to guard as the apple of his eye, as it was a sacred character. Mr Wilkins finds it but a little different from the Dewadgari.

Segeberg || Segovia.

The language itſelf is a mixture of Perſian, Arabic, and Shanſcrit, grafted upon the provincial dialect of Punjab, which is a kind of Hindowee, or, as we commonly call it, *Moors*.

SEGEBERG, a town of Germany, in the duchy of Holſtein, and in Wagria; with a caſtle ſtanding on a high mountain, conſiſting of limeſtone, large quantities of which are carried to Hamburg and Lubec. It belongs to Denmark, and is ſeated on the river Treve, in E. Long. 10. 9. N. Lat. 54. 0.

SEGEDIN, a ſtrong town of Lower Hungary, in the county of Czongrad, with a caſtle. The Imperialiſts took it from the Turks in 1686. It is ſeated at the confluence of the rivers Teſſe and Maſroch, in E. Long. 20. 35. N. Lat. 46. 28.

SEGMENT *of a* CIRCLE, in geometry, is that part of the circle contained between a chord and an arch of the ſame circle.

SEGNA, a city of Croatia, belonging to the houſe of Auſtria, and ſeated on the coaſt of the gulf of Venice. It was formerly a place of ſtrength and great importance; but it has ſuffered many calamities, and its inhabitants at preſent do not amount to 7000. In the beginning of this century it ſent 50 merchant ſhips to ſea; but the inconveniency of its ſituation and badneſs of its harbour, in which the ſea is never calm, diſcouraged navigation, and Segna has now very few ſhips belonging to it. Among the cuſtoms of the Segnans, Mr Fortis mentions one relative to the dead, which for its ſingularity may be worthy of notice.

Fortis's Travels into Dalmatia.

"All the relations and friends of the family go to kiſs the corpſe, by way of taking leave, before burial. Each of them uncovers the face, over which a handkerchief is ſpread, more or leſs rich according to the family; having kiſſed the dead perſon, every one throws another handkerchief over the face; all which remain to the heirs, and ſometimes there are 20, 30, and more at this ceremony. Some throw all theſe handkerchiefs into the grave with the corpſe; and this, in former times, was the general cuſtom; but then they were rich. This ſeems to have been brought into uſe as a ſubſtitute for the ancient *vaſa lachrymatoria*." E. Long. 15. 21. N. Lat. 45. 22.

SEGNI, an ancient town of Italy, in the Campagna of Rome, with a biſhop's ſee, and the title of duchy. It is ſaid that organs were firſt invented here. It is ſeated on a mountain. E. Long. 13. 15. N. Lat. 41. 50.

SEGORBE, a town of Spain, in the kingdom of Valencia, with the title of a duchy, and a biſhop's ſee. It is ſeated on the ſide of a hill, between the mountains, in a ſoil very fertile in corn and wine, and where there are quarries of fine marble. It was taken from the Moors in 1245; and the Romans thought it worth their while to carry ſome of the marble to Rome. W. Long. 0. 3. N. Lat. 39. 48.

SEGOVIA, an ancient city of Spain, of great power in the time of the Cæſars, is built upon two hills near the banks of the Arayda in Old Caſtile. W. Long. 3. 48. N. Lat. 41. 0. It is ſtill a biſhop's ſee, and is diſtinguiſhed for ſome venerable remains of antiquity. In the year 1525 the city contained 5000 families, but now they do not ſurpaſs 2000, a ſcanty population for 25 pariſhes; yet, beſides 21 churches and a cathedral, there are 21 convents.

The firſt object in Segovia that attracts the eye is the aqueduct, which the ſingular ſituation of the city renders neceſſary. As it is built upon two hills, and the valley by which they are ſeparated, and extends conſiderably in every direction, it was difficult for a part of the citizens to be ſupplied with water. The difficulty was removed, according to the opinion of the learned, in the reign of Trajan, by this aqueduct, which is one of the moſt aſtoniſhing and the beſt preſerved of the Roman works. In the opinion of Mr Swinburne, who ſurveyed it in 1776, and who ſeems to have given a very accurate account of the curioſities of Segovia, it is ſuperior in elegance of proportion to the Pont du Gard at Niſmes. It is ſo perfectly well preſerved, that it does not ſeem leaky in any part. From the firſt low arches to the reſervoir in the town, its length is 2400 Spaniſh feet; its greateſt height (in the Plaza del Azobejo at the foot of the walls) is 104; it is there compoſed of a double row of arches, built of large ſquare ſtones without mortar, and over them a hollow wall of coarſer materials for the channel of the water, covered with large oblong flags. Of the lower range of arcades, which are 15 feet wide by 65 high, there are 42. The upper arches are 119 in number, their height 27 Spaniſh feet, their breadth ſeventeen, the tranſverſal thickneſs, or depth of the piers, eight feet.

Segovia.

Swinburne's Travels through Spain.

The cathedral is a mixture of the Gothic and Mooriſh architecture. The inſide is very ſpacious and of majeſtic ſimplicity. The windows are well diſpoſed, and the great altar has been lately decorated with the fineſt Grenadian marble. But it is to be regretted, that in this cathedral, as well as in moſt others of Spain, the choir is placed in the middle of the nave. The church is nearly upon the model of the great church of Salamanca, but it is not ſo highly finiſhed.

Travels in Spain by the Chev. de Bourgoanne.

The alcazar, or ancient palace of the Moors, ſtands in one of the fineſt poſitions poſſible, on a rock riſing above the open country. A very pretty river waſhes the foot of the precipice, and the city lies admirably well on each ſide on the brow of the hill; the declivity is woody, and the banks charmingly rural; the ſnowy mountains and dark foreſts of Saint Ildefonzo compoſe an awful back ground to the picture. Towards the town there is a large court before the great outward tower, which, as the priſon of Gil Blas, is ſo well deſcribed by Le Sage, that the ſubject requires no farther explanation. The reſt of the buildings form an antique palace, which has ſeldom been inhabited by any but priſoners ſince the reign of Ferdinand and Iſabella, who were much attached to this ſituation. There are ſome magnificent halls in it, with much gilding in the ceilings, in a ſemi-barbarous taſte. All the kings of Spain are ſeated in ſtate along the cornice of the great ſaloon; but it is doubtful whether they are like the princes whoſe names they bear; if that reſemblance, however, be wanting, they have no other merit to claim. The royal apartments are now occupied by a college of young gentlemen cadets, educated at the king's expence in all the ſciences requiſite for forming an engineer. The grand-maſter of the ordnance reſides at Segovia, which is the head eſtabliſhment of the Spaniſh artillery.

The mint is below the alcazar, a large building, the moſt ancient place of coinage in the kingdom. The machines for melting, ſtamping, and milling the coin, are worked by water: but there is reaſon to believe that

govia
||
jant.

that Seville has at preſent more buſineſs, as being nearer the ſource of riches, the port of Cadiz, where the ingots of America are landed.

The unevenneſs of the crown of the hill gives a wild look to this city. Moſt of the ſtreets are crooked and dirty, the houſes wooden and very wretched; nor do the inhabitants appear much the richer for their cloth manufactory. Indeed, it is not in a very flouriſhing condition, but what cloth they make is very fine.

The country about Segovia has the reputation of being the beſt for rearing the kind of ſheep that produces the beautiful Spaniſh wool; but as thoſe flocks wander over many other parts of the kingdom, Segovia ſeems to have no excluſive title to this reputation. Segovia (ſays Mr Townſend, whoſe valuable travels will be read with much pleaſure) was once famous for its cloth made on the king's account; but other nations have ſince become rivals in this branch, and the manufacture in this city has been gradually declining. When the king gave it up to a private company, he left about 3000l. in trade; but now he is no longer a partner in the buſineſs. In the year 1612 were made here 25,500 pieces of cloth, which conſumed 44,625 quintals of wool, employed 34,189 perſons; but at preſent they make only about 4000 pieces. The principal imperfections of this cloth are, that the thread is not even, and that much greaſe remains in it when it is delivered to the dyer; in conſequence of which the colour is apt to fail. Yet, independently of imperfections, ſo many are the diſadvantages under which the manufacture labours, that foreigners can afford to pay 3l. for the arroba of fine wool, for which the Spaniard gives no more than 20 ſhillings, and after all his charges can command the market even in the ports of Spain.

onſend's
rney
gh
n.

Segovia (New), a town of North America, in New Spain, and in the audience of Guatimala; ſeated on the river Yare, on the confines of the province of Honduras. W. Long. 84. 30. N. Lat. 13. 25.

Segovia, a town of America, in Terra Firma, and in the province of Venezuela, ſeated on a river, near a very high mountain, where there are mines of gold. W. Long. 65. 30. N. Lat. 8. 20.

Segovia, a town of Aſia, in the iſland of Manila, and one of the largeſt of the Philippines, ſeated at the north end of the iſland, 240 miles north of Manila, and ſubject to Spain. E. Long. 120. 59. N. Lat. 18. 36.

SEGREANT, is the herald's word for a griffin when drawn in a leaping poſture and diſplaying his wings as if ready to fly.

SEGUE, in the Italian muſic, is often found before *aria*, *alleluja*, *amen*, &c. to ſhow that thoſe portions or parts are to be ſung immediately after the laſt note of that part over which it is writ; but if theſe words *ſi placet*, or *ad libitum*, are joined therewith, it ſignifies, that theſe portions may be ſung or not at pleaſure.

SEGUIERIA, in botany; a plant belonging to the claſs of polyandria, and the order of monogynia. The calyx is pentaphyllous; the phylla are oblong, concave, coloured, and permanent; there is no corolla. The capſule is oblong and monoſpermous, the large ala terminating in ſmall lateral alæ. There is only one ſpecies, the *americana*.

SEJANT, a term uſed in heraldry, when a lion, or other beaſt, is drawn in an eſcutcheon ſitting like a cat with his fore-feet ſtraight. Sejanus.

SEJANUS (Ælius), a native of Vulſinum in Tuſcany, who diſtinguiſhed himſelf in the court of Tiberius. His father's name was Seius Strabo; a Roman knight, commander of the pretorian guards. His mother was deſcended from the Junian family. Sejanus firſt gained the favours of Caius Cæſar, the grandſon of Auguſtus, but afterwards he attached himſelf to the intereſt and the views of Tiberius, who then ſat on the imperial throne. The emperor, who was naturally of a ſuſpicious temper, was free and open with Sejanus, and while he diſtruſted others, he communicated his greateſt ſecrets to this fawning favourite. Sejanus improved this confidence; and when he had found that he poſſeſſed the eſteem of Tiberius, he next endeavoured to become the favourite of the ſoldiers, and the darling of the ſenate. As commander of the pretorian guards he was the ſecond man in Rome, and in that important office he made uſe of inſinuations and every mean artifice to make himſelf beloved and revered. His affability and condeſcenſion gained him the hearts of the common ſoldiers, and, by appointing his own favourites and adherents to places of truſt and honour, all the officers and centurions of the army became devoted to his intereſt. The views of Sejanus in this were well known; yet, to advance with more ſucceſs, he attempted to gain the affection of the ſenators. In this he met with no oppoſition. A man who has the diſpoſal of places of honour and dignity, and who has the command of the public money, cannot but be the favourite of thoſe who are in need of his aſſiſtance. It is even ſaid, that Sejanus gained to his views all the wives of the ſenators, by a private and moſt ſecret promiſe of marriage to each of them, whenever he had made himſelf independent and ſovereign of Rome. Yet, however ſucceſsful with the beſt and nobleſt families in the empire, Sejanus had to combat numbers in the houſe of the emperor; but theſe ſeeming obſtacles were ſoon removed. All the children and grandchildren of Tiberius were ſacrificed to the ambition of the favourite under various pretences; and Druſus the ſon of the emperor, by ſtriking Sejanus, made his deſtruction ſure and inevitable. Livia, the wife of Druſus, was gained by Sejanus; and, though the mother of many children, ſhe was prevailed upon to aſſiſt her adulterer in the murderer of her huſband, and ſhe conſented to marry him when Druſus was dead. No ſooner was Druſus poiſoned, than Sejanus openly declared his wiſh to marry Livia. This was ſtrongly oppoſed by Tiberius; and the emperor, by recommending Germanicus to the ſenators for his ſucceſſor, rendered Sejanus bold and determined. He was more urgent in his demands; and when he could not gain the conſent of the emperor, he perſuaded him to retire to ſolitude from the noiſe of Rome and the troubles of the government. Tiberius, naturally fond of eaſe and luxury, yielded to his repreſentations, and retired to Campania, leaving Sejanus at the head of the empire. This was highly gratifying to the favourite, but he was not without a maſter. Prudence and moderation might have made him what he wiſhed to be; but having offended the emperor beyond forgiveneſs, he reſolved to retrieve his loſs, and by one vigorous effort to decide the fate of the empire. He called together his friends and followers; he paid

Lemprière's Dictionary.

court

Sejanus.

court to ſuch as ſeemed diſſaffected; he held forth rewards and promiſes; and, having increaſed the number of his partiſans, formed a bold conſpiracy, reſolved by any means to ſeize the ſovereign power.

A powerful league was formed with aſtoniſhing rapidity, and great numbers of all deſcriptions, ſenators as well as military men, entered into the plot. Among theſe, Satrius Secundus was the confidential friend and prime agent of the miniſter. Whatever was this man's motive, whether fear, or views of intereſt, or ingratitude (for no principle of honour can be imputed to him), he reſolved to betray the ſecret to Tiberius. For this purpoſe he addreſſed himſelf to Antonia, the daughter of Anthony the triumvir, the widow of Druſus, and the mother of Germanicus. When this illuſtrious woman, who was honoured by the court and revered by the people, heard the particulars, ſhe ſent deſpatches to the emperor by one of her ſlaves. Tiberius was aſtoniſhed, but not diſmayed. The danger preſſed; his habitual ſlowneſs was out of ſeaſon; the time called for vigour and deciſive meaſures. He ſent Macro to Rome, with a ſpecial commiſſion to take upon him the command of the prætorian guards. He added full inſtructions for his conduct in all emergencies. Early in the morning on the 15th, before the kalends of November, a report was ſpread, that letters had arrived at Rome, in which the emperor ſignified his intention to aſſociate Sejanus with himſelf in the tribunitian power. The ſenate was ſummoned to meet in the temple of Apollo, near the imperial palace. Sejanus attended without delay. A party of the prætorians followed him. Macro met him in the veſtibule of the temple. He approached the miniſter with all demonſtrations of profound reſpect, and taking him aſide, "Be not ſurpriſed (he ſaid) that you have no letter from the prince: it is his pleaſure to declare you his colleague in the tribunitian power; but he thinks that a matter of ſo much importance ſhould be communicated to the fathers by the voice of the conſuls. I am going to deliver the emperor's orders. Sejanus, elated with joy, and fluſhed with his new dignity, entered the ſenate houſe; Macro followed him. As ſoon as the conſuls arrived, he delivered the letter from Tiberius, and immediately went forth to the prætorian guards. He informed them, that by order of the prince, a large donative was to be diſtributed among the ſoldiers. He added, that, by a new commiſſion, he himſelf was appointed their commanding officer; and, if they followed him to the camp, they would there receive the promiſed bounty. The lure was not thrown out in vain: the prætorian guards quitted their ſtation. Laco, who ſtood near at hand, immediately ſurrounded the ſenate houſe with a body of the city cohorts.

The letter to the conſuls was confuſed, obſcure, and tedious, only glancing at Sejanus, till at laſt the language of invective left no room for doubt. Sejanus kept his ſeat like a man benumbed, ſenſeleſs and ſtupid with aſtoniſhment. His friends, who a little before congratulated him on his new dignity, deſerted him on every ſide. He was commanded by the conſul to riſe and follow him, and being loaded with irons, was conducted to priſon. His downfal filled the city with exultation. The populace, who worſhipped him in the hour of proſperity, rejoiced to ſee the ſad cataſtrophe to which he was now reduced. They followed in crowds, rending the air with ſhouts, and pouring forth a torrent of abuſe and ſcurrilous language. The priſoner endeavoured to hide his face; but the mob delighted to ſee remorſe and ſhame and guilt and horror in every feature of his diſtracted countenance. They reviled him for his acts of cruelty; they laughed at his wild ambition; they tore down his images, and daſhed his ſtatues to pieces. He was doomed by Tiberius to ſuffer death on that very day; but, as he had a powerful faction in the ſenate, it was not thought adviſable, for the mere formality of a regular condemnation, to hazard a debate. Private orders were given to Macro to deſpatch him without delay; but the conſul, ſeeing the diſpoſitions of the people, and the calm neutrality of the prætorian guards, judged it beſt to re-aſſemble the fathers. They met in the temple of Concord. With one voice Sejanus was condemned to die, and the ſentence was executed without delay. He was ſtrangled in the priſon. His body was dragged to the Gemoniæ, and, after every ſpecies of inſult from the populace, at the end of three days was thrown into the Tiber. Such was the tragic end of that ambitious favourite. He fell a terrible example to all, who, in any age or country, may hereafter endeavour by their vices to riſe above their fellow citizens.

Murphy's Tacitus, book V.

Seignior. Seiſin.

SEIGNIOR, is, in its general ſignification, the ſame with *lord*; but is particularly uſed for the lord of the fee as of a manor, as *ſeigneur* among the feudiſts is he who grants a fee or benefit out of the land to another; and the reaſon is, becauſe having granted away the uſe and profit of the land, the property or dominion he ſtill retains in himſelf.

SEIGNIORAGE, is a royalty or prerogative of the king, whereby he claims an allowance of gold and ſilver bought in the maſs to be exchanged for coin. As ſeigniorage, out of every pound weight of gold, the king had for his coin 5s. of which he paid to the maſter of the mint ſometimes 1s. and ſometimes 1s. 6d. Upon every pound weight of ſilver, the ſeigniorage anſwered to the king in the time of Edward III. was 18 penny-weights, which then amounted to about 1s. out of which he ſometimes paid 8d. at others 9d. to the maſter. In the reign of King Henry V. the king's ſeigniorage of every pound of ſilver was 15d. &c.

SEIGNIORY, is borrowed from the French *ſeigneure*, i. e. *dominatus*, *imperium*, *principatus*; and ſignifies with us a manor or lordſhip, *ſeigniory de ſokemans*. *Seigniory in groſs*, ſeems to be the title of him who is not lord by means of any manor, but immediately in his own perſon; as *tenure in capite*, whereby one holds of the king as of his crown, is *ſegniory in groſs*.

SEIKS. See HINDOSTAN, p. 530.

SEISIN, in law, ſignifies poſſeſſion. In this ſenſe we, ſay, *premier ſeiſin*, for the firſt poſſeſſion, &c.

Seiſin is divided into that *in deed* or *in fact*, and that *in law*. A ſeiſin *deed* is where a poſſeſſion is actually taken: but a ſeiſin in *law* is, where lands deſcend, and the party has not entered thereon; or in other words, it is where a perſon has a right to lands, &c. and is by wrong diſſeiſed of them. A ſeiſin in law is held to be ſufficient to avow on; though to the bringing of an aſſize, actual ſeiſin is required; and where ſeiſin is alleged, the perſon pleading it muſt ſhow of what eſtate he is ſeſed, &c.

Seiſin of a ſuperior ſervice is deemed to be a ſeiſin of

eiſin. of all ſuperior and caſual ſervices that are incident thereto; and ſeiſin of a leſſee for years, is ſufficient for him in reverſion. Seiſin.

Livery of SEISIN, in law, an eſſential ceremony in the conveyance of landed property; being no other than the pure feodal inveſtiture, or delivery of corporal poſſeſſion of the land or tenement. This was held abſolutely neceſſary to complete the donation; *Nam feudum ſine inveſtitura nullo modo conſtitui potuit*: and an eſtate was then only perfect when, as Fleta expreſſes it in our law, *fit juris et ſeiſinæ conjunctio.* See FEOFMENT.

Inveſtitures, in their original riſe, were probably intended to demonſtrate in conquered countries the actual poſſeſſion of the lord; and that he did not grant a bare litigious right, which the ſoldier was ill qualified to proſecute, but a peaceable and firm poſſeſſion. And, at a time when writing was ſeldom practiſed, a mere oral gift, at a diſtance from the ſpot that was given, was not likely to be either long or accurately retained in the memory of byſtanders, who were very little intereſted in the grant. Afterwards they were retained as a public and notorious act, that the country might take notice of and teſtify the tranſfer of the eſtate; and that ſuch as claimed title by other means might know againſt whom to bring their actions.

In all well-governed nations, ſome notoriety of this kind has been ever held requiſite, in order to acquire and aſcertain the property of lands. In the Roman law, *plenum dominium* was not ſaid to ſubſiſt unleſs where a man had both the *right* and the *corporal poſſeſſion*; which poſſeſſion could not be acquired without both an actual intention to poſſeſs, and an actual ſeiſin, or entry into the premiſes, or part of them, in the name of the whole. And even in eccleſiaſtical promotions, where the freehold paſſes to the perſon promoted, corporal poſſeſſion is required at this day to veſt the property completely in the new proprietor; who, according to the diſtinction of the canoniſts, acquires the *jus ad rem*, or inchoate and imperfect right, by nomination and inſtitution; but not the *jus in re*, or complete and full right, unleſs by corporal poſſeſſion. Therefore in dignities poſſeſſion is given by inſtalment; in rectories and vicarages by indiction; without which no temporal rights accrue to the miniſter, though every eccleſiaſtical power is veſted in him by inſtitution. So alſo even in deſcents of lands, by our law, which are caſt on the heir by act of the law itſelf, the heir has not *plenum dominium*, or full and complete ownerſhip, till he has made an actual corporal entry into the lands: for if he dies before *entry* made, *his* heir ſhall not be entitled to take the poſſeſſion, but the heir of the perſon who was laſt actually ſeiſed. It is not therefore only a mere right to enter, but the actual entry, that makes a man complete owner; ſo as to tranſmit the inheritance to his own heirs: *non jus, ſed ſeiſina, facit ſtipitem.*

Yet the corporal tradition of lands being ſometimes inconvenient, a ſymbolical delivery of poſſeſſion was in many caſes anciently allowed; by tranſferring ſomething near at hand, in the preſence of credible witneſſes, which by agreement ſhould ſerve to repreſent the very thing deſigned to be conveyed; and an occupancy of this ſign or ſymbol was permitted as equivalent to occupancy of the land itſelf. Among the Jews we find the evidence of a purchaſe thus defined in the book of Ruth: "Now this was the manner in former time in Iſrael, concerning redeeming and concerning changing, for to confirm all things: a man plucked off his ſhoe, and gave it to his neighbour; and this was a teſtimony in Iſrael." Among the ancient Goths and Swedes, contracts for the ſale of lands were made in the preſence of witneſſes, who extended the cloak of the buyer, while the ſeller caſt a clod of the land nto it, in order to give poſſeſſion; and a ſtaff or wand was alſo delivered from the vender to the vendee, which paſſed through the hands of the witneſſes. With our Saxon anceſtors the delivery of a turf was a neceſſary ſolemnity to eſtabliſh the conveyance of lands. And, to this day, the conveyance of our copyhold eſtates is uſually made from the ſeller to the lord or his ſteward by delivery of a rod or verge, and then from the lord to the purchaſer by re-delivery of the ſame in the preſence of a jury of tenants.

Conveyances in writing were the laſt and moſt refined improvement. The mere delivery of poſſeſſion, either actual or ſymbolical, depending on the ocular teſtimony and remembrance of the witneſſes, was liable to be forgotten or miſrepreſented, and became frequently incapable of proof. Beſides, the new occaſions and neceſſities introduced by the advancement of commerce, required means to be deviſed of charging and encumbering eſtates, and of making them liable to a multitude of conditions and minute deſignations, for the purpoſes of raiſing money, without an abſolute ſale of the land; and ſometimes the like proceedings were found uſeful in order to make a decent and competent proviſion for the numerous branches of a family, and for other domeſtic views. None of which could be effected by a mere, ſimple, corporal tranſfer of the ſoil from one man to another, which was principally calculated for conveying an abſolute unlimited dominion. Written deeds were therefore introduced, in order to ſpecify and perpetuate the peculiar purpoſes of the party who conveyed: yet ſtill, for a very long ſeries of years, they were never made uſe of, but in company with the more ancient and notorious method of tranſfer by delivery of corporal poſſeſſion.

Livery of ſeiſin, by the common law, is neceſſary to be made upon every grant of an eſtate of freehold in hereditaments corporeal, whether of inheritance or for life only. In hereditaments incorporeal it is impoſſible to be made; for they are not the object of the ſenſes: and in leaſes for years, or other chattel intereſts, it is not neceſſary. In leaſes for years indeed an actual *entry* is neceſſary, to veſt the eſtate in the leſſee: for a bare leaſe gives him only a right to enter, which is called his intereſt in the term, or *intereſſe termini*: and when he enters in purſuance of that right, he is then, and not before, in poſſeſſion of his term, and complete tenant for years. This entry by the tenant himſelf ſerves the purpoſe of notoriety, as well as livery of ſeiſin from the granter could have done; which it would have been improper to have given in this caſe, becauſe that ſolemnity is appropriated to the conveyance of a freehold. And this is one reaſon why freeholds cannot be made to commence *in futuro*, becauſe they cannot (at the common law) be made but by livery of ſeiſin; which livery, being an actual manual tradition of the land, muſt take effect *in præſenti*, or not at all.

Livery of ſeiſin is either in *deed* or in *law*.

Seiſin, Seize.

Livery in *deed* is thus performed. The feoffor, leſſor, or his attorney, together with the feoffee, leſſee, or his attorney, (for this may as effectually be done by deputy or attorney as by the principals themſelves in perſon), come to the land or to the houſe; and there, in the preſence of witneſſes, declare the contents of the feoffment or leaſe on which livery is to be made. And then the feoffor, if it be of land, doth deliver to the feoffee, all other perſons being out of the ground, a clod or turf, or a twig or bough there growing, with words to this effect: "I deliver theſe to you in the name of ſeiſin of all the lands and tenements contained in this deed." But, if it be of a houſe, the feoffor muſt take the ring or latch of the door, the houſe being quite empty, and deliver it to the feoffee in the ſame form; and then the feoffee muſt enter alone, and ſhut the door, and then open it, and let in the others. If the conveyance or feoffment be of divers lands, lying ſcattered in one and the ſame county, then in the feoffor's poſſeſſion, livery of ſeiſin of any parcel, in the name of the reſt, ſufficeth for all; but if they be in ſeveral counties, there muſt be as many liveries as there are counties. For, if the title to theſe lands comes to be diſputed, there muſt be as many trials as there are counties, and the jury of one county are no judges of the notoriety of a fact in another. Beſides, anciently, this ſeiſin was obliged to be delivered *coram paribus de vicineto*, before the peers or freeholders of the neighbourhood, who atteſted ſuch delivery in the body or on the back of the deed; according to the rule of the feodal law, *Pares debent intereſſe inveſtituræ feudi, et non alii*: for which this reaſon is expreſsly given; becauſe the peers or vaſſals of the lord, being bound by their oath of fealty, will take care that no fraud be committed to his prejudice, which ſtrangers might be apt to connive at. And though afterwards the ocular atteſtation of the *pares* was held unneceſſary, and livery might be made before any credible witneſſes, yet the trial, in caſe it was diſputed, (like that of all other atteſtations), was ſtill reſerved to the *pares* or jury of the county. Alſo, if the lands be out on leaſe, though all lie in the ſame county, there muſt be as many liveries as there are tenants: becauſe no livery can be made in this caſe, but by the conſent of the particular tenant; and the conſent of one will not bind the reſt. And in all theſe caſes it is prudent, and uſual, to endorſe the livery of ſeiſin on the back of the deed, ſpecifying the manner, place, and time of making it; together with the names of the witneſſes. And thus much for livery in deed.

Livery in *law* is where the ſame is not made *on* the land, but *in ſight of it* only; the feoffor ſaying to the feoffee, "I give you yonder land, enter and take poſſeſſion." Here, if the feoffee enters during the life of the feoffor, it is a good livery, but not otherwiſe; unleſs he dares not enter through fear of his life or bodily harm; and then his continual claim, made yearly in due form of law, as near as poſſible to the lands, will ſuffice without an entry. This livery in law cannot, however, be given or received by attorney, but only by the parties themſelves.

SEIZE, in the ſea language, is to make faſt or bind, particularly to faſten two ropes together with rope yarn. The ſeizing of a boat is a rope tied to a ring or little chain in the fore-ſhip of the boat, by which means it is faſtened to the ſide of the ſhip.

SEIZURE, in commerce, an arreſt of ſome merchandiſe, moveable, or other matter, either in conſequence of ſome law or of ſome expreſs order of the ſovereign. Contraband goods, thoſe fraudulently entered, or landed without entering at all, or at wrong places, are ſubject to ſeizure. In ſeizures among us, one half goes to the informer, and the other half to the king.

Seizure ‖ Selden.

SELAGO, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 48th order, *Aggregatæ*. The calyx is quinquefid: the tube of the corolla capillary, with the limb nearly equal, and a ſingle ſeed. There are 22 ſpecies.

SELDEN (John), called by Grotius *the glory of England*, was born at Salvington in Suſſex in 1584. He was educated at the free-ſchool at Chicheſter; whence he was ſent to Hart-Hall in the univerſity of Oxford, where he ſtaid four years. In 1612, he entered himſelf in Clifford's Inn, in order to ſtudy the law; and about two years after removed to the Inner Temple, where he ſoon acquired great reputation by his learning. He had already publiſhed ſeveral of his works; and this year wrote verſes in Latin, Greek, and Engliſh, upon Mr William Browne's Britannia's Paſtorals. In 1614, he publiſhed his Titles of Honour; and in 1616, his Notes on Sir John Forteſcue's book *De Laudibus Legum Angliæ*. In 1618, he publiſhed his Hiſtory of Tythes; which gave great offence to the clergy, and was animadverted upon by ſeveral writers; and for that book he was called before the high commiſſion court, and obliged to make a public acknowledgment of his ſorrow for having publiſhed it. In 1621, being ſent for by the parliament, though he was not then a member of that houſe, and giving his opinion very ſtrongly in favour of their privileges in oppoſition to the court, he was committed to the cuſtody of the ſheriff of London, but was ſet at liberty after five weeks confinement. In 1623, he was choſen burgeſs for Lancaſter; but, amidſt all the diviſions of the nation, kept himſelf neuter, proſecuting his ſtudies with ſuch application, that though he was the next year choſen reader of Lyon's Inn, he refuſed to perform that office. In 1625, he was choſen burgeſs for Great Bedwin in Wiltſhire, to ſerve in the firſt parliament of King Charles I. in which he declared himſelf warmly againſt the duke of Buckingham; and on his grace's being impeached by the houſe of commons, was appointed one of the managers of the articles againſt him. In 1627 and 1628, he oppoſed the court party with great vigour. The parliament being prorogued to January 20. 1629, Mr Selden retired to the earl of Kent's houſe at Wreſt, in Bedfordſhire, where he finiſhed his *Marmora Arundeliana*. The parliament being met, he, among others, again diſtinguiſhed himſelf by his zeal againſt the court; when the king diſſolving the parliament, ordered ſeveral of the members to be brought before the King's Bench bar, and committed to the Tower. Among theſe was Mr Selden, who inſiſting on the benefit of the laws, and refuſing to make his ſubmiſſion, was removed to the King's Bench priſon. Being here in danger of his life on account of the plague then raging in Southwark, he petitioned the lord high treaſurer, at the end of Trinity term, to intercede with his majeſty that he might be removed to the Gate-Houſe, Weſtminſter, which was granted: but in Michaelmas term following, the judges objecting to the lord treaſurer's warrant, by which he had

enites. had been removed to the Gate-Houſe, an order was made for conveying him back to the King's Bench, whence he was releaſed in the latter end of the ſame year; but fifteen years after, the parliament ordered him 5000l. for the loſſes he had ſuſtained on this occaſion. He was afterwards committed, with ſeveral other gentlemen, for diſperſing a libel; but the author, who was abroad, being diſcovered, they were at length ſet at liberty. In 1634, a diſpute ariſing between the Engliſh and Dutch concerning the herring-fiſhery on the Britiſh coaſt, he was prevailed upon by Archbiſhop Laud to draw up his *Mare Clauſum*, in anſwer to Grotius's *Mare Liberum*: which greatly recommended him to the favour of the court. In 1640, he was choſen member for the univerſity of Oxford; when he again oppoſed the court, though he might, by complying, have raiſed himſelf to very conſiderable poſts. In 1643, he was appointed one of the lay-members to ſit in the aſſembly of divines at Weſtminſter, and was the ſame year appointed keeper of the records in the Tower. Whilſt he attended his duty in the aſſembly, a warm debate aroſe reſpecting the diſtance of Jericho from Jeruſalem. The party which contended for the ſhorteſt diſtance, urged, as a proof of their opinion being well founded, that fiſhes were carried from the one city to the other, and ſold in the market. Their adverſaries were ready to yield to the force of this concluſive argument, when Selden, who deſpiſed both parties, as well as the frivolouſneſs of their diſpute, exclaimed, "Perhaps the fiſhes were ſalted!" This unexpected remark left the victory doubtful, and renewed the debate; and our author, who was ſick of ſuch trifling, ſoon found employment more ſuited to his genius; for, in 1645, he was made one of the commiſſioners of the admiralty. The ſame year he was unanimouſly elected maſter of Trinity college, Cambridge; but declined accepting. He died in 1654; and was interred in the Temple-church, where a monument is erected to his memory. Dr Wilkes obſerves, that he was a man of uncommon gravity and greatneſs of ſoul, averſe to flattery, liberal to ſcholars, charitable to the poor; and though he had a great latitude in his principles with regard to eccleſiaſtical power, yet he had a ſincere regard for the church of England. He wrote many learned works beſides thoſe already mentioned; the principal of which are, 1. *De Jure Naturali et Gentium juxta Diſciplinam Hebræorum.* 2. *De Nuptiis et Divorciis.* 3. *De Anno Civili veterum Hæbræorum.* 4. *De Nummis.* 5. *De Diis Syris.* 6. *Uxor Hebraica.* 7. *Jani Anglorum Facies altera*, &c. All his works were printed together in 1726 in 3 vols. folio.

SELENITES, in natural hiſtory, the name of a large claſs of foſſils, the characters of which are theſe: they are bodies compoſed of ſlender and ſcarce viſible filaments, arranged into fine, even, and thin flakes; and thoſe diſpoſed into regular figures, in the ſeveral different genera, approaching to a rhomboid, or hexangular column, or a rectangled parallelogram; fiſſile, like the tales, but they not only lie in a horizontal, but alſo in a perpendicular direction: they are flexile in a ſmall degree, but not at all elaſtic; they do not ferment with acid menſtrua, but readily calcine in the fire. Of this claſs there are ſeven orders of bodies, and under thoſe ten genera. The ſelenitæ of the firſt order are thoſe compoſed of horizontal plates, and approaching to a rhomboidal form: of the ſecond are thoſe compoſed of horizontal plates, arranged into a columnar and angular form: of the third are thoſe whoſe filaments are ſcarce viſibly arranged into plates, but which, in the whole maſſes, appear rather of a ſtriated than of a tubulated ſtructure: of the fourth are thoſe which are flat, but of no determinately angular figure; of the fifth are thoſe formed of plates, perpendicularly arranged: of the ſixth are thoſe formed of congeries of plates, arranged into the figure of a ſtar; and of the ſeventh are thoſe of a complex and indeterminate figure. Selenites ‖ Selucia.

Of the firſt of theſe orders there are three genera. 1. The *leptodecarhombes.* 2. The *pachodecarhombes.* 3. The *tetradecarhombes.* Of the ſecond order there are alſo three genera. 1. The *iſchnambluces.* 2. The *iſambluces.* 3. The *oxuciæ.* Of the third order there is only one known genus, the *inamblucia.* Of the fourth order there is alſo only one known genus, the *ſanidia.* Of the fifth order there is alſo only one known genus, the *cathetolipes.* Of the ſixth order, there are two genera. 1. The *lepaſtra.* 2. The *trichestra.* Of the ſeventh order there is only one genus, the *ſymplexia.*

The ſtructure of the ſelenitæ of all the genera of the firſt order is exactly alike; they are all compoſed of a great number of broad flakes or plates, in a great meaſure externally reſembling the flakes of the foliaceous tales: theſe are of the length and breadth of the whole maſs; the top and bottom being each only one ſuch plate, and thoſe between them in like manner, each complete and ſingle; and the body may always be eaſily and evenly ſplit, according to the direction of theſe flakes. Theſe differ, however, extremely from the tales, for they are each compoſed of a number of parallel threads or filaments, which are uſually diſpoſed parallelly to the ſides of the body, though ſometimes parallelly to its ends. In many of the ſpecies they are alſo divided by parallel lines, placed at a conſiderable diſtance from each other, and the plates in ſplitting often break at theſe lines; add to this, that they are not elaſtic, and that they readily calcine. The ſtructure of thoſe of the ſecond order is the ſame with that of the firſt; but that in many of the ſpecimens of them the filaments of which the plates are compoſed run in two directions, and meet in an obtuſe angle; and in the middle there is generally ſeen in this caſe a ſtraight line running the whole length of the column, and ſmall parcels of clay inſinuating themſelves into this crack, repreſent in it the figure of an ear of graſs ſo naturally, as to have deceived many into a belief that there was really an ear of graſs there. The other orders conſiſting only of ſingle genera, the ſtructure of each is explained under the generical name.

SELENITES, in chemiſtry, called alſo *gypſum ſpatoſum*, a ſpecies of gypſum or plaſter of Paris. See GYPSUM.

SELENOGRAPHY, a branch of coſmography, which deſcribes the moon and all the parts and appearances thereof, as geography does thoſe of the earth. See MOON.

SELEUCIA, (anc. geog.), ſurnamed *Babylonia*, becauſe ſituated on its confines, at the confluence of the Euphrates and Tigris. Ptolemy places it in Meſopotamia. It is called alſo *Seleucia ad Tigrim*, (Polybius, Strabo, Iſidorus, Characenus); waſhed on the ſouth by the Euphrates, on the eaſt by the Tigris (Theophylactus); generally agreed to have been built or enlarged by Seleucus Nicanor, maſter of the eaſt after Alexander; by means of which Babylon came to be deſerted.

Seleucidæ || Self.

It is said to have been originally called *Coche*, (Ammian, Eutropius); though others, as Arrian, diſtinguiſh it, as a village, from *Seleucia*: and, according to Zoſimus, the ancient name of Seleucia was *Zochaſia*. Now called *Bagdad*. E. Long. 44. 21. N. Lat. 33. 10. There were many other cities of the ſame name, all built by Seleucus Nicanor.

SELEUCIDÆ, in chronology. Era of the Seleucidæ, or the Syro-Macedonian era, is a computation of time, commencing from the eſtabliſhment of the Seleucidæ, a race of Greek kings, who reigned as ſucceſſors of Alexander the Great in Syria, as the Ptolemies did in Egypt. This era we find expreſſed in the books of the Maccabees, and on a great number of Greek medals ſtruck by the cities of Syria, &c. The Rabbins call it the *era of contracts*, and the Arabs *therik dilkarnain*, that is, the "era of the two horns." According to the beſt accounts, the firſt year of this era falls in the year 311 B. C. being 12 years after Alexander's death.

SELEUCUS (Nicanor), one of the chief generals under Alexander the Great, and, after his death, founder of the race of princes called *Seleucidæ*. He is equally celebrated as a renowned warrior, and as the father of his people; yet his virtues could not protect him from the fatal ambition of Ceraunus, one of his courtiers, by whom he was aſſaſſinated 280 B. C.

SELF-HEAL, the PRUNELLA VULGARIS of Linnæus. The ſtem is erect, and about eight or ten inches high. The leaves grow on footſtalks, are ovato-oblong, ſlightly indented, and ſomewhat hairy. The bracteæ are heart-ſhaped, oppoſite, and fringed. The flowers are white or purpliſh, grow on denſe ſpikes, and are terminal. This plant is perennial, grows wild in meadows and paſture grounds, and flowers in June and July.

This herb is recommended as a mild reſtringent and vulnerary in ſpittings of blood, and other hemorrhagies and fluxes; and in gargariſms againſt aphthæ and inflammations of the fauces. Its virtues do not appear to be very great; to the taſte it diſcovers a very ſlight auſterity or bitteriſhneſs, which is more ſenſible in the flowery tops than in the leaves, though the latter are generally directed for medicinal uſe.

Lewis's Materia Medica.

SELF Command, is that ſteady equanimity which enables a man in every ſituation to exert his reaſoning faculty with coolneſs, and to do what the preſent circumſtances require. It depends much upon the natural temperament of the body, and much upon the moral cultivation of the mind. He who enjoys good health, and has braced his frame by exerciſe, has always a greater command of himſelf than a man of equal mental powers, who has ſuffered his conſtitution to become relaxed by indolence; and he who has from his early youth been accuſtomed to make his paſſions ſubmit to his reaſon, muſt, in any ſudden emergency, be more capable of acting properly than he who has tamely yielded to his paſſion. Hence it is that recluſe and literary men, when forced into the buſtle of public life, are incapable of acting where promptneſs is requiſite; and that men who have once or twice yielded to a ſenſe of impending danger ſeldom acquire afterwards that command of themſelves which may be neceſſary to extricate them from ſubſequent dangers. In one of the earlieſt battles fought by the late king of Pruſſia, the ſovereign was among the firſt men who quitted the field: had he behaved in the ſame manner a ſecond and a third time, he would never have become that hero whoſe actions aſtoniſhed Europe. A celebrated engineer among ourſelves, who was well known to the writer of this ſhort article, had little ſcience, and was a ſtranger to the principles of his own art; but being poſſeſſed of a firm and vigorous frame, and having been accuſtomed to ſtruggle with dangers and difficulties, he had ſuch a conſtant command of himſelf, as enabled him to employ with great coolneſs every neceſſary reſource in the day of battle. Self.

But it is not only in battle, and in the face of immediate danger, that ſelf-command is neceſſary to enable a man to act with propriety. There is no ſituation in life where difficulties, greater or leſs, are not to be encountered; and he who would paſs through life with comfort to himſelf, and with utility to the public, muſt endeavour to keep his paſſions in conſtant ſubjection to his reaſon. No man can enjoy without inquietude what he cannot loſe without pain; and no man who is overwhelmed with deſpondency under any ſudden misfortune can exert the talents neceſſary to retrieve his circumſtances. We ought, therefore, by every means to endeavour to obtain a conſtant command of ourſelves; and nowhere ſhall we find better leſſons for this purpoſe than in ancient Lacedemon. There certain occupations were appointed for each ſex, for every hour, and for every ſeaſon of life. In a life always active, the paſſions have no opportunity to deceive, ſeduce, or corrupt; and the nervous ſyſtem acquires a firmneſs which makes it a fit inſtrument to a vigorous mind.

SELF-Defence implies not only the preſervation of one's life, but alſo the protection of his property, becauſe without property life cannot be preſerved in a civilized nation. The extent of property eſſential to life is indeed ſmall, and this conſideration may enable us to decide a queſtion which ſome moraliſts have made intricate. By what means, it has been aſked, may a man protect his property? May he kill the perſon who attacks it, if he cannot otherwiſe repel the attack?

That a man, in the ſtate of nature, may kill the perſon who makes an attack on his life, if he cannot otherwiſe repel the attack, is a truth which has never been controverted; and he may do the ſame in civil ſociety, if his danger be ſo imminent that it cannot be exerted by the interpoſition of the protection provided for individuals by the ſtate. In all poſſible ſituations, except the three following, whatever is abſolutely neceſſary to the preſervation of life may be lawfully performed, for the law of ſelf-preſervation is the firſt and moſt ſacred of thoſe laws which are impreſſed upon every mind by the Author of nature.

The three excepted ſituations are thoſe of a ſoldier in the day of battle, of a criminal about to ſuffer by the laws of his country, and of a man called upon to renounce his religion. The ſoldier hazards his life in the moſt honourable of all cauſes, and cannot betray his truſt, or play the coward, without incurring a high degree of moral turpitude. He knows that the very profeſſion in which he is engaged neceſſarily ſubjects him to danger; and he voluntarily incurred that danger for the good of his country, which, with great propriety, annexes to his profeſſion peculiar privileges and much glory. The criminal under ſentence of death cannot, without adding to his guilt, reſiſt the execution of that ſentence;

elf. sentence; for the power of inflicting punishment is essential to society, and society is the ordinance of God, (see SOCIETY). The man who is called upon to renounce his religion ought to submit to the cruellest death rather than comply with that request, since religion is his only security for future and permanent happiness. But in every other situation, that which is absolutely necessary to the preservation of life is undoubtedly lawful. Hence it is, that a person sinking in water is never thought to be guilty of any crime, though he drag his neighbour after him by his endeavours to save himself; and hence, too, a man in danger of perishing by shipwreck may drive another from a plank which cannot carry them both, for since one of two lives must be lost, no law, human or divine, calls upon either of them to prefer his neighbour's life to his own.

But though the rights of self-defence authorize us to repel every attack made upon our life, and in cases of extremity to save ourselves at the expence of the life of our innocent neighbour, it is not so evident that, rather than give to an unjust demand a few shillings or pounds, we may lawfully deprive a fellow creature of life, and the public of a citizen. A few pounds lost may be easily regained; but life when lost can never be recovered. If these pounds, indeed, be the whole of a man's property; if they include his clothes, his food, and the house where he shelters his head—there cannot be a doubt but that, rather than part with them, he may lawfully kill the aggressor, for no man can exist without shelter, food, and raiment. But it is seldom that an attempt is made, or is indeed practicable, to rob a man at once of all that he possesses. The question then of any importance is, May a man put a robber to death rather than part with a small part of his property? Mr Paley doubts whether he could innocently do so in a state of nature, "because it cannot be contended to be for the augmentation of human happiness, that one man should lose his life or limb, rather than another a pennyworth of his property." He allows, that in civil society the life of the aggressor may be always taken away by the person aggrieved, or meant to be aggrieved, when the crime attempted is such as would subject its perpetrator to death by the laws of his country.

It is not often that we feel ourselves disposed to differ in opinion from this most valuable and intelligent writer; but on the present occasion we cannot help thinking that he does not reason with his usual precision. To us he even seems to lose sight of his own principles. No legislature can have a right to take away life in civil society, but in such cases as individuals have the same right in a state of nature. If therefore a man, in the state of nature, have not a right to protect his property by killing the aggressor, when it cannot be otherwise protected, it appears to us self-evident that no legislature can have a right to inflict the punishment of death upon such offences; but if the laws inflicting death upon the crime of robbery be morally evil, it is certain that an individual cannot be innocent when he prevents robbery by the death of the robber, merely because he knows that the laws of his country have decreed that punishment against those convicted of that crime. But we think that the protection of property by the death of the aggressor may be completely vindicated upon more general principles. It is necessary, in every state, that property be protected, or mankind could not subsist; but in a state of nature every man must be the defender of his own property, which in that state must necessarily be small: and if he be not allowed to defend it by every mean in his power, he will not long be able to protect it at all. By giving him such liberty, a few individuals may, indeed, occasionally lose their lives and limbs for the preservation of a very small portion of private property; but we believe that the sum of human happiness will be more augmented by cutting off such worthless wretches than by exposing property to perpetual depredation; and therefore, if general utility be the criterion of moral good, we must be of opinion that a man may in every case lawfully kill a robber rather than comply with his unjust demand. Self.

But if a man may without guilt preserve his property by the death of the aggressor, when it cannot be preserved by any other means, much more may a woman have recourse to the last extremity to protect her chastity from forcible violation. This, indeed, is admitted by Mr Paley himself, and will be controverted by no man who reflects on the importance of the female character, and the probable consequences of the smallest deviation from the established laws of female honour. See SEDUCTION.

SELF-Knowledge, the knowledge of one's own character, abilities, opinions, virtues, and vices. This has always been considered as a difficult though important acquisition. It is difficult, because it is disagreeable to investigate our errors, our faults, and vices; because we are apt to be partial to ourselves, even when we have done wrong; and because time and habitual attention are requisite to enable us to discover our real character. But these difficulties are more than counterbalanced by the advantages of self-knowledge.

By knowing the extent of our abilities, we shall never rashly engage in enterprises where our ineffectual exertions may be productive of harm: by investigating our opinions, we may discover those which have no foundation, and those also which lead us insensibly into vice. By examining our virtues and vices, we shall learn what principles ought to be strengthened, and what habits ought to be removed.

Man is a rational and intelligent being, capable of great improvement, and liable to great vices. If he acts without examining his principles, he may be hurried by blind passion into crimes. If he aspires at noble and valuable acquisitions, he must act upon a plan, with deliberation and fore-thought; for he is not like a vegetable, which attains perfection by the influence of external causes: he has powers within himself which must be exerted, and exerted with judgment, in order to attain the perfection of his nature. To enable him to employ these powers aright, he must know, first, what is his duty; and, secondly, he must often review his principles and conduct, that he may discover whether he is performing his duty, or in what circumstances he has failed. When he finds that he has fallen into error and vice, he will naturally inquire what causes have produced this effect, that he may avoid the same for the time to come. This is the method by which every reformation in religion and science has been produced, and the method by which the arts have been improved. Before Lord Bacon introduced the new way of philosophizing, he must first have considered wherein true philosophy consisted; secondly, he must have inquired

in

Self. in what reſpects the ancient method of philoſophizing was falſe or uſeleſs: and after determining theſe two points, he was qualified to deſcribe the way by which the ſtudy of philoſophy could be ſucceſsfully purſued without deviating into hypotheſis and error. Luther found out the errors of the church of Rome by comparing their doctrines with the Scriptures. But had this compariſon never been made, the Reformation could never have taken place. Without ſelf-knowledge, or without that knowledge of our character which is derived from a compariſon of our principles and conduct with a perfect ſtandard of morality, we can never form plans and reſolutions, or make any exertion to abandon the vicious habits which we have contracted, and ſtrengthen thoſe virtuous principles in which we are deficient.

As much may be learned from the errors of thoſe who have been in ſimilar ſituations with ourſelves; ſo many uſeful cautions may be obtained from our own errors; and he that will remember theſe, will ſeldom be twice guilty of the ſame vice.

It was evidently the intention of Providence that man ſhould be guided chiefly by experience. It is by the obſervations which we make on what we ſee paſſing around us, or from what we ſuffer in our own perſon, that we form maxims for the conduct of life. The more minutely therefore we attend to our principles, and the more maxims we form, we ſhall be the better fitted to attain moral perfection.

With reſpect to our underſtanding, to mark the errors which we have fallen into, either by its natural defects or by negligence, is alſo of great importance; for the greateſt genius and moſt profound ſcholar are liable to theſe errors, and often commit them as well as the weak and illiterate. But by obſerving them, and tracing them to their cauſes, they at length acquire an habitual accuracy. It is true, that men of feeble minds can never by knowing their own defects exalt themſelves to the rank of genius; but ſuch knowledge will enable them to improve their underſtandings, and ſo to appreciate their own powers, as ſeldom to attempt what is beyond their ſtrength. They may thus become uſeful members of ſociety; and though they will not probably be admired for their abilities, they will yet eſcape the ridicule which is poured upon vanity.

It is difficult to lay down preciſe rules for the acquiſition of this ſelf-knowledge, becauſe almoſt every man is blinded by a fallacy peculiar to himſelf. But when one has got rid of that partiality which ariſes from ſelf-love, he may eaſily form a juſt eſtimate of his moral improvements, by comparing the general courſe of his conduct with the ſtandard of his duty; and if he has any doubt of the extent of his intellectual attainments, he will moſt readily diſcover the truth by comparing them with the attainments of others who have been moſt ſucceſsful in the ſame purſuits. Should vanity ariſe in his mind from ſuch a compariſon, let him then compare the extent of his knowledge with what is yet to be known, and he will then be in little danger of thinking of himſelf more highly than he ought to think. See PREJUDICE and *SELF-Partiality*.

SELF-Love, is that inſtinctive principle which impels every animal, rational and irrational, to preſerve its life and promote its own happineſs. It is very generally confounded with ſelfiſhneſs; but we think that the one propenſity is diſtinct from the other. Every man loves himſelf; but every man is not ſelfiſh. The ſelfiſh man graſps at all *immediate* advantages, regardleſs of the conſequences which his conduct may have upon his neighbour. Self-love only prompts him who is actuated by it to procure to himſelf the greateſt poſſible ſum of happineſs during the whole of his exiſtence. In this purſuit the rational ſelf-lover will often forego a preſent enjoyment to obtain a greater and more permanent one in reverſion; and he will as often ſubmit to a preſent pain to avoid a greater hereafter. Self-love, as diſtinguiſhed from ſelfiſhneſs, always comprehends the whole of a man's exiſtence, and in that extended ſenſe of the phraſe, we heſitate not to ſay that every man is a ſelf-lover; for, with eternity in his view, it is ſurely not poſſible for the moſt diſintereſted of the human race not to prefer himſelf to all other men, if their future and everlaſting intereſts could come into competition. This indeed they never can do; for though the introduction of evil into the world, and the different ranks which it makes neceſſary in ſociety, put it in the power of a man to raiſe himſelf, in the preſent ſtate, by the depreſſion of his neighbour, or by the practice of injuſtice, yet in the purſuit of a prize which is to be gained only by ſoberneſs, righteouſneſs, and piety, there can be no rivalſhip among the different competitors. The ſucceſs of one is no injury to another; and therefore, in this ſenſe of the phraſe, ſelf-love is not only lawful, but abſolutely unavoidable. It has been a queſtion in morals, whether it be not likewiſe the incentive to every action, however virtuous or apparently diſintereſted? Self.

Thoſe who maintain the affirmative ſide of this queſtion ſay, that the proſpect of immediate pleaſure, or the dread of immediate pain, is the only apparent motive to action in the minds of infants, and indeed of all who look not before them, and infer the future from the paſt. They own, that when a boy has had ſome experience, and is capable of making compariſons, he will often decline an immediate enjoyment which he has formerly found productive of future evil more than equivalent to all its good; but in doing ſo they think, and they think juſtly, that he is ſtill actuated by the principle of ſelf-love, purſuing the greateſt good of which he knows himſelf to be capable. After experiencing that truth, equity, and benevolence in all his dealings is the readieſt, and indeed the only certain, method of ſecuring to himſelf the kindneſs and good offices of his fellow-creatures, and much more when he has learned that they will recommend him to the Supreme Being, upon whom depends his exiſtence and all his enjoyments, they admit that he will practice truth, equity, and benevolence; but ſtill, from the ſame principle, purſuing his own ultimate happineſs as the object which he has always in view. The proſpect of this great object will make him feel an exquiſite pleaſure in the performance of the actions which he conceives as neceſſary to its attainment, till at laſt, without attending in each inſtance to their conſequences, he will, by the great aſſociating principle which has been explained elſewhere (ſee METAPHYSICS, Part I. Chap I.) feel a refined enjoyment in the actions themſelves, and perform them, as occaſions offer, without deliberation or reflection. Such, they think, is the origin of benevolence itſelf, and indeed of every virtue.

Thoſe who take the other ſide of the queſtion, can hardly deny that ſelf-love thus modified may prompt to

virtuous

lf.

virtuous and apparently diſintereſted conduct; but they think it degrading the dignity of man to ſuppoſe him actuated ſolely by motives which can be traced back to a deſire of his own happineſs. They obſerve, that the Author of our nature has not left the preſervation of the individual, or the continuance of the ſpecies, to the deductions of our reaſon, computing the ſum of happineſs which the actions neceſſary to theſe ends produce to ourſelves: on the contrary, He has taken care of both, by the ſurer impulſe of inſtinct planted in us for theſe very purpoſes. And is it conceivable, ſay they, that He would leave the care of our fellow-creatures a matter of indifference, till each man ſhould be able to diſcover or be taught that by loving his neighbour, and doing him all the good in his power, he would be moſt effectually promoting his own happineſs? It is diſhonouring virtue, they continue, to make it proceed in any inſtance from a proſpect of happineſs, or a dread of miſery; and they appeal from theory to fact, as exhibited in the conduct of ſavage tribes, who deliberate little on the conſequences of their actions.

Their antagoniſts reply, that the conduct of ſavage tribes is to be conſidered as that of children in civilized nations, regulated entirely by the examples which they have before them; that their actions cannot be the offſpring of innate inſtincts, otherwiſe ſavage virtues would, under ſimilar circumſtances, everywhere be the ſame, which is contrary to fact; that virtue proceeds from an intereſted motive on either ſuppoſition; and that the motive which the inſtinctive ſcheme holds up is the moſt ſelfiſh of the two. The other theory ſuppoſes, that the governing motive is the hope of *future* happineſs and the dread of *future* miſery; the inſtinctive ſcheme ſupplies a *preſent* motive in the ſelf-complacency ariſing in the heart from a conſciouſneſs of right conduct. The former is a rational motive, the latter has nothing more to do with reaſon than the enjoyment ariſing from eating and drinking, or from the intercourſe between the ſexes. But we mean not to purſue the ſubject farther, as we have ſaid enough on it in the articles BENEVOLENCE, INSTINCT, PASSION, and PHILANTHROPY. We ſhall therefore conclude with obſerving that there is certainly a virtuous as well as a vicious ſelf-love, and that "true ſelf-love and ſocial are the ſame."

Self-Murder. See SUICIDE.

Self-Partiality, is a phraſe employed by ſome philoſophers * to expreſs that weakneſs of human nature through which men overvalue themſelves when compared with others. It is diſtinguiſhed from general partiality, by thoſe who make uſe of the expreſſion, becauſe it is thought that a man is led to over-rate his own accompliſhments, either by a particular inſtinct, or by a proceſs of intellect different from that by which he over-rates the accompliſhments of his friends or children. The former kind of partiality is wholly ſelfiſh; the latter partakes much of benevolence.

* Lord ...'s ... of ...ling.

This diſtinction may perhaps be deemed plauſible by thoſe who conſider the human mind as little more than a bundle of inſtincts; but it muſt appear perfectly ridiculous to ſuch as reſolve the greater part of apparent inſtincts into early and deep-rooted aſſociations of ideas. If the partialities which moſt men have to their friends, their families, and themſelves, be inſtinctive, they are certainly inſtincts of different kinds; but an inſtinctive partiality is a contradiction in terms. Partiality is founded on a compariſon between two or more objects; but genuine inſtincts form no compariſons. See INSTINCT. No man can be ſaid to be partial to the late Dr Johnſon, merely for thinking highly of his intellectual powers; nor was the doctor partial to himſelf, though he thought in this reſpect with the generality of his countrymen; but if, upon a compariſon with Milton, he was deemed the greater poet of the two, ſuch a judgement will be allowed to be partial, whether formed by himſelf or by any of his admirers. We apprehend, however, that the proceſs of its formation was the ſame in every mind by which it was held.

Self.

The origin of ſelf-partiality is not difficult to be found; and our partialities to our friends may be traced to a ſimilar ſource. By the conſtitution of our nature we are impelled to ſhun pain and to purſue pleaſure; but remorſe, the ſevereſt of all pains, is the never-failing conſequence of vicious conduct. Remorſe ariſes from the dread of that puniſhment which we believe will in a future ſtate be inflicted on vice unrepented of in this; and therefore every vicious perſon endeavours by all poſſible means to baniſh that dread from his own mind. One way of effecting this is to compare his own life with the lives of others; for he fancies that if numbers be as wicked as himſelf, the benevolent Lord of all things will not involve them in one common ruin. Hence, by magnifying to himſelf the temptations which led him aſtray, and diminiſhing the injuries which his conduct has done in the world, and by adopting a courſe diametrically the reverſe, when eſtimating the morality or immorality of the conduct of his neighbours, he ſoon comes to believe that he is at leaſt not more wicked than they. Thus is ſelf-partiality formed in the mind, and quickly blinds him who is under its influence ſo completely, as to hide from him the very faults which he ſees and blames in others. Hence the coward thinks himſelf only cautious, the miſer frugal. Partiality is formed in the very ſame manner to natural or acquired accompliſhments, whether mental or corporeal. Theſe always procure reſpect to him who is poſſeſſed of them; and as reſpect is accompanied with many advantages, every man wiſhes to obtain it for himſelf. If he fail in his attempts, he conſoles himſelf with the perſuaſion that it is at leaſt due to his merits, and that it is only withheld by the envy of the public. He compares the particular branch of ſcience or bodily accompliſhment in which he himſelf moſt excels, with thoſe which have conferred ſplendour on his rival; and eaſily finds that his own excellencies are of the higheſt order, and entitled to the greateſt ſhare of public eſteem. Hence the polite ſcholar deſpiſes the mathematician; the reader of Ariſtotle and Plato all the modern diſcoveries in phyſical and moral ſcience; and the mere experimentaliſt holds in the moſt ſovereign contempt a critical knowledge of the ancient languages. The pupil of the ancients denies the merits of the moderns, whilſt the mere modern allows nothing to the ancients; and thus each becomes partial to his own acquiſitions, and of courſe to himſelf, for having been at the trouble to make them.

Partiality to our friends and families is generated in the very ſame way. Whenever we acquire ſuch an affection for them as to conſider their happineſs as adding to our own (ſee PASSION), we magnify their excellencies,

Selim ‖ Selkirk.

cellencies, and diminiſh their defects, for the ſame reaſon, and by the ſame proceſs, that we magnify and diminiſh our own. All partialities, however, are prejudices, and prejudices of the worſt kind. They ought therefore to be guarded againſt with the utmoſt care, by the ſame means which we have elſewhere recommended (ſee PREJUDICE and METAPHYSICS, N° 98.); and he who is partial to his own virtue or his own knowledge, will do well to compare the former, not with the conduct of his neighbour, but with the expreſs rule of his duty; and to conſider the latter as no farther valuable than as it contributes to the ſum of human happineſs.

SELIM I. emperor of the Turks, was the ſecond ſon of Bajazet II. He made war upon his father, and though defeated in 1511, he at laſt dethroned him and took him priſoner, and immediately deſpatched him by poiſon, together with his elder brother Achmet, and his younger Korkud, an amiable and enlightened prince. Having eſtabliſhed his throne by theſe crimes, he marched againſt Campſon Gaury ſovereign of Egypt, gained a great victory at Aleppo, and ſlew their general. But though the ſultan periſhed in the battle, the Mameluks determined to oppoſe the emperor. Selim entering their country at the head of his army, defeated the Egyptians in two battles, and ordered Toumon Bey, the new elected ſultan, who had fallen into his hands, to be hung on a gibbet. He then took Cairo and Alexandria, and in a ſhort time reduced all Egypt to ſubjection. Thus ended the dominion of the Mameluks in Egypt, which had continued for more than 260 years. He confirmed the ancient privileges of the Venetians in Egypt and Syria, by which they carried on their commerce with India, and formed a league with them to deſtroy the power of the Portugueſe in that country. (See INDIA, N° 37.) Selim had before this gained a great victory over the Perſians, and ſtripped them of Tauris and Keman. He was preparing to attack Chriſtendom when he was ſeized with an ulcerous ſore in the back. Thinking that the air of Adrianople would reſtore his health, he ordered himſelf to be conducted thither; but he died at Clari in Thrace on his road to that city, in the year 1520, in the very ſpot where he had poiſoned his father. He reigned 8 years, and lived 54. He was a prince of great courage, ſobriety, and liberality: he was fond of hiſtory, and wrote ſome verſes. But theſe good qualities were obſcured by the moſt abominable crimes that ever diſgraced human nature: he made his way to the throne by ſhedding the blood of his father, and ſecured it by murdering his brothers and eight nephews, and every baſhaw who had been faithful to his duty.

SELINUM, in botany: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is oval, oblong, compreſſed, plane, and ſtriated in the middle: the involucrum is reflexed; the petals cordate and equal. There are ſeven ſpecies, the ſylveſtre, paluſtre, cuſtriacum, carvifolia, chabraei, ſeguieri, monnieri.

SELKIRK (Alexander), whoſe adventures gave riſe to a well-known hiſtorical romance, was born at Largo, in the county of Fife, about the year 1676, and was bred a ſeamen. He went from England, in 1703, in the capacity of ſailing-maſter of a ſmall veſſel called the *Cinque-Ports Galley*, Charles Pickering captain, burthen about 90 tons, with 16 guns and 63 men; and in September the ſame year ſailed from Cork, in company with another ſhip of 26 guns and 120 men, called the St George, commanded by that famous navigator William Dampier, intending to cruiſe on the Spaniards in the South ſea. On the coaſt of Braſil, Pickering died, and was ſucceeded in his command by his lieutenant Thomas Stradling. They proceeded on their voyage round Cape Horn to the iſland of Juan Fernandes, whence they were driven by the appearance of two French ſhips of 36 guns each, and left five of Stradling's men there on ſhore, who were taken off by the French. Hence they ſailed to the coaſt of America, where Dampier and Stradling quarrelled, and ſeparated by agreement, on the 19th of May 1704. In September following, Stradling came again to the iſland of Juan Fernandes, where Selkirk and his captain had a difference, which, with the circumſtance of the ſhip's being very leaky, and in bad condition, induced him to determine on ſtaying there alone; but when his companions were about to depart, his reſolution was ſhaken, and he deſired to be taken on board again. The captain, however, refuſed to admit him, and he was obliged to remain, having nothing but his clothes, bedding, a gun, and a ſmall quantity of powder and ball; a hatchet, knife, and kettle; his books, and mathematical and nautical inſtruments. He kept up his ſpirits tolerably till he ſaw the veſſel put off, when (as he afterwards related) his heart yearned within him, and melted at parting with his comrades and all human ſociety at once.

Selkirk.

> " ——Yet believe me, Arcas,
> Such is the rooted love we bear mankind,
> All ruffians as they were, I never heard
> A ſound ſo diſmal as their parting oars."
>
> *Thomſon's Agamemnon.*

Thus left ſole monarch of the iſland, with plenty of the neceſſaries of life, he found himſelf in a ſituation hardly ſupportable. He had fiſh, goat's fleſh, turnips and other vegetables; yet he grew dejected, languid, and melancholy, to ſuch a degree as to be ſcarce able to refrain from doing violence to himſelf. Eighteen months paſſed before he could, by reaſoning, reading his bible, and ſtudy, be thoroughly reconciled to his condition. At length he grew happy, employing himſelf in decorating his huts, chaſing the goats, whom he equalled in ſpeed, and ſcarcely ever failed of catching. He alſo tamed young kids, laming them to prevent their becoming wild; and he kept a guard of tame cats about him, to defend him when aſleep from the rats, who were very troubleſome. When his clothes were worn out, he made others of goats ſkins, but could not ſucceed in making ſhoes, with the uſe of which, however, habit, in time, enabled him to diſpenſe. His only liquor was water. He computed that he had caught 1000 goats during his abode in the iſland; of which he had let go 500, after marking them by ſlitting their ears. Commodore Anſon's people, who were there about 30 years after, found the firſt goat which they ſhot upon landing was thus marked, and as it appeared to be very old, concluded that it had been under the power of Selkirk. But it appears by Captain Carteret's account of his voyage in the Swallow ſloop, that other perſons practiſed this mode of marking, as he found a

goat with his ears thus ſlit on the neighbouring iſland of Maſſafuero, where Selkirk never was. He made companions of his tame goats and cats, often dancing and ſinging with them. Though he conſtantly performed his devotions at ſtated hours, and read aloud; yet, when he was taken off the iſland, his language, from diſuſe of converſation, was become ſcarcely intelligible. In this ſolitude he continued four years and four months; during which time only two incidents happened which he thought worth relating, the occurrences of every day being in his circumſtances nearly ſimilar. The one was, that, purſuing a goat eagerly, he caught it juſt on the edge of a precipice, which was covered with buſhes, ſo that he did not perceive it, and he fell over to the bottom, where he lay (according to Captain Rogers's account) 24 hours ſenſeleſs; but, as he related to Sir R. Steele, he computed, by the alteration of the moon, that he had lain three days. When he came to himſelf, he found the goat lying under him dead. It was with great difficulty that he could crawl to his habitation, whence he was unable to ſtir for ten days, and did not recover of his bruiſes for a long time. The other event was the arrival of a ſhip, which he at firſt ſuppoſed to be French: and ſuch is the natural love of ſociety in the human mind, that he was eager to abandon his ſolitary felicity, and ſurrender himſelf to them, although enemies; but upon their landing, approaching them, he found them to be Spaniards, of whom he had too great a dread to truſt himſelf in their hands. They were by this time ſo near that it required all his agility to eſcape, which he effected by climbing into a thick tree, being ſhot at ſeveral times as he ran off. Fortunately the Spaniards did not diſcover him, though they ſtayed ſome time under the tree where he was hid, and killed ſome goats juſt by. In this ſolitude Selkirk remained until the 2d of February 1709, when he ſaw two ſhips come into the bay, and knew them to be Engliſh. He immediately lighted a fire as a ſignal; and on their coming on ſhore, found they were the Duke Captain Rogers, and the Ducheſs Captain Courtney, two privateers from Briſtol. He gave them the beſt entertainment he could afford; and, as they had been a long time at ſea, without freſh proviſions, the goats which he caught were highly acceptable. His habitation conſiſting of two huts, one to ſleep in, the other to dreſs his food in, was ſo obſcurely ſituated, and ſo difficult of acceſs, that only one of the ſhip's officers would accompany him to it. Dampier, who was pilot on board the Duke, and knew Selkirk very well, told Captain Rogers, that, when on board the Cinque Ports, he was the beſt ſeaman on board that veſſel; upon which Captain Rogers appointed him maſter's mate of the Duke. After a fortnight's ſtay at Juan Fernandes, the ſhips proceeded on their cruiſe againſt the Spaniards; plundered a town on the coaſt of Peru; took a Manilla ſhip off California; and returned by way of the Eaſt Indies to England, where they arrived the 1ſt of October 1711; Selkirk having been abſent eight years, more than half of which time he had ſpent alone in the iſland. The public curioſity being excited reſpecting him, he was induced to put his papers into the hands of Defoe, to arrange and form them into a regular narrative. Theſe papers muſt have been drawn up after he left Juan Fernandes, as he had no means of recording his tranſactions there. Captain Cooke remarks, as an extraordinary circumſtance, that he had contrived to keep an account of the days of the week and month: but this might be done, as Defoe makes Robinſon Cruſoe do, by cutting notches in a poſt, or many other methods. From this account of Selkirk, Defoe took the idea of writing a more extenſive work, the romance of Robinſon Cruſoe, and very diſhoneſtly defrauded the original proprietor of his ſhare of the profits. Of the time or place or manner of this extraordinary man's death we have received no account; but in 1792 the cheſt and muſket which Selkirk had with him on the iſland were in the poſſeſſion of his grand nephew, John Selkirk weaver in Largo, where doubtleſs they are at preſent.

Selkirk, the capital of the county of the ſame name, is a ſmall town pleaſantly ſituated on a riſing ground, and enjoys an extenſive proſpect in all directions, eſpecially up and down the river Etterick. It is remarkable for nothing but thoſe plaintive airs produced in its neighbourhood, the natural ſimplicity of which are the pride of Scotland and the admiration of ſtrangers. W. Long. 2. 46. N. Lat. 45. 26.

SELKIRKSHIRE, called alſo the *Sheriffdom of Etterick Foreſt*, a county of Scotland, extending about 20 miles in length from eaſt to weſt, and about 12 in breadth from ſouth to north. It borders on the north with part of Tweeddale and Mid-Lothian; on the ſouth and eaſt with Teviotdale; and on the weſt with Annandale. This county was formerly reſerved by the Scottiſh princes for the pleaſure of the chaſe, and where they had houſes for the reception of their train. At that time the face of the country was covered with woods, in which there were great numbers of red and fallow deer, whence it had the name of *Etterick Foreſt*. The woods, however, are now almoſt entirely cut down, and the county is chiefly ſupported by the breed of ſheep. They are generally ſold into the ſouth, but ſometimes into the Highlands, about the month of March, where they are kept during ſummer; and after being improved by the mountain-graſs, are returned into the Lowlands in the beginning of winter.

This county, though not very populous at preſent, was once the nurſe of heroes, who were juſtly accounted the bulwark of their native ſoil, being ever ready to brave danger and death in its defence. Of this we have a memorable proof in the pathetic lamentations of their wives and daughters for the diſaſter of the field of Flowden, "where their brave foreſters were a' wed away." The rivers Etterick and Yarrow unite a little above the town of Selkirk, and terminate in the Tweed. For five miles above its junction with the Etterick, the Tweed is ſtill adorned with woods, and leads the pleaſed imagination to contemplate what this country muſt have been in former times. The Yarrow, for about five miles above its junction with Etterick, exhibits nature in a bold and ſtriking aſpect. Its native woods ſtill remain, through which the ſtream has cut its turbid courſe, deeply ingulfed amidſt rugged rocks. Here, certainly in a flood, ſtood the deſcriptive Thomſon when he ſaw it

Statiſtical Account of Scotland, Vol. II.

"Boil, and wheel, and foam, and thunder through."

Upon a peninſula, cut out by the ſurrounding ſtream, in the middle of this fantaſtically wild ſcene of grandeur and beauty, ſtands the caſtle of Newark, which has been ſuppoſed by many to be the birth-place of Mary Scot the flower of Yarrow; but this we believe to be a miſtake.

Sella, Seltzer.

SELLA TURCICA, is a deep depreſſion between the clinoid apophyſes of the ſphenoid bone. See ANATOMY, p. 682.

SELTZER WATER, is a mineral water which ſprings up at Lower Seltzer, a village in the electorate of Triers, about 10 miles from Frankfort on the Maine. It is a very uſeful medicinal water. It contains, according to ſome, a very ſmall portion of calcareous earth, of a native mineral alkali, and an acid; but of theſe the quantity is too ſmall to attribute any medicinal virtues to; but it contains alſo near 1-7th of its bulk of fixed air, which is more than is found in any other mineral water, and to this it owes its principal virtues. Others have ſaid that it is of the very ſame nature with Pyrmont water, and contains a ſubtile aqueous fluid, a volatile iron, and a predominant alkali, all joined together into one briſk ſpirituous water. The conſequence of theſe different opinions reſpecting its conſtituent parts is, that different methods have been recommended for imitating it.

According to the former analyſis, artificial Seltzer water may be prepared by adding one ſcruple of magneſia alba, ſix ſcruples of foſſil alkali, and four ſcruples of common ſalt, to each gallon of water, and ſaturating the water with fixed air or carbonic acid. According to the latter it may be imitated by adding to a quart of the pureſt and lighteſt water thirty drops of a ſtrong ſolution of iron made in ſpirit of ſalt, a drachm of oil of tartar per deliquium, and thirty drops of ſpirit of vitriol, or a little more or leſs as is found neceſſary, not to let the alkali of the oil of tartar prevail too ſtrongly, tho' it muſt prevail a little. If the proportions be carefully obſerved, and the whole of theſe ingredients ſhaken briſkly together, the artificial Seltzer or Pyrmont water thus made will ſtrongly reſemble the natural, and have the ſame good effect in medicine.

But as fixed air is the only efficacious medicinal part of the compoſition of Seltzer water, the beſt method of imitating it is by impregnating common water with that acid by a proceſs for which we are indebted to Dr Prieſtley. The firſt idea of this kind occurred to him in 1767, when, having placed ſhallow veſſels of water within the region of fixed air, on the ſurface of the fermenting veſſels of a brewery, and left them all night in that ſituation, he found that the water had acquired a very ſenſible and pleaſant impregnation. He proceeded to accelerate the impregnation by pouring the water from one veſſel into another, while they were both held within the ſphere of the fixed air. The method of effecting this by air diſlodged from chalk and other calcareous ſubſtances did not occur to him till the year 1772, when he publiſhed his directions for this purpoſe, together with a drawing of the neceſſary apparatus, which he had before communicated to the Board of Admiralty. That apparatus has now given way to another invented by Dr Nooth, which is made of glaſs, and ſtands on a wooden veſſel *dd* (fig. 1.) reſembling a tea-board: the middle veſſel B has a neck which is inſerted into the mouth of the veſſel A, to which it is ground air-tight. The lower neck of the veſſel B has a glaſs ſtopper S, compoſed of two parts, both having holes ſufficient to let a good quantity of air paſs through them. Between theſe two parts is left a ſmall ſpace, containing a plano-convex lens, which acts like a valve, in letting the air paſs from below upwards, and hindering its return into the veſſel A. The upper veſſel C terminates below in a tube *r t*, which being crooked, hinders the immediate aſcent of the bubbles of fixed air into that veſſel, before they reach the ſurface of the water in the veſſel B. The veſſel C is alſo ground air-tight to the upper neck or the middle veſſel B, and has a ſtopper *p* fitted to its upper mouth, which has a hole through its middle. The upper veſſel C holds juſt half as much as the middle one B; and the end *t* of the crooked tube goes no lower than the middle of the veſſel B.

Plate CCCLXIV.

Seltze

For the uſe of this apparatus: Fill the middle veſſel B with ſpring or any other wholeſome water, and join to it the veſſel C. Pour water into the veſſel A (by the opening *m*, or otherwiſe) ſo as to cover the riſing part of its bottom: for this about three-fourths of a pint will be ſufficient. Fill an ounce phial with oil of vitriol, and add it to the water, ſhaking the veſſel ſo as to mix them well together. As heat is generated, it will be beſt to add the oil by a little at a time, otherwiſe the veſſel may be broken. Put to this, through a wide glaſs or paper funnel, about an ounce of powdered raw chalk or marble. White marble being firſt granulated, or pounded like coarſe ſand, is better for the purpoſe than pounded chalk, becauſe it is harder; and therefore the action of the diluted acid upon it is ſlower, and laſts to a conſiderable time. On this account the ſupply of fixed air from it is more regular than with the chalk: and beſides, when no more air is produced, the water may be decanted from the veſſel A, and the white ſediment waſhed off, and the remaining granulated marble may be employed again, by adding to it freſh water and a new quantity of oil of vitriol. The funnel in this proceſs is made uſe of, in order to prevent the powder from touching the inſide of the veſſel's mouth; for if that happens, it will ſtick ſo ſtrongly to the neck of the veſſel B as not to admit of their being ſeparated without breaking. Place immediately the two veſſels B and C (faſtened to each other) into the mouth of the veſſel A, as in the figure, and all the fixed air which is diſengaged from the chalk or marble by the oil of vitriol will paſs up through the valve in S into the veſſel B. When this fixed air comes to the top of the veſſel B, it will diſlodge from thence as much water as is equal to its bulk; which water will be forced up through the crooked tube into the upper veſſel C.

Care muſt be taken not to ſhake the veſſel A when the powdered chalk is put in; otherwiſe a great and ſudden effervеſcence will enſue, which will perhaps expel part of the contents. In this caſe it may be neceſſary to open a little the ſtopper *p*, in order to give vent, otherwiſe the veſſel A may burſt. It will be proper alſo to throw away the contents and waſh the veſſel; for the matter will ſtick between the necks of the veſſels, and cement them together. The operation muſt then be begun afreſh. But if the chalk be put into the veſſel looſely wrapt up in paper, this accident will be ſtill better guarded againſt. When the effervеſcence goes on well, the veſſel C will ſoon be filled with water, and the veſſel B half filled with air; which will eaſily be known to be the caſe by the air going up in large bubbles through the crooked tube *r t*.

When this is obſerved, take off the two veſſels B and C together as they are, and ſhake them ſo that the water and air within them may be much agitated. A great part

Seltzer. part of the fixed air will be abſorbed into the water, as will appear by the end of the crooked tube being conſiderably under the ſurface of the water in the veſſel. The ſhaking them for two or three minutes will be ſufficient for this purpoſe. Theſe veſſels muſt not be ſhaken while joined to the under one A, otherwiſe too great an effervescence will be occaſioned in the latter, together with the ill conſequence above mentioned. After the water and air have been ſufficiently agitated, looſen the upper veſſel C, ſo that the remaining water may fall down into B, and the unabſorbed air paſs out. Put theſe veſſels together, and replace them into the mouth of A, in order that B may be again half filled with fixed air. Shake the veſſels B and C, and let out the unabſorbed air as before. By repeating the operation three or four times, the water will be ſufficiently impregnated.

Whenever the effervescence nearly ceaſes in the veſſel A, it may be renewed by giving it a gentle ſhake, ſo that the powdered chalk or marble at the bottom may be mixed with the oil of vitriol and water above it; for then a greater quantity of fixed air will be diſengaged. When the effervescence can be no longer renewed by ſhaking the veſſel A, either more chalk muſt be put in, or more oil of vitriol; or more water, if neither of theſe produce the deſired effect.

Mr Magellan has ſtill further improved this contrivance. He has two ſets of the veſſels B and C. While he is ſhaking the air and water contained in one of theſe ſets, the other may be receiving fixed air from the veſſel A. By this means twice the quantity of water may be impregnated in the ſame time. He has a wooden ſtand on which to fix the veſſels B, C, when taken off from A, which is very convenient. He has a ſmall tin trough for meaſuring the quantity of chalk or marble requiſite for one operation, and a wide glaſs funnel for putting it through into the veſſel A, to prevent its ſticking to the ſides, as mentioned before.

He has alſo contrived a ſtopper without a hole, to be uſed occaſionally inſtead of the perforated one *p*. It muſt be of a conical figure, and very looſe; but ſo exactly and ſmoothly ground as to be air-tight merely by its preſſure. Its uſe is to compreſs the fixed air on the water, and thereby increaſe the impregnation. For by keeping the air on the water in this compreſſed ſtate, the latter may be made to ſparkle like champaign. And if the veſſels are ſtrong, there will be no danger of their burſting in the operation.

The water thus impregnated may be drawn out at the opening *k*. But if it is not wanted immediately, it will be better to let it remain in the machine, where it has no communication with the external air; otherwiſe the fixed air flies off by degrees, and the water becomes vapid and flat. But it may be kept a long time in bottles well ſtopped, eſpecially if they are placed with their mouths downwards.

Dr Withering of Birmingham has lately contrived a new apparatus for impregnating water with fixed air, which, he ſays, is preferable to that in common uſe, becauſe it can be made at leſs expence, and is more eaſily prepared; becauſe the whole quantity of fixable air produced is converted to uſe, without any waſte of the vitriolic acid; becauſe it impregnates three times the quantity of water at one time more completely and with leſs trouble; and the impregnated water will always retain its virtue, if the joints and cocks of the machine are made perfectly air-tight; for which purpoſe they ſhould once a-year be ſupplied with a ſmall quantity of unſalted lard. This apparatus is exhibited by fig. 2. and conſiſts of a glaſs veſſel A, about ten inches high in the cylindrical part, and ſix inches and a half in diameter; another glaſs veſſel B, about twelve inches high in the conical part, one inch and a half in the neck, and five inches in diameter at the bottom: a copper pipe C paſſing through the ſtopper of the veſſel B, and tied faſt in the flexible tube D, made of ſtrong leather, air-tight, and kept hollow by means of a ſpiral wire paſſing through its whole length; a conical braſs pipe E, with a ſtop-cock faſtened to the tube D; another conical pipe F, with a ſtop-cock G, into which the end of the tube E is accurately ground ſo as to be air-tight, and cutting off all communication with the atmoſphere when the pipe E is removed; two large hog's bladders H, H, each of which ought to hold two quarts; a ſtop-cock I to prevent the water riſing into the bladders when the veſſel A is agitated; a bladder K tied to the crooked tube with the ſtop-cock I, which occaſionally opens or ſhuts the communication with the veſſel B; a glaſs funnel M, accurately fitted with the glaſs ſtopper N; an aperture O, fitted with a glaſs ſtopper or ſilver cock, from which the impregnated water is to be drawn for uſe; and, laſtly, the tube P opening into the veſſel A. When this apparatus is uſed, let the veſſel A be filled with pure water, and any other ingredients that are required, in a proper proportion; into the veſſel B put as much marble or whiting, in ſmall lumps, as will cover its bottom to the height of about two inches, and pour in water to the height repreſented by the dotted line; let the mouth of the veſſel A be well fitted with a cork, and through a hole in the cork paſs the tube P, putting upon the cork melted ſealing-wax of the ſofteſt kind, or modelling-wax, ſo as to make the whole air tight. Let the mouth of the veſſel B be ſtopped with a piece of mahogany, turned into a conical figure in a lathe, and of a ſize ſomewhat larger than the mouth of the glaſs will admit; put this piece of wood into melted bees-wax, and heat the wax till the wood begins to grow black: when cool, turn it again till it fits the mouth of the veſſel: the tubes C, L, and M are fitted into holes and bored through the wooden ſtopper previous to its being immerſed in the wax; puſh theſe tubes through the holes, and preſs the ſtopper into the orifice of the veſſel B, and cement the whole with ſealing or modelling-wax; ſhut the ſtop-cocks I and L, having previouſly preſſed the air out of the bladder K: open the ſtop-cocks G and E; then ſqueeze the air out of the bladders H, H, and afterwards preſs the conical pipe E into the pipe F; pour about a large ſpoonful of oil of vitriol through the funnel M, and ſtop it with its ſtopper N. The fixable air let looſe by the effervescence in the veſſel B, riſing through the tube C, paſſes into the bladders H, H, and diſtends them. In this caſe open the ſtop-cock I, and from the aperture O draw out about a quart of water; and the ſpace before occupied by the water will be filled with fixable air, which ſoon begins to be abſorbed by the remaining water, and is ſtill ſupplied from the bladders H, H, and from the effervescing mixture in the veſſel B. When the bladders are conſiderably collapſed, more vitriolic acid muſt be added through the

Seltzer. funnel M, ſo that they may be always kept pretty fully diſtended. When an impregnation is ſpeedily required, turn the ſtop-cocks at G and E, and open that at L; then ſeparate the pipe E from the tube F, and agitate the veſſel A; the fixable air will paſs into the bladder K, and may be preſſed into the two other bladders, when the parts of the apparatus are united. During the agitation, the ſtop-cock at I ſhould be cloſed, and opened only occaſionally to ſupply out of the bladders H, H, the fixable air abſorbed by the water. If a ſtrong impregnation be required, this proceſs ſhould be carried on in a room, the heat of which does not exceed forty-eight degrees of Fahrenheit's thermometer. Dr Withering obſerves, that the impregnated water receives no taſte from the bladders; and that if the veſſel A with its impregnated water be ſeparated from the veſſel B at the conical parting E, F, it may be encloſed in a pyramidal mahogany caſe, out of the lower part of which the ſilver cock at O projects; and thus ſerves for an ornamental as well as luxurious and ſalubrious addition to the ſide-board, particularly in the ſummer and autumnal ſeaſons.

The artificial mineral waters thus made, are more pleaſant to the taſte than the natural Pyrmont or Seltzer waters; which, beſides their fixed air, contain ſaline particles of a diſagreeable taſte, which are known to contribute little or nothing to their medicinal virtues, and may, in ſome caſes, be hurtful. They are likewiſe conſiderably ſtronger. According to Sir John Pringle, theſe waters may be made more nearly to reſemble genuine Pyrmont water, by adding to each pint of them from eight to ten drops of *tinctura martis cum ſpiritu ſalis*. Or this may be done, by adding to the water in the middle veſſel B (fig. 1.), in the proportion of about thirty grains of Epſom ſalt, ten grains of common ſalt, a ſcruple of magneſia alba, and a drachm of iron filings or iron wire, clean and free from ruſt, to one gallon of ſpring water, and impregnating the whole with fixed air in the matter already deſcribed. Let them remain, till the other ingredients and as much of the iron as is neceſſary are diſſolved; which will be in two or three days: or the magneſia may be omitted, and then the operation will be finiſhed in leſs than half that time. Theſe waters may be rendered ferruginous or chalybeate very eaſily, by putting in the middle veſſel two or more ſlender phials, filled with cuttings of fine iron-binding wire, or with ſmall iron nails; becauſe the impregnated water will diſſolve the iron ſo faſt, as to become well ſaturated with it in a few hours, according to the experiments of Mr Lane. But the method of rendering theſe artificial waters chalybeate, uſed by Dr Hulme, is to add one grain of ſalt of ſteel to each pint (ſixteen ounces) of water already impregnated with fixed air.

But the ingenious Mr Bewley has invented a ſtill better method of exhibiting fixed air as a medicine. He directs a ſcruple of alkaline ſalt to be diſſolved in a ſufficient quantity (a quarter of a pint, or leſs) of water, which is to be impregnated with as much fixed air as it can imbibe: this is to be taken at one doſe. Mr Bewley directs it to be prepared in larger quantities at a time, and calls it his mephitic julep. If immediately after it a ſpoonful of lemon juice, mixed with two or three ſpoonfuls of water, and ſweetened with ſugar, be drunk, the fixed air will be extricated in the ſtomach; and thus a much greater quantity of it may be given than the ſame quantity of water alone can be made to imbibe. Fixed air acts as a corroborant; and therefore may be given with ſucceſs in weakneſs of the ſtomach, and in vomitings ariſing from that cauſe. It has alſo been given with ſucceſs in the ſtone and in nephritic complaints. When the lungs are purulent, fixed air mixed with the air drawn into the lungs has repeatedly been found to perform a cure. The bark alſo may be given with advantage in water impregnated with fixed air, as they both coincide in their effect. Fixed air may be applied by means of a ſyringe, funnel, or otherwiſe, to inflamed breaſts, putrid ulcers, mortified parts, ulcerated ſore throats, and has been found in ſuch and ſimilar caſes to have very remarkable efficacy. It may alſo be given internally at the ſame time. In putrid dyſenteries, and in putrid ſtools, fixed air may be given by way of clyſter. Fermenting cataplaſms are of ſervice, chiefly as they ſupply fixed air to the part. In caſes of putridity fixed air has been ſucceſsfully applied to the ſurface of the body expoſed to ſtreams of it. It is alſo found an excellent cooling as well as ſtrengthening beverage in hot relaxing weather, and has the advantage of being pleaſant to the taſte.

Sem. Semen.

SEM, or Shem, the ſon of Noah, memorable for his filial piety in concealing the folly and diſgrace of his father: for which he received a remarkable benediction, about 2476 B. C. He lived to the age of 600 years.

Ras Sem. See *Ras Sem* and *Petrified City*.

SEMECARPUS, in botany; a genus of the trigynia order, belonging to the pentandria claſs of plants. The corolla is quinquepetalous; the drupa is heart-ſhaped, cellulous, and monoſpermous. There is but one ſpecies,

SEMEN, Seed. See Botany, Sect. IV. p. 435.

With reſpect to number, plants are either furniſhed with one ſeed, as ſea-pink and biſtort; two, as woodroof and the umbelliferous plants; three, as ſpurge; four, as the lip-flowers of Tournefort and rough-leaved plants of Ray; or many, as ranunculus, anemone, and poppy.

The form of the ſeeds is likewiſe extremely various, being either large or ſmall, round, oval, heart-ſhaped, kidney-ſhaped, angular, prickly, rough, hairy, wrinkled, ſleek or ſhining, black, white, or brown. Moſt ſeeds have only one cell or internal cavity; thoſe of leſſer burdock, valerian, lamb's lettuce, cornelian cherry, and ſebeſten, have two.

With reſpect to ſubſtance, ſeeds are either ſoft, membranaceous, or of a hard bony ſubſtance; as in gromwell, tamarind, and all the nuciferous plants.

In point of magnitude, ſeeds are either very large, as in the cocoa-nut; or very ſmall, as in campanela, *ammannia*, rampions, and throat-wort.

With reſpect to ſituation, they are either diſperſed promiſcuouſly through the pulp *(ſemina nidulantia)*, as in water-lily; affixed to a ſuture or joining of the valves of the ſeed-veſſel, as in the croſs-ſhaped and pea-bloom flowers; or placed upon a *placenta* or receptacle within the ſeed veſſel, as in tobacco and thorn-apple.

Seeds are ſaid to be naked *(ſemina nuda)* which are not contained in a cover or veſſel: ſuch are thoſe of the lip and compound flowers, the umbelliferous and rough-leaved plants; covered ſeeds *(ſemina tecta)* are contained

Semen. contained in ſome veſſel, whether of the capſule, pod, berry, apple, or cherry kind.

A ſimple ſeed is ſuch as bears neither crown, wing, nor downy *pappus*; the varieties in ſeeds, ariſing from theſe circumſtances, are particularly enumerated under their reſpective heads.

In aſſimilating the animal and vegetable kingdoms, Linnæus denominates ſeeds the eggs of plants. The fecundity of plants is frequently marvellous; from a ſingle plant or ſtalk of Indian or Turkey wheat, are produced, in one ſummer, 2000 ſeeds; of elecampane, 3000; of ſun-flower, 4000; of poppy, 32,000; of a ſpike of cat's tail, 10,000 and upwards; a ſingle fruit, or ſeed-veſſel, of tobacco, contains 1000 ſeeds; that of white poppy, 8000. Mr Ray relates, from experiments made by himſelf, that 1012 tobacco ſeeds are equal in weight to one grain; and that the weight of the whole quantum of ſeeds in a ſingle tobacco plant, is ſuch as muſt, according to the above proportion, determine their number to be 360,000. The ſame author eſtimates the annual produce of a ſingle ſtalk of ſpleen-wort to be upwards of one million of ſeeds.

The diſſemination of plants reſpects the different methods or vehicles by which nature has contrived to diſperſe their ſeeds for the purpoſe of increaſe. Theſe by naturaliſts are generally reckoned four:—

1. Rivers and running waters. 2. The wind. 3. Animals. 4. An elaſtic ſpring, peculiar to the ſeeds themſelves.

1. The ſeeds which are carried along by rivers and torrents are frequently conveyed many hundreds of leagues from their native ſoil, and caſt upon a very different climate, to which, however, by degrees they render themſelves familiar.

2. Thoſe which are carried by the wind, are either *winged*, as in fir-tree, trumpet-flower, tulip-tree, birch, arbor-vitæ, meadow-rue, and jeſſamine, and ſome umbelliferous plants; furniſhed with a *pappus*, or downy crown, as in valerian, poplar, reed, ſucculent ſwallow-wort, cotton-tree, and many of the compound flowers; placed within a winged *calyx* or ſeed-veſſel, as in ſcabious, ſea-pink, dock, dioſcorea, aſh, maple, and elm-trees, logwood and woad; or, laſtly, contained within a ſwelled *calyx* or ſeed-veſſel, as in winter-cherry, cucubalus, melilot, bladder-nut, fumitory, bladder-ſena, heart-ſeed, and chick-peaſe.

3. Many birds ſwallow the ſeeds of vanelloe, juniper, miſſetoe, oats, millet, and other graſſes, and void them entire. Squirrels, rats, parrots, and other animals, ſuffer many of the ſeeds which they devour to eſcape, and thus in effect diſſeminate them. Moles, ants, earthworms, and other inſects, by ploughing up the earth, admit a free paſſage to thoſe ſeeds which have been ſcattered upon its ſurface. Again, ſome ſeeds attach themſelves to animals, by means of hooks, crotchets, or hairs, which are either affixed to the ſeeds themſelves, as in hounds-tongue, mouſe-ear, vervain, carrot, baſtard parſley, ſanicle, water hemp-agrimony, *arctopus* and *verbeſina*; to their calyx, as in burdock, agrimony, *rhexia*, ſmall wild bugloſs, dock, nettle, pellitory, and lead-wort; or to their fruit or ſeed-veſſel, as in liquorice, enchanter's night-ſhade, croſs-wort, clivers, French honeyſuckle, and arrow-headed graſs.

4. The ſeeds which diſperſe themſelves by an elaſtic force, have that force reſident either in their *calyx*, as in oats and the greater number of ferns; in their *pappus*, as in centaurea crupina; or in their *capſule*, as in gerannium, herb-bennet, African ſpiræa, fraxinella, horſe-tail, balſam, Malabar nut, cucumber, elaterium, and male balſam apple. Semen ‖ Semi.

Semen, in the animal economy. See Physiology, Sect. xii. and Anatomy, N° 109.

Semen Sanctum, or *Santonicum*. See Artemisia.

SEMENDRIAH, a town of Turkey in Europe, in the province of Servia, with a good citadel. It is the capital of a ſangiacate, was taken by the Turks in 1690, and is ſeated on the Danube, in E. Long. 21. 45. N. Lat. 45. 0.

Sementinæ feriæ, in antiquity, feaſts held annually among the Romans, to obtain of the gods a plentiful harveſt. They were celebrated in the temple of Tellus, where ſolemn ſacrifices were offered to Tellus and Ceres. Theſe feaſts were held about ſeed-time, uſually in the month of January; for, as Macrobius obſerves, they were moveable feaſts.

SEMI, a word borrowed from the Latin, ſignifying *half*; but only uſed in compoſition with other words, as in the following articles:—

Semi-Arians, in eccleſiaſtical hiſtory, a branch of the ancient Arians, conſiſting, according to Epiphanius, of ſuch as, in appearance, condemned the errors of that hereſiarch, but yet acquieſced in ſome of the principles thereof, only palliating and hiding them under ſofter and more moderate terms. Though they ſeparated from the Arian faction (ſee Arians), they could never be brought to acknowledge that the Son was homoouſios, that is, conſubſtantial, or of the ſame ſubſtance with the Father; they would only allow him to be homoiouſios, that is, of a like ſubſtance with the Father, or ſimilar to the Father in his eſſence, not by nature, but by a peculiar privilege.

The ſemi-arianiſm of the moderns conſiſts in their maintaining that the Son was from all eternity begotten by the *will* of the Father, contrary to the doctrine of the orthodox, who ſeem to teach that the eternal generation is *neceſſary*. Such at leaſt are the reſpective opinions of Dr Clarke and Biſhop Bull. See Theology.

Semicircle, in geometry, half a circle, or that figure comprehended between the diameter of the circle and half its circumference.

Semicolon, in grammar, one of the points or ſtops uſed to diſtinguiſh the ſeveral members of a ſentence from each other.

The mark or character of the ſemicolon is (;), and has its name as being of ſomewhat leſs effect than a colon: or as demanding a ſhorter pauſe.

The proper uſe of the ſemicolon is to diſtinguiſh the conjunct members of a ſentence. Now, by a conjunct member of a ſentence is meant ſuch a one as contains at leaſt two ſimple members.—Whenever, then, a ſentence can be divided into ſeveral members of the ſame degree, which are again diviſible into other ſimple members, the former are to be ſeparated by a ſemicolon. For inſtance: "If fortune bear a great ſway over him, who has nicely ſtated and concerted every circumſtance of an affair; we muſt not commit every thing, without reſerve, to fortune, leſt ſhe have too great a hold of us." Again: *Si quantum in agro locisque deſertis audacia poteſt, tantum in foro atque judiciis impudentia valeret; non minus in cauſa cederet Aulus Cæcinna Sexta Ælutii impudentiæ,*

Semicubium ‖ Semipelagians.

dentiæ, quam tum in vi faciendâ, cessit audaciæ. An instance in a more complex sentence we have in Cicero: *Res familiaris primum bene parta sit, nulloque turpi quæstu: tum quam plurimis, modo dignis, se utilem præbeat; deinde augeatur ratione, diligentia, parsimonia; nec libidini potius luxuriæque, quam liberalitate et beneficentiæ pareat.*

But though the proper use of the semicolon be to distinguish conjunct members, it is not necessary that all the members divided hereby be conjunct. For upon dividing a sentence into great and equal parts, if one of them be conjunct, all those other parts of the same degree are to be distinguished by a semicolon.—Sometimes also it happens, that members that are opposite to each other, but relate to the same verb, are separated by a semicolon. Thus Cicero: *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc scelus*, &c. To this likewise may be referred such sentences, where the whole going before, the parts follow: as "The parts of oratory are four; invention, disposition, elocution, and pronunciation."

SEMICUBIUM, in medicine, a half-bath, wherein the patient is only placed up to the navel.

SEMIDIAMETER, half the diameter, or a right line drawn from the centre of a circle or sphere to its circumference: being the same with what is otherwise called the *radius*.

SEMIFLOSCULUS, in botany, a term used to express the flowers of the syngenesia class. These semifloscuti are petals, hollow in their lower part, but in their upper flat, and continued in the shape of a tongue.

SEMITONE, in music. See INTERVAL.

SEMINAL, something belonging to the semen or seed.

SEMINARY, in its primary sense, the ground where any thing is sown, to be afterwards transplanted.

SEMINARY, in a figurative sense, is frequently applied to places of education, whence scholars are transplanted into life.—In Catholic countries it is particularly used for a kind of college or school, where youth are instructed in the ceremonies, &c. of the sacred ministry. Of these there are great numbers; it being ordained by the council of Trent, that there be a seminary belonging to each cathedral, under the direction of the bishop.

SEMINATION, denotes the manner or act of shedding and dispersing the seed of plants. See SEMEN.

SEMIPELAGIANS, in ecclesiastical history, a name anciently, and even at this day, given to such as retain some tincture of Pelagianism. See PELAGIANS.

Cassian, who had been a deacon of Constantinople, and was afterwards a priest at Marseilles, was the chief of these Semipelagians; whose leading principles were, 1. That God did not dispense his grace to one more than another in consequence of predestination, *i. e.* an eternal and absolute decree, but was willing to save all men, if they complied with the terms of his gospel. 2. That Christ died for all men. 3. That the grace purchased by Christ, and necessary to salvation, was offered to all men. 4. That man, before he received grace, was capable of faith and holy desires. 5. That man was born free, and was consequently capable of resisting the influences of grace, or of complying with its suggestion. The Semipelagians were very numerous; and the doctrine of Cassian, though variously explained, was received in the greatest part of the monastic schools in Gaul, from whence it spread itself far and wide thro' the European provinces. As to the Greeks and other eastern Christians, they had embraced the Semipelagian doctrines before Cassian, and still adhere to them. In the 6th century, the controversy between the Semipelagians and the disciples of Augustin prevailed much, and continued to divide the western churches.

Semiramis ‖ Sempervivum.

SEMIRAMIS (fab. hist.), a celebrated queen of Assyria, daughter of the goddess Dereeto, by a young Assyrian. She was exposed in a desert; but her life was preserved by doves for one whole year, till Simmas, one of the shepherds of Ninus, found her and brought her up as his own child. Semiramis, when grown up, married Menones, the governor of Nineveh, and accompanied him to the siege of Bactria; where, by her advice and prudent directions, she hastened the king's operations, and took the city. These eminent services, together with her uncommon beauty, endeared her to Ninus. The monarch asked her of her husband, and offered him his daughter Sosana in her stead; but Menones, who tenderly loved Semiramis, refused; and when Ninus had added threats to entreaties, he hanged himself. No sooner was Menones dead, than Semiramis, who was of an aspiring soul, married Ninus, by whom she had a son called *Ninyas*. Ninus was so fond of Semiramis, that at her request he resigned the crown, and commanded her to be proclaimed queen and sole empress of Assyria. Of this, however, he had cause to repent; Semiramis put him to death, the better to establish herself on the throne; and when she had no enemies to fear at home, she began to repair the capital of her empire, and by her means Babylon became the most superb and magnificent city in the world. She visited every part of her dominions, and left everywhere immortal monuments of her greatness and benevolence. To render the roads passable and communication easy, she hollowed mountains and filled up valleys, and water was conveyed at a great expense by large and convenient aqueducts to barren deserts and unfruitful plains. She was not less distinguished as a warrior: Many of the neighbouring nations were conquered; and when Semiramis was once told as she was dressing her hair, that Babylon had revolted, she left her toilette with precipitation, and though only half dressed, she refused to have the rest of her head adorned before the sedition was quelled and tranquillity re-established. Semiramis has been accused of licentiousness; and some authors have observed that she regularly called the strongest and stoutest men in her army to her arms, and afterwards put them to death, that they might not be living witnesses of her incontinence. Her passion for her son was also unnatural; and it was this criminal propensity which induced Ninyas to destroy his mother with his own hands. Some say that Semiramis was changed into a dove after death, and received immortal honours in Assyria. It is supposed that she lived about 11 centuries before the Christian era, and that she died in the 62d year of her age and the 25th of her reign. Many fabulous reports have been propagated about Semiramis, and some have declared that for some time she disguised herself and passed for her son Ninyas. *Lempriere's Bibliotheca Classica.*

SEMPERVIVUM, HOUSE-LEEK, in botany: A genus of plants belonging to the order of dodecagynia, and to the class of dodecandria; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is divided into 12 parts; the petals are 12, and the capsules

Senate.

12, containing many ſeeds. There are 12 ſpecies; the arboreum, canarienſe, glutinoſum, glanduloſum, tectorum, globiferum, villoſum, tortuoſum, arachnoideum, montanum, ſedeforme, and menanthes. Linnæus has only eight of theſe. The tectorum alone is a native of Britain. The ſtalk is about a foot high; the radical leaves are thick, oval, pointed, fringed, and ſpreading in a roſe; thoſe on the ſtem are imbricated and membranous: the flowers are pale red and ſeſſile, and grow on curved terminal bunches. It is frequent on the tops of houſes, and flowers in July.

cvie's
...oria
...dica.

The following chemical deſcription of this ſpecies is given by Lewis: "The leaves of houſe leek, of no remarkable ſmell, diſcover to the taſte a mild ſubacid auſterity: their expreſſed juice, of a pale yellowiſh hue when ſiltered, yields on inſpiſſation a deep yellow, tenacious, mucilaginous maſs, conſiderably acidulous and acerb: from whence it may be preſumed, that this herb has ſome claim to the refrigerant and reſtringent virtues that have been aſcribed to it. It is obſervable that the ſiltered juice, on the addition of an equal quantity of rectified ſpirit of wine, forms a light white coagulum, like cream of fine pomatum, of a weak but penetrating taſte: this, freed from the fluid part, and expoſed to the air, almoſt totally exhales. From this experiment it is concluded by ſome, that houſe-leek contains a volatile alkaline ſalt: but the juice coagulates in the ſame manner with volatile alkalies themſelves, as alſo with fixed alkalies: Acids produce no coagulation."

SENAAR, or SENNAAR. See SENNAAR.

SENATE, in general, is an aſſembly or council of ſenators; that is, of the principal inhabitants of a ſtate, who have a ſhare in the government.

The ſenate of ancient Rome is of all others the moſt celebrated. It exerciſed no contentious juriſdiction; but appointed judges, either from among the ſenators or knights, to determine proceſſes: it alſo appointed governors of provinces, and diſpoſed of the revenues of the commonwealth, &c. Yet did not the whole ſovereign power reſide in the ſenate, ſince it could not elect magiſtrates, make laws, or decide of war and peace; in all which caſes the ſenate was obliged to conſult the people.

The ſenate, when firſt inſtituted by Romulus, conſiſted of 100 members; to whom he afterwards added the ſame number when the Sabines had migrated to Rome. Tarquin the Elder made the ſenate conſiſt of 300, and this number remained fixed for a long time; but afterwards it fluctuated greatly, and was increaſed firſt to 700, and afterwards to 900 by J. Cæſar, who filled the ſenate with men of every rank and order. Under Auguſtus the ſenators amounted to 1000, but this number was reduced, and fixed to 600. The place of a ſenator was always beſtowed upon merit: the monarchs had the privilege of chooſing the members; and after the expulſion of the Tarquins, it was one of the rights of the conſuls, till the election of the cenſors, who from their office ſeemed moſt capable of making choice of men whoſe character was irreproachable, whoſe morals were pure, and relations honourable. Only particular families were admitted into the ſenate; and when the plebeians were permitted to ſhare the honours of the ſtate, it was then required that they ſhould be born of free citizens. It was alſo required that the candidates ſhould be knights before their admiſſion into the ſenate. They were to be above the age of 25, and to have previouſly paſſed through the inferior offices of quæſtor, tribune of the people, edile, pretor, and conſul. Senator, Senatus.

The ſenate always met of courſe on the 1ſt of January, for the inauguration of the new conſuls; and in all months, univerſally, there were three days, viz. the kalends, nones, and ides, on which it regularly met; but it always met on extraordinary occaſions, when called together by a conſul, tribune, or dictator.

To render their decrees valid and authentic, a certain number of members was requiſite, and ſuch as were abſent without ſome proper cauſe were always fined. In the reign of Auguſtus, 400 ſenators were requiſite to make a ſenate. Nothing was tranſacted before ſunriſe or after ſunſet. In their office the ſenators were the guardians of religion, they diſpoſed of the provinces as they pleaſed, they prorogued the aſſemblies of the people, they appointed thankſgivings, nominated their ambaſſadors, diſtributed the public money, and in ſhort had the management of every thing political or civil in the republic, except the creating of magiſtrates, the enacting of laws, and the declarations of war or peace, which were confined to the aſſemblies of the people.

SENATOR, in general, denotes a member of ſome ſenate.

The dignity of a Roman ſenator could not be ſupported without the poſſeſſion of 80,000 ſeſterces, or about 700ol. Engliſh money; and therefore ſuch as ſquandered away their money, and whoſe fortune was reduced below this ſum, were generally ſtruck out of the liſt of ſenators. This regulation was not made in the firſt ages of the republic, when the Romans boaſted of their poverty. The ſenators were not permitted to be of any trade or profeſſion. They were diſtinguiſhed from the reſt of the people by their dreſs; they wore the laticlave, half-boots of a black colour, with a creſcent or ſilver buckle in the form of a C; but this laſt honour was confined only to the deſcendants of thoſe hundred ſenators who had been elected by Romulus, as the letter C ſeems to imply. See the preceding article.

Among us, ſenator is a member of parliament. In the laws of King Edward the Confeſſor, we are told that the Britons called thoſe *ſenators* whom the Saxons called afterwards *aldermen* and *borough-maſters*; though not for their age, but their wiſdom; for ſome of them were young men, but very well ſkilled in the laws. Kenulph king of the Mercians granted a charter, which ran thus: viz. *Conſilio et conſenſu* epiſcoporum *et* ſenatorum *gentis ſuæ largitus fuit dicto monaſterio*, &c.

In Scotland, the lords of ſeſſion are called *ſenators* of the college of juſtice.

SENATUS AUCTORITAS. See the next article.

SENATUS-Conſultum, which made part of the Roman law. When any public matter was introduced into the ſenate, which was always called *referre ad ſenatum*, any ſenator whoſe opinion was aſked, was permitted to ſpeak upon it as long as he pleaſed, and on that account it was often uſual for the ſenators to protract their ſpeeches till it was too late to determine. When the queſtion was put, they paſſed to the ſide of that ſpeaker whoſe opinion they approved, and a majority of votes was eaſily collected, without the trouble of

Seneca. of counting the numbers. When the majority was known, the matter was determined, and a *ſenatus-conſultum* was immediately written by the clerks of the houſe, at the feet of the chief magiſtrates, and it was ſigned by all the principal members of the houſe. When there was not a ſufficient number of members to make a ſenate, the deciſion was called *ſenatus auctoritas*, but it was of no force if it did not afterwards paſs into a *ſenatus-conſultum*.

The *ſenatus-conſulta* were at firſt left in the cuſtody of the kings, and afterwards of the conſuls, who could ſuppreſs or preſerve them; but about the year of Rome 304, they were always depoſited in the temple of Ceres, and afterwards in the treaſury, by the ediles of the people.

SENECA (Lucius Annæus), a Stoic philoſopher, was born at Corduba in Spain, about the beginning of the Chriſtian era, of an equeſtrian family, which had probably been tranſplanted thither in a colony from Rome. He was the ſecond ſon of Marcus Annæus Seneca, commonly called the *rhetorician*, whoſe remains are printed under the title of *Suaſoriæ et Controverſiæ, cum Declamationum Excerptis*; and his youngeſt brother Annæus Mela (for there were three of them) had the honour of being father to the poet Lucan. He was removed to Rome, together with his father and the reſt of his family, while he was yet in his infancy. There he was educated in the moſt liberal manner, and under the beſt maſters. He learned eloquence from his father; but his genius rather leading him to philoſophy, he put himſelf under the Stoics Attalus, Sotion, and Papirius Fabianus; men famous in their way, and of whom he has made honourable mention in his writings. It is probable, too, that he travelled when he was young, ſince we find him, in ſeveral parts of his works, particularly in his *Quæſtiones Naturales*, making very exact and curious obſervations upon Egypt and the Nile.—But this, though entirely agreeable to his own humour, did not at all correſpond with that ſcheme or plan of life which his father had drawn out for him; who therefore forced him to the bar, and put him upon ſoliciting for public employments; ſo that he afterwards became quæſtor, prætor, and, as Lipſius will have it, even conſul.

In the firſt year of the reign of Claudius, when Julia the daughter of Germanicus was accuſed of adultery by Meſſalina, and baniſhed, Seneca was baniſhed too, being charged as one of the adulterers. Corſica was the ſeat of his exile, where he lived eight years; "happy in the midſt of thoſe things which uſually make other people miſerable; *inter eas res beatus, quæ ſolent miſeros facere*:" and where he wrote his books of conſolation, addreſſed to his mother Helvia, and to his friend Polybius, and perhaps ſome of thoſe tragedies which go under his name; for he ſays, *modo ſe levioribus ſtudiis ibi oblectaſſe*. Agrippina being married to Claudius, upon the death of Meſſalina, ſhe prevailed with the emperor to recal Seneca from baniſhment; and afterwards procured him to be tutor to her ſon Nero, whom ſhe deſigned for the empire. Africanus Burrhus, a prætorian præfect, was joined with him in this important charge: and theſe two preceptors, who were intruſted with equal authority, had each his reſpective department. By the bounty and generoſity of his royal pupil, Seneca acquired that prodigious wealth which rendered him in a manner equal to kings. His houſes and walks were the moſt magnificent in Rome. His villas were innumerable: and he had immenſe ſums of money placed out at intereſt in almoſt every part of the world. The hiſtorian Dio reports him to have had 250,000l. ſterling at intereſt in Britain alone; and reckons his calling it in all at a ſum, as one of the cauſes of a war with that nation. Seneca.

All this wealth, however, together with the luxury and effeminacy of a court, does not appear to have had any ill effect upon the temper and diſpoſition of Seneca. He continued abſtemious, exact in his manners, and, above all, free from the vices ſo commonly prevalent in ſuch places, flattery and ambition. "I had rather (ſaid he to Nero) offend you by ſpeaking the truth, than pleaſe you by lying and flattery: *malueri im veris offendere, quam placere adulando.*" How well he acquitted himſelf in quality of preceptor to his prince, may be known from the five firſt years of Nero's reign, which have always been conſidered as a perfect pattern of good government; and if that emperor had but been as obſervant of his maſter through the whole courſe of it, as he was at the beginning, he would have been the delight, and not, as he afterwards proved, the curſe and deteſtation of mankind. But when Poppæa and Tigellinus had got the command of his humour, and hurried him into the moſt extravagant and abominable vices, he ſoon grew weary of his maſter, whoſe life muſt indeed have been a conſtant rebuke to him. Seneca, perceiving that his favour declined at court, and that he had many accuſers about the prince, who were perpetually whiſpering in his ear the great riches of Seneca, his magnificent houſes and fine gardens, and what a favourite through means of theſe he was grown with the people, made an offer of them all to Nero. Nero refuſed to accept them: which, however, did not hinder Seneca from changing his way of life; for, as Tacitus relates, he "kept no more levees, declined the uſual civilities which had been paid to him, and, under a pretence of indiſpoſition, or ſome engagement or other, avoided as much as poſſible appearing in public."

Nero, in the mean time, who, as it is ſuppoſed, had deſpatched Burrhus by poiſon, could not be eaſy till he had rid himſelf of Seneca alſo: For Burrhus was the manager of his military concerns, and Seneca conducted his civil affairs. Accordingly, he attempted, by means of Cleonicus, a freed man of Seneca, to take him off by poiſon; but this not ſucceeding, he ordered him to be put to death, upon an information that he was privy to Piſo's conſpiracy againſt his perſon. Not that he had any real proof of Seneca's being at all concerned in this plot, but only that he was glad to lay hold of any pretence for deſtroying him.—He left Seneca, however, at liberty to chooſe his manner of dying; who cauſed his veins to be opened immediately. His wife Paulina, who was very young in compariſon of himſelf, had yet the reſolution and affection to bear him company, and thereupon ordered her veins to be opened at the ſame time; but as Nero was not willing to make his cruelty more odious and inſupportable than there ſeemed occaſion for, he gave orders to have her death prevented: upon which her wounds were bound up, and the blood ſtopped, in juſt time enough to ſave her; tho', as Tacitus ſays, ſhe looked ſo miſer-

ably

eneca, enefcio-

ably pale and wan all her life after, that it was eaſy to read the loſs of her blood and ſpirits in her countenance. In the mean time, Seneca, finding his death ſlow and lingering, deſired Statius Annæus his phyſician to give him a doſe of poiſon, which had been prepared ſome time before in caſe it ſhould be wanted; but this not having its uſual effect, he was carried to a hot bath, where he was at length ſtifled with the ſteams. He died, as Lipſius conjectures, in the 63d or 64th year of his age, and in about the 10th or 11th of Nero's reign. Tacitus, on mentioning his death, obſerves, that, as he entered the bath, he took of the water, and with it ſprinkled ſome of his neareſt domeſtics, ſaying, "That he offered thoſe libations to Jupiter the Deliverer." Theſe words are an evident proof that Seneca was not a Chriſtian, as ſome have imagined him to have been; and that the 13 epiſtles from Seneca to St Paul, and from St Paul to Seneca, are ſuppoſititious pieces. His philoſophical works are well known.—They conſiſt of 124 *epiſtles* and diſtinct treatiſes; and, except his books of phyſical queſtions, are chiefly of the moral kind, treating of anger, conſolation, providence, tranquillity of mind, conſtancy, clemency, the ſhortneſs of life, a happy life, retirement, benefits. He has been juſtly cenſured by Quintilian and other critics, as one of the firſt corrupters of the Roman ſtyle; but his works are highly valuable, on account of the vaſt erudition which they diſcover, and the beautiful moral ſentiments which they contain.

SENECIO, GROUNDSEL, in botany: A genus belonging to the claſs of ſyngeneſia, and to the order of polygamia ſuperflua; and in the natural claſſification ranked under the 49th order, *Compoſitæ*. The receptacle is naked; the pappus ſimple; the calyx cylindrical and calycinated. The ſcales are equal and contiguous, ſo as to ſeem entire; thoſe at the baſe are few, and have their apices or points decayed. There are 57 ſpecies. Of theſe, ſeven are Britiſh, the vulgaris, viſcoſus, ſylvaticus, erucifolius, jacobæa, paludoſus, and ſaracenicus.

1. The *vulgaris*, or common groundſel, has its corollæ naked, its leaves ſeſſile, ſmooth, and ſinuated, their ſegments ſhort, broad, and minutely ſerrated; the flowers are yellow, and without radii. This weed grows in cultivated ground everywhere, and flowers in May. Its leaves have been uſed in medicine externally as a vulnerary and refrigerant, and internally as a mild emetic; but they have little or no efficacy. 2. The *viſcoſus*, or cotton groundſel, has its corollæ revolute, its leaves pinnatifid, viſcid, and downy. The ſcales of the calyx are lax and hairy, and are of the ſame length with the perianthium. 3. The *ſylvaticus*, or mountain groundſel, has its corollæ revolute, its leaves pinnatifid and dentated, the ſtem corymbous and erect. It flowers in July, and is frequent in woods and heaths. 4. The *erucifolius*, hoary perennial ragwort; the corollæ are radiant; the leaves are pinnatifid, dentated, and downy beneath; the ſtem is erect, and two feet high; the flowers are yellow, and grow in cluſters. This plant is frequent in woods and hedges. 5. The *jacobæa*, common ragwort; the corollæ are radiant; the leaves pinnated and lyre-ſhaped, and of a dark green colour; the ſtalk is erect, round, and generally purpliſh; the flowers grow in cluſters on the tops of the ſtalks. The leaves have a bitteriſh ſubacrid taſte, and extremely nauſeous. Simon Pauli ſays, that a decoction of them cured many ſoldiers of an epidemic dyſentery. 6. The *paludoſus*, marſh ragwort; the corollæ are radiant; the leaves ſword-ſhaped, acutely ſerrated, and ſomewhat downy underneath; the ſtem is erect, branched towards the top, and four or five feet high; the flowers are large and yellow. This plant is frequent in fens and ditches in England. 7. The *ſaracenicus*, broad-leaved ragwort; the corollæ are radiant; the leaves are lanceolated, ſerrated, and ſomewhat ſmooth; the ſtem is erect, ſimple, and four or five feet high; there are ſeveral flowers on each footſtalk, which are yellow, and grow in cluſters on the top. The plant grows in moiſt paſtures in England; and flowers in July or Auguſt.

Senegal.

SENEGAL, a part of Negroland in Africa, the boundaries of which are not known. See GUINEA.

Iſle of SENEGAL, ſometimes called *St Louis*, is a ſmall iſland in the mouth of the river Senegal, and according to Maſkelyne's tables is ſituated in N. Lat. 15. 53. W. Long. 16. 31. The Dutch were the firſt Europeans who ſettled at Senegal; but their colony was expelled by the French in 1687. It was taken by the Engliſh in 1692; and retaken by the French the year following. It was a ſecond time taken poſſeſſion of by the Engliſh in 1758; but in 1779 the French recovered it, and it was ceded by the Britiſh crown by the treaty of 1783.

The beſt account of this iſland which we have ſeen, is given in the intereſting voyage of M. Saugnier to the coaſt of Africa. This adventurer viſited Senegal in June 1785.

"The iſland (ſays he), properly ſpeaking, is only a bank of ſand in the middle of the river. It is 1000 geometrical paces long, and about 60 in its greateſt width; is almoſt on a level with the river and with the ſea, being defended from the latter by Barbary point, which is of greater elevation than the colony. The eaſtern branch of the river is the more conſiderable of the two, being about 400 toiſes acroſs; the weſtern branch is only from 50 to 200 toiſes wide. The iſle conſiſts entirely of burning ſands, on the barren ſurface of which you ſometimes meet with ſcattered flints, thrown out among their ballaſt by veſſels coming from Goree, or with the ruins of buildings formerly erected by Europeans. There is ſcarcely ſuch a thing as a garden upon the iſland; European ſeeds in general not thriving here. It is not ſurpriſing that the ſoil is ſo unproductive; for the air is ſtrongly impregnated with ſea ſalt, which pervades every thing, and conſumes even iron in a very ſhort ſpace of time. The heats are exceſſive, and rendered ſtill more inſupportable by the reflection of the ſand; ſo that from ten in the morning until four in the afternoon it is almoſt impoſſible to do any work. During the months of January, February, March, and April, the heats are moderated; but in Auguſt and the following months they become ſo oppreſſive as even to affect the natives themſelves. What effect then muſt they have upon the Europeans, ſuddenly tranſported into this burning climate? The nights are a little leſs ſultry; not always, however, but only when the ſea breeze ſets in. It is then that the inhabitants of the colony breathe a freſher air, for which they have been longing the whole of the day; but this air in our climate would ſeem a burning vapour. The nights are nevertheleſs troubleſome, notwithſtanding the comforts of the

Senegal. sea breeze. The inſtant the ſun is ſet, we are aſſailed by an infinity of gnats, which are called *moſchettos*; their ſtings are very painful, and their multitudes incredible. The inhabitants find but a poor defence in their gauze curtains. For my own part, accuſtomed as I had been to live among the Moors, I was but little annoyed by theſe inſects. Being half a ſavage, I felt no deſire to recommend myſelf to the favourable regard of the fair ſex, and I was therefore under no neceſſity of taking care of my perſon. In imitation of my former maſters, I ſmeared myſelf with butter, and this expedient preſerved me at all times from theſe impertinent ſtingers, theſe ſpiteful enemies to the repoſe of the human kind.

"If the proſpect of Senegal is not agreeable to the eye, much leſs are its environs, which are covered over only with ſand, and overrun with mangles. It may be ſaid, without exaggeration, that there is not a more forlorn ſituation to be found on the face of the inhabited globe, or a place in which the common neceſſaries of life are procured with greater difficulties. Water, that indiſpenſable aliment of man, is here not potable. Wells are dug in the ſand to the depth of five or ſix feet, and water is obtained by theſe means; but whatever pains are taken to freſhen it, it ever retains a brackiſh taſte. I have diſtilled this water myſelf, and obſerved that it always had a diſagreeable ſavour, which cannot fail to be hurtful to the health: it is true, that when the river is high, its ſtreams are freſh, but the water is only the more dangerous. It proves the cauſe of moſt of thoſe maladies which carry off the Europeans ſo rapidly, that at the end of every three years the colony has a freſh ſet of inhabitants. The blacks themſelves, although accuſtomed to the climate, are not in this ſeaſon free from diſeaſe."

The fort of St Louis is a quadrangle, and has two baſtions of conſiderable ſtrength; but the greateſt ſecurity of the fort is its natural ſituation. The cannon of the fort are numerous, and the arſenal well ſupplied with ſmall arms and ſtores. Beſides this fort the French had no other upon the river, except Fort St Joſeph, which ſtands about four leagues below the cataract at Govina, though they had a few factories in different parts.

The principal commodity of this country is that of gum Senegal (ſee *Gum-Senegal*), which is a valuable branch of commerce, as it is uſed in many arts and manufactures, particularly by the painters in water colours, the ſilk weavers, and dyers.

The French import from the river Senegal not only gum-arabic, but elephants teeth, hides, bees wax, gold duſt, cotton, oſtrich feathers, ambergris, indigo, and civet.

Notwithſtanding the barrenneſs of the ſpot, Senegal contains more than 6000 negroes, including the captives of the Tapades, or negroes born of the black inhabitants of the country. They are never put up to ſale, unleſs convicted of ſome crime. Their huts, conſtructed in the form of bee hives, and ſupported upon four ſtakes, ſurround the habitations of the negro inhabitants. The entire height of thoſe huts may riſe to about 12 feet, the width in every direction is commonly from 10 to 12. The beds are compoſed of hurdles laid upon croſs bars, ſupported by forked ſtakes at the height of about a foot from the ground. Here the ſlaves ſleep promiſcuouſly, men, women, girls, and boys. A fire is made in the middle of the hut, which is filled with ſmoke, ſufficient to ſtifle any man but a negro. Sene

The men are tall, and the women are accounted the handſomeſt negreſſes of all Africa. The Senegalians may be conſidered as the moſt courageous people of that part of the world, without even excepting the Moors. Their courage, however, is more nearly allied to temerity than to bravery. In the courſe of the voyage to Galam, they meet the greateſt dangers with gaiety and ſong; they dread neither muſket nor cannon, and are equally fearleſs of the cayman or crocodile. Should one of their companions be killed, and devoured by theſe animals before their face, they are not deterred from plunging into the water, if the working of the ſhip require it. Theſe excellent qualifications which diſtinguiſh them, and on which they value themſelves ſo much, do not, however, preſerve them from the common contagion of the country, which inclines them all to rapine. They are emulous to ſurpaſs one another in all the arts of overreaching and fraud. The conduct of the Europeans has, no doubt, encouraged theſe vices as much as the leſſons of the marabous, who inculcate the duty of plundering the Chriſtians to the utmoſt of their power.

The Yolof negroes of Senegal are either Chriſtians, or Mahometans, or rather one and the other, or with more truth neither; religion being a matter of indifference to them. Thoſe on the continent are of the ſame way of thinking, and their religious practices are kept up only for the ſake of form. A bar of iron, or a few beads, will make them change their opinion at will. By ſuch means are they acted upon; a ſufficient proof of their want of all religious principle. The marabous, or prieſts, and the men of their law, are no better than the reſt. "I have examined the character of ſeveral of this order of men (ſays M. Saugnier), and even among the nation of the Poules, who are conſidered as great fanatics, I diſcovered that they were only publicly attached to their opinions. 'This white man (ſay they) does ſo; he is better informed than I, and why ſhould not I imitate his example?' This way of reaſoning is common to all that tract of country.

The colony of Senegal is ſurrounded with iſlands, which, on account of the proximity of the ſea, are all more unhealthy than that on which the town is built. They are full of ſtanding pools, that, when dried up by the ſun, exhale a putrid vapour that carries mortality with it, and deſolates theſe iſlands. It is doubtleſs the ſame cauſe that takes off ſo many of the French at Senegal during the dangerous ſeaſon of the year. This alſo may be in part occaſioned by the bad quality of the water, which flows from the ponds in the neighbourhood of the colony, and though incorporated with that of the river, comes down little agitated by the current, and is eaſily diſtinguiſhed by a vapidneſs of taſte. This particular is, in my opinion, eſſentially worthy of notice, and if properly attended to by our medical men, might become the means of preſerving many lives.

Senegal River, ſee Niger. As ſo little is known reſpecting this river, which is one of the greateſt in Africa, any additional information muſt be intereſting. We ſhall therefore preſent our readers with the account contained in the communications preſented to the Aſſociation

Senegal, Seneka.

tion for promoting the diſcovery of the Interior Parts of Africa, which, as far as we know, is the lateſt and moſt authentic.

The river known to Europeans by the name of *Niger* or *Senegal* runs on the ſouth of the kingdom of Caſhna, in its courſe towards Tombuctou; and if the report which Ben Alli heard in that town may be credited it is afterwards loſt in the ſands on the ſouth of the country of Tombuctou. In the map (A), only the known part of its courſe is marked by a line; and the ſuppoſititious part by dots. It may be proper to obſerve, that the Africans have two names for this river; that is, *Neel il Abeed*, or river of the Negroes; and *Neel-il Kabeer*, or the great river. They alſo term the Nile (that is the Egyptian river) *Neel Shem*; ſo that the term *Neel*, from whence our Nile, is nothing more than the appellative of river; like Ganges, or Sinde.

Of this river the riſe and termination are unknown, but the courſe is from eaſt to weſt. So great is its rapidity, that no veſſel can aſcend its ſtream; and ſuch is the want of ſkill, or ſuch the abſence of commercial inducements among the nations who inhabit its borders, that even with the current, neither veſſels nor boats are ſeen to navigate. In one place, indeed, the traveller finds accommodations for the paſſage of himſelf and of his goods; but even there, tho' the ferrymen, by the indulgence of the ſultan of Caſhna, are exempted from all taxes, the boat which conveys the merchandiſes is nothing more than an ill-conſtructed raft; for the planks are faſtened to the timbers with ropes, and the ſeams are cloſed both within and without by a plaſter of tough clay, of which a large proviſion is always carried on the raft, for the purpoſe of excluding the ſtream wherever its entrance is obſerved.

The depth of the river at the place of paſſage, which is more than a hundred miles to the ſouth of the city of Caſhna, the capital of the empire of that name, is eſtimated at 23 or 24 feet Engliſh. Its depth is from 10 to 12 peeks, each of which is 27 inches.

Its width is ſuch, that even at the iſland of Gongoo, where the ferrymen reſide, the ſound of the loudeſt voice from the northern ſhore is ſcarcely heard; and at Tombuctou, where the name of *Gnewa*, or black, is given to the ſtream, the width is deſcribed as being about that of the Thames at Weſtminſter. In the rainy ſeaſon it ſwells above the banks and not only floods the adjacent lands, but often ſweeps before it the cattle and cottages of the ſhort-ſighted or too confident inhabitants.

That the people who live in the neighbourhood of the Niger ſhould refuſe to profit by its navigation, may juſtly ſurpriſe the traveller; but much greater is his aſtoniſhment, when he finds that even the food which the bounty of the ſtream would give, is uſeleſsly offered to their acceptance; for ſuch is the want of ſkill, or ſuch the ſettled diſlike of the people to this ſort of proviſion, that the fiſh with which the river abounds are left in undiſturbed poſſeſſion of its waters.

SENEKA, or SENEGA, *Rattleſnake-root*, *Milk-wort*, a medicinal plant. See POLYGALA.

SENESCHAL, (*Seneſchallus*), derived from the German *ſein* "a houſe or place," and *ſcale* "an officer," is a ſteward, and ſignifies one who has the diſpenſing of juſtice in ſome particular caſes: As the high ſeneſchal or ſteward of England; *ſeneſchal de la hotel de roi*, "ſteward of the king's houſehold, ſeneſchals or ſtewards of courts, &c." *Co. Lit.* 61. *Croke's Juriſd.* 102. *Kitch.* 38. See STEWARD. Seneſchal ‖ Sennaar.

SENNA, the leaf of the caſſia ſenna of Linnæus. See CASSIA.

Senna appears to have been cultivated in England in the time of Parkinſon (1640); and Miller tells us, that by keeping theſe plants in a hot-bed all the ſummer, he frequently had them in flower; but adds, it is very rarely that they perfect their ſeeds in England. There can be little doubt, however, but that ſome of the Britiſh poſſeſſions may be found well enough adapted to the growth of this vegetable, and that the patriotic views of the Society for encouraging Arts, &c. which has offered a reward to thoſe who ſucceed in the attempt, will be ultimately accompliſhed. *Woodville's Medical Botany.*

Senna, which is in common uſe as a purgative, was firſt known to the Arabian phyſicians Serapion and Meſue: the firſt among the Greeks who takes any notice of it is Actuarius, but he only ſpeaks of the fruit, and not of the leaves. To remove the diſagreeable taſte of this medicine, Dr Cullen recommends coriander ſeeds; and, for preventing the gripings with which it is ſometimes attended, he thinks the warmer aromatics, as cardamoms, or ginger, would be more effectual.

The *Senna Italica*, or blunt-leaved ſenna, is a variety of the Alexandrian ſpecies; which, by its cultivation in the ſouth of France (Provence), has been found to aſſume this change. It is leſs purgative than the pointed leaved ſenna, and is therefore to be given in larger doſes. It was employed as a cathartic by Dr Wright at Jamaica, where it grows on the ſand-banks near the ſea. *Lond. Med. Obſ. & Jour.* Vol. VIII.

SENNAAR, a country of Africa, bordering upon Abyſſinia, with the title of a kingdom; the preſent government of which was eſtabliſhed in the 16th century by a race of negroes named, in their own language, *Shillook*. This country, together with all the northern parts of Africa, had been overrun by the Saracens during the rapid conqueſts of the caliphs; but inſtead of erecting any diſtinct principalities here, as in other parts, they had incorporated themſelves with the old inhabitants called *Shepherds*, whom they found at their arrival; had converted them to their religion, and become one people with them. In 1504 the Shillook, a people before unknown, came from the weſtern banks of the river Bahiar el Abiad, which empties itſelf into the Nile, and conquered the country; allowing the Arabs, however, to retain their poſſeſſions on condition of paying them a certain tribute. Theſe founded the city of Sennaar, and have ever ſince continued to carry on an intercourſe with Egypt in the way of merchandiſe. At the eſtabliſhment of their monarchy the whole nation were Pagans, but ſoon after became converts to Mohammedaniſm, and took the name of *Funge*, an appellation ſignifying "lords or conquerors," and likewiſe

(A) The map alluded to is that which accompanies the volume which contains the proceedings of the Aſſociations. This work was printed in 1791.

Sennaar. wife free citizens. Mr Bruce, who paſſed through this country in his return from Abyſſinia, gives a liſt of 20 kings who have reigned in it ſince the conqueſt of the Shilluck.

This country is inhabited by a people ſo barbarous and brutiſh, that no hiſtory of them can be expected. One of the moſt remarkable of their cuſtoms is, that the king aſcends the throne with the expectation of being murdered whenever the general council of the nation thinks proper. The dreadful office of executioner belongs to one ſingle officer, ſtyled, in the language of the country, *Sid el Coom*; and who is always a relation of the monarch himſelf. It was from his regiſters that Mr Bruce took the liſt of the kings already mentioned, with the number of years they reigned, and which may therefore be received as authentic. The Sid el Coom in office at the time that Mr Bruce viſited this country was named Achmet, and was one of his beſt friends. He had murdered the late king, with three of his ſons, one of whom was an infant at its mother's breaſt; he was alſo in daily expectation of performing the ſame office to the reigning ſovereign. He was by no means reſerved concerning the nature of his office, but anſwered freely every queſtion that was put to him. When aſked by Mr Bruce why he murdered the king's young ſon in his father's preſence? he anſwered, that he did it from a principle of duty to the king himſelf, who had a right to ſee his ſon killed in a lawful and regular manner, which was by cutting his throat with a ſword, and not in a more painful or ignominious way, which the malice of his enemies might poſſibly have inflicted.

Bruce's Travels, Vol. IV.

The king, he ſaid, was very little concerned at the ſight of his ſon's death, but he was ſo very unwilling to die himſelf, that he often preſſed the executioner to let him eſcape; but finding his entreaties ineffectual, he ſubmitted at laſt without reſiſtance. On being aſked, whether he was not afraid of coming into the preſence of the king, conſidering the office he might poſſibly have to perform? he replied, that he was not in the leaſt afraid on this account: that it was his duty to be with the king every morning, and very late in the evening; that the king knew he would have no hand in promoting his death; but that, when the matter was abſolutely determined, the reſt was only an affair of decency; and it would undoubtedly be his own choice, rather to fall by the hand of his own relation in private than by a hired aſſaſſin, an Arab, or a Chriſtian ſlave, in the ſight of the populace. Baady the king's father, having the misfortune to be taken priſoner, was ſent to Atbara to Welled Haſſan the governor of that province to be put to death there. But the king, who was a ſtrong man, and always armed, kept ſo much upon his guard, that Welled could find no opportunity of killing him but by running him through the back with a lance as he was waſhing his hands. For this Welled himſelf was afterwards put to death; not on account of the murder itſelf, but becauſe, in the firſt place, he, who was not the proper executioner, had preſumed to put the king to death; and, in the next, becauſe he had done it with a lance, whereas the only lawful inſtrument was a ſword.

On the death of any of the ſovereigns of this country, his eldeſt ſon ſucceeds to the throne of courſe; on which as many of his brothers as can be found are apprehended, and put to death by the Sid el Coom in the manner already related. Women are excluded from the ſovereignty here as well as in Abyſſinia. The princeſſes of Sennaar, however, are worſe off than thoſe of Abyſſinia, having no ſettled income, nor being treated in any degree better than the daughters of private perſons. The king is obliged, once in his lifetime, to plough and ſow a piece of ground; whence he is named *Baady*, the "countryman or peaſant;" a title as common among the monarchs of Sennaar as Cæſar was among the Romans. The royal family were originally negroes; but as the kings frequently marry Arab women, the white colour of the mother is communicated to the child. This, we are told by Mr Bruce, is invariably the caſe when a negro man of Sennaar marries an Arab woman; and it holds equally good when an Arab man marries a negro woman; and he likewiſe informs us, that he never ſaw one black Arab all the time he was at Sennaar. Sennaar

The ſoil and climate of this country is extremely unfavourable both to man and beaſt. The men are ſtrong and remarkable for their ſize, but ſhort-lived; and there is ſuch a mortality among the children, that were it not for a conſtant importation of ſlaves, the metropolis would be depopulated. The ſhortneſs of their lives, however, may perhaps be accounted for, from their indulging themſelves from their infancy in every kind of exceſs. No horſe, mule, nor aſs, will live at Sennaar or for many miles round it. The caſe is the ſame with bullocks, ſheep, dogs, cats, and poultry; all of them muſt go to the ſands every half-year. It is difficult to account for this mortality; though Mr Bruce aſſures us it is the caſe everywhere about the metropolis of this country, where the ſoil is a fat earth, during the firſt ſeaſon of the rains. Two greyhounds which he brought along with him from Atbara, and the mules he brought from Abyſſinia, lived only a few weeks after their arrival at Sennaar. Several of the kings of Sennaar have tried to keep lions, but it was always found impoſſible to preſerve them alive after the rains. They will live, however, as well as other quadrupeds, in the ſands, at no great diſtance from the capital. No ſpecies of tree except the lemon flowers near the city; the cultivation of the roſe has often been attempted, but always without ſucceſs. In other reſpects, however, the ſoil of Sennaar is exceedingly fertile, being ſaid to yield 300 fold; but this is thought by Mr Bruce to be a great exaggeration. It is all ſown with dora or millet, which is the principal food of the people; wheat and rice are alſo produced here, which are ſold by the pound, even in years of plenty. The ſoil all round is ſtrongly impregnated with ſalt, ſo that a ſufficient quantity to ſerve the inhabitants is extracted from it.

Sennaar, a city of Africa, the capital of the kingdom of that name. It ſtands, according to Mr Bruce's obſervations, in N. Lat. 13° 34′ 36″ E. Long. 33° 30′ 30″, on the weſtern ſide of the Nile, and cloſe upon the banks of it; the ground on which it ſtands being juſt high enough to prevent the inundation. The town is very populous, and contains a great many houſes. In Poncet's time they were all of one ſtory; but now moſt of the officers have houſes of two ſtories high. They are built of clay mixed with a very little ſtraw, and have all flat roofs; which ſhows that the rains here

moſt

Sennaar. must be much leſs in quantity than to the ſouthward. During the time of Mr Bruce's reſidence here, however, there was one week of continual rain, and the Nile, after loud thunder and great darkneſs to the ſouth, increaſed violently; the whole ſtream being covered with the wrecks of houſes and their furniture; ſo that he ſuppoſed it had deſtroyed many villages to the ſouthward. About 12 miles to the north-weſt of Sennaar is a collection of villages named *Shaddly*, from a great ſaint of that name, who conſtructed ſeveral granaries here. Theſe are no other than large pits dug in the ground, and well plaſtered in the inſide with clay, then filled with grain when it is at its loweſt price, and afterwards covered up and plaſtered again at top: theſe pits they call *matamores*. On any proſpect of dearth they are opened, and the corn ſold to the people. About 24 miles north of Shaddly there is another ſet of granaries named *Wed-Aboud*, ſtill greater than Shaddly; and upon theſe two the ſubſiſtence of the Arabs principally depends: for as theſe people are at continual war with each other, and direct their fury rather againſt the crops than the perſons of their enemies, the whole of them would be unavoidably ſtarved, were it not for this extraordinary reſource. Small villages of ſoldiers are ſcattered up and down this country to guard the grain after it is ſown, which is only that ſpecies of millet named *Dora*; the ſoil, it is ſaid, being incapable of producing any other. There are great hollows made in the earth at proper diſtances throughout the country, which fill with water in the rainy ſeaſon, and are afterwards of great uſe to the Arabs as they paſs from the cultivated parts to the lands. The fly, which is ſuch a dreadful enemy to the cattle, is never ſeen to the northward of Shaddly.

To the weſtward of theſe granaries the country is quite full of trees as far as the river Abiad, or El-aice. In this extenſive plain there ariſe two ridges of mountains, one called *Jibbel Moira*, or the *Mountain of water*; the other *Jibbel Segud*, or the *Cold Mountain*. Both of them enjoy a fine climate, and ſerve for a protection to the farms about Shaddly and Aboud already mentioned. Here alſo are fortreſſes placed in the way of the Arabs, which ſerve to oblige them to pay tribute in their flight from the cultivated country, during the rains, to the dry lands of Atbara. Each of theſe diſtricts is governed by the deſcendant of their ancient and native princes, who long reſiſted all the power of the Arabs. Sacrifices of a horrid nature are ſaid to have been offered up on theſe mountains till about the year 1554, when one of the kings of Sennaar beſieged firſt one and then the other of the princes in their mountains; and having forced them to ſurrender, he faſtened a chain of gold to each of their ears, expoſed them in the market place at Sennaar, and ſold them for ſlaves at leſs than a farthing each. Soon after this they were circumciſed, converted to the Mahometan religion, and reſtored to their kingdoms.

ol IV. 475.

"Nothing (ſays Mr Bruce) is more pleaſant than the country around Sennaar in the end of Auguſt and beginning of September. The grain, being now ſprung up, makes the whole of this immenſe plain appear a level green land, interſperſed with great lakes of water, and ornamented at certain intervals with groups of villages; the conical tops of the houſes preſenting at a diſtance the appearance of ſmall encampments. Through this very extenſive plain winds the Nile, a delightful river there, above a mile broad, full to the very brim, but never overflowing. Everywhere on theſe banks are ſeen herds of the moſt beautiful cattle of various kinds. The banks of the Nile about Sennaar reſemble the pleaſanteſt part of Holland in the ſummer ſeaſon; but ſoon after, when the rains ceaſe, and the ſun exerts its utmoſt influence, the dora begins to ripen, the leaves to turn yellow and to rot, the lakes to putrefy, ſmell, become full of vermine, and all its beauty ſuddenly diſappears: bare ſcorched Nubia returns, and all its terrors of poiſonous winds and moving ſands, glowing and ventilated with ſultry blaſts, which are followed by a troop of terrible attendants; epilepſies, apoplexies, violent fevers, obſtinate agues, and lingering painful dyſenteries, ſtill more obſtinate and mortal. Sennaar.

"War and treaſon ſeem to be the only employment of this horrid people, whom Heaven has ſeparated by almoſt impaſſable deſerts from the reſt of mankind; confining them to an accurſed ſpot, ſeemingly to give them an earneſt in time of the only other curſe which he has reſerved to them for an eternal hereafter."

With regard to the climate of the country round Sennaar, Mr Bruce has ſeveral very curious obſervations. The thermometer riſes in the ſhade to 119 degrees; but the degree indicated by this inſtrument does not at all correſpond with the ſenſations occaſioned by it; nor with the colour of the people who live under it. "Nations of blacks (ſays he) live within latitude 13 and 14 degrees; about 10 degrees ſouth of them, nearly under the line, all the people are white, as we had an opportunity of obſerving daily in the Galla Sennaar, which is in latitude 13 degrees, and is hotter by the thermometer 50 degrees, when the ſun is moſt diſtant from it, than Gondar, which is a degree farther ſouth, when the ſun is vertical. Cold and hot (ſays our author) are terms merely relative, not determined by the latitude, but elevation of the place. When, therefore, we ſay *hot*, ſome other explanation is neceſſary concerning the place where we are, in order to give an adequate idea of the ſenſations of that heat upon the body, and the effects of it upon the lungs. The degree of the thermometer conveys this but very imperfectly; 90 degrees is exceſſively hot at Loheia in Arabia Felix; and yet the latitude of Loheia is but 15 degrees; whereas 90 degrees at Sennaar is only warm as to ſenſe; though Sennaar, as we have already ſaid, is in latitude 13 degrees.

"At Sennaar, then, I call it *cold*, when one fully clothed and at reſt feels himſelf in want of fire. I call it *cool*, when one fully clothed and at reſt feels he could bear more covering all over, or in part, than he has at that time. It call it *temperate*, when a man ſo clothed, and at reſt, feels no ſuch want, and can take moderate exerciſe, ſuch as walking about a room without ſweating. I call it *warm*, when a man, ſo clothed, does not ſweat when at reſt; but, upon taking moderate exerciſe, ſweats, and again cools. I call it *hot*, when a man at reſt, or with moderate excerciſe, ſweats exceſſively. I call it *very hot*, when a man with thin, or little clothing, ſweats much, though at reſt. I call it *exceſſive hot*, when a man, in his ſhirt and at reſt, ſweats exceſſively, when all motion is painful, and the knees feel feeble, as if after a fever. I call it *extreme hot*, when the ſtrength fails, a diſpoſition to faint comes on, a ſtraitneſs is found

in

Sennaar. on the temples, as if a ſmall cord was drawn tight about the head, the voice impaired, the ſkin dry, and the head ſeems more than ordinarily large and light. This, I apprehend, denotes death at hand; but this is rarely or never effected by the ſun alone, without the addition of that poiſonous wind which purſued us through Atbara, where it has, no doubt, contributed to the total extinction of every thing that hath the breath of life. A thermometer, graduated upon this ſcale, would exhibit a figure very different from the common one; for I am convinced by experiment, that a web of the fineſt muſlin, wrapt round the body at Sennaar, will occaſion at mid-day a greater ſenſation of heat in the body, than a riſe of 5 degrees in the thermometer of Fahrenheit.

"At Sennaar, from 70 to 78 degrees of Fahrenheit's thermometer is cool; from 79 to 92 temperate; at 92 degrees begins warmth. Although the degree of the thermometer marks a greater heat than is felt by the bodies of us ſtrangers, it ſeems to me that the ſenſations of the natives bear ſtill a leſs proportion to that degree than ours. On the 2d of Auguſt, while I was lying perfectly enervated on a carpet in a room deluged with water at 12 o'clock, the thermometer at 116, I ſaw ſeveral black labourers pulling down a houſe, working with great vigour, without any ſymptoms of being incommoded."

The dreſs of the people of Sennaar conſiſts only of a long ſhirt of blue cloth, which wraps them up from the under part of the neck to the feet. It does not, however, conceal the neck in the men, though it does in the women. The men ſometimes have a ſaſh tied about their middle; and both men and women go barefooted in the houſes, whatever their rank may be. The floors of their apartments, eſpecially thoſe of the women, are covered with Perſian carpets. Both men and women anoint themſelves, at leaſt once a-day, with camel's greaſe mixed with civet, which, they imagine, ſoftens their ſkins, and preſerves them from cutaneous eruptions; of which they are ſo fearful, that they confine themſelves to the houſe if they obſerve the ſmalleſt pimple on their ſkins. With the ſame view of preſerving their ſkins, though they have a clean ſhirt every day, they ſleep with a greaſed one at night, having no other covering but this. Their bed is a tanned bull's hide, which this conſtant greaſing ſoftens very much; it is alſo very cool, though it gives a ſmell to their bodies from which they cannot be freed by any waſhing.

Our author gives a very curious deſcription of the queens and ladies of the court at Sennaar. He had acceſs to them as a phyſician, and was permitted to pay his viſit alone. He was firſt ſhown into a large ſquare apartment, where there were about 50 black women, all quite naked excepting a very narrow piece of cotton rag about their waiſts. As he was muſing whether theſe were all queens, one of them took him by the hand, and led him into another apartment much better lighted than the former. Here he ſaw three women ſitting upon a bench or ſofa covered with blue Surat cloth; they themſelves being clothed from the neck to the feet with cotton ſhirts of the ſame colour. Theſe were three of the king's wives; his favourite, who was one of the number, appeared to be about ſix feet high, and ſo corpulent that our traveller imagined her to be the largeſt creature he had ſeen next to the elephant and rhinoceros. Her features perfectly reſembled thoſe of a negro: a ring of gold paſſed through her under lip, and weighed it down, till, like a flap, it covered her chin, leaving her teeth bare, which were ſmall and very fine. The inſide of her lip was made black with antimony. Her ears reached down to her ſhoulders, and had the appearance of wings: there was a gold ring in each of them about five inches in diameter, and ſomewhat ſmaller than a man's little finger; the weight of which had drawn down the hole where her ear was pierced ſo much that three fingers might eaſily paſs above the ring. She had a gold necklace like that called *Eſclavage*, of ſeveral rows, one below another; to which were hung rows of ſequins pierced. She had two manacles of gold upon her ancles larger than thoſe uſed for chaining felons. Our author could not imagine how it was poſſible for her to walk with them, till he was informed that they were hollow. The others were dreſſed much in the ſame manner; only there was one who had chains coming from her ears to the outſide of each noſtril, where they were faſtened. A ring was alſo put through the griſtle of her noſe, and which hung down to the opening of her mouth; having all together ſomething of the appearance of a horſe's bridle; and Mr Bruce thinks that ſhe muſt have breathed with difficulty.

The poorer ſort of the people of Sennaar live upon the flour or bread of millet; the rich make puddings of this, toaſting the flour before the fire, and putting milk and butter into it; beſides which they uſe beef partly roaſted and partly raw. They have very fine and fat horned cattle, but the meat commonly ſold in the market is camel's fleſh. The liver and ſpare rib of this animal are always eaten raw; nor did our author ſee one inſtance to the contrary all the time he was in the country. Hog's fleſh is not ſold in the market; but all the common people of Sennaar eat it openly; thoſe in office, who pretend to be Mahometans, doing the ſame in ſecret.

There are no manufactures in this country, and the principal article of trade is blue Surat cloth. In former times, when caravans could paſs with ſafety, Indian goods were brought in quantities from Jidda to Sennaar, and then diſperſed over the country of the blacks. The returns were made in gold, a powder called *Tibbar*, civet, rhinoceroſes horns, ivory, oſtrich feathers, and above all ſtaves or glaſs, more of theſe being exported from Sennaar than from all the eaſt of Africa. This trade, however, as well as that of the gold and ivory, is almoſt deſtroyed; though the gold is ſtill reputed to be the beſt and pureſt in Africa, and is therefore bought at Mocha to be carried to India, where it all centres at laſt.

SENNERTUS (Daniel), an eminent phyſician, was born in 1572 at Breſlau; and in 1593 he was ſent to Wittemberg, where he made great progreſs in philoſophy and phyſic. He viſited the univerſities of Leipſic, Jena, Francfort upon the Oder, and Berlin; but ſoon returned to Wittemberg, where he was promoted to the degree of doctor of phyſic, and ſoon after to a profeſſorſhip in the ſame faculty. He was the firſt who introduced the ſtudy of chemiſtry into that univerſity; he gained a great reputation by his works and practice, and was very generous to the poor. He died of the plague at Wittemberg, in 1637. He raiſed himſelf

enemies by contradicting the ancients. He thought the ſeed of all living creatures animated, and that the ſoul of this ſeed produces organization. He was accuſed of impiety for aſſerting that the ſouls of beaſts are not material; for this was affirmed to be the ſame thing with aſſerting that they are immortal; but he rejected this conſequence, as he well might do. See METAPHYSICS, Part III. Chap. VI.

SENONES, (anc. geog.), a people of Gallia Celtica, ſituated on the Sequana to the ſouth of the Pariſii, near the confluence of the Jeauna or Yonne with the above-mentioned river. Their moſt conſiderable exploit was their invaſion of Italy, and taking and burning ROME, as related under that article. This was done by a colony of them long before tranſported into Italy, and ſettled on the Adriatic. Their capital, Agendicum in Gaul, was in the lower age called *Senones*, now *Sens*. In Italy the Senones extended themſelves as far as the river Aeſis; but were afterwards driven beyond the Rubicon, which became the boundary of Gallia Ciſalpina, (Polybius, Strabo.)

SENSATION, in philoſophy, the perception of external objects by means of the ſenſes. See METAPHYSICS, Part I. Chap. I.

SENSE, a faculty of the ſoul whereby it perceives external objects by means of the impreſſions they make on certain organs of the body. See METAPHYSICS, Part I. and ANATOMY, N° 137. &c.

Common SENSE, is a term that has been variouſly uſed both by ancient and modern writers. With ſome it has been ſynonymous with public ſenſe; with others it has denoted prudence; in certain inſtances, it has been confounded with ſome of the powers of taſte; and, accordingly, thoſe who commit egregious blunders with regard to decorum, ſaying and doing what is offenſive to their company, and inconſiſtent with their own character, have been charged with a defect in common ſenſe. Some men are diſtinguiſhed by an uncommon acuteneſs in diſcovering the characters of others; and this talent has been ſometimes called *common ſenſe*; ſimilar to which is that uſe of the term, which makes it to ſignify that experience and knowledge of life which is acquired by living in ſociety. To this meaning Quintilian refers, ſpeaking of the advantages of a public education: *Senſum ipſum qui communis dicitur, ubi diſcet, cum ſe à congreſſu, qui non hominibus ſolum, ſed mutis quoque animalibus naturalis eſt, ſegregarit?* Lib. I. cap. 2.

But the term *common ſenſe* hath in modern times been uſed to ſignify that power of the mind which perceives truth, or commands belief, not by progreſſive argumentation, but by an inſtantaneous, inſtinctive, and irreſiſtible impulſe; derived neither from education nor from habit, but from nature; acting independently of our will, whenever its object is preſented, according to an eſtabliſhed law, and therefore called *ſenſe*; and acting in a ſimilar manner upon all, or at leaſt upon a great majority of mankind, and therefore called *common ſenſe*. See METAPHYSICS, N° 127.

Moral SENSE, is a determination of the mind to be pleaſed with the contemplation of thoſe affections, actions, or characters, of rational agents, which we call *good* or *virtuous*.

This moral ſenſe of beauty in actions and affections may appear ſtrange at firſt view: ſome of our moraliſts themſelves are offended at it in Lord Shaftesbury, as being accuſtomed to deduce every approbation or averſion from rational views of intereſt. It is certain that his lordſhip has carried the influence of the moral ſenſe very far, and ſome of his followers have carried it farther. The advocates for the ſelfiſh ſyſtem ſeem to drive their opinions to the oppoſite extreme, and we have elſewhere endeavoured to ſhow that the truth lies between the contending parties. See MORAL PHILOSOPHY, N° 27—32.

Public SENSE is defined by the noble author of the Characteriſtics to be an innate propenſity to be pleaſed with the happineſs of others, and to be uneaſy at their miſery. It is found, he ſays, in a greater or leſs degree in all men, and was ſometimes called *κοινοσημια*, or *ſenſus communis*, by ancient writers.

Of the reality of this public ſenſe we have great doubts. The conduct of ſavages, who are more under the influence of original inſtinct than civilized men, gives no countenance to it. Their affections ſeem all to be ſelfiſh, or at leaſt to ſpring from ſelf-love variouſly modified. For the happineſs of their wives they have very little regard, conſidering them merely as inſtruments of their own pleaſure, and valuing them for nothing elſe. Hence they make them toil, while they themſelves indulge in liſtleſs idleneſs. To their children we believe they exhibit ſtrong ſymptoms of attachment, as ſoon as they derive aſſiſtance from them in war, or in the buſineſs of the chaſe; but during the helpleſs years of infancy, the child is left by the ſelfiſh father wholly to the care and protection of its wretched mother; who, impelled by the *ſtorgé* of all females to their young, cheriſhes her offſpring with great fondneſs.—The ſavage is, indeed, ſuſceptible of ſtrong attachments, ſimilar to that which we call friendſhip; but ſuch attachments are no proofs of diſintereſted benevolence, or what his lordſhip calls the *public ſenſe*. Two barbarous heroes are probably firſt linked together by the obſervation of each other's proweſs in war, or their ſkill in purſuing their game; for ſuch obſervation cannot fail to ſhow them that they may be uſeful to one another; and we have elſewhere ſhown how real friendſhip may ſpring from ſentiments originally ſelfiſh. The ſavage is very much attached to his horde or tribe, and this attachment reſembles patriotiſm: but patriotiſm itſelf is not a ſentiment of pure benevolence delighting in the happineſs of others, and grieving at their miſery: for the patriot prefers his own country to all others, and is not very ſcrupulous with reſpect to the rectitude of the means by which he promotes its intereſt, or depreſſes its rivals. The ſavage purſues with relentleſs rigour the enemies of himſelf or of the tribe to which he belongs; ſhows no mercy to them when in his power, but puts them to the cruelleſt death, and carries their ſcalps to the leader of his party. Theſe facts, which cannot be controverted, are perfectly irreconcileable with innate benevolence, or a public ſenſe comprehending the whole race of men; and ſhow the truth of that theory by which we have in another place endeavoured to account for all the paſſions, ſocial as well as ſelfiſh. See PASSION.

SENSIBLE NOTE, in muſic, is that which conſtitutes a third major above the dominant, and a ſemi-

tone

Senſibility. tone beneath the tonic. *Si*, or B, is the ſenſible note in the tone of *ut* or C *ſol* ♯; or G ſharp, in the tone of *la* or A.

They call it the *ſenſible note* on this account, that it cauſes to be perceived the tone or natural ſeries of the key and the tonic itſelf; upon which, after the chord of the dominant, the ſenſible note taking the ſhorteſt road, is under a neceſſity of riſing: which has made ſome authors treat this ſenſible note as a major diſſonance, for want of obſerving, that diſſonance, being a relation, cannot be conſtituted unleſs by two notes between which it ſubſiſts.

It is not meant that the ſenſible note is the ſeventh of the tone, becauſe, in the minor mode, this ſeventh cannot be a ſenſible note but in aſcending; for, in deſcending, it is at the diſtance of a full note from the tonic, and of a third minor from the dominant.

SENSIBILITY, is a nice and delicate perception of pleaſure or pain, beauty or deformity. It is very nearly allied to taſte; and, as far as it is natural, ſeems to depend upon the organization of the nervous ſyſtem. It is capable, however, of cultivation, and is experienced in a much higher degree in civilized than in ſavage nations, and among perſons liberally educated than among boors and illiterate mechanics. The man who has cultivated any of the fine arts has a much quicker and more exquiſite perception of beauty and deformity in the execution of that art, than another of equal or even greater natural powers, who has but caſually inſpected its productions. He who has been long accuſtomed to that decorum of manners which characterizes the polite part of the world, perceives almoſt inſtantaneouſly the ſmalleſt deviation from it, and feels himſelf almoſt as much hurt by behaviour harmleſs in itſelf, as by the groſſeſt rudeneſs; and the man who has long proceeded ſteadily in the paths of virtue, and often painted to himſelf the deformity of vice, and the miſeries of which it is productive, is more quickly alarmed at any deviation from rectitude, than another who, though his life has been ſtained by no crime, has yet thought leſs upon the principles of virtue and conſequences of vice.

Every thing which can be called ſenſibility, and is not born with man, may be reſolved into aſſociation, and is to be regulated accordingly; for ſenſibilities may be acquired which are inimical to happineſs and to the practice of virtue. The man is not to be envied who has ſo accuſtomed himſelf to the forms of polite addreſs as to be hurt by the unaffected language and manners of the honeſt peaſant, with whom he may have occaſion to tranſact buſineſs; nor is he likely to acquire much uſeful knowledge who has ſo ſedulouſly ſtudied the beauties of compoſition as to be unable to read without diſguſt a book of ſcience or of hiſtory, of which the ſtyle comes not up to his ſtandard of perfection. That ſenſibility which we either have from nature, or neceſſarily acquire, of the miſeries of others, is of the greateſt uſe when properly regulated, as it powerfully impels us to relieve their diſtreſs; but if it by any means become ſo exquiſite as to make us ſhun the ſight of miſery, it counteracts the end for which it was implanted in our nature, and only deprives us of happineſs, while it contributes nothing to the good of others. Indeed there is reaſon to believe that all ſuch extreme ſenſibilities are ſelfiſh affectations, employed as apologies for withholding from the miſerable that relief which it is in our power to give; for there is not a fact better eſtabliſhed in the ſcience of human nature; than that paſſive perceptions grow gradually weaker by repetition, while active habits daily acquire ſtrength. Senſi-bi-li-ty.

It is of great importance to a literary man to cultivate his taſte, becauſe it is the ſource of much elegant and refined pleaſure, (ſee TASTE); but there is a degree of faſtidiouſneſs which renders that pleaſure impoſſible to be obtained, and is the certain indication of expiring letters. It is neceſſary to ſubmit to the artificial rules of politeneſs, for they tend to promote the peace and harmony of ſociety, and are ſometimes a uſeful ſubſtitute for moral virtue; but he who with reſpect to them has ſo much ſenſibility as to be diſguſted with all whoſe manners are not equally poliſhed with his own, is a very troubleſome member of ſociety. It is every man's duty to cultivate his moral ſenſibilities, ſo as to make them ſubſervient to the purpoſes for which they were given to him; but if he either feel, or pretend to feel, the miſeries of others to ſo exquiſite a degree as to be unable to afford them the relief which they have a right to expect, his ſenſibilities are of no good tendency.

That the man of true ſenſibility has more pains and more pleaſures than the callous wretch, is univerſally admitted, as well as that his enjoyments and ſufferings are more exquiſite in their kinds; and as no man lives for himſelf alone, no man will acknowledge his want of ſenſibility, or expreſs a wiſh that his heart were callous. It is, however, a matter of ſome moment to diſtinguiſh real ſenſibilities from ridiculous affectations, thoſe which tend to increaſe the ſum of human happineſs from ſuch as have a contrary tendency; and to cultivate them all in ſuch a manner as to make them anſwer the ends for which they were implanted in us by the beneficent Author of nature. This can be done only by watching over them as over other aſſociations, (ſee METAPHYSICS, N° 98.); for exceſſive ſenſibility, as it is not the gift of nature, is the bane of human happineſs. "Too much tenderneſs (as Rouſſeau well obſerves) proves the bittereſt curſe inſtead of the moſt fruitful bleſſing; vexation and diſappointment are its certain conſequences. The temperature of the air, the change of the ſeaſons, the brilliancy of the ſun, or thickneſs of the fogs, are ſo many moving ſprings to the unhappy poſſeſſor, and he becomes the wanton ſport of their arbitration."

SENSITIVE PLANT. See MIMOSA, DIONÆA, and HEDYSARUM.

The ſenſitive plants are well known to poſſeſs a kind of motion, by which the leaves and ſtalks are contracted and fall down upon being ſlightly touched, or ſhaken with ſome degree of violence.

The contraction of the leaves and branches of the ſenſitive plant when touched, is a very ſingular phenomenon. Different hypotheſes have been formed by botaniſts in order to explain it; but we are diſpoſed to believe that theſe have generally been deduced rather from analogical reaſoning than from a collection of facts and obſervation. We ſhall therefore give an account of all the important facts which we have been able to collect upon this curious ſubject; and then draw ſuch concluſions as obviouſly reſult from them, without, however attempting to ſupport any old, or to eſtabliſh a new, hypotheſis.

1. It is difficult to touch the leaf of a healthy ſenſitive plant ſo delicately that it will not immediately collapſe

Senſitive. lapſe (A), the foliola or little leaves moving at their baſe till they come into contact, and then applying themſelves cloſe together. If the leaf be touched with a little more force, the oppoſite leaf will exhibit the ſame appearance. If a little more force be applied, the partial footſtalks bend down towards the common footſtalk from which they iſſue, making with it a more acute angle than before. If the touch be more violent ſtill, all the leaves ſituated on the ſame ſide with the one that has been touched will inſtantly collapſe, and the partial footſtalk will approach the common footſtalk to which it is attached, in the ſame manner as the partial footſtalk of the leaf approaches the ſtem or branch from which it iſſues; ſo that the whole plant, from having its branches extended, will immediately appear like a weeping birch.

2. Theſe motions of the plant are performed by means of three diſtinct and ſenſible articulations. The firſt, that of the foliola or lobes to the partial footſtalk; the ſecond, that of the partial footſtalk to the common one; the third, that of the common footſtalk to the trunk. The primary motion of all which is the cloſing of the leaf upon the partial footſtalk, which is performed in a ſimilar manner, and by a ſimilar articulation. This, however, is much leſs viſible than the others. Theſe motions are wholly independent on one another, as may be proved by experiment. It appears that if the partial footſtalks are moved, and collapſe toward the petioli, or theſe toward the trunk, the little leaves, whoſe motion is uſually primary to theſe, ſhould be affected alſo; yet experiment proves that it is poſſible to touch the footſtalks in ſuch a manner as to affect them only, and make them apply themſelves to the trunk, while the leaves feel nothing of the touch; but this cannot be, unleſs the footſtalks are ſo diſpoſed as that they can fall to the trunk, without ſuffering their leaves to touch any part of the plant in their paſſage, becauſe, if they do, they are immediately affected.

3. Winds and heavy rains make the leaves of the ſenſitive plant contract and cloſe; but no ſuch effect is produced from ſlight ſhowers.

4. At night, or when expoſed to much cold in the day, the leaves meet and cloſe in the ſame manner as when touched, folding their upper ſurfaces together, and in part over each other, like ſcales or tiles, ſo as to expoſe as little as poſſible of the upper ſurface to the air. The oppoſite ſides of the leaves (foliola) do not come cloſe together in the night, for when touched they apply themſelves cloſer together. Dr Darwin kept a ſenſitive plant in a dark place for ſome hours after daybreak; the leaves and footſtalks were collapſed as in its moſt profound ſleep; and, on expoſing it to the light, above 20 minutes paſſed before it was expanded.

5. In the month of Auguſt, a ſenſitive plant was carried in a pot out of its uſual place into a dark cave, the motion that it received in the carriage ſhut up its leaves, and they did not open till 24 hours afterwards; at this time they became moderately open, but were afterwards ſubject to no changes at night or morning, but remained three days and nights with their leaves in the ſame moderately open ſtate. At the end of this time they were brought out again into the air, and there recovered their natural periodical motions, ſhutting every night, and opening every morning, as naturally and as ſtrongly as if the plant had not been in this forced ſtate; and while in the cave, it was obſerved to be very little leſs affected with the touch than when abroad in the open air. Senſitive.

6. The great heats of ſummer, when there is open ſunſhine at noon, affect the plant in ſome degree like cold, cauſing it to ſhut up its leaves a little, but never in any very great degree. The plant, however, is leaſt of all affected about nine o'clock in the morning, and that is conſequently the propereſt time to make experiments on it. A branch of the ſenſitive plant cut off, and laid by, retains yet its property of ſhutting up and opening in the morning for ſome days; and it holds it longer if kept with one end in water, than if left to dry more ſuddenly.

7. The leaves only of the ſenſitive plant ſhut up in the night, not the branches: and if it be touched at this time, the branches are affected in the ſame manner as in the day, ſhutting up, or approaching to the ſtalk or trunk, in the ſame manner, and often with more force. It is of no conſequence what the ſubſtance is with which the plant is touched, it anſwers alike to all; but there may be obſerved a little ſpot, diſtinguiſhable by its paler colour in the articulations of its leaves, where the greateſt and niceſt ſenſibility is evidently placed.

8. Duhamel having obſerved, about the 15th of September, in moderate weather, the natural motion of a branch of a ſenſitive plant, remarked, that at nine in the morning it formed with the ſtem an angle of 100 degrees; at noon, 112 degrees; at three afternoon, it returned to 100; and after touching the branch, the angle was reduced to 90. Three quarters of an hour after it had mounted to 112; and, at eight at night, it deſcended again, without being touched, to 90. The day after, in finer weather, the ſame branch, at eight in the morning, made an angle of 135 degrees with the ſtem; after being touched, the angle was diminiſhed to 80; an hour after, it roſe again to 135; being touched a ſecond time, it deſcended again to 80; an hour and a half after, it had riſen to 145; and upon being touched a third time, deſcended to 135; and remained in that poſition till five o'clock in the afternoon, when being touched a fourth time it fell to 110.

9. The parts of the plants which have collapſed afterwards unfold themſelves, and return to their former expanded ſtate. The time required for that purpoſe varies, according to the vigour of the plant, the ſeaſon of the year, the hour of the day, the ſtate of the atmoſphere. Sometimes half an hour is requiſite, ſometimes only ten minutes. The order in which the parts recover themſelves varies in like manner: ſometimes it is the common footſtalk; ſometimes the rib to which

(A) As the nature of the ſenſitive plant is curious, we wiſh to make the deſcription of it intelligible to thoſe who are not acquainted with the technical language of botany. We have therefore uſed the word *leaf* inſtead of *foliolum*, or lobe.

Senſitive. the leaves are attached; and ſometimes the leaves themſelves are expanded, before the other parts have made any attempt to be reinſtated in their former poſition.

10. If, without ſhaking the other ſmaller leaves, we cut off the half of a leaf or lobe belonging to the laſt pair at the extremity or ſummit of a wing, the leaf cut, and its antagoniſt, that is to ſay, the firſt pair, begin to approach each other; then the ſecond, and ſo on ſucceſſively, till all the leſſer leaves, or lobes of that wing, have collapſed in like manner. Frequently, after 12 or 15 ſeconds, the lobes of the other wings, which were not immediately affected by the ſtroke, ſhut; whilſt the ſtalk and its wing, beginning at the bottom, and proceeding in order to the top, gradually recover themſelves. If, inſtead of one of the leſſer extreme leaves, we cut off one belonging to the pair that is next the footſtalk its antagoniſt ſhuts, as do the other pairs ſucceſſively, from the bottom to the top. If all the leaves of one ſide of a wing be cut off, the oppoſite leaves are not affected, but remain expanded. With ſome addreſs, it is poſſible even to cut off a branch without hurting the leaves, or making them fall. The common footſtalk of the winged leaves being cut as far as three-fourths of its diameter, all the parts which hang down collapſe, but quickly recover without appearing to have ſuffered any conſiderable violence by the ſhock. An inciſion being made into one of the principal branches to the depth of one-half the diameter, the branches ſituated betwixt the ſection and the root will fall down; thoſe above the inciſion remain as before, and the leſſer leaves continue open; but this direction is ſoon deſtroyed, by cutting off one of the lobes at the extremity, as was obſerved above. Laſtly, A whole wing being cut off with precaution near its inſertion into the common footſtalk, the other wings are not affected by it, and its own lobes do not ſhut. No motion enſues from piercing the branch with a needle or other ſharp inſtrument.

11. If the end of one of the leaves be burned with the flame of a candle, or by a burning glaſs, or by touching it with hot iron, it cloſes up in a moment, and the oppoſite leaf does the ſame, and after that the whole ſeries of leaves on each ſide of the partial or little footſtalk; then the footſtalk itſelf; then the branch or common footſtalk; all do the ſame, if the burning has been in a ſufficient degree. This proves that there is a very nice communication between all the parts of the plant, by means of which the burning, which only is applied to the extremity of one leaf, diffuſes its influence through every part of the ſhrub. If a drop of aquafortis be carefully laid upon a leaf of the ſenſitive plant, ſo as not to ſhake it in the leaſt, the leaf does not begin to move till the acrid liquor corrodes the ſubſtance of it: but at that time, not only that particular leaf, but all the leaves placed on the ſame footſtalk, cloſe themſelves up. The vapour of burning ſulphur has alſo this effect on many leaves at once, according as they are more or leſs expoſed to it; but a bottle of very acrid and ſulphureous ſpirit of vitriol, placed under the branches unſtopped, produces no ſuch effect. Wetting the leaves with ſpirit of wine has been obſerved alſo to have no effect, nor the rubbing oil of almonds over them; though this laſt application deſtroys many plants.

From the preceding experiments the following concluſions may be fairly drawn: 1. The contraction of Senſitive. the parts of the ſenſitive plant is occaſioned by an external force, and the contraction is in proportion to the force. 2. All bodies which can exert any force affect the ſenſitive plant; ſome by the touch or by agitation, as the wind, rain, &c.; ſome by chemical influence, as heat and cold. 3. Touching or agitating the plant produces a greater effect than an inciſion or cutting off a part, or by applying heat or cold.

Attempts have been made to explain theſe curious phenomena. Dr Darwin, in the notes to his admired poem, entitled, *The Botanic Garden*, lays it down as a principle, that "the ſleep of animals conſiſts in a ſuſpenſion of voluntary motion; and as vegetables are ſubject to ſleep as well as animals, there is reaſon to conclude (ſays he) that the various action of cloſing their petals and foliage may be juſtly aſcribed to a voluntary power; for without the faculty of volition ſleep would not have been neceſſary to them." Whether this definition of ſleep when applied to animals be juſt, we ſhall not inquire; but it is evident the ſuppoſed analogy between the ſleep of animals and the ſleep of plants has led Dr Darwin to admit this aſtoniſhing concluſion, that plants have volition. As volition preſuppoſes a mind or ſoul, it were to be wiſhed that he had given us ſome information concerning the nature of a vegetable ſoul, which can think and will. We ſuſpect, however, that this vegetable ſoul will turn out to be a mere mechanical or chemical one; for it is affected by external forces uniformly in the ſame way, its volition is merely paſſive, and never makes any ſucceſsful reſiſtance againſt thoſe cauſes by which it is influenced. All this is a mere abuſe of words. The ſleep of plants is a metaphorical expreſſion, and has not the leaſt reſemblance to the ſleep of animals. Plants are ſaid to ſleep when the flowers or leaves are contracted and folded together; but we never heard that there is any ſimilar contraction in the body of an animal during ſleep.

The fibres of vegetables have been compared with the muſcles of animals, and the motions of the ſenſitive plant have been ſuppoſed the ſame with muſcular motion. Between the fibres of vegetables and the muſcles of animals, however, there is not the leaſt ſimilarity. If muſcles be cut through, ſo as to be ſeparated from the joints to which they are attached, their powers are completely deſtroyed; but this is not the caſe with vegetable fibres. The following very ingenious experiment which was communicated to us by a reſpectable member of the Univerſity of Edinburgh, is deciſive on this ſubject. He ſelected a growing poppy at that period of its growth, before unfolding, when the head and neck are bent down almoſt double. He cut the ſtalk where it was curved half through on the under ſide, and half through at a ſmall diſtance on the upper ſide, and half through in the middle point between the two ſections, ſo that the ends of the fibres were ſeparated from the ſtalk. Notwithſtanding theſe ſeveral cuttings on the neck, the poppy raiſed its head, and aſſumed a more erect poſition. There is, therefore, a complete diſtinction between muſcular motion and the motions of a plant, for no motion can take place in the limb of an animal when the muſcles of that limb are cut.

In fine, we look upon all attempts to explain the motions of plants as abſurd, and all reaſoning from ſuppoſed analogy between animals and vegetables as the

ſource

ntente
ntiment.

ource of wild conjecture, and not of ſound philoſophy. We view the contraction and expanſion of the ſenſitive plant in the ſame light as we do gravitation, chemical attraction, electricity, and magnetiſm, as a ſingular fact, the circumſtances of which we may be fully acquainted with, but muſt deſpair of underſtanding its cauſe.

What has been ſaid under this article chiefly refers to the *mimoſa ſenſitiva* and *pudica*. For a full account of the motions of vegetables in general, ſee *Vegetable Motion*, under the article MOTION.

SENTENCE, in law, a judgment paſſed in court by the judge in ſome proceſs, either civil or criminal. See JUDGMENT.

SENTENCE, in grammar, denotes a period; or a ſet of words comprehending ſome perfect ſenſe or ſentiment of the mind. The buſineſs of pointing is to diſtinguiſh the ſeveral parts and members of ſentences, ſo as to render the ſenſe thereof as clear, diſtinct, and full as poſſible. See PUNCTUATION.

In every ſentence there are two parts neceſſarily required; a noun for the ſubject, and a definitive verb: whatever is found more than theſe two, affects one of them, either immediately, or by the intervention of ſome other, whereby the firſt is affected.

Again, Every ſentence is either ſimple or compound: a ſimple ſentence is that conſiſting of one ſingle ſubject, and one finite verb.—A compound ſentence contains ſeveral ſubjects and finite verbs, either expreſsly or implicitly.

A ſimple ſentence needs no point or diſtinction; only a period to cloſe it: as, "A good man loves virtue for itſelf."—In ſuch a ſentence, the ſeveral adjuncts affect either the ſubject or the verb in a different manner. Thus the word *good* expreſſes the quality of the ſubject, *virtue* the object of the action, and *for itſelf* the end thereof.—Now none of theſe adjuncts can be ſeparated from the reſt of the ſentence: for if one be, why ſhould not all the reſt? and if all be, the ſentence will be minced into almoſt as many parts as there are words.

But if ſeveral adjuncts be attributed in the ſame manner either to the ſubject or the verb, the ſentence becomes compound, and is to be divided into parts.

In every compound ſentence, as many ſubjects, or as many finite verbs as there are, either expreſsly or implied, ſo many diſtinctions may there be. Thus; "My hopes, fears, joys, pains, all centre in you." And thus *Catilina abiit, exceſſit, evaſit, erupit.*——The reaſon of which pointing is obvious; for as many ſubjects or finite verbs as there are in a ſentence, ſo many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwiſe, they are to be conceived as equal. Since, as every ſubject requires its verbs, ſo every verb requires its ſubject, wherewith it may agree: excepting, perhaps, in ſome figurative expreſſions.

SENTICOSÆ (from *ſentis*, a "briar or bramble);" the name of the 35th order in Linnæus's fragments of a natural method, conſiſting of roſe, bramble, and other plants, which reſemble them in port and external ſtructure. See BOTANY, page 465.

SENTIMENT, according to Lord Kames, is a term appropriated to ſuch thoughts as are prompted by paſſion. It differs from a perception; for a perception ſignifies the act by which we become conſcious of external objects. It differs from conſciouſneſs of an internal action, ſuch as thinking, ſuſpending thought, inclining, reſolving, willing, &c. And it differs from the conception of a relation among objects; a conception of that kind being termed *opinion*. Sentiment.

SENTIMENTS, in poetry. To talk in the language of muſic, each paſſion hath a certain tone, to which every ſentiment proceeding from it ought to be tuned with the greateſt accuracy: which is no eaſy work, eſpecially where ſuch harmony ought to be ſupported during the courſe of a long theatrical repreſentation. In order to reach ſuch delicacy of execution, it is neceſſary that a writer aſſume the preciſe character and paſſion of the perſonage repreſented; which requires an uncommon genius. But it is the only difficulty; for the writer, who, annihilating himſelf, can thus become another perſon, need be in no pain about the ſentiments that belong to the aſſumed character: theſe will flow without the leaſt ſtudy, or even preconception; and will frequently be as delightfully new to himſelf as to his reader. But if a lively picture even of a ſingle emotion require an effort of genius, how much greater the effort to compoſe a paſſionate dialogue with as many different tones of paſſion as there are ſpeakers? With what ductility of feeling muſt that writer be endued, who approaches perfection in ſuch a work; when it is neceſſary to aſſume different and even oppoſite characters and paſſions in the quickeſt ſucceſſion? Yet this work, difficult as it is, yields to that of compoſing a dialogue in genteel comedy, exhibiting characters without paſſion. The reaſon is, that the different tones of character are more delicate, and leſs in ſight, than thoſe of paſſion; and, accordingly, many writers, who have no genius for drawing characters, make a ſhift to repreſent, tolerably well, an ordinary paſſion in its ſimple movements. But of all works of this kind, what is truly the moſt difficult, is a characteriſtical dialogue upon any philoſophical ſubject; to interweave characters with reaſoning, by ſuiting to the character of each ſpeaker a peculiarity not only of thought but of expreſſion, requires the perfection of genius, taſte, and judgment.

How difficult dialogue writing is, will be evident, even without reaſoning, from the miſerable compoſitions of that kind found without number in all languages. The art of mimicking any ſingularity in geſture or in voice, is a rare talent, though directed by ſight and hearing, the acuteſt and moſt lively of our external ſenſes: how much more rare muſt that talent be, of imitating characters and internal emotions, tracing all their different tints, and repreſenting them in a lively manner by natural ſentiments properly expreſſed? The truth is, ſuch execution is too delicate for an ordinary genius; and for that reaſon the bulk of writers, inſtead of expreſſing a paſſion as one does who feels it, content themſelves with deſcribing it in the language of a ſpectator. To awake paſſion by an internal effort merely, without any external cauſe, requires great ſenſibility; and yet that operation is neceſſary, not leſs to the writer than to the actor; becauſe none but thoſe who actually feel a paſſion can repreſent it to the life. The writer's part is the more complicated: he muſt add compoſition to paſſion: and muſt, in the quickeſt ſucceſſion, adopt every different character. But a very humble flight of imagination may ſerve to convert a

Sentiments. writer into a ſpectator, ſo as to figure, in ſome obſcure manner, an action as paſſing in his ſight and hearing. In that figured ſituation, being led naturally to write like a ſpectator, he entertains his readers with his own reflections, with cool deſcription, and florid declamation; inſtead of making them eye-witneſſes, as it were, to a real event, and to every movement of genuine paſſion. Thus moſt of our plays appear to be caſt in the ſame mould; perſonages without character, the mere outlines of paſſion, a tireſome monotony, and a pompous declamatory ſtyle.

This deſcriptive manner of repreſenting paſſion is a very cold entertainment; our ſympathy is not raiſed by deſcription; we muſt firſt be lulled into a dream of reality, and every thing muſt appear as paſſing in our ſight. Unhappy is the player of genius who acts a part in what may be termed a *deſcriptive tragedy*; after aſſuming the very paſſion that is to be repreſented, how is he cramped in action, when he muſt utter, not the ſentiments of the paſſion he feels, but a cold deſcription in the language of a byſtander? It is that imperfection, undoubtedly, in the bulk of our plays, which confines our ſtage almoſt entirely to Shakeſpeare, notwithſtanding his many irregularities. In our late Engliſh tragedies, we ſometimes find ſentiments tolerably well adapted to a plain paſſion: but we muſt not in any of them expect a ſentiment expreſſive of character; and, upon that very account, our late performances of the dramatic kind are for the moſt part intolerably inſipid.

But it may be proper to illuſtrate this ſubject by examples. The firſt examples ſhall be of ſentiments that appear the legitimate offspring of paſſion; to which ſhall be oppoſed what are deſcriptive only, and illegitimate: and in making this compariſon, the inſtances ſhall be borrowed from Shakeſpeare and Corneille, who for genius in dramatic compoſition ſtand uppermoſt in the rolls of fame.

I. Shakeſpeare ſhall furniſh the firſt example, being of ſentiments dictated by a violent and perturbed paſſion:

Lear. ——————Filial ingratitude!
Is it not as if this mouth ſhould tear this hand
For lifting food to't?—But I'll puniſh home;
No, I will weep no more.——In ſuch a night,
To ſhut me out!——Pour on, I will endure.
In ſuch a night as this! O Regan, Goneril,
Your old kind father, whoſe frank heart gave all—
O! that way madneſs lies: let me ſhun that;
No more of that.——————

Kent. Good, my lord, enter here.

Lear. Prithee, go in thyſelf, ſeek thine own eaſe,
This tempeſt will not give me leave to ponder
On things would hurt me more:—but I'll go in;
In, boy, go firſt. You houſeleſs poverty——
Nay, get thee in; I'll pray, and then I'll ſleep—
Poor naked wretches, whereſoe'er you are,
That bide the pelting of this pitileſs ſtorm!
How ſhall your houſeleſs heads, and unfed ſides,
Your loop'd and window'd raggedneſs defend you
From ſeaſons ſuch as this!——O I have ta'en
Too little care of this! take phyſic, Pomp;
Expoſe thyſelf to feel what wretches feel,
That thou may'ſt ſhake the ſuperflux to them, Sentime
And ſhow the heav'ns more juſt.

King Lear, Act III. ſc. 5.

With regard to the French author, truth obliges us to acknowledge, that he deſcribes in the ſtyle of a ſpectator, inſtead of expreſſing paſſion like one who feels it; which naturally betrays him into a tireſome monotony, and a pompous declamatory ſtyle. It is ſcarce neceſſary to give examples, for he never varies from that tone. We ſhall, however, take two paſſages at a venture, in order to be confronted with thoſe tranſcribed above. In the tragedy of Cinna, after the conſpiracy was diſcovered, Æmilia, having nothing in view but racks and death to herſelf and her lover, receives a pardon from Auguſtus, attended with the brighteſt circumſtances of magnanimity and tenderneſs. This is a lucky ſituation for repreſenting the paſſions of ſurpriſe and gratitude in their different ſtages, which ſeem naturally to be what follow. Theſe paſſions, raiſed at once to the utmoſt pitch, and being at firſt too big for utterance, muſt, for ſome moments, be expreſſed by violent geſtures only: ſo ſoon as there is vent for words, the firſt expreſſions are broken and interrupted: at laſt, we ought to expect a tide of intermingled ſentiments, occaſioned by the fluctuation of the mind between the two paſſions. Æmilia is made to behave in a very different manner: with extreme coolneſs ſhe deſcribes her own ſituation, as if ſhe were merely a ſpectator; or rather the poet takes the taſk off her hands:

Et je me rends, Seigneur, à ces hautes bontés:
Je recouvre la vûe auprès de leurs clartés.
Je connois mon forfait qui me ſembloit juſtice:
Et ce que n'avoit pû la terreur du ſupplice,
Je ſens naitre en mon ame un repentir puiſſant,
Et mon cœur en ſecret me dit, qu'il y conſent.
Le ciel a réſolu votre grandeur ſuprême;
Et pour preuve, Seigneur, je n'en veux que moi-même.
J'oſe avec vanité me donner cet éclat,
Puiſqu'il change mon cœur, qu'il veut changer l'état.
Ma haine va mourir, que j'ai crue immortelle;
Elle eſt morte, et ce cœur devient ſujet fidele;
Et prenant déſormais cette haine en horreur,
L'ardeur de vous ſervir ſuccede à ſa fureur.

Act V. ſc. 3.

So much in general upon the genuine ſentiments of paſſion. We proceed to particular obſervations. And, firſt, paſſions ſeldom continue uniform any conſiderable time: they generally fluctuate, ſwelling and ſubſiding by turns, often in a quick ſucceſſion; and the ſentiments cannot be juſt unleſs they correſpond to ſuch fluctuation. Accordingly, a climax never ſhows better than in expreſſing a ſwelling paſſion: the following paſſages may ſuffice for an illuſtration.

Almeria. ——————How haſt thou charm'd
The wildneſs of the waves and rocks to this;
That thus relenting they have giv'n thee back
To earth, to light and life, to love and me?

Mourning Bride, Act I. ſc. 7.

I would not be the villain that thou think'ſt
For the whole ſpace that's in the tyrant's graſp,
And the rich earth to boot.

Macbeth, Act IV. ſc. 4.

The

timents. The following paſſage expreſſes finely the progreſs of conviction.

Let me not ſtir, nor breathe, leſt I diſſolve
That tender, lovely form, of painted air,
So like Almeria. Ha! it ſinks, it falls;
I'll catch it e'er it goes, and graſp her ſhade.
'Tis life! 'tis warm! 'tis ſhe! 'tis ſhe herſelf!
It is Almeria! 'tis, it is my wife!

Mourning Bride, Act II. ſc. 6.

In the progreſs of thought our reſolutions become more vigorous as well as our paſſions.

If ever I do yield or give conſent,
By any action, word, or thought, to wed
Another lord; may then juſt heav'n ſhow'r down, &c.

Mourning Bride, Act I. ſc. 1.

And this leads to a ſecond obſervation, That the different ſtages of a paſſion, and its different directions, from birth to extinction, muſt be carefully repreſented in their order; becauſe otherwiſe the ſentiments, by being miſplaced, will appear forced and unnatural.—Reſentment, for example, when provoked by an atrocious injury, diſcharges itſelf firſt upon the author: ſentiments therefore of revenge come always firſt, and muſt in ſome meaſure be exhauſted before the perſon injured think of grieving for himſelf. In the Cid of Corneille, Don Diegue having been affronted in a cruel manner, expreſſes ſcarce any ſentiment of revenge, but is totally occupied in contemplating the low ſituation to which he is reduced by the affront:

O rage! ô deſeſpoir! ô vieilleſſe ennemie!
N'ai-je donc tant vecu que pour cette infamie?
Et ne ſuis-je blanchi dans les travaux guerriers,
Que pour voir en un jour fletrir tant de lauriers?
Mon bras, qu'avec reſpect tout l'Eſpagne admire,
Mon bras qui tant de fois a ſauvé cet empire,
Tant de fois affermi le trône de ſon roi,
Trahit donc ma querelle, et ne fait rien pour moi!
O cruel ſouvenir de ma gloire paſſé!
Oeuvre de tant de jours en un jour effacée!
Nouvelle dignité fatale à mon bonheur!
Precipice élevé d'où tombe mon honneur!
Faut-il de votre eclat voir triompher le comte,
Et mourir ſans vengeance, ou vivre dans la honte?
Comte, ſois de mon prince à preſent gouverneur,
Ce haut rang n'admet point un homme ſans honneur;
Et ton jaloux orgueil par cet affront inſigne,
Malgré le choix du roi, m'en a ſû rendre indigne.
Et toi, de mes exploits glorieux inſtrument,
Mais d'un corps tout de glace inutile ornement,
Fer jadis tant à craindre, et qui dans cette offenſe,
M'as ſervi de parade, et non pas de defenſe,
Va, quitte deſormais le dernier des humains,
Paſſe pour me venger en de meilleures mains.

Le Cid, Act I. ſc. 7.

Theſe ſentiments are certainly not the firſt that are ſuggeſted by the paſſion of reſentment. As the firſt movements of reſentment are always directed to its object, the very ſame is the caſe of grief. Yet with relation to the ſudden and ſevere diſtemper that ſeized Alexander bathing in the river Cydnus, Quintus Curtius deſcribes the firſt emotions of the army as directed to themſelves, lamenting that they were left without a leader, far from home, and had ſcarce any hopes of returning in ſafety: their king's diſtreſs, which muſt naturally have been their firſt concern, occupies them but in the ſecond place according to that author. In the Aminta of Taſſo, Sylvia, upon a report of her lover's death, which ſhe believed certain, inſtead of bemoaning the loſs of her beloved, turns her thoughts upon herſelf, and wonders her heart does not break: Sentiments.

Ohime, ben ſon di ſaſſo,
Poi che queſta novella no m'uccide. Act IV. ſc. 2.

In the tragedy of Jane Shore, Alicia, in the full purpoſe of deſtroying her rival, has the following reflection:

Oh Jealouſy! thou bane of pleaſing friendſhip,
Thou worſt invader of our tender boſoms;
How does thy rancour poiſon all our ſoftneſs,
And turn our gentle nature into bitterneſs!
See where ſhe comes! Once my heart's deareſt bleſſing,
Now my chang'd eyes are blaſted with her beauty,
Loathe that known face, and ſicken to behold her.

Act III. ſc. 1.

Theſe are the reflections of a cool ſpectator. A paſſion, while it has the aſcendant, and is freely indulged, ſuggeſts not to the perſon who feels it any ſentiment to its own prejudice: reflections like the foregoing occur not readily till the paſſion has ſpent its vigour.

A perſon ſometimes is agitated at once by different paſſions; and the mind in that caſe, vibrating like a pendulum, vents itſelf in ſentiments that partake of the ſame vibration. This we give as a third obſervation:

Queen. Would I had never trod this Engliſh earth,
Or felt the flatteries that grow upon it!
Ye've angels faces, but heav'n knows your hearts.
What ſhall become of me now? wretched lady!
I am the moſt unhappy woman living.
Alas! poor wenches, where are now your fortunes?
[*To her women.*
Shipwreck'd upon a kingdom, where no pity,
No friends, no hope, no kindred, weep for me!
Almoſt no grave allow'd me.

Henry VIII. Act. III. ſc. 1.

Othello. Oh devil, devil!
If that the earth could teem with woman's tears,
Each drop ſhe falls would prove a crocodile.
Out of my ſight!
Deſdemona. I will not ſtay t'offend you. [*Going.*
Lodovico. Truly, an obedient lady:
I do beſeech your lordſhip, call her back.
Oth. Miſtreſs——
Def. My lord.
Oth. What would you with her, Sir?
Lod. Who, I, my lord?
Oth. Ay; you did wiſh that I would make her turn.
Sir, ſhe can turn and turn, and yet go on;
And turn again. And ſhe can weep, Sir, weep;
And ſhe's obedient: as you ſay, obedient:
Very obedient—proceed you in your tears—
Concerning this, Sir,—oh well painted paſſion!—
I am commanded home—get you away,
I'll ſend for you anon—Sir, I obey the mandate,
And will return to Venice.——Hence, avaunt!
[*Exit* Deſdemona.

Othello, Act IV. ſc. 6.

Æmilia.

Sentiments.

Æmilia. Oh! my good lord, I would ſpeak a word with you.

Othello. Yes, 'tis Æmilia—By and by.—She's dead.
'Tis like ſhe comes to ſpeak of Caſſio's death;
The noiſe was high.—Ha! no more moving?
Still as the grave. Shall ſhe come in? wer't good?
I think ſhe ſtirs again—No—what's the beſt?
If ſhe come in, ſhe'll, ſure, ſpeak to my wife:
My wife! my wife! what wife? I have no wife;
Oh inſupportable? oh heavy hour!

Othello, Act V. ſc. 2.

A fourth obſervation is, That nature, which gave us paſſions, and made them extremely beneficial when moderate, intended undoubtedly that they ſhould be ſubjected to the government of reaſon and conſcience. It is therefore againſt the order of nature, that paſſion in any caſe ſhould take the lead in contradiction to reaſon and conſcience: ſuch a ſtate of mind is a ſort of anarchy which every one is aſhamed of and endeavours to hide or diſſemble. Even love, however laudable, is attended with a conſcious ſhame when it becomes immoderate: it is covered from the world, and diſcloſed only to the beloved object:

Et que l'amour ſouvent de remors combattu
Paroiſſe une foibleſſe, et non une vertu.

Boileau, l'Art Poet. Chant. III. l. 101.

O, they love leaſt that let men know they love.

Two Gentlemen of Verona, Act I. ſc. 3.

Hence a capital rule in the repreſentation of immoderate paſſions, that they ought to be hid or diſſembled as much as poſſible. And this holds in an eſpecial manner with reſpect to criminal paſſions: one never counſels the commiſſion of a crime in plain terms; guilt muſt not appear in its native colours, even in thought; the propoſal muſt be made by hints, and by repreſenting the action in ſome favourable light. Of the propriety of ſentiment upon ſuch an occaſion, Shakeſpeare, in the *Tempeſt*, has given us a beautiful example, in a ſpeech by the uſurping duke of Milan, adviſing Sebaſtian to murder his brother the king of Naples:

Antonio. ——————What might,
Worthy Sebaſtian,—O, what might—no more.
And yet, methinks, I ſee it in thy face
What thou ſhouldſt be: the occaſion ſpeaks thee, and
My ſtrong imagination ſees a crown
Dropping upon thy head. Act II. ſc. 2.

A picture of this kind, perhaps ſtill finer, is exhibited in King John, where that tyrant ſolicits (*Act III. ſc.* 5.) Hubert to murder the young prince Arthur; but it is too long to be inſerted here.

II. As things are beſt illuſtrated by their contraries, we proceed to faulty ſentiments, diſdaining to be indebted for examples to any but the moſt approved authors. The firſt claſs ſhall conſiſt of ſentiments that accord not with the paſſion; or, in other words, ſentiments that the paſſion does not naturally ſuggeſt. In the ſecond claſs ſhall be ranged ſentiments that may belong to an ordinary paſſion, but unſuitable to it as tinctured by a ſingular character. Thoughts that properly are not ſentiments, but rather deſcriptions, make a third. Sentiments that belong to the paſſion repreſented, but are faulty as being introduced too early or too late, make a fourth. Vicious ſentiments expoſed in their native dreſs, inſtead of being concealed or diſguiſed, make a fifth. And in the laſt claſs ſhall be colected ſentiments ſuited to no character nor paſſion, and therefore unnatural.

Sentim

The *firſt* claſs contains faulty ſentiments of various kinds, which we ſhall endeavour to diſtinguiſh from each other.

1. Of ſentiments that are faulty by being above the tone of the paſſion, the following may ſerve as an example:

Othello. ——————O my ſoul's joy!
If after every tempeſt come ſuch calms,
May the winds blow till they have waken'd death:
And let the labouring bark climb hills of ſeas
Olympus high, and duck again as low
As hell's from heaven? *Othello*, Act II. ſc. 6.

This ſentiment may be ſuggeſted by violent and inflamed paſſion; but it is not ſuited to the ſatisfaction, however great, that one feels upon eſcaping danger.

2. Inſtance of ſentiments below the tone of the paſſion. Ptolemy, by putting Pompey to death, having incurred the diſpleaſure of Cæſar, was in the utmoſt dread of being dethroned: in that agitating ſituation, Corneille makes him utter a ſpeech full of cool reflection, that is in no degree expreſſive of the paſſion.

Ah! ſi je t'avois crû, je n'aurois pas de maitre,
Je ſerois dans le trône où le ciel m'a fait naître;
Mais c'eſt une imprudence aſſez commune aux rois,
D'écouter trop d'avis, et ſe tromper au choix.
Le Deſtin les aveugle au bord du précipice,
Ou ſi quelque lumiere en leur ame ſe gliſſe,
Cette fauſſe clarté dont il les eblouit,
Le plonge dans une gouffre, et puis s'evanouit.

La Mort de Pompé, Act IV. ſc. 1.

3. Sentiments that agree not with the tone of the paſſion; as where a pleaſant ſentiment is grafted upon a painful paſſion, or the contrary. In the following inſtances, the ſentiments are too gay for a ſerious paſſion:

No happier taſk theſe faded eyes purſue;
To read and weep is all they now can do.

Eloiſa to Abelard. l. 47.

Again;

Heav'n firſt taught letters for ſome wretch's aid,
Some baniſh'd lover, or ſome captive maid:
They live, they ſpeak, they breathe what love inſpires,
Warm from the ſoul, and faithful to its fires;
The virgin's wiſh without her fears impart,
Excuſe the bluſh, and pour out all the heart;
Speed the ſoft intercourſe from ſoul to ſoul,
And waft a ſigh from Indus to the pole.

Eloiſa to Abelard, l. 51.

Theſe thoughts are pretty: they ſuit Pope, but not Eloiſa.

Satan, enraged by a threatening of the angel Gabriel, anſwers thus:

Then when I am thy captive, talk of chains,
Proud limitary cherub; but ere then
Far heavier load thyſelf expect to feel
From my prevailing arm, though heaven's King

ments.

Ride on thy wings, and thou with thy compeers,
Us'd to the yoke, draw'ſt his triumphant wheels
In progreſs thro' the road of heav'n *ſtar-pav'd.*
Paradiſe Loſt, B. IV.

The concluding epithet forms a grand and delightful image, which cannot be the genuine offspring of rage.

4. Sentiments too artificial for a ſerious paſſion. The firſt example is a ſpeech of Percy expiring.

O, Harry, thou haſt robb'd me of my growth:
I better brook the loſs of brittle life,
Than thoſe proud titles thou haſt won of me. [fleſh.
They wound my thoughts worſe than thy ſword my
But thought's the ſlave of life, and life time's fool;
And time, that takes ſurvey of all the world,
Muſt have ſtop.
Firſt Part, Henry IV. Act V. ſc. 9.

The ſentiments of the *Mourning Bride* are for the moſt part no leſs delicate than juſt copies of nature: in the following exception the picture is beautiful, but too artful to be ſuggeſted by ſevere grief.

Almeria. O no! Time gives increaſe to my afflictions.
The circling hours, that gather all the woes
Which are diffus'd through the revolving year,
Come heavy laden with th' oppreſſive weight
To me; with me, ſucceſſively, they leave
The ſighs, the tears, the groans, the reſtleſs cares,
And all the damps of grief, that did retard their flight;
They ſhake their downy wings, and ſcatter all
The dire collected dews on my poor head;
Then fly with joy and ſwiftneſs from me. Act I. ſc. 1.

In the ſame play, Almeria ſeeing a dead body, which ſhe took to be Alphonſo's, expreſſes ſentiments ſtrained and artificial, which nature ſuggeſts not to any perſon upon ſuch an occaſion:

Had they or hearts or eyes, that did this deed?
Could eyes endure to guide ſuch cruel hands?
Are not my eyes guilty alike with theirs,
That thus can gaze, and yet not turn to ſtone?
—I do not weep! The ſprings of tears are dry'd,
And of a ſudden I am calm, as if [der'd!
All things were well; and yet my huſband's mur-
Yes, yes, I know to mourn: I'll ſluice this heart,
The ſource of wo, and let the torrent in.
Act V. ſc. 11.

Pope's elegy to the memory of an unfortunate lady, expreſſes delicately the moſt tender concern and ſorrow that one can feel for the deplorable fate of a perſon of worth. Such a poem, deeply ſerious and pathetic, rejects with diſdain all fiction. Upon that account, the following paſſage deſerves no quarter; for it is not the language of the heart, but of the imagination indulging its flights at eaſe, and by that means is eminently diſcordant with the ſubject. It would be a ſtill more ſevere cenſure, if it ſhould be aſcribed to imitation, copying indiſcreetly what has been ſaid by others:

What tho' no weeping loves thy aſhes grace,
Nor poliſh'd marble emulate thy face?
What though no ſacred earth allow thee room,
Nor hallow'd dirge be mutter'd o'er thy tomb?
Yet ſhall thy grave with riſing flow'rs be dreſt,
And the green turf lie lightly on thy breaſt:
There ſhall the morn her earlieſt tears beſtow,
There the firſt roſes of the year ſhall blow;
While angels with their ſilver wings o'erſhade
The ground, now ſacred by thy relics made.

Sentiments.

5. Fanciful or finical ſentiments. Sentiments that degenerate into point or conceit, however they may amuſe in an idle hour, can never be the offspring of any ſerious or important paſſion. In the *Jeruſalem* of Taſſo, Tancred, after a ſingle combat, ſpent with fatigue, and loſs of blood, falls into a ſwoon; in which ſituation, underſtood to be dead, he is diſcovered by Erminia, who was in love with him to diſtraction. A more happy ſituation cannot be imagined, to raiſe grief in an inſtant to its higheſt pitch; and yet, in venting her ſorrow, ſhe deſcends moſt abominably into antitheſis and conceit even of the loweſt kind:

E in lui verſò d'inefficabil vena
Lacrime, e voce di ſoſpiri miſta.
In che miſero punto hor qui me mena
Fortuna? a che veduta amara e triſta?
Dopo gran tempo i' ti ritrovo à pena
Tancredi, e ti riveggio, e non ſon viſta
Viſta non ſon da te, benche preſente
T trovando ti perdo eternamente.
Canto XIX. ſt. 105.

Armida's lamentation reſpecting her lover Rinaldo is in the ſame vicious taſte. *Vid.* Canto XX. ſtan. 124, 125, 126.

Queen. Give me no help in lamentation,
I am not barren to bring forth complaints:
All ſprings reduce their currents to mine eyes,
That I, being govern'd by the wat'ry moon,
May ſend forth plenteous tears to drown the world,
Ah, for my huſband, for my dear Lord Edward.
King Richard III. Act 2. ſc. 2.

Jane Shore utters her laſt breath in a witty conceit:

Then all is well, and I ſhall ſleep in peace——
'Tis very dark, and I have loſt you now——
Was there not ſomething I would have bequeath'd you?
But I have nothing left me to beſtow,
Nothing but one ſad ſigh. Oh mercy, Heav'n! [*Dies.*
Act V.

Guilford to Lady Jane Gray, when both were condemned to die:

Thou ſtand'ſt unmov'd;
Calm temper ſits upon thy beauteous brow;
Thy eyes that flow'd ſo faſt for Edward's loſs,
Gaze unconcern'd upon the ruin round thee,
As if thou had'ſt reſolv'd to brave thy fate,
And triumph in the midſt of deſolation.
Ha! ſee, it ſwells, the liquid cryſtal riſes,
It ſtarts in ſpite of thee——but I will catch it,
Nor let the earth be wet with dew ſo rich.
Lady Jane Gray, Act IV. near the end.

The concluding ſentiment is altogether finical, unſuitable to the importance of the occaſion, and even to the dignity of the paſſion of love.

Corneille,

Sentiments.

Corneille, in his *Examen of the Cid*, anſwering an objection, That his ſentiments are ſometimes too much refined for perſons in deep diſtreſs, obſerves, that if poets did not indulge ſentiments more ingenious or refined than are prompted by paſſion, their performances would often be low, and extreme grief would never ſuggeſt but exclamations merely. This is in plain language to aſſert, that forced thoughts are more agreeable than thoſe that are natural, and ought to be preferred.

The *ſecond* claſs is of ſentiments that may belong to an ordinary paſſion, but are not perfectly concordant with it, as tinctured by a ſingular character.

In the laſt act of that excellent comedy *The Careleſs Huſband*, Lady Eaſy, upon Sir Charles's reformation, is made to expreſs more violent and turbulent ſentiments of joy than are conſiſtent with the mildneſs of her character.

Lady Eaſy. O the ſoft treaſure! O the dear reward of long deſiring love.—Thus! thus to have you mine, is ſomething more than happineſs; 'tis double life, and madneſs of abounding joy.

The following inſtances are deſcriptions rather than ſentiments, which compoſe a *third* claſs.

Of this deſcriptive manner of painting the paſſions, there is in the *Hippolytus* of Euripides, *Act V.* an illuſtrious inſtance, viz. the ſpeech of Theſeus, upon hearing of his ſon's diſmal exit. In Racine's tragedy of *Eſther*, the queen hearing of the decree iſſued againſt her people, inſtead of expreſſing ſentiments ſuitable to the occaſion, turns her attention upon herſelf, and deſcribes with accuracy her own ſituation.

Juſte ciel! tout mon ſang dans mes veines ſe glace.
Act I. ſc. 3.

Again,

Aman. C'en eſt fait. Mon orgueil eſt forcé de plier.
L'inexorable Aman eſt reduit à prier.
Eſther, Act III. ſc. 5.

Athalie. Quel prodige nouveau me trouble et m'embarraſſe?
La douceur de ſa voix, ſon enfance, ſa grace,
Font inſenſiblement a mon inimitié
Succeder—Je ſerois ſenſible a la pitié?
Athalie, Act II. ſc. 7.

Titus. O de ma paſſion fureur deſeſperée!
Brutus of Voltaire, Act III. ſc. 6.

What other are the foregoing inſtances but deſcribing the paſſion another feels?

The *fourth* claſs is of ſentiments expreſſed too early or too late.

Some examples mentioned above belong to this claſs. Add the following from *Venice Preſerv'd*, Act V. at the cloſe of the ſcene between Belvidera and her father Priuli. The account given by Belvidera of the danger ſhe was in, and of her huſband threatening to murder her, ought naturally to have alarmed her relenting father, and to have made him expreſs the moſt perturbed ſentiments. Inſtead of which he diſſolves into tenderneſs and love for his daughter, as if he had already delivered her from danger, and as if there were a perfect tranquillity.

Canſt thou forgive me all my follies paſt!
I'll henceforth be indeed a father; never,
Never more thus expoſe, but cheriſh thee,
Dear as the vital warmth that feeds my life,
Dear as thoſe eyes that weep in fondneſs o'er thee:
Peace to thy heart.

Immoral ſentiments expoſed in their native colours, inſtead of being concealed or diſguiſed, compoſe the *fifth* claſs.

The Lady Macbeth, projecting the death of the king, has the following ſoliloquy:

——————The raven himſelf's not hoarſe
That croaks the fatal entrance of Duncan
Under my battlements. Come, all you ſpirits
That tend on mortal thoughts, unſex me here,
And fill me from the crown to the toe, top full
Of direct cruelty; make thick my blood,
Stop up th' acceſs and paſſage to remorſe,
That no compunctious viſitings of nature
Shake my fell purpoſe. *Macbeth*, Act. I. ſc. 7.

This ſpeech is not natural. A treacherous murder was never perpetrated even by the moſt hardened miſcreant without compunction; and that the lady here muſt have been in horrible agitation, appears from her invoking the infernal ſpirits to fill her with cruelty, and to ſtop up all avenues to remorſe. But in that ſtate of mind it is a never-failing artifice of ſelf-deceit to draw the thickeſt veil over the wicked action, and to extenuate it by all the circumſtances that imagination can ſuggeſt: and if the crime cannot bear diſguiſe, the next attempt is to thruſt it out of mind altogether, and to ruſh on to action without thought. This laſt was the huſband's method.

Strange things I have in head, that will to hand;
Which muſt be acted ere they muſt be ſcann'd.
Act III. ſc. 5.

The lady follows neither of theſe courſes, but in a deliberate manner endeavours to fortify her heart in the commiſſion of an execrable crime, without even attempting to colour it. This we think, is not natural; we hope there is no ſuch wretch to be found as is here repreſented.

The *laſt* claſs comprehends ſentiments that are unnatural, as being ſuited to no character nor paſſion. Theſe may be ſubdivided into three branches: firſt, ſentiments unſuitable to the conſtitution of man, and to the laws of his nature: ſecond, inconſiſtent ſentiments; third, ſentiments that are pure rant and extravagance.

When the fable is of human affairs, every event, every incident, and every circumſtance, ought to be natural, otherwiſe the imitation is imperfect. But an imperfect imitation is a venial fault, compared with that of running croſs to nature. In the *Hippolytus* of Euripides, (*Act IV. ſc.* 5.), Hippolytus wiſhing for another ſelf in his own ſituation, "How much (ſays he) ſhould I be touched with his misfortune!" as if it were natural to grieve more for the misfortunes of another than for one's own.

Oſmyn. Yet I beheld her—yet—and now no more.
Turn your lights inward, eyes, and view my thought:
So ſhall you ſtill behold her—'Twill not be.

timents. O impotence of ſight! mechanic ſenſe,
Which to exterior objects ow'ſt thy faculty,
Not ſeeing of election, but neceſſity.
Thus do our eyes, as do all common mirrors,
Succeſſively reflect ſucceeding images,
Nor what they would, but muſt; a ſtar or toad;
Juſt as the hand of chance adminiſters!
Mourning Bride, Act II. ſc. 8.

No man, in his ſenſes, ever thought of applying his eyes to diſcover what paſſes in his mind; far leſs of blaming his eyes for not ſeeing a thought or idea. In Moliere's *l'Avare* (Act IV. ſc. 7.) Harpagon, being robbed of his money, ſeizes himſelf by the arm, miſtaking it for that of the robber. And again he expreſſes himſelf as follows:

Je veux aller querir la juſtice, et faire donner la queſtion à toute ma maiſon; à ſervantes, à valets, à fils, à fille, et à moi auſſi.

This is ſo abſurd as ſcarce to provoke a ſmile, if it be not at the author.

Of the ſecond branch the following example may ſuffice:

——— Now bid me run,
And I will ſtrive with things *impoſſible*,
Yea, get the better of them.
Julius Cæſar, Act. II. ſc. 3.

Of the third branch, take the following ſamples. Lucan, talking of Pompey's ſepulchre.

——— Romanum nomen, et omne
Imperium magno eſt tumuli modus. Obrue ſaxa
Crimine plena deûm. Si tota eſt Herculis Oete,
Et juga tota vacant Bromio Nyſeia; quare
Unus in Egypto Magno lapis? Omnia Lagi
Rura tenere poteſt, ſi nullo ceſpite nomen
Hæſerit. Erremus populi, cinerumque tuorum,
Magne, metu nullas Nili calcemus arenas.
Lib. VIII. l. 798.

Thus, in Rowe's tranſlation:

Where there are ſeas, or air, or earth, or ſkies,
Where'er Rome's empire ſtretches, Pompey lies.
Far be the vile memorial then convey'd!
Nor let this ſtone the partial gods upbraid.
Shall Hercules all Oeta's heights demand,
And Nyſa's hill for Bacchus only ſtand;
While one poor pebble is the warrior's doom
That fought the cauſe of liberty and Rome?
If Fate decrees he muſt in Egypt lie,
Let the whole fertile realm his grave ſupply,
Yield the wide country to his awful ſhade,
Nor let us dare on any part to tread,
Fearful we violate the mighty dead.

The following paſſages are pure rant. Coriolanus, ſpeaking to his mother,

What is this?
Your knees to me? to your corrected ſon?
Then let the pebbles on the hungry beach
Fillop the ſtars: then let the mutinous winds
Strike the proud cedars 'gainſt the fiery ſun:
Murd'ring impoſſibility, to make
What cannot be, ſlight work.
Coriolanus, Act V. ſc. 3.

Cæſar. ——— Danger knows full well,
That Cæſar is more dangerous than he.
We were two lions litter'd in one day,
And I the elder and more terrible.
Julius Cæſar, Act II. ſc. 4.

Ventidius. But you, ere love miſled your wand'ring eyes,
Were ſure the chief and beſt of human race,
Fram'd in the very pride and boaſt of nature,
So perfect, that the gods who form'd you wonder'd
At their own ſkill, and cry'd, A lucky hit
Has mended our deſign. *Dryden, All for Love*, Act I.

Not to talk of the impiety of this ſentiment, it is ludicrous inſtead of being lofty.

The famous epitaph on Raphael is not leſs abſurd than any of the foregoing paſſages:

Raphael, timuit, quo ſoſpite, vinci,
Rerum magna parens, et moriente mori.

Imitated by Pope, in his epitaph on Sir Godfrey Kneller:

Living, great Nature fear'd he might outvie
Her works; and dying, fears herſelf may die.

Such is the force of imitation; for Pope of himſelf would never have been guilty of a thought ſo extravagant.

SENTINEL, or SENTRY, in military affairs, a private ſoldier placed in ſome poſt to watch the approach of the enemy, to prevent ſurpriſes, to ſtop ſuch as would paſs without orders or diſcovering who they are. They are placed before the arms of all guards, at the tents and doors of general officers, colonels of regiments, &c.

SENTINEL Perdu, a ſoldier poſted near an enemy, or in ſome very dangerous poſt where he is in hazard of being loſt.

All ſentinels are to be vigilant on their poſts; neither are they to ſing, ſmoke tobacco, nor ſuffer any noiſe to be made near them. They are to have a watchful eye over the things committed to their charge. They are not to ſuffer any light to remain, or any fire to be made, near their poſts in the night time; neither is any ſentry to be relieved or removed from his poſt but by the corporal of the guard. They are not to ſuffer any one to touch or handle their arms, or in the night-time to come within ten yards of their poſt.

No perſon is to ſtrike or abuſe a ſentry on his poſt; but when he has committed a crime, he is to be relieved, and then puniſhed according to the rules and articles of war.

A ſentinel, on his poſt in the night, is to know nobody but by the counter-ſign: when he challenges, and is anſwered *Relief*, he calls out, *Stand, relief! advance, corporal!* upon which the corporal halts his men, and advances alone within a yard of the ſentry's firelock (firſt ordering his party to reſt, on which the ſentry does the ſame), and gives him the counter-ſign, taking care that no one hear it.

SEPIA, the CUTTLE-FISH, a genus belonging to the order of vermes moluſca. There are eight brachia interſperſed on the interior ſide, with little round ſerrated cups, by the contraction of which the animal lays faſt hold of any thing. Beſides theſe eight arms, it

Sentiments || Sepia.

Sepia. it has two tentacula longer than the arms, and frequently pedunculated. The mouth is ſituated in the centre of the arms, and is horny and hooked, like the bill of a hawk. The eyes are below the tentacula, towards the body of the animal. The body is fleſhy, and received into a ſheath as far as the breaſt. Their food are tunnies, ſprats, lobſters, and other ſhell-fiſh. With their arms and trunks they faſten themſelves, to reſiſt the motion of the waves. Their beak is like that of a parrot. The females are diſtinguiſhed by two paps. They copulate as the polypi do, by a mutual embrace, and lay their eggs upon ſea-weed and plants, in parcels like bunches of grapes. Immediately after they are laid they are white, and the males paſs over and impregnate them with a black liquor, after which they grow larger. On opening the egg, the embyro-cuttle is found alive. The males are very conſtant, accompany their females everywhere, face every danger in their defence, and reſcue them intrepidly at the hazard of their own lives. The timorous females fly as ſoon as they ſee the males wounded. The noiſe of a cuttle-fiſh, on being dragged out of the water reſembles the grunting of a hog. When the male is purſued by the ſea-wolf or other ravenous fiſh, he ſhuns the danger by ſtratagem. He ſquirts his black liqour, ſometimes to the quantity of a dram, by which the water becomes black as ink, under ſhelter of which he baffles the purſuit of his enemy. This ink or black liquor has been denominated by Mr le Cat *æthiops animal*, and is reſerved in a particular gland. In its liquid ſtate it reſembles that of the choroid in man, and would then communicate an indelible dye; when dry, it might be taken for the product of the black liquor in negroes dried, and made a precipitate by ſpirit of wine. This æthiops animal in negroes as well as in the cuttle-fiſh, is more abundant after death than even during life. It may ſerve either for writing or printing; in the former of which ways the Romans uſed it. It is ſaid to be an ingredient in the compoſition of Indian ink mixed with rice. There are five ſpecies.

1. The loligo, or great cuttle, with ſhort arms and long tentacula; the lower part of the body rhomboid and pinnated, the upper thick and cylindric. They inhabit all our ſeas, where having blackened the water by the effuſion of their ink, they abſcond, and with their tail leap out of the water. They are gregarious and ſwift in their motions: they take their prey by means of their arms; and embracing it, bring it to their central mouth. They adhere to the rocks, when they wiſh to be quieſcent, by means of the concave diſcs that are placed along their arms.

2. The octopodia, with eight arms, connected at their bottom by a membrane. This is the polypus of Pliny, which he diſtinguiſhes from the loligo and ſepia by the want of the tail and tentacula. They inhabit our ſeas, but are moſt at home in the Mediterranean. In hot climates theſe are found of an enormous ſize. The Indians affirm, that ſome have been ſeen two fathoms broad, over their centre, and each arm nine fathoms long. When the Indians navigate their little boats, they go in dread of them; and leſt theſe animals ſhould fling their arms over and ſink them, they never ſail without an axe to cut them off. When uſed for food they are ſerved up red from their own liquor, which from boiling with the addition of nitre becomes red. Barthol. ſays, upon cutting one of them open, ſo great a light broke forth, that at night, upon taking away the candle, the whole houſe ſeemed to be in a blaze. Sepia

3. The media, or middle cuttle, with a long, ſlender, cylindric body; tail finned, pointed, and carinated on each ſide; two long tentacula; the body almoſt tranſparent, green, but convertible into a dirty brown: confirming the remark of Pliny, that they change their colour through fear, adapting it, chameleon-like, to that of the place they are in. The eyes are large and ſmaragdine.

4. The ſepiola, or ſmall cuttle, with a ſhort body, rounded at the bottom, has a round fin on each ſide and two tentacula. They are taken off Flintſhire, but chiefly inhabit the Mediterranean.

5. The officinalis, or officinal cuttle, with an ovated body, has fins along the whole of the ſides, almoſt meeting at the bottom; and two long tentacula. The body contains the bone, the cuttle-bone of the ſhops, which was formerly uſed as an abſorbent. The bones are frequently flung on all our ſhores; the animal very rarely. The conger eels bite off their arms, or feet; but they grow again, as does the lizard's tail, (Plin. IX. 29). They are preyed upon by the plaice. This fiſh emits (in common with the other ſpecies), when frighted or purſued, the black liquor which the ancients ſuppoſed darkened the circumambient waves, and concealed it from the enemy.

> The endanger'd cuttle thus evades his fears,
> And native hoards of fluid ſafety bears.
> A pitchy ink peculiar glands ſupply,
> Whoſe ſhades the ſharpeſt beam of light defy.
> Purſu'd, he bids the ſable fountains flow,
> And, wrapt in clouds, eludes th' impending foe,
> The fiſh retreats unſeen, while ſelf-born night,
> With pious ſhade befriends her parent's flight.

The ancients ſometimes made uſe of it inſtead of ink. Perſius mentions the ſpecies in his deſcription of the noble ſtudent.

> *Jam liber, et bicolor poſitis membrana capillis,*
> *Inque manus chartæ, nodaſque venit arundo.*
> *Tum querimur, craſſus calamo quod pendeat humor;*
> *Nigra quod infuſa veneſcat* ſepia *lympha.*
>
> At length, his book he ſpreads, his pen he takes;
> His papers here in learned order lays,
> And there his parchment's ſmoother ſide diſplays.
> But oh! what croſſes wait on ſtudious men!
> The *cuttle*'s juice hangs clotted at our pen.
> *In all my life ſuch ſtuff I never knew,*
> *So gummy thick*—Dilute it, it will do.
> *Nay, now 'tis water!* DRYDEN.

This animal was eſteemed a delicacy by the ancients, and is eaten even at preſent by the Italians. Rondeletius gives us two receipts for the dreſſing, which may be continued to this day. Athenæus alſo leaves us the method of making an antique cuttle-fiſh ſauſage; and we learn from Ariſtotle, that thoſe animals are in higheſt ſeaſon when pregnant.

SEPIARIÆ, from *ſepes*, "a hedge"), the name of the 44th order of Linnæus's Fragments of a Natural Method,

Seps ‖ pter vir.

Method, consisting of a beautiful collection of woody plants, some of which, from their size and elegance, are very proper furniture for hedges. See BOTANY, p. 467.

SEPS, in zoology, a species of LACERTA.

SEPTARIÆ, in natural history, a large class of fossils, commonly known by the names of *ludus Helmontii* and *waxen veins*.

They are defined to be fossils not inflammable, nor soluble in water; of a moderately firm texture and dusky hue, divided by several septa or thin partitions, and composed of a sparry matter greatly debased by earth; not giving fire with steel; fermenting with acids, and in great part dissolved by them; and calcining in a moderate fire.

Of this class there are two distinct orders of bodies, and under those six genera. The septariæ of the first order are those which are usually found in large masses, of a simple uniform construction, but divided by large septa either into larger and more irregular portions, or into smaller and more equal ones, called *taic*. The genera of this order are four. 1. Those divided by septa of spar, called *fecomiæ*: 2. Those divided by septa of earthy matter, called *gaiophragmia*: 3. Those divided by septa of the matter of the pyrites, called *pyritecia*: And, 4. Those divided by septa of spar, with an admixture of crystal, called *diaugophragmia*.

Those of the second order are such as are usually found in smaller masses, of a crustated structure, formed by various incrustations round a central nucleus, and divided by very thin septa. Of this order are only two genera. 1. Those with a short roundish nucleus, enclosed within the body of the mass; and, 2. Those with a long nucleus, standing out beyond the ends of the mass.

SEPTAS, in botany: A genus of plants belonging to the order of *Heptagynia*, and the class of *Heptandria*; and in the natural system ranged under the 13th order, *Succulentæ*. The calyx is divided into seven parts; the petals are seven; the germens seven: the capsules are also seven, and contain many seeds. There is only one species, the *Capensis*, which is a native of the Cape of Good Hope, is round-leaved, and flowers in August or September.

SEPTEMBER, the ninth month of the year, consisting of only thirty days; it took its name as being the seventh month, reckoning from March, with which the Romans began their year.

SEPTENNIAL, any thing lasting seven years.

SEPTENNIAL Elections. Blackstone, in his Commentaries, Vol. I. p. 189. says, (after observing that the utmost extent of time allowed the same parliament to sit by the stat. 6 W. and M. c. 2. was three years), "But, by the statute 1 Geo. I. st. 2. c. 38. (in order *professedly* to prevent the great and continued expences of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government, just then recovering from the late rebellion), this term was prolonged to seven years; and what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years enacted its own continuance for seven."

SEPTENTRIO, in astronomy, a constellation, more usually called *ursa minor*.

In cosmography, the term *septentrio* denotes the same with *north*: and hence septentrional is applied to any thing belonging to the north; as *septentrional signs, parallels*, &c.

Septics, Septizon.

SEPTICS, are those substances which promote putrefaction, chiefly the calcareous earths, magnesia, and testaceous powders. From the many curious experiments made by Sir John Pringle to ascertain the *septic* and *antiseptic* virtues of natural bodies, it appears that there are very few substances of a truly *septic* nature. Those commonly reputed such by authors, as the alkaline and volatile salts, he found to be nowise *septic*. However, he discovered some, where it seemed least likely to find any such quality; these were chalk, common salt, and testaceous powders. He mixed twenty grains of crabs eyes, prepared with six drachms of ox's gall, and an equal quantity of water. Into another phial he put an equal quantity of gall and water, but no crabs-eyes. Both these mixtures being placed in the furnace, the putrefaction began much sooner, where the powder was, than in the other phial. On making a like experiment with chalk, its *septic* virtue was found to be much greater than that of the crabs-eyes: nay, what the doctor had never met with before, in a mixture of two drachms of flesh, with two ounces of water and thirty grains of prepared chalk, the flesh was resolved into a perfect mucus in a few days.

To try whether the testaceous powders would also dissolve vegetable substances, the doctor mixed them with barley and water, and compared this mixture with another of barley and water alone. After a long maceration by a fire, the plain water was found to swell the barley, and turn mucilaginous and sour; but that with the powder kept the grain to its natural size, and though it softened it, yet made no mucilage, and remained sweet.

Nothing could be more unexpected, than to find sea salt a hastener of putrefaction; but the fact is thus; one drachm of salt preserves two drachms of fresh beef in two ounces of water, above thirty hours uncorrupted, in a heat equal to that of the human body; or, which is the same thing, this quantity of salt keeps flesh sweet twenty hours longer than pure water; but then half a drachm of salt does not preserve it above two hours longer. Twenty-five grains have little or no antiseptic virtue, and ten, fifteen, or even twenty grains, manifestly both hasten and heighten the corruption. The quantity which had the most putrefying quality, was found to be about ten grains to the above proportion of flesh and water.

Many inferences might be drawn from this experiment: one is, that since salt is never taken in aliment beyond the proportion of the corrupting quantities, it would appear that it is subservient to digestion chiefly by its *septic* virtue, that is, by softening and resolving meats; an action very different from what is commonly believed.

It is to be observed, that the above experiments were made with the salt kept for domestic uses. See Pringle's Observ. on the Diseases of the Army, p. 348, et seq.

SEPTIZON, or SEPTIZONIUM, in Roman antiquity, a celebrated mausoleum, built by Septimus Severus, in the tenth region of the city of Rome: it was so

Septuagesima, Septuagint.

called from *ſeptem* and *zona*, by reaſon it conſiſted of ſeven ſtories, each of which was ſurrounded by a row of columns.

SEPTUAGESIMA, in the kalendar, denotes the third Sunday before Lent, or before Quadrageſima Sunday: ſuppoſed by ſome to take its name from its being about ſeventy days before Eaſter.

SEPTUAGINT, the name given to a Greek verſion of the books of the Old Teſtament, from its being ſuppoſed to be the work of ſeventy-two Jews, who are uſually called the *ſeventy interpreters*, becauſe ſeventy is a round number.

The hiſtory of this verſion is expreſsly written by Ariſtæas, an officer of the guards to Ptolemy Philadelphus, the ſubſtance of whoſe account is as follows: Ptolemy having erected a fine library at Alexandria, which he took care to fill with the moſt curious and valuable books from all parts of the world, was informed that the Jews had one containing the laws of Moſes, and the hiſtory of that people; and being deſirous of enriching his library with a Greek tranſlation of it, applied to the high-prieſt of the Jews; and to engage him to comply with his requeſt, ſet at liberty all the Jews whom his father Ptolemy Soter had reduced to ſlavery. After ſuch a ſtep, he eaſily obtained what he deſired; Eleazar the Jewiſh high prieſt ſent back his ambaſſadors with an exact copy of the Moſaical law, written in letters of gold, and ſix elders of each tribe, in all ſeventy two; who were received with marks of reſpect by the king, and then conducted into the iſle of Pharos, where they were lodged in a houſe prepared for their reception, and ſupplied with every thing neceſſary. They ſet about the tranſlation without loſs of time, and finiſhed it in ſeventy-two days: and the whole being read in the preſence of the king, he admired the profound wiſdom of the laws of Moſes; and ſent back the deputies laden with preſents, for themſelves, the high prieſt, and the temple.

Ariſtobulus, who was tutor to Ptolemy Phyſcon, Philo who lived in our Saviour's time, and was contemporary with the apoſtles, and Joſephus, ſpeak of this tranſlation as made by 72 interpreters, by the care of Demetrius Phalereus, in the reign of Ptolemy Philadelphus. All the Chriſtian writers, during the firſt 15 centuries of the Chriſtian era, have admitted this account of the Septuagint as an undoubted fact. But ſince the Reformation, critics have boldly called it in queſtion, becauſe it was attended with circumſtances which they think inconſiſtent, or, at leaſt, improbable. Du Pin has aſked, why were 72 interpreters employed, ſince 12 would have been ſufficient? Such an objection is trifling. We may as well aſk, why did King James I. employ 54 tranſlators in rendering the Bible into Engliſh, ſince Du Pin thinks 12 would have been ſufficient?

1. Prideaux objects, that the Septuagint is not written in the Jewiſh, but in the Alexandrian dialect; and could not therefore be the work of natives of Paleſtine. But theſe dialects were probably at that time the ſame, for both Jews and Alexandrians had received the Greek language from the Macedonians about 50 years before.

2. Prideaux farther contends, that all the books of the Old Teſtament could not be tranſlated at the ſame time; for they exhibit great difference of ſtyle. To this it is ſufficient to reply, that they were the work of 72 men, each of whom had ſeparate portions aſſigned them. Septuag

3. The Dean alſo urges, that Ariſtæas, Ariſtobulus, Philo, and Joſephus, all directly tell us, that the law was tranſlated without mentioning any of the other ſacred books. But nothing was more common among writers of the Jewiſh nation than to give this name to the Scriptures as a whole. In the New Teſtament law is uſed as ſynonymous with what we call the Old Teſtament. Beſides, it is expreſsly ſaid by Ariſtobulus, in a fragment quoted by Euſebius (*Præp. Evan.* l. 1.), that the whole Sacred Scripture was rightly tranſlated through the means of Demetrius Phalereus, and by the command of Philadelphus. Joſephus indeed, ſays the learned Dean, aſſerts, in the preface to his Antiquities, that the Jewiſh interpreters did not tranſlate for Ptolemy the whole Scriptures, but the law only. Here the evidence is contradictory, and we have to determine, whether Ariſtobulus or Joſephus be moſt worthy of credit. We do not mean, however, to accuſe either of forgery, but only to inquire which had the beſt opportunities of knowing the truth. Ariſtobulus was an Alexandriau Jew, tutor to an Egyptian king, and lived within 100 years after the tranſlation was made, and certainly had acceſs to ſee it in the royal library. Joſephus was a native of Paleſtine, and lived not until 300 years or more after the tranſlation was made, and many years after it was burnt along with the whole library of Alexandria in the wars of Julius Cæſar. Suppoſing the veracity of theſe two writers equal, as we have no proof of the contrary, which of them ought we to conſider as the beſt evidence? Ariſtobulus ſurely. Prideaux, indeed, ſeems doubtful whether there was ever ſuch a man; and Dr Hody ſuppoſes that the Commentaries on the five books of Moſes, which bear the name of Ariſtobulus, were a forgery of the ſecond century. To prove the exiſtence of any human being, who lived 2000 years before us, and did not perform ſuch works as no mere man ever performed, is a taſk which we are not diſpoſed to undertake; and we believe it would not be leſs difficult to prove that Philo and Joſephus exiſted, than that ſuch a perſon as Ariſtobulus did not exiſt. If the writings which have paſſed under his name were a forgery of the ſecond century, it is ſurpriſing that they ſhould have impoſed upon Clemens Alexandrinus, who lived in the ſame century, and was a man of abilities, learning, and well acquainted with the writings of the ancients. Euſebius, too, in his *Præp. Evan.* quotes the commentaries of Ariſtobulus. But, continues the learned Dean, "Clemens Alexandrinus is the firſt author that mentions them. Now, had any ſuch commentaries exiſted in the time of Philo and Joſephus, they would ſurely have mentioned them. But is the circumſtance of its not being quoted by every ſucceeding author a ſufficient reaſon to diſprove the authenticity of any book? Neither Philo nor Joſephus undertook to give a liſt of preceding authors, and it was by no means the uniform practice of theſe times always to name the authors from whom they derived their information."

4. Prideaux farther contends, that the ſum which Ptolemy is ſaid to have given to the interpreters is too great to be credible. If his computation were juſt, it certainly would be ſo. He makes it 2,000,000l. ſterling,

Septuagint. Sterling, but other writers * reduce it to 85,421l. and ſome to 56,947l.; neither of which is a ſum ſo very extraordinary in ſo great and magnificent a prince as Philadelphus, who ſpent, according to a paſſage in Athenæus (Lib. V.), no leſs than 10,000 talents on the furniture of one tent; which is ſix times more than what was ſpent in the whole of the embaſſy and tranſlation, which amounted only to 1552 talents.

5. Prideaux ſays, "that what convicts the whole ſtory of Ariſteas of falſity is, that he makes Demetrius Phalereus to be the chief actor in it, and a great favourite of the king; whereas Philadelphus, as ſoon as his father was dead, caſt him into priſon, where he ſoon after died." But it may be replied, that Philadelphus reigned two years jointly with his father Lagus, and it is not ſaid by Hermippus that Demetrius was out of favour with Philadelphus during his father's life. Now, if the Septuagint was tranſlated in the beginning of the reign of Philadelphus, as Euſebius and Jerome think, the difficulty will be removed. Demetrius might have been librarian during the reign of Philadelphus, and yet impriſoned on the death of Lagus. Indeed, as the cauſe of Philadelphus's diſpleaſure was the advice which Demetrius gave to his father, to prefer the ſons of Arſinoe before the ſon of Berenice, he could ſcarcely ſhow it till his father's death. The Septuagint tranſlation might therefore be begun while Philadelphus reigned jointly with his father, but not be finiſhed till after his father's death.

6. Beſides the objections which have been conſidered, there is only one that deſerves notice. The ancient Chriſtians not only differ from one another concerning the time in which Ariſtobulus lived, but even contradict themſelves in different parts of their works. Sometimes they tell us, he dedicated his book to Ptolemy Philometer, at other times they ſay, it was addreſſed to Philadelphus and his father. Sometimes they make him the ſame perſon who is mentioned in 2 Maccabees, chap. 1. and ſometimes one of the 72 interpreters 152 years before. It is difficult to explain how authors fall into ſuch inconſiſtencies, but it is probably occaſioned by their quoting from memory. This was certainly the practice of almoſt all the early Chriſtian writers, and ſometimes of the apoſtles themſelves. Miſtakes were therefore inevitable. Joſephus has varied in the circumſtances of the ſame event, in his antiquities and wars of the Jews, probably from the ſame cauſe; but we do not hence conclude, that every circumſtance of ſuch a relation is entirely falſe. In the account of the marquis of Argyll's death in the reign of Charles II. we have a very remarkable contradiction. Lord Clarendon relates, that he was condemned to be hanged, which was performed the ſame day: on the contrary, Burnet, Woodrow, Heath, Echard, concur in ſtating, that he was beheaded; and that he was condemned upon the Saturday and executed upon the Monday †. Was any reader of Engliſh hiſtory ſo ſceptic enough to raiſe from hence a queſtion, whether the marquis of Argyll was executed or not? Yet this ought to be left in uncertainty according to the way of reaſoning in which the facts reſpecting the tranſlation of the Septuagint is attempted to be diſproved.

Such are the objections which the learned and ingenious Prideaux has raiſed againſt the common account of the Septuagint tranſlation, and ſuch are the anſwers which may be given to them. We have choſen to ſupport that opinion which is ſanctioned by hiſtorical evidence, in preference to the conjectures of modern critics however ingenious: being perſuaded, that there are many things recorded in hiſtory, which, though perfectly true, yet, from our imperfect knowledge of the concomitant circumſtances, may, at a diſtant period, ſeem liable to objections. To thoſe who require poſitive evidence, it may be ſtated thus: Ariſteas, Ariſtobulus, Philo, and Joſephus, aſſure us, that the law was tranſlated. Taking the law in the moſt reſtricted ſenſe, we have at leaſt ſufficient authority to aſſert, that the Pentateuch was rendered into Greek under Ptolemy Philadelphus. Ariſtobulus affirms, that the whole Scriptures were tranſlated by the 72. Joſephus confines their labours to the books of Moſes. He therefore who cannot determine to which of the two the greateſt reſpect is due, may ſuſpend his opinion. It is certain, however, that many of the other books were tranſlated before the age of our Saviour; for they are quoted both by him and his apoſtles: and, perhaps, by a minute examination of ancient authors, in the ſame way that Dr Lardner has examined the Chriſtian fathers to prove the antiquity of the New Teſtament, the preciſe period in which the whole books of the Septuagint were compoſed might, with conſiderable accuracy, be aſcertained.

For 400 years this tranſlation was in high eſtimation with the Jews. It was read in their ſynagogues in preference to the Hebrew; not only in thoſe places where Greek was the common language, but in many ſynagogues of Jeruſalem and Judea. But when they ſaw that it was equally valued by the Chriſtians, they became jealous of it, and at length, in the ſecond century, Aquila, an apoſtate Chriſtian, attempted to ſubſtitute another Greek tranſlation in its place. In this work he was careful to give the ancient prophecies concerning the Meſſiah a different turn from the Septuagint, that they might not be applicable to Chriſt. In the ſame deſign he was followed by Symmachus and Theodotion, who alſo, as St Jerome informs us, wrote out of hatred to Chriſtianity.

In the mean time, the Septuagint, from the ignorance, boldneſs, and careleſſneſs of tranſcribers, became full of errors. To correct theſe, Origen publiſhed a new edition in the beginning of the third century, in which he placed the tranſlations of Aquila, Symmachus, and Theodotion. This edition was called *Tetrapla*, the tranſlations being arranged oppoſite to one another in four columns. He alſo added one column, containing the Hebrew text in Hebrew letters, and another exhibiting it in Greek. In a ſecond edition he publiſhed two additional Greek verſions; one of which was found at Nicopolis, and the other at Jericho: this was called the *Hexapla*. By comparing ſo many tranſlations, Origen endeavoured to form a correct copy of the Scriptures. Where they all agreed, he conſidered them right. The paſſages which he found in the LXX, but not in the Hebrew text, he marked with an obeliſk: what he found in the Hebrew, but not in the LXX, he marked with an aſteriſk. St Jerome ſays, that the additions which Origen made to the LXX, and marked with an aſteriſk, were taken from Theodotion. From this valuable work of Origen the verſion of the LXX was tranſcribed in a ſeparate volume, with the aſteriſks and obeliſks

Septuagint. obeliſks for the uſe of the churches; and from this circumſtance the great work itſelf was neglected and loſt.

About the year 300 two new editions of the LXX were publiſhed; the one by Heſychius an Egyptian biſhop, and the other by Lucian a preſbyter of Antioch. But as theſe authors did not mark with any note of diſtinction the alterations which they had made, their edition does not poſſeſs the advantages of Origen's.

The beſt edition of the LXX is that of Dr Grabe, which was publiſhed in the beginning of the preſent century. He had acceſs to two MSS, nearly of equal antiquity, the one found in the Vatican library at Rome, the other in the Royal library at St James's, which was preſented to Charles I. by Cyril, patriarch of Alexandria, and hence is commonly called the *Alexandrian MS.* Anxious to diſcover which of theſe was according to the edition of Origen, Dr Grabe collected the fragments of the Hexapla, and found they agreed with the Alexandrian MS. but not with the Vatican where it differed with the other. Hence he concluded that the Alexandrian MS. was taken from the edition of Origen. By comparing the quotations from ſcripture in the works of Athanaſius and St Cyril (who were patriarchs of Alexandria at the time St Jerome ſays Heſychius's edition of the LXX was there uſed) with the Vatican MS. he found they agreed ſo well that he juſtly inferred that that MS. was taken from the edition of Heſychius.

This verſion was in uſe to the time of our bleſſed Saviour, and is that out of which moſt of the citations in the New Teſtament, from the Old, are taken. It was alſo the ordinary and canonical tranſlation made uſe of by the Chriſtian church in the earlieſt ages; and it ſtill ſubſiſts in the churches both of the eaſt and weſt.

Thoſe who deſire a more particular account of the Septuagint tranſlation may conſult Hody *de Bibliorum Textibus*, Prideaux's Connexions, Owen's Inquiry into the Septuagint Verſion, Blair's Lectures on the Canon, and Michaelis's Introduction to the New Teſtament, laſt edition.

Septuagint Chronology, the chronology which is formed from the dates and periods of time mentioned in the Septuagint tranſlation of the Old Teſtament. It reckons 1500 years more from the creation to Abraham than the Hebrew bible. Dr Kennicot, in the diſſertation prefixed to his Hebrew bible, has ſhown it to be very probable that the chronology of the Hebrew ſcriptures, ſince the period juſt mentioned, was corrupted by the Jews, between the years 175 and 200, and that the chronology of the Septuagint is more agreeable to truth. It is a fact, that during the ſecond and third centuries the Hebrew ſcriptures were almoſt entirely in the hands of the Jews, while the Septuagint was confined to the Chriſtians. The Jews had therefore a very favourable opportunity for this corruption. The following is the reaſon which is given by oriental writers: It being a very ancient tradition, that the Meſſiah was to come in the ſixth chiliad, becauſe he was to come in the laſt days (founded on a myſtical application of the ſix days creation), the contrivance was *to ſhorten the age of the world from about* 5500 *to* 3760; *and thence to prove that Jeſus could not be the Meſſiah.* Dr Kennicot adds, that ſome Hebrew copies having the larger chronology were extant till the time of Euſebius, and ſome till the year 700.

SEPTUM, in anatomy, an encloſure or partition; a term applied to ſeveral parts of the body, which ſerve to ſeparate one part from another; as, *ſeptum narium*, or partition between the noſtrils, &c.

SEPULCHRAL, ſomething belonging to ſepulchres or tombs: thus a ſepulchral column is a column erected over a tomb, with an inſcription on its ſhaft; and ſepulchral lamps, thoſe ſaid to have been found burning in the tombs of ſeveral martyrs and others. See Lamp.

SEPULCHRE, a tomb or place deſtined for the interment of the dead. This term is chiefly uſed in ſpeaking of the burying-places of the ancients, thoſe of the moderns being uſually called *tombs*.

Sepulchres were held ſacred and inviolable; and the care taken of them has always been held a religious duty, grounded on the fear of God, and the belief of the ſoul's immortality. Thoſe who have ſearched or violated them have been thought odious by all nations, and were always ſeverely puniſhed.

The Egyptians called ſepulchres *eternal houſes*, in contradiſtinction to their ordinary houſes or palaces, which they called *inns*, on account of their ſhort ſtay in the one in compariſon of their long abode in the other. See Tomb.

Regular Canons of St Sepulchre, a religious order, formerly inſtituted at Jeruſalem, in honour of the holy ſepulchre, or the tomb of Jeſus Chriſt.

Many of theſe canons were brought from the Holy Land into Europe, particularly into France, by Louis the Younger; into Poland, by Jaxa, a Poliſh gentleman; and into Flanders, by the counts thereof; many alſo came into England. This order was, however, ſuppreſſed by Pope Innocent VIII. who gave its revenues and effects to that of our lady of Bethlehem: which alſo becoming extinct, they were beſtowed on the knights of St John of Jeruſalem. But the ſuppreſſion did not take effect in Poland, where they ſtill ſubſiſt, as alſo in ſeveral provinces of Germany. Theſe canons follow the rule of St Auguſtine.

Knights of the Holy Sepulchre, a military order, eſtabliſhed in Paleſtine about the year 1114.

The knights of this order in Flanders choſe Philip II. king of Spain, for their maſter, in 1558, and afterwards his ſon; but the grand-maſter of the order of Malta prevailed on the laſt to reſign; and when afterwards the duke of Nevers aſſumed the ſame quality in France, the ſame grand-maſter, by his intereſt and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta.

SEQUANI, a people anciently forming a part of Gallia Celtica, but annexed to Belgica by Auguſtus, ſeparated from the Helvetii by Mount Jura, with the Rhine on the eaſt (Strabo), bordering on the Ædui, and Seguſtiano to the ſouth, and Lingones to the weſt (Tacitus). Now Franche Comte.

SEQUESTRATION, in common law, is ſetting aſide the thing in controverſy from the poſſeſſion of both the parties that contend for it. In which ſenſe it is either voluntary, as when done by the conſent of the parties; or neceſſary, as where it is done by the judge,

Sequeſtration. judge, of his own authority, whether the parties will or not.

SEQUESTRATION, in the civil law, is the act of the ordinary, diſpoſing of the goods and chattels of one deceaſed, whoſe eſtate no man will meddle with.

A widow is alſo ſaid to ſequeſter, when ſhe diſclaims having any thing to do with the eſtate of her deceaſed huſband.

Among the Romaniſts, in queſtions of marriage, where the wife complains of impotency in the huſband, ſhe is to be ſequeſtered into a convent, or into the hands of matrons, till the proceſs be determined.

SEQUESTRATION is alſo uſed for the act of gathering the fruits of a benefice void, to the uſe of the next incumbent.

Sometimes a benefice is kept under ſequeſtration for many years, when it is of ſo ſmall value, that no clergyman fit to ſerve the cure will be at the charge of taking it by inſtitution; in which caſe the ſequeſtration is committed either to the curate alone, or to the curate and church-wardens jointly. Sometimes the profits of a living in controverſy, either by the conſent of the parties, or the judge's authority, are ſequeſtered and placed for ſafety in a third hand, till the ſuit is determined, a miniſter being appointed by the judge to ſerve the cure, and allowed a certain ſalary out of the profits. Sometimes the profits of a living are ſequeſtered for neglect of duty, for dilapidations, or for ſatisfying the debts of the incumbent.

SEQUESTRATION, in chancery, is a commiſſion uſually directed to ſeven perſons therein named, empowering them to ſeize the defendant's perſonal eſtate, and the profits of his real, and to detain them, ſubject to the order of the court. It iſſues on the return of the ſerjeant at arms, wherein it is certified, that the defendant had ſecreted himſelf.

Sequeſtrations were firſt introduced by Sir Nicholas Bacon, lord keeper in the reign of Queen Elizabeth; before which the court found ſome difficulty in enforcing its proceſs and decrees; and they do not ſeem to be in the nature of proceſs to bring in the defendant, but only intended to enforce the performance of the court's decree.

A ſequeſtration is alſo made, in London, upon an action of debt; the courſe of proceeding in ſuch caſe is this: The action being entered, the officer goes to the defendant's ſhop or warehouſe, when no perſon is there, and takes a padlock, and hangs it on the door, uttering theſe words: "I do ſequeſter this warehouſe, and the goods and merchandiſe therein, of the defendant in this action, to the uſe of the plaintiff," &c. after which he ſets on his ſeal, and makes a return of the ſequeſtration in the compter; and four days being paſſed after the return made, the plaintiff may, at the next court, have judgment to open the ſhop or warehouſe, and to have the goods appraiſed by two freemen, who are to be ſworn at the next court held for that compter; and then the ſerjeant puts his hand to the bill of appraiſement, and the court grants judgment thereon; but yet the defendant may put in bail before ſatisfaction, and by that means diſſolve the ſequeſtration; and after ſatisfaction, may put in bail to diſprove the debt, &c.

In the time of the civil wars, ſequeſtration was uſed for a ſeizing of the eſtates of delinquents for the uſe of the commonwealth. Sequeſtration

SEQUESTRATION, in Scots law. See LAW, p. 683.

SEQUIN, a gold coin, ſtruck at Venice, and in ſeveral parts of the Grand Signior's dominions. In Turkey it is called *dahab*, or piece of gold, and according to Volney is in value about 6s. 3d. ſterling. It varies, however, conſiderably in its value in different countries. At Venice it is equal to about 9s. 2d. ſterling. Seraglio.

The Venetian ſequins are in great requeſt in Syria, from the fineneſs of their ſtandard, and the practice they have of employing them for women's trinkets. The faſhion of theſe trinkets does not require much art; the piece of gold is ſimply pierced, in order to ſuſpend it by a chain, likewiſe of gold, which flows upon the breaſt. The more ſequins that are attached to this chain, and the greater the number of theſe chains, the more is a woman thought to be ornamented. This is the favourite luxury, and the emulation of all ranks. Even the female peaſants, for want of gold, wear piaſtres or ſmaller pieces; but the women of a certain rank diſdain ſilver; they will accept of nothing but ſequins of Venice, or large Spaniſh pieces, and cruſadoes. Some of them wear 200 or 300, as well lying flat, as ſtrung one on another, and hung near the forehead, at the edge of the head dreſs. It is a real load: but they do not think they can pay too dearly for the ſatisfaction of exhibiting this treaſure at the public bath, before a crowd of rivals, to awaken whoſe jealouſy conſtitutes their chief pleaſure. The effect of this luxury on commerce, is the withdrawing conſiderable ſums from circulation, which remain dead; beſides, that when any of theſe pieces return into common uſe, having loſt their weight by being pierced, it becomes neceſſary to weigh them. The practice of weighing money is general in Syria, Egypt, and all Turkey. No piece, however effaced, is refuſed there; the merchant draws out his ſcales and weighs it, as in the days of Abraham, when he purchaſed his ſepulchre. In conſiderable payments, an agent of exchange is ſent for, who counts paras by thouſands, rejects a great many pieces of falſe money, and weighs all the ſequins, either ſeparately or together.

SERAGLIO, formed from the Perſian word *ſeraw*, or Turkiſh word *ſarai*, which ſignifies a houſe, and is commonly uſed to expreſs the houſe or palace of a prince. In this ſenſe it is frequently uſed at Conſtantinople; the houſes of foreign ambaſſadors are called *ſeraglios*. But it is commonly uſed by way of eminence for the palace of the grand ſignior at Conſtantinople, where he keeps his court, and where his concubines are lodged, and where the youth are trained up for the chief poſts of the empire.

It is a triangle about three Italian miles round, wholly within the city, at the end of the promontory Chryſoceras, now called the *Seraglio Point*. The buildings run back to the top of the hill, and from thence are gardens that reach to the edge of the ſea. It is encloſed with a very high and ſtrong wall, upon which there are ſeveral watch towers: and it has many gates, ſome of which open towards the ſea-ſide, and the reſt into the city; but the chief gate is one of the latter, which is conſtantly guarded by a company of capoochees, or porters; and in the night it is well guarded towards the

seraglio. the ſea. The outward appearance is not very beautiful, the architecture being irregular, conſiſting of ſeparate edifices in the form of pavilions and domes.

The ladies of the ſeraglio are a collection of beautiful young women, chiefly ſent as preſents from the provinces and the Greek iſlands, moſt of them the children of Chriſtian parents. The brave prince Heraclius hath for ſome years paſt aboliſhed the infamous tribute of children of both ſexes, which Georgia formerly paid every year to the Porte. The number of women in the harem depends on the taſte of the reigning monarch or ſultan. Selim had 2000, Achmet had but 300, and the late ſultan had nearly 1600. On their admiſſion they are committed to the care of old ladies, taught ſewing and embroidery, muſic, dancing, and other accompliſhments, and furniſhed with the richeſt clothes and ornaments. They all ſleep in ſeparate beds, and between every fifth there is a preceptreſs. Their chief governeſs is called *Katon Kiaga*, or governeſs of the noble young ladies. There is not one ſervant among them, for they are obliged to wait on one another by rotation; the laſt that is entered ſerves her who preceded her and herſelf. Theſe ladies are ſcarcely ever ſuffered to go abroad, except when the grand ſignior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are encloſed with lattices and linen curtains; and when they go by land they are put into cloſe chariots, and ſignals are made at certain diſtances, to give notice that none approach the roads through which they march. The boats of the harem, which carry the grand ſignior's wives, are manned with 24 rowers, and have white covered tilts, ſhut alternately by Venetian blinds. Among the emperor's attendants are a number of mutes, who act and converſe by ſigns with great quickneſs, and ſome dwarfs, who are exhibited for the diverſion of his majeſty.

When he permits the women to walk in the gardens of the ſeraglio, all people are ordered to retire, and on every ſide there is a guard of black eunuchs, with ſabres in their hands, while others go their rounds in order to hinder any perſon from ſeeing them. If, unfortunately, any one is found in the garden, even thro' ignorance or inadvertance, he is undoubtedly killed, and his head brought to the feet of the grand ſignior, who gives a great reward to the guard for their vigilance. Sometimes the grand ſignior paſſes into the gardens to amuſe himſelf when the women are there; and it is then that they make uſe of their utmoſt efforts, by dancing, ſinging, ſeducing geſtures, and amorous blandiſhments, to enſnare the affections of the monarch. It is not permitted that the monarch ſhould take a virgin to his bed, except during the ſolemn feſtivals, and on occaſion of ſome extraordinary rejoicings, or the arrival of ſome good news. Upon ſuch occaſions, if the ſultan chooſes a new companion to his bed, he enters into the apartment of the women, who are ranged in files by the governeſſes, to whom he ſpeaks, and intimates the perſon he likes beſt: the ceremony of the handkerchief, which the grand ſignior is ſaid to throw the girl that he cleſts, is an idle tale, without any foundation. As ſoon as the grand ſignior has choſen the girl that he has deſtined to be the partner of his bed, all the others follow her to the bath, waſhing and perfuming her, and dreſſing her ſuperbly, conducting her ſinging, dancing, and rejoicing, to the bedchamber of the grand ſignior, who is generally, on ſuch an occaſion, already in bed. Scarcely has the new elected favourite entered the chamber, introduced by the grand eunuch who is upon guard, than ſhe kneels down, and when the ſultan calls her, ſhe creeps into bed to him at the foot of the bed, if the ſultan does not order her, by eſpecial grace, to approach by the ſide: after a certain time, upon a ſignal given by the ſultan, the governeſs of the girls, with all her ſuite, enter the apartment, and take her back again, conducting her with the ſame ceremony to the women's apartments; and if by good fortune ſhe becomes pregnant, and is delivered of a boy, ſhe is called *aſaki ſultaneſs*, that is to ſay, ſultaneſs-mother; for the firſt ſon ſhe has the honour to be crowned, and ſhe has the liberty of forming her court. Eunuchs are alſo aſſigned for her guard, and for her particular ſervice. No other ladies, though delivered of boys, are either crowned or maintained with ſuch coſtly diſtinction as the firſt; however, they have their ſervice apart, and handſome appointments. After the death of the ſultan, the mothers of the male children are ſhut up in the old ſeraglio, from whence they can never come out any more, unleſs any of their ſons aſcend the throne. Baron de Tott informs us, that the female ſlave who becomes the mother of a ſultan, and lives long enough to ſee her ſon mount the throne, is the only woman who at that period alone acquires the diſtinction of *ſultana-mother*; ſhe is till then in the interior of her priſon with her ſon. The title of *bache kadun*, principal woman, is the firſt dignity of the grand ſignior's harem; and ſhe hath a larger allowance than thoſe who have the title of ſecond, third, and fouth woman, which are the four free women the Koran allows.

This is a deſcription of the grand ſignior's ſeraglio: we ſhall now add an account of the ſeraglio or *harem*, as it is often called, of the emperor of Morocco, from the very intereſting tour of Mr Lempriere. This gentleman being a ſurgeon by profeſſion, was admitted into the harem to preſcribe for ſome of the ladies who were indiſpoſed, and was therefore enabled to give a particular account of this female priſon, and, what is ſtill more curious, of the manners and behaviour of its inhabitants.

The harem forms a part of the palace. The apartments, which are all on the ground floor, are ſquare, very lofty, and four of them encloſe a ſpacious ſquare court, into which they open by means of large folding doors. In the centre of theſe courts, which are floored with blue and white checqured tiling, is a fountain, ſupplied by pipes from a large reſervoir on the outſide of the palace, which ſerves for the frequent ablutions recommended by the Mahometan religion, as well as for other purpoſes. The whole of the harem conſiſts of about twelve of theſe ſquare courts, communicating with each other by narrow paſſages, which afford a free acceſs from one part of it to another, and of which all the women are allowed to avail themſelves.

The apartments are ornamented on the outſide with beautiful carved wood. In the inſide moſt of the rooms are hung with rich damaſk of various colours; the floors are covered with beautiful carpets, and there are mattreſſes diſpoſed at different diſtances, for the purpoſes of ſitting and ſleeping.

Beſides

Seraglio.

Beſides theſe, the apartments are furniſhed at each extremity with an elegant European mahogany bedſtead, hung with damaſk, having on it ſeveral mattreſſes placed one over the other, which are covered with various coloured ſilks; but theſe beds are merely placed there to ornament the room. In all the apartments, without exception, the ceiling is wood, carved and painted. The principal ornaments in ſome were large and valuable looking glaſſes, hung on different parts of the walls. In others, clocks and watches of different ſizes, in glaſs caſes, were diſpoſed in the ſame manner.

The ſultana Lalla Batoom and another favourite were indulged with a whole ſquare to themſelves; but the concubines were only each allowed a ſingle room.

Each female had a ſeparate daily allowance from the emperor, proportioned to the eſtimation in which they were held by him. The late emperor's allowance was very trifling; Lalla Douyaw, the favourite ſultana, had very little more than half a crown Engliſh a-day, and the others leſs in proportion. It muſt be allowed, that the emperor made them occaſional preſents of money, dreſs, and trinkets; but this could never be ſufficient to ſupport the number of domeſtics and other expences they muſt incur. Their greateſt dependence therefore was on the preſents they received from thoſe Europeans and Moors who viſited the court, and who employed their influence in obtaining ſome particular favour from the emperor. This was the moſt ſucceſsful mode that could be adopted. When Mr Lempriere was at Morocco, a Jew, deſirous of obtaining a very advantageous favour from the emperor, for which he had been a long time unſucceſsfully ſoliciting, ſent to all the principal ladies of the harem preſents of pearls to a very large amount; the conſequence was, that they all went in a body to the emperor, and immediately obtained the wiſhed-for conceſſion.

The ladies ſeparately furniſh their own rooms, hire their own domeſtics, and, in fact, do what they pleaſe in the harem, but are not permitted to go out without an expreſs order from the emperor, who very ſeldom grants them that favour, except when they are to be removed from one palace to another. In that caſe, a party of ſoldiers is deſpatched a little diſtance before them, to diſperſe the male paſſengers in particular, and to prevent the poſſibility of their being ſeen. This previous ſtep being taken, a piece of linen cloth is tied round the lower part of the face, and afterwards theſe miſerable females cover themſelves entirely with their haicks, and either mount mules, which they ride like men, or, what is more uſual, are put into a ſquare carriage or litter, conſtructed for this purpoſe, which by its lattice work allows them to ſee without being ſeen. In this manner they ſet off, under the charge of a guard of black eunuchs. This journey, and ſometimes a walk within the bounds of the palace, with which they are, however, ſeldom indulged, is the only exerciſe they are permitted to take.

The late emperor's harem conſiſted of between 60 and 100 females, beſides their domeſtics and ſlaves, which were very numerous. Many of the concubines were Mooriſh women, who had been preſented to the emperor, as the Moors conſider it an honour to have their daughters in the harem; ſeveral were European ſlaves, who had either been made captives, or purchaſed by the emperor; and ſome were negroes.

In this group the Europeans, or their deſcendants had by far the greateſt claim to the character of handſome. There was one in particular, who was a native of Spain, and taken into the harem at about the ſame age as Lalla Douyaw, who was indeed a perfect beauty. Nor was this lady quite ſingular in that reſpect, for many others were almoſt equally handſome.

The eunuchs, who have the entire charge of the women, and who in fact live always among them, are the children of negro ſlaves. They are generally either very ſhort and fat, or elſe tall, deformed, and lame. Their voices have that particular tone which is obſervable in youths who are juſt arriving at manhood; and their perſons altogether afford a diſguſting image of weakneſs and effeminacy.

The ſame gentleman gives us a very curious account of the manners and ignorance of theſe immured females, from his own obſervation when viſiting the prince's harem. "Attended by an eunuch (ſays he), after paſſing the gate of the harem, which is always locked, and under the care of a guard of eunuchs, we entered a narrow and dark paſſage, which ſoon brought us to the court, into which the women's chambers open. We here ſaw numbers of both black and white women and children; ſome concubines, ſome ſlaves, and other hired domeſtics.

"Upon their obſerving the unuſual figure of an European, the whole multitude in a body ſurrounded me, and expreſſed the utmoſt aſtoniſhment at my dreſs and appearance. Some ſtood motionleſs, with their hands lifted up, their eyes fixed, and their mouths open, in the uſual attitude of wonder and ſurpriſe. Some burſt into immoderate fits of laughter; while others again came up, and with uncommon attention eyed me from head to foot. The parts of my dreſs which ſeemed moſt to attract their notice were my buckles, buttons, and ſtockings; for neither men nor women in this country wear any thing of the kind. With reſpect to the club of my hair, they ſeemed utterly at a loſs in what view to conſider it; but the powder which I wore they conceived to be employed for the purpoſe of deſtroying vermine. Moſt of the children, when they ſaw me, ran away in the moſt perfect conſternation; and on the whole, I appeared as ſingular an animal, and I dare ſay had the honour of exciting as much curioſity and attention, as a lion or a man tiger juſt imported from abroad, and introduced into a country town in England on a market day. Every time I viſited the harem, I was ſurrounded and laughed at by this curious mob, who, on my entering the gate, followed me cloſe to the very chamber to which I was proceeding, and on my return univerſally eſcorted me out.

"The greateſt part of the women were uncommonly fat and unwieldy; had black and full eyes, round faces, with ſmall noſes. They were of different complexions; ſome very fair, ſome ſallow, and others again perfect negroes.

"One of my new patients being ready to receive me, I was deſired to walk into her room; where, to my great ſurpriſe, I ſaw nothing but a curtain drawn quite acroſs the apartment, ſimilar to that of a theatre which ſeparates the ſtage from the audience. A female domeſtic brought a very low ſtool, placed it near the curtain, and told me I was to ſit down there, and feel her miſtreſs's pulſe.

Seraglio.

"The lady, who had by this time ſummoned up courage to ſpeak, introduced her hand from the bottom of the curtain, and deſired me to inform her of all her complaints, which ſhe conceived I might perfectly do by merely feeling the pulſe. It was in vain to aſk her where her pain was ſeated, whether in her ſtomach, head, or back; the only anſwer I could procure was a requeſt to feel the pulſe of the other hand, and then point out the ſeat of the diſeaſe, and the nature of the pain.

"Having neither ſatisfied my curioſity by exhibiting her face, nor made me acquainted with the nature of her complaint, I was under the neceſſity of informing her in poſitive terms, that to underſtand the diſeaſe, it was abſolutely neceſſary to ſee the tongue as well as to feel the pulſe; and that without it I could do nothing for her. My eloquence, or rather that of my Jewiſh interpreter, was, however, for a long time exerted in vain; and I am perſuaded ſhe would have diſmiſſed me without any further inquiry, had not her invention ſupplied her with a happy expedient to remove her embarraſſment. She contrived at laſt to cut a hole through the curtain, through which ſhe extruded her tongue, and thus complied with my injunction as far as it was neceſſary in a medical view, but moſt effectually diſappointed my curioſity.

"I was afterwards ordered to look at another of the prince's wives, who was affected with a ſcrophulous ſwelling in her neck. This lady was, in the ſame manner as the other, at firſt excluded from my ſight; but as ſhe was obliged to ſhow me her complaint, I had an opportunity of ſeeing her face, and obſerved it to be very handſome."

It is curious to obſerve the ſtrange and childiſh notions of perſons who have been totally ſecluded from the world. All the ladies of the harem expected that our author ſhould have inſtantly diſcovered their complaints upon feeling the pulſe, and that he could cure every diſeaſe inſtantaneouſly. He found them proud and vain of their perſons, and extremely ignorant. "Among many ridiculous queſtions, they aſked my interpreter (ſays M. Lempriere) if I could read and write: upon being anſwered in the affirmative, they expreſſed the utmoſt ſurpriſe and admiration at the abilities of the Chriſtians. There was not one among them who could do either; theſe rudiments of learning are indeed only the lot of a few of their men, who on that account are named *Talbs*, or explainers of the Mahometan law."

It is melancholy to reflect on the ſituation of theſe unfortunate women. Being conſidered as the mere inſtruments of pleaſure, no attention is paid to the improvement of their minds. They have no employment to occupy their time. Their needle work is performed by ſeweſſes; their food is dreſſed, and their chambers taken care of by ſlaves and domeſtics. They have no amuſement but a rude and barbarous kind of melancholy muſic, without melody, variety, or taſte; and converſation with one another, which muſt indeed be very confined, uniform, and inanimate, as they never ſee a new object. Excluded from the enjoyment of freſh air and exerciſe, ſo neceſſary for the ſupport of health and life; deprived of all ſociety but that of their fellow ſufferers, a ſociety to which moſt of them would prefer ſolitude itſelf; they are only to be conſidered as the moſt abject of ſlaves—ſlaves to the vices and caprice of a licentious tyrant, who exacts even from his wives themſelves a degree of ſubmiſſion and reſpect which borders upon idolatry, and which God and nature never meant ſhould be paid to a mortal.

Ser.. ‖ Seraph

SERAI, a building on the high road, or in large cities in India, erected for the accommodation of travellers.

SERAPH, or Seraphim, a ſpirit of the higheſt rank in the hierarchy of angels; who are thus called from their being ſuppoſed to be moſt inflamed with divine love, by their nearer and more immediate attendance at the throne of God, and to communicate their fervour to the remoter and inferior orders. See Angel.

SERAPHIC, burning or inflamed with love or zeal, like a ſeraphim: thus St Bonaventure is called the *ſeraphic doctor*, from his abundant zeal and fervour.

SERAPIAS, in botany: A genus of plants belonging to the order of diandria, and to the claſs of gynandria; and in the natural ſyſtem arranged under the 7th order, *Orchideæ*. The nectarium is egg-ſhaped and gibbous, with an egg-ſhaped lip. The ſpecies, according to Linnæus, are ten. 1. Latifolia; 2. Longifolia; 3. Grandiflora, or enſifolia; 4. Lancifolia; 5. Rubra; 6. Lingua; 7. Cordigera; 8. Capenſis; 9. Erecta; 10. Falcata. The three firſt are natives of Britain. 1. The *Latifolia*, or broad-leaved helleborine, is diſtinguiſhed by fibrous bulbs, by ovate ſtem-claſping leaves, and pendulous flowers. The ſtalk is erect, about a cubit high, and furniſhed with ſix or eight nervous oval leaves; the ſpike is about ſix inches long; the three upper petals are of a green colour, and of an oval acute form; the lateral ones are a little ſhorter, and of a white colour, with a little tinge of green. 2. The *Paluſtris*, or marſh helleborine, grows in rough boggy paſtures and marſhes, and flowers in July. It is diſtinguiſhed by fibrous bulbs, ſword-ſhaped ſeſſile leaves, pendulous flowers; and the lip of the nectarium is obtuſe, ſomewhat ſerrated, and longer than the petals. The flowers grow to the number of 15 or 20 in a looſe ſpike. The three exterior petals are green mixed with red; the lateral ones are white with a red bluſh; and the nectarium is marked with red lines and yellow tubercuious ſpots. 3. The *Grandiflora*, or white-flowered helleborine, grows in woods, and flowers in June. Its characteriſtics are, fibrous bulbs, ſword-ſhaped leaves, erect flowers; and the lip of the nectarium is obtuſe and ſhorter than the petals. The flowers are large and erect, and conſiſting of ſix or eight in a thin ſpike; the petals are all white, and connive together; the lip of the nectarium is encloſed within the petals, is white and ſtreaked with three yellow prominent lines.

SERAPION, a phyſician of Alexandria. He and Philinus of the iſle of Cos were both ſcholars of Herophilus, and were founders of the empiric ſect; which happened about 287 B. C.

SERAPIS, in mythology, an Egyptian deity, who was worſhipped under various names and attributes, as the tutelary god of Egypt in general, and as the patron of ſeveral of their principal cities. Tacitus informs us, that he was worſhipped as a kind of univerſal deity that repreſented Eſculapius, Oſiris, Jupiter, and Pluto; and he was ſometimes taken for Jupiter Ammon, the Sun, and Neptune; and the honours that were rendered to

Serapis ‖ Serene.

him at Alexandria were more ſolemn and extraordinary than thoſe of any other place.

Plutarch and Clemens of Alexandria, as well as Tacitus *, inform us, that while the firſt Ptolemy was employed in fortifying Alexandria with walls, adorning it with temples and ſtately buildings, there appeared to him in his ſleep a young man of extraordinary beauty, of a ſtature more than human, admoniſhing him to deſpatch into Pontus ſome of his moſt truſty friends to bring from thence his ſtatue: he aſſured him, that the city and kingdom which poſſeſſed it ſhould prove happy, glorious, and powerful. The young man having thus ſpoke, diſappeared, mounting up into heaven in a blaze.

* *Tac. Hiſt.* l. iv. cap. 3. *Plut. de Iſide et Oſiride Clem. Alex. in Protr.*

Ptolemy diſcovered his viſion to the prieſts; but finding them ignorant of Pontus, he had recourſe to an Athenian, who informed him that near Sinope, a city of Pontus, there was a temple much reſorted to by the natives, which was conſecrated to Pluto, where he had a ſtatue, near which ſtood that of a woman. Ptolemy, neglecting the injunctions of the apparition, it again appeared to him in a menacing attitude; and the king immediately deſpatched ambaſſadors to the Serapian monarch, loaded with preſents. The king of Sinope conſented; but his ſubjects oppoſed the removal of the ſtatue. The god, however, of his own accord, as we are informed, conveyed himſelf to the ambaſſador's ſhip, and in three days landed in Alexandria. The ſtatue of Serapis was erected in one of the ſuburbs of the city, where a magnificent temple was afterwards reared.

The ſtatue of Serapis, according to Macrobius, was of a human form, with a baſket or buſhel on his head, ſignifying plenty; his right hand leaned on the head of a ſerpent, whoſe body was wound round a figure with three heads, of a dog, a lion, and a wolf; in his left hand he held a meaſure of a cubit length, as it were to take the height of the waters of the Nile. The figure of Serapis is found on many ancient medals.

The famous temple of Serapis at Alexandria was deſtroyed by order of Theodoſius; and the celebrated ſtatue of this deity was broken in pieces, and its limbs carried firſt in triumph by the Chriſtians through the city, and then thrown into a fierce fire, kindled for that purpoſe in the amphitheatre. As the Egyptians aſcribed the overflowing of the Nile, to which was owing the fertility of their country, to the benign influence of their god Serapis, they concluded, that now he was deſtroyed, the river would no longer overflow, and that a general famine would enſue; but when they obſerved, on the contrary, that the Nile ſwelled to a greater height than had been known in the memory of man, and thereby produced an immenſe plenty of all kinds of proviſions, many of the Pagans, renouncing the worſhip of idols, adored the God of the Chriſtians.

SERENA GUTTA, the ſame as *amaurɔſis*. See MEDICINE, N° 360.

SERENADE, a kind of concert given in the night by a lover to his miſtreſs, under her window. Theſe ſometimes only conſiſt of inſtrumental muſic, but at other times voices are added: the muſic and ſongs compoſed for theſe occaſions are alſo called *ſerenades*.

SERENE, a title of honour given to ſeveral princes and to the principal magiſtrates of republics. The king of Britain, the republic and doge of Venice, and the children of the king of Spain, are called *moſt ſerene*; and when the pope or the ſacred college write to the emperor, to kings, or to the doge, they give them no other title. In like manner, the emperor gives no other title to any king, except to the king of France.

Serenus ‖ Serge.

SERENUS (Sammonicus), a celebrated phyſician in the reigns of the emperor Severus and Caracalla, in and about the year 200. He wrote ſeveral treatiſes on hiſtory and the works of nature; but there is only one of them extant, which is a very indifferent poem on the Remedies of Diſeaſes. He was murdered at a feſtival by the order of Caracalla. He had a library that contained 62,000 volumes, which Quintus Serenus Sammonicus his ſon gave to Gordian the Younger, to whom he was preceptor.

SERES (Ptolemy), a people of the Farther Aſia; bounded on the weſt by Scythia extra Imaum; on the north and eaſt, by Terra Incognita; and on the ſouth, by India extra Gangem. According to theſe limits, their country anſwers nearly to Cathay or North China. Other authors vary greatly in placing them, though the generality agree in placing them far to the eaſt. Mela places them between the Indi and Scythæ; and perhaps beyond the Indi, if we diſtinguiſh the Sinæ from them. The ancients commend them for their cotton manufactures, different from the produce of the bombyces or ſilk worms, called *ſeres* by the Greeks; whence *ſerica* "ſilk."

SERGE, a woollen quilted ſtuff, manufactured on a loom with four treddles, after the manner of ratteens, and other ſtuffs that have the whale. The goodneſs of ſerges is known by the quilting, as that of cloths by the ſpinning. Of ſerges there are various kinds, denominated either from the different qualities thereof, or from the places where they are wrought. The moſt conſiderable is the London ſerge, now highly valued abroad, particularly in France, where a manufacture is carried on with conſiderable ſucceſs, under the title of *ſerge façon de Londres*.

The method of making the London ſerge we ſhall now deſcribe: For wool, the longeſt is choſen for the warp, and the ſhorteſt for the woof. Before either kind is uſed, it is firſt ſcoured, by putting it in a copper of liquor, ſomewhat more than lukewarm, compoſed of three parts of fair water and one of urine. After having ſtayed long enough therein for the liquor to diſſolve, and take off the greaſe, &c. it is ſtirred briſkly about with a wooden peel; taken out of the liquor, drained, and waſhed in a running water, dried in the ſhade, beaten with ſticks on a wooden rack to drive out the coarſer duſt and filth, and then picked clean with the hands. Thus far prepared, it is greaſed with oil of olives, and the longeſt part, deſtined for the warp, is combed with large combs, heated in a little furnace for the purpoſe. To clear off the oil again, the wool is put in a liquor compoſed of hot water, with ſoap melted therein: whence being taken out, wrung, and dried, it is ſpun on the wheel.

As to the ſhorter wool, intended for the woof, it is only carded on the knee with ſmall cards, and then ſpun on the wheel, without being ſcoured of its oil. It muſt be remarked, that the thread for the warp is always to be ſpun much finer, and better twiſted, than that of the woof. The wool both for the warp and the woof being ſpun, and the thread divided into ſkains, that of the woof is put on ſpools (unleſs it have been

Serge, Ser. cant.

ſpun upon them) fit for the cavity or eye of the ſhuttle, and that for the warp is wound on a kind of wooden bobbins to fit it for warping. When warped, it is ſtiffened with a kind of ſize, whereof that made of the ſhreds of parchment is held the beſt; and when dry is put on the loom.

When mounted on the loom, the workmen raiſing and lowering the threads (which are paſſed through a reed), by means of four treddles placed underneath the loom, which he makes to act tranſverſely, equally, and alternately, one after another, with his feet, in proportion as the threads are raiſed and lowered, throws the ſhuttle acroſs from one ſide to the other; and each time that the ſhuttle is thrown, and the thread of the woof is croſſed between thoſe of the warp, ſtrikes it with the frame to which the reed is faſtened, through thoſe teeth the threads of the warp paſs; and this ſtroke he repeats twice or thrice, or even more, till he judges the croſſing of the ſerge ſufficiently cloſe: thus he proceeds till the warp is all filled with woof.

The ſerge now taken off the loom is carried to the fuller, who ſcours it in the trough of his mill with a kind of fat earth, called *fuller's earth*, firſt purged of all ſtones and filth. After three or four hours ſcouring, the fuller's earth is waſhed out in fair water, brought by little and little into the trough, out of which it is taken when all the earth is cleared; then with a kind of iron pincers or plyers, they pull off all the knots, ends, ſtraws, &c. ſticking out on the ſurface on either ſide; and then returning it into the fulling trough, where it is worked with water ſomewhat more than lukewarm, with ſoap diſſolved therein for near two hours; it is then waſhed out till ſuch time as the water becomes quite clear, and there be no ſigns of ſoap left; then it is taken out of the trough, the knots, &c. again pulled off, and then put on the tenter to dry, taking care as faſt as it dries to ſtretch it out both in length and breadth till it be brought to its juſt dimenſions. When well dried, it is taken off the tenter, and dyed, ſhorn, and preſſed.

SERGEANT, or SERJEANT, *at Law* or *of the Coif*, is the higheſt degree taken at the common law, as that of Doctor is of the civil law; and as theſe are ſuppoſed to be the moſt learned and experienced in the practice of the courts, there is one court appointed for them to plead in by themſelves, which is the common pleas, where the common law of England is moſt ſtrictly obſerved: but they are not reſtricted from pleading in any other court, where the judges, who cannot have that honour till they have taken the degree of ſerjeant at law, call them *brothers*.

Sergeant at Arms, or *Mace*, an officer appointed to attend the perſon of the king; to arreſt traitors, and ſuch perſons of quality as offend; and to attend the lord high ſteward, when ſitting in judgment on a traitor.

Of theſe, by ſtatute 13 Rich. II. cap. 6. there are not to be above 30 in the realm. There are now nine at court at 100l. *per annum* ſalary each; they are called the *king's ſergeants at arms*, to diſtinguiſh them from others: they are created with great ceremony, the perſon kneeling before the king, his majeſty lays the mace on his right ſhoulder, and ſays, *Riſe up, ſergeant at arms, and ſquire for ever*. They have beſides, a patent for the office, which they hold for life.

They have their attendance in the preſence chamber where the band of gentlemen penſioners wait; and receiving the king at the door, they carry the maces before him to the chapel door, whilſt the band of penſioners ſtand foremoſt, and make a lane for the king, as they alſo do when the king goes to the houſe of lords.

There are four other ſergeants at arms, created in the ſame manner; one who attends the lord chancellor; a ſecond, the lord treaſurer; a third, the ſpeaker of the houſe of commons; and a fourth, the lord mayor of London on ſolemn occaſions.

They have a conſiderable ſhare of the fees of honour, and travelling charges allowed them when in waiting, viz. five ſhillings *per* day when the court is within ten miles of London, and ten ſhillings when twenty miles from London. The places are in the lord chamberlain's gift.

There are alſo ſergeants of the mace of an inferior kind, who attend the mayor or other head officer of a corporation.

Common Sergeant, an officer in the city of London, who attends the lord mayor and court of aldermen on court days, and is in council with them on all occaſions, within and without the precincts or liberties of the city. He is to take care of orphans eſtates, either by taking account of them, or to ſign their indentures, before their paſſing the lord mayor and court of aldermen: and he was likewiſe to let and manage the orphans eſtates, according to his judgment to their beſt advantage. See Recorder.

Sergeant, in war, is a noncommiſſioned officer in a company of foot or troop of dragoons, armed with a halbert, and appointed to ſee diſcipline obſerved, to teach the ſoldiers the exerciſe of their arms, to order, ſtraighten, and form their ranks, files, &c. He receives the orders from the adjutant, which he communicates to his officers. Each company generally has two ſergeants.

SERGEANTY (*Serjeantia*), ſignifies, in law, a ſervice that cannot be due by a tenant to any lord but the king; and this is either *grand ſergeanty*, or *petit*. The firſt is a tenure by which the one holds his lands of the king by ſuch ſervices as he ought to do in perſon to the king at his coronation; and may alſo concern matters military, or ſervices of honour in peace: as to be the king's butler, carver, &c. *Petit ſergeanty* is where a man holds lands of the king to furniſh him yearly with ſome ſmall thing towards his wars; and in effect payable as rent. Though all tenures are turned into *ſoccage* by the 12 Car. II. cap. 24, yet the honorary ſervices of grand ſergeanty ſtill remain, being therein excepted. See *Knight-Service*.

SERIES, in general, denotes a continual ſucceſſion of things in the ſame order, and having the ſame relation or connexion with each other: in this ſenſe we ſay, a ſeries of emperors, kings, biſhops, &c.

In natural hiſtory, a ſeries is uſed for an order or ſubdiviſion of ſome claſs of natural bodies; comprehending all ſuch as are diſtinguiſhed from the other bodies of that claſs, by certain characters which they poſſeſs in common, and which the reſt of the bodies of that caſt have not.

1 Series.

Series, in arithmetic and algebra, a rank or number of terms in ſucceſſion, increaſing or diminiſhing in ſome certain ratio or proportion. There are ſeveral kinds of ſeries; as *arithmetical*, *geometrical*, *infinite*, &c.

2 Various kinds of

The

Series. The two firſt of theſe are, however, more generally known or diſtinguiſhed by the names of *arithmetical* and *geometrical progreſſion*. Theſe ſerieſes have already been explained and illuſtrated in the article ALGEBRA, particularly the two firſt: it therefore only remains, in this place, to add a little to what has already been done to the laſt of theſe: namely,

INFINITE SERIES,

3 Infinite ſeries. Is formed by dividing the numerator of a fraction by its denominator, that denominator being a compound quantity; or by extracting the root of a ſurd.

4 Converging and diverging ſeries. An infinite ſeries is either *converging* or *diverging*.

A converging ſeries is that in which the magnitude of the ſeveral terms gradually diminiſhes; and a diverging ſeries is that in which the ſucceſſive terms increaſe in magnitude.

5 Law of an infinite ſeries. The *law* of an infinite ſeries is the order in which the terms are obſerved to proceed. This law is often eaſily diſcovered from a few of the firſt terms of the ſeries; and then the ſeries may be continued as far as may be thought neceſſary, without any farther diviſion or evolution.

An infinite ſeries, as has already been obſerved, is obtained by diviſion or evolution; but as that method is very tedious, various other methods have been propoſed for performing the ſame in a more eaſy manner; as by aſſuming a ſeries with unknown coefficients, by the binomial theorem, &c.

I. *Of the Method of Series by Diviſion and Evolution.*

RULE.

6 Method of converting fractional quantity to an infinite ſeries, by diviſion. Let the diviſion or evolution of the given fraction, which is to be converted into an infinite ſeries, be performed as in Chapters I. and IV. of our article ALGEBRA, and the required ſeries will be obtained.

EXAMPLES.

1. Convert the fraction $\frac{1}{1-x}$ into an infinite ſeries?

$$1-x)\ 1\ (1+x+x^2+x^3+x^4, \text{ \&c.}$$
$$1-x$$
$$x$$
$$x-x^2$$
$$x^2$$
$$x^2-x^3$$
$$x^3$$
$$x^3-x^4$$
$$x^4$$
$$x^4-x^5$$
$$x^5$$

Hence the fraction $\frac{1}{1-x}=1+x+x^2+x^3+x^4$, &c.

From inſpection of the terms of this ſeries, it appears that each term is formed by multiplying the preceding term by x; and hence it may be continued as far as may be thought neceſſary without continuing the diviſion.

2. Let the fraction $\frac{ay}{1+x}$ be converted into an infinite ſeries?

$$1+x)\ ay\ (ay-ayx+ayx^2-ayx^3+ayx^4, \text{ \&c.}$$
$$ay+ayx$$
$$-ayx$$
$$-ayx-ayx^2$$
$$ayx^2$$
$$ayx^2+ayx^3$$
$$-ayx^3$$
$$-ayx^3-axy^4$$
$$axy^4$$
$$axy^4+ax^5$$
$$-ax^5$$

Hence $\frac{ay}{1+x}=ay\times 1-x+x^2-x^3+x^4$ &c.

and the law of the ſeries is obvious.

3. Reduce the fraction $\frac{m^2+x^2}{m+x}$ into an infinite ſeries?

$$m+x)\ m^2+x^2\ (m-x+\frac{2x^2}{m}-\frac{2x^3}{m^2}+\frac{2x^4}{m^3}, \text{ \&c.}$$
$$m^2+mx$$
$$-mx+x^2$$
$$-mx-x^2$$
$$2x^2$$
$$2x^2+\frac{2x^3}{m}$$
$$-\frac{2x^3}{m}$$
$$-\frac{2x^3}{m}-\frac{2x^4}{m^2}$$
$$\frac{2x^4}{m^2}, \text{ \&c.}$$

Hence $\frac{m^2+x^2}{m+x}=m-x+\frac{2x}{m}\times\frac{x}{1}-\frac{x^2}{m}+\frac{x^3}{m^2}$, &c. and the law of the ſeries is evident.

4. Convert the quantity $\frac{a^2}{a^2+2ay+y^2}$ into an infinite ſeries?

$$a^2+2ay+y^2)\ a^2\ (1-\frac{2y}{a}+\frac{3y^2}{a^2}-\frac{4y^3}{a^3}, \text{ \&c.}$$
$$a^2+2ay+y^2$$
$$-2ay-y^2$$
$$-2ay-4y^2-\frac{2y^3}{a}$$
$$3y^2+\frac{2y^3}{a}$$
$$3y^2+\frac{6y^3}{a}+\frac{3y^4}{a^2}$$
$$-\frac{4y^3}{a}-\frac{3y^4}{a^2}$$

Whence

Series. Whence $\frac{a^2}{a^2+2ay+y^2} = 1 - \frac{2y}{a} + \frac{3y^2}{a^2} - \frac{4y^3}{a^3}$, &c.; and each term is found by multiplying the preceding by $\frac{y}{a}$ and increasing the coefficient by unity.

7 And evolution.

5. Let $\sqrt{a^2+x^2}$ be converted into an infinite series?

$$\frac{a^2}{a^2}+x^2\Big)a+\frac{x^2}{2a}-\frac{x^4}{8a^3}+\frac{x^6}{16a^5}-\frac{x^8}{128x^7}$$

$$2a+\frac{x^2}{2a}\Big)x^2+\frac{x^4}{4a^2}$$

$$2a\frac{x^2}{a}-\frac{x^4}{8a^3}\Big)-\frac{x}{4a^2}$$

$$-\frac{x^4}{4a^2}-\frac{x^6}{8a^4}+\frac{x^8}{64a^6}$$

$$2a+\frac{x^2}{a}-\frac{x^4}{4a^3}+\frac{x^6}{16a^5}\Big)\frac{x^6}{8a^4}-\frac{x^8}{64a^6}$$

$$\frac{x^6}{8a^4}+\frac{x^8}{16a^6}-\frac{x^{10}}{64a^8}+\frac{x^{12}}{256a^{10}}$$

$$-\frac{5x^8}{64a^6}+\frac{x^{10}}{64a^8}-\frac{x^{12}}{256a^{10}}$$

Hence the square root of $a^2+x^2 = a+\frac{x^2}{2a}-\frac{x^4}{8a^3}+\frac{x^6}{16a^5}-\frac{x^8}{128x^7}$, &c.

In continuing the operation, those terms may be neglected whose dimensions exceed those of the last term to which the root is to be continued.

II. *Of the Method of Series by assuming a Series with unknown Coefficients.*

8 By means of an assumed series.

Rule. Assume a series with unknown coefficients to represent that required. Let this series be multiplied or involved, according to the nature of the question; and the quantities of the same dimension being put equal to each other, the coefficients will be determined; and hence the required series will be known.

Examples. 1. Let $\frac{1}{a-x}$ be converted into an infinite series? Assume $\frac{1}{a-x} = A + Bx + Cx^2 + Dx^3 + Ex^4$, &c.

Then this assumed series, multiplied by $a-x$, gives

$$1 = aA + aBx + aCx^2 + aDx^3 + aEx^4, \text{ &c.}$$
$$- Ax - Bx^2 - Cx^3 - Dx^4, \text{ &c.}$$

Now, by equating the coefficients of the same powers of x, we have $aA = 1$, $aB - A = 0$, $aC - B = 0$, $aD - C = 0$, $aE - D = 0$, &c. Hence $A = \frac{1}{a}$, $B = \frac{A}{a} = \frac{1}{a^2}$, $C = \frac{B}{a} = \frac{1}{a^3}$, $D = \frac{C}{a} = \frac{1}{a^4}$, $E = \frac{D}{a} = \frac{1}{a^5}$, &c.; whence, by substitution, we have $\frac{1}{a-x} = \frac{1}{a} + \frac{x}{a^2} + \frac{x^2}{a^3} + \frac{x^3}{a^4} + \frac{x^4}{a^5}$, &c.

2. Convert the quantity $\frac{c^2}{c^2+2cy-y^2}$ into an infinite series?

Let the assumed series be $A + By + Cy^2 + Dy^3$, &c. which multiplied by $c^2+2cy-y^2$, gives

$$c^2 = c^2A + c^2By + c^2Cy^2 + c^2Dy^3, \text{ &c.}$$
$$+2cAy + 2cBy^2 + 2cCy^3$$
$$- Ay^2 - By^3.$$

Now, by equating the coefficients of the homologous terms, we have $c^2 = c^2A$, $c^2B + 2cA = 0$, $c^2C + 2cB - A = 0$, $c^2D + 2cC - B = 0$, &c.; whence $A = 1$, $B = -\frac{2A}{c} = -\frac{2}{c}$, $C = \frac{A-2cB}{c^2} = \frac{1+4}{c^2} = \frac{5}{c^2}$, $D = \frac{B-2cC}{c^2} = \frac{-2-10}{c^3} = -\frac{12}{c^3}$, &c.; whence $\frac{c^2}{c^2+2cy-y^2} = 1 - \frac{2y}{c} + \frac{5y^2}{c^2} - \frac{12y^3}{c^3}$ &c.

3. Required the square root of a^2-x^2?

Let $\overline{a^2-x^2}\Big|^{\frac{1}{2}} = A + Bx^2 + Cx^4 + Dx^6$, &c. which being squared gives

$$a^2-x^2 = A^2 + 2ABx^2 + B^2x^4 + 2ADx^6, \text{ &c.}$$
$$+2ACx^4 + 2BCx^6.$$

Hence $A^2 = a^2$, $2AB + 1 = 0$, $B^2 + 2AC = 0$, $2AD + 2BC = 0$, &c. Then $A = a$, $B = -\frac{1}{2A} = -\frac{1}{2a}$, $C = -\frac{B^2}{2A} = \frac{1}{8a^3}$, $D = -\frac{BC}{A} = \frac{1}{16a^5}$, &c.; whence $\overline{a^2-x^2}\Big|^{\frac{1}{2}} = a - \frac{x^2}{2a} - \frac{x^4}{8a^3} - \frac{x^6}{16a^5}$, &c.

III. *Of the Method of reducing a fractional Quantity into an Infinite Series by the Binomial Theorem.*

As this method has already been illustrated in the article Algebra, we shall therefore briefly state the theorem, and add a few examples.

Binomial Theorem.

$$\overline{a+b}\Big|^{\frac{m}{n}} = a^{\frac{m}{n}} + \frac{m}{n}a^{\frac{m-n}{n}}b + \frac{m}{n}\times\frac{m-n}{2n}\times a^{\frac{m-2n}{n}}b^2 + \frac{m}{n}\times\frac{m-n}{2n}\times\frac{m-2n}{3n}\times a^{\frac{m-3n}{n}}b^3, \text{ &c.}$$

Or $a^{\frac{m}{n}}\times\overline{1+\frac{b}{a}}\Big|^{\frac{m}{n}} = a^{\frac{m}{n}}\times 1 + \frac{m}{n}\times\frac{b}{a} + \frac{m}{n}\times\frac{m-n}{2n}\times\frac{b^2}{a^2} + \frac{m}{n}\times\frac{m-n}{2n}\times\frac{m-2n}{3n}\times\frac{b^3}{a^3}$, &c.

Examples.

1. Let $\overline{\frac{a}{ax-x^2}}\Big|^{\frac{1}{2}}$ be converted into an infinite series? Now $\overline{\frac{a}{ax-x^2}}\Big|^{\frac{1}{2}} = a\times\overline{ax-x^2}\Big|^{-\frac{1}{2}} = \overline{\frac{a}{ax}}\Big|^{\frac{1}{2}}\times\overline{1-\frac{x}{a}}\Big|^{-\frac{1}{2}} = \overline{\frac{a}{x}}\Big|^{\frac{1}{2}}\times\overline{1-\frac{x}{a}}\Big|^{-\frac{1}{2}}$. And this last expression, being compared with the general theorem, gives $\frac{b}{a} = \frac{x}{a}$, $m = -1$, $n = 2$. Hence by substitution, we have $\overline{\frac{a}{ax-x^2}}\Big|^{\frac{1}{2}} = \overline{\frac{a}{x}}\Big|^{\frac{1}{2}}\times 1 - \frac{1}{2}\times\frac{x}{a} - \frac{1}{2}\times\frac{-1-2}{4}\times\frac{x^2}{a^2} - \frac{1}{2}\times$

tion. $\frac{-1 \cdot -2}{4} \times \frac{x^3}{a^3}$, &c. $= \overline{a|^{\frac{1}{2}}} + 1 + \frac{x}{2a} + \frac{3x^2}{8a^2} + \frac{5x^3}{16a^3} + \frac{35x^4}{128a^4}$, &c.

2. Required the square root of $a^2 + x^2$?

By comparing this with the general theorem, we have $a = a^2$, $b = x^2$, $m = 1$, $n = 2$. Hence, by ſubſtitution, the ſeries becomes $a \times 1 + \frac{1}{2} \times \frac{x^2}{a^2} + \frac{1}{2} \times \frac{1-2}{2 \times 2} \times \frac{x^4}{a^4} + \frac{1}{2} \times \frac{1-2}{2 \times 2} \times \frac{1-4}{3 \times 2} \times \frac{x^6}{a^6}$, &c. $= a \times 1 + \frac{x^2}{2a} - \frac{x^4}{8a^3} + \frac{x^6}{16a^5} - \frac{5x^8}{128a^7}$, &c. And $\overline{a^2 - b^2|^{\frac{1}{2}}} = a \times 1 - \frac{x^2}{2a} - \frac{x^4}{8a^3} - \frac{x^6}{16a^5} - \frac{5x^8}{128a^7}$, &c.

In order to apply this to numbers, let the ſquare root of 85 be required? Now, the ſquare root of 85 $= \sqrt{81 + 4}$; hence $a = 9$, and $x^2 = 4$.

Then

1	=	1.000000
$\frac{x^2}{2a^2}$	$= \frac{4}{2 \times 81}$ =	0.024691
$\frac{x^4}{8a^4}$	$= \frac{4 \times 4}{8 \times 81 \times 81}$ =	0.000304
$\frac{x^6}{16a^6}$	$= \frac{4 \times 4 \times 4}{16 \times 81 \times 81 \times 81}$ =	0.000007
		1.024394
		9
Square root of 85	=	9.219546,

true except the laſt decimal.

3. Required the cube root of $a^3 + b^3$?

This being compared with the general theorem gives $z = x^3$, $b = y^3$, $m = 1$, $n = 3$. Hence $\overline{a^3 + b^3|^{\frac{1}{3}}} = a^{\frac{3}{3}} \times 1 + \frac{1}{3} \times \frac{y^3}{x^3} + \frac{1}{3} \times \frac{1-3}{6} \times \frac{y^6}{x^6} + \frac{1}{3} \times \frac{1-3}{6} \times \frac{1-6}{9} \times \frac{y^9}{x^9}$, &c. $= a \times 1 + \frac{y^3}{3x^3} - \frac{y^6}{9x^6} + \frac{5y^9}{81x^9} - \frac{10y^{12}}{243x^{12}}$, &c. And $\overline{a^3 - b^3|^{\frac{1}{3}}} = a \times 1 - \frac{y^3}{3x^3} - \frac{y^6}{9x^6} - \frac{5y^9}{81x^9} - \frac{10y^{12}}{243x^{12}}$, &c.

Let the cube root of 600 be required? Now $600|^{\frac{1}{3}} = 8 \times \overline{1 + \frac{88}{512}|^{\frac{1}{3}}}$. Then $y^3 = 88$, $x^3 = 512$, $m = 1$, and $n = 3$.

Then

1		1.00000000
$\frac{y^3}{3x^3}$	$= \frac{88}{3 \times 512}$ =	0.05729166
$\frac{y^6}{9x^6}$	$= \frac{1}{9} \times \frac{88}{512}\|^2$ =	0.00328233
$\frac{5y^9}{81x^9}$	$= \frac{5}{81} \times \frac{88}{512}\|^3$ =	0.00031341
$\frac{10y^{12}}{243x^{12}}$	$= \frac{10}{243} \times \frac{88}{512}\|^4$ =	0.00003591
$\frac{22y^{15}}{729x^{15}}$	$= \frac{22}{729} \times \frac{88}{512}\|^5$ =	0.00000453
$\frac{154y^{18}}{6561x^{18}}$	$= \frac{154}{6561} \times \frac{88}{512}\|^6$ =	0.00000060
$\frac{374y^{21}}{19683x^{21}}$	$= \frac{374}{19683} \times \frac{88}{512}\|^7$ =	0.00000008
$\frac{935y^{24}}{59049x^{24}}$	$= \frac{935}{59049} \times \frac{88}{512}\|^8$ =	−0.00000001
	Sum of the poſitive terms,	1.05760968
	Sum of the negative terms,	0.00331885
	Difference,	1.05429083
		8
	Cube root of 600, =	8.43432664

Series.

In operations of this kind, the neareſt power to the given number, whether greater or leſs than it, is to be uſed, as by that means the ſeries will converge more quickly.

Involution and evolution of an infinite ſeries.

An infinite ſeries may be involved to any given power, or any propoſed root of a given ſeries may be extracted by means of the following general theorem.

$z^m \times (a + bx + cx^2 + dx^3 + ex^4, \text{ &c.})^m = z^m$, multiplied by

$$a^m + m\,b\,a^{m-1}x + m \cdot \frac{m-1}{2} \cdot a^{m-2}b^2 + m\,a^{m-1}c \Big\} x^2$$
$$+ m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3}b^3 + m \cdot \frac{m-1}{2} \cdot 2a^{m-2}bc + ma^{m-1}d \Big\} x^3$$
$$+ m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot a^{m-4}b^4 + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot 3a^{m-3}b^2c + m \cdot \frac{m-1}{2} \cdot a^{m-2} \cdot \begin{cases} 2bd \\ +c^2 \end{cases} + ma^{m-1}e \Big\} x^4$$
$$+ m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot a^{m-5}b^5 + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot 4a^{m-4}b^3c + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot 3a^{m-3} \begin{cases} bc^2 \\ +b^2d \end{cases} + m \cdot \frac{m-1}{2} \cdot 2a^{m-2} \begin{cases} cd \\ +be \end{cases} + ma^{m-1}f \Big\} x^5$$
$$+ m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot \frac{m-5}{6} \cdot a^{m-6}b^6 + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot 5a^{m-5}b^4c + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot a^{m-4} \begin{cases} 6b^2c^2 \\ 4bd \end{cases} + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3} \begin{cases} 3b^2e \\ 6bcd \\ e^3 \end{cases} + m \cdot \frac{m-1}{2} \cdot a^{m-2} \begin{cases} 2bf \\ 2ce \\ d^2 \end{cases} + ma^{m-1}g \Big\} x^6$$

&c.

Now

Series. Now each term of the given ſeries is to be compared with the correſpondent terms in the firſt part of the above theorem; and by ſubſtitution in the ſecond, the ſeveral terms of the required ſeries will be obtained.

EXAMPLES.

1*ſt*, What is the ſquare of the ſeries $y-y^3+y^5-y^7+$, &c.?

By comparing this with the general theorem, we find $z=y$, $a=1$, $b=0$, $c=-1$, $d=0$, $g=-1$, &c. and $m=2$; whence $\overline{y-y^3+y^5-y^7}|^2 = y^2 \times (1 - 2ax^2 + c^2x^4 - 2cex^6 + 2ex^4 - 2gx^6)$, &c. $= y^2 \times (1-2y^2+3y^4-4y^6)$

&c. $= y^2-2y^4+3y^6-4y^8$, &c.

2*d*, Required the fourth power of the ſeries $1+x+x^2+x^3$, &c.?

Here $z=1$, $a=1$, $b=1$, $c=1$, $d=1$, and $m=4$.

Then $\overline{1+x+x^2+x^3, \text{ &c.}}|^4 = 1+4bx+6b^2x^2+4b^3x^3+b^4x^4$, &c.
$+4c \quad +12bc+12b^2c$
$+4d+6c^2$
$+12bd$
$+4e$
$= 1+4x+10x^2+20x^3+35x^4$, &c.

3*d*, What is the ſquare of $\frac{1}{x}+\frac{1}{x^2}+\frac{1}{x^3}+\frac{1}{x^4}$, &c.

In this caſe $z=\frac{1}{x}$, $x=\frac{1}{x}$, $a=1$, $b=1$, $c=1$, $d=1$, and $m=2$.

Then $\overline{\frac{1}{x}+\frac{1}{x}+\frac{1}{x^3}\text{ &c.}}|^2 = \frac{1}{x^2} \times \left(1+2b\times\frac{1}{x}+b^2\times\frac{1}{x^2}+2bc\times\frac{1}{x^3}+2bd\times\frac{1}{x^4}, \text{ &c.}\right.$
$+2c \quad +2d \quad +c^2$
$+2e$
$= \frac{1}{x^2}\times\left(1+\frac{2}{x}+\frac{3}{x^2}+\frac{4}{x^3}=\frac{5}{x^4}, \text{ &c.}\right)$
$= \frac{1}{x^2}+\frac{2}{x^3}+\frac{3}{x^4}+\frac{4}{x^5}+\frac{5}{x^6}$, &c.

4*th*, What is the ſquare root of $\frac{1}{r^2-\frac{z^2}{2}+\frac{z^4}{4r^2}-\frac{z^6}{6r^4}+\frac{z^8}{8r^6}, \text{ &c.}}$

The quantity reduced is $\frac{1}{r^2} \times \frac{1}{1-\frac{z^2}{2r^2}+\frac{z^4}{4r^4}-\frac{z^6}{6r^6}+\frac{z^8}{8r^8}, \text{ &c.}}$

In this example $z=\frac{1}{r^2}$, $x=z^2$, $a=1$, $b=-\frac{1}{2^2}$, $c=\frac{1}{4r^4}$, $d=-\frac{1}{6r^6}$, &c. and $m=-\frac{1}{2}$, $\frac{m-1}{2}=-\frac{3}{4}$, $\frac{m-2}{3}=-\frac{5}{6}$, $\frac{m-3}{4}=-\frac{7}{8}$, &c.

Then $\frac{1}{r^2-\frac{z^2}{2}+\frac{z^4}{4r^2}, \text{ &c.}} = \frac{1}{r} \times \left(1+\frac{x}{4r^2}+\frac{3x^2}{32r^4}+\frac{5x^3}{128r^6}, \text{ &c.}\right.$
$-\frac{1}{8r^4}-\frac{3}{32r^6}$
$+\frac{1}{12r^6}$
$= \frac{1}{r}+\frac{x}{4r^3}+\frac{x^2}{32r^5}+\frac{11x^3}{384r^7}$, &c.

11 Of an harmonical ſeries.

Harmonic SERIES, a ſeries of terms formed in harmonical proportion. It has been already obſerved in the article PROPORTION, that if three numbers be in harmonical proportion, the firſt is to the third as the difference between the firſt and ſecond is to the difference between the ſecond and third.

Let a, b, and x be three terms in harmonical proportion: then $a : x :: a-b : b-x$

whence $ax-bx=ab-ax$.

and $2ax-bx=ab$.

then $x=\frac{ab}{2a-b}$. Hence the three firſt terms of this ſeries is a, b, $\frac{ab}{2a-b}$.

Again, let x be the fourth term, to find which in terms of a and b, we have

$$b : x :: b-\frac{ab}{2a-b} : \frac{ab}{2a-b}-x$$

Then $bx-\frac{ab}{2a-b}\cdot x = \frac{ab^2}{2a-b}-bx$

$$\frac{3ab-2b^2}{2a-b}\cdot x = \frac{ab^2}{2a-b}$$

$$x = \frac{ab^2}{2a-b}\cdot\frac{2a-b}{3ab-2b^2} = \frac{ab}{3a-2b};$$

therefore the four firſt terms are a. b. $\frac{ab}{2a-b}$, $\frac{ab}{3a-2b}$.

Whence the law of the ſeries is obvious, and it may be continued

The thod tend ſerie

Series. continued as follows, $a.\ b.\ \frac{ab}{2a-b},\ \frac{ab}{3a-2b},\ \frac{ab}{4-3b},\ \frac{ab}{5a-4b}$, &c. and the nth term is $\frac{ab}{n-1.\ a-n-2.\ b}$.

If, in a series of terms in harmonical proportion, a and b be two affirmative quantities, and such that $a < b$, then this series, which is positive at first, will become negative as soon as $n-2 . b$ exceeds $n-1 . a$. But if $a > b$, the series will converge, and although produced to infinity, will not become negative.

Let a and b be equal to 2 and 1 respectively; then this series becomes $\frac{1}{2}.\frac{1}{1}.\frac{1}{2}.\frac{1}{3}$, &c. and since, if each term of an harmonical series be divided by the same quantity, the series will still be harmonical. Therefore $\frac{1}{1}.\frac{1}{2}.\frac{1}{1}.\frac{1}{2}.\frac{1}{3}$, &c. is an harmonical series: whence the denominators of this series form a series of numbers in arithmetical progression; and conversely, the reciprocals of an arithmetical progression are in harmonical proportion.

Returning Series, a series of which any term is formed by the addition of a certain number of preceding terms, multiplied or divided by any determinate numbers whether positive or negative. Thus 2. 3. 19. 101. 543. 2917. 15671, &c. is a recurring series, each term of which is formed by the addition of the two preceding terms, the first of which being previously multiplied by the constant quantity 2 and the other by 5. Thus the third term $19 = 2\times2+3\times5$; the fourth term $101 = 3\times2+19\times5$, &c.

The principal operation in a series of this nature is that of finding its sum.—For this purpose, the two first and two last terms of the series must be given, together with the constant multipliers.

Let a, b, c, d, e, f, &c. be any number of terms of a series formed according to the above law, each successive term being equal to the sum of the products of the two preceding terms, the first being multiplied by the given quantity m, and the other by the given quantity n. Hence we will have the following series of equations $c = ma+nb$, $d = mb+nc$, $e = mc+nd$, $f = md+ne$, &c. Then adding these equations we obtain $c+d+e+f = m\times a+b+c+d+n\times b+c+d+e$. Now the first member of this equation is the sum of all the terms except the two first; the quantity by which m is multiplied in the second member is the sum of all the terms except the two last; and that by which n is multiplied is the sum of all the terms except the first and last. Now let s = sum of the series; then $s-a-b = m\times s-e-f+n\times s-a-f$. Hence $s = \frac{m\times e+f+n\times a+f-a-b.}{m+n-1.}$

Let the sum of the first seven terms of the above series be required.

Two last terms	15671	First term	2
	2917	Last term	15671
Sum - -	18588	Sum	15673
m -	2	n -	5
	37176		78365
	78365		
Sum - -	115541		
$-2+3$	5		
$2+5-1=6$	115536		
	19256 = Sum of the series.		

Reversion of Series, is the method of finding the value of the quantity whose several powers are involved in a series, in terms of the quantity which is equal to the given series. Series.

In order to this, a series must be assumed, which being involved and substituted for the quantity equal to the series, and its powers, neglecting those terms whose powers exceed the highest power to which it is proposed to extend the series.

Let it be required to revert the series $ax+bx^2+cx^3+dx^4+ex^5$, &c. $= y$; or, to find x in an infinite series expressed in the powers of y.

Substitute y^n for x, and the indices of the powers of y in the equation will be n, $2n$, $3n$, &c. and 1, therefore $n=1$; and the differences are 0. 1. 2. 3. 4. 5. &c. Hence, in this case, the series to be assumed is $Ay+By^2+Cy^3+Dy^4$, &c. which being involved and substituted for the respective powers of x, then we have

$$\left.\begin{array}{rl} ax = & aAy+aBy^2+aCy^3+aDy^4, \text{ \&c.} \\ bx^2 = & +bA^2y^2+2bABy^3+2bACy^4 \\ & \quad +bB^2y^4 \\ cx^3 = & +cA^3y^3+3cA^2By^4, \text{ \&c.} \\ dx^4 = & +dA^4y^4, \text{ \&c.} \end{array}\right\} \text{ \&c.} \Bigg\} = y$$

Whence, by comparing the homologous terms, we have $aAy = y$; therefore $A = \frac{1}{a}$, $B = \frac{b}{a^3}$, $C = \left(-\frac{2bAB+cA^3}{a}\right) = \frac{2b^2-ac}{a^5}$; $D = \left(-\frac{2bAC+bB^2+3cA^2B+dA^4}{a}\right) = \frac{5abc-5b^3-a^2d}{a^7}$, &c. and consequently $x = \frac{y}{a} - \frac{by^2}{a^3} + \frac{2b^2-ac}{a^5}\times y^3 - \frac{5b^3-5abc+a^2d}{a^7}\times y^4$, &c.

Examples.

1*st*, Let $x-\frac{x^2}{2}+\frac{x^3}{3}-\frac{x^4}{4}$, &c. $= y$. There a being in this case equal to 1, $b = -\frac{1}{2}$, $c = \frac{1}{3}$, $d = -\frac{1}{4}$, &c. we shall, by substituting these values, have $x = y+\frac{y^2}{2}+\frac{y^3}{6}+\frac{y^4}{24}$, &c.

2*d*, Let $x-x^2+x^3-x^4+x^5$, &c. $= y$; to find x?

In this example we have $x = x$, $a = 1$, $b = -1$, $c = 1$, $d = -1$, &c.; whence $x = \frac{y}{1}+\frac{1}{1}y^2+\frac{2-1}{1}y^3+\frac{-5+5-1}{1}y^4$, &c. $= y+y^2+y^3+y^4$ &c.

3*d*, Let $a = r-\frac{x^2}{2r}+\frac{x^4}{24r^3}-\frac{x^6}{720r^5}+\frac{x^8}{4032r^7}$, &c. to find x?

Put $r-a = v$; then $v = \frac{x^2}{2r}-\frac{x^4}{24r^3}+\frac{x^6}{720r^5}-\frac{x^8}{4032r^7}$, &c. By comparison we find $x = x^2$, $y = v$, $a = \frac{1}{2r^2}$, $b = \frac{-1}{24r^3}$, $c = \frac{1}{720r^5}$, $d = \frac{-1}{4032r^7}$, &c.

Series.

Hence $x^3 = 2rv - \frac{-1}{\frac{24r^3}{1}}v^2 + \frac{\frac{1}{288r^6}}{\frac{1}{32r^5}} \cdot \frac{1}{1440r^9}$

v^3, &c. $= 2rv + \frac{1}{3}v^2 + \frac{4}{45r}v^3 + \frac{1}{35r^2}v^4$, &c.

whence $x = \sqrt{2r}v \times \left(1 + \frac{v}{12r} + \frac{3v}{160r^2} + \frac{5}{896}\frac{v^3}{r^3}\right.$, &c.

Summation of SERIES is the method of finding the ſum of the terms of an infinite ſeries produced to infinity, or the ſum of any number of terms of ſuch a ſeries.

The value of any arithmetical ſeries, as $1^2 + 2^2 + 3^2 + 4^2 \ldots\ldots n^2$, varies according as (n) the number of its terms varies; and therefore, if it can be expreſſed in a general manner, it muſt be explicable by n and its powers with determinate coefficients; and thoſe powers, in this caſe, muſt be rational, or ſuch whoſe indices are whole poſitive numbers; becauſe the progreſſion, being a whole number, cannot admit of ſurd quantities. Laſtly, It will appear, that the greateſt of the ſaid indices cannot exceed the common index of the ſeries by more than unity; for, otherwiſe, when n is taken indefinitely great, the higheſt power of n would be indefinitely greater than the ſum of all the reſt of the terms.

Thus the higheſt power of n, in an expreſſion exhibiting the value of $1^2 + 2^2 + 3^2 + 4^2 \ldots n^2$, cannot be greater than n^3; for $1^2 + 2^2 + 3^2 + 4^2 \ldots\ldots n^2$ is manifeſtly leſs than n^3, or $n^3 + n^2 + n^2 +$, &c. continued to n terms; but n^4, when n is indefinitely great, is indefinitely greater than n^3, or any other inferior power of n, and therefore cannot enter into the equation. This being premiſed, the method of inveſtigation may be as follows:

EXAMPLES.

1. Required the ſum of n terms of the ſeries $1 + 2 + 3 + 4 + \ldots\ldots n$?

Let $An^2 + Bn$ be aſſumed, as an univerſal expreſſion for the value of $1 + 2 + 3 + 4 \ldots\ldots n$, where A and B repreſent unknown but determinate quantities. Therefore, ſince the equation is ſuppoſed to hold univerſally, whatſoever is the number of terms, it is evident, that if the number of terms be increaſed by unity, or, which is the ſame thing, if $n + 1$ be wrote therein inſtead of n, the equation will ſtill ſubſiſt; and we ſhall have $A \times \overline{n+1}|^2 + B \times n + 1 = 1 + 2 + 3 + 4 \ldots\ldots n + \overline{n+1}$. From which the firſt equation being ſubtracted, there remains $A \times \overline{n+1}|^2 - An^2 + B \times \overline{n+1} - Bn = n + 1$; this contracted will be $2An + A + B = n + 1$; whence we have $2A - 1 \times n + A + B - 1 = 0$: Wherefore, by taking $2A - 1 = 0$, and $A + B - 1 = 0$, we have $A = \frac{1}{2}$, and $B = \frac{1}{2}$; and conſequently

$1 + 2 + 3 + 4 \ldots\ldots n \ (= An^2 + Bn) = \frac{n^2}{2} + \frac{n}{2} = \frac{n \times \overline{n+1}}{2}$.

What is the ſum of the ten firſt terms of the ſeries $1 + 2 + 3$, &c.?

In this caſe $n = 10$, then $\frac{n \times \overline{n+1}}{2} = \frac{10 \times 11}{2} = 55$.

2. Required the ſum of the ſeries $1^2 + 2^2 + 3^2 \ldots\ldots n^2$, or $1, + 4 + 9 + 16 \ldots\ldots n$? Series.

Let $An^3 + Bn^2 + Cn$, according to the aforeſaid obſervations, be aſſumed $= 1^2 + 2^2 + 3^2 \ldots\ldots n^2$; then, as in the preceding caſe, we ſhall have $A \times \overline{n+1}|^3 + B \times \overline{n+1}|^2 + C \times \overline{n+1} = 1^2 + 2^2 + 3^2 \ldots\ldots n^2 \times \overline{n+1}|^2$; that is, by involving $n + 1$ to its ſeveral powers, $An^3 + 3An^2 + 3An + A + Bn^2 + 2Bn + B + Cn + C = 1^2 + 2^2 + 3^2 \ldots n^2 + \overline{n+1}|^2$; from which ſubtracting the former equation, we obtain $3An^2 + 3An + A + 2Bn + B + C \ (= \overline{n+1}|^2) = n^2 + 2n + 1$; and conſequently $3A - 1 \times n^2 + 3A + 2B - 2 \times n + A + B + C - 1 = 0$; whence $3A - 1 = 0$, $3A + 2B - 2 = 0$, and $A + B + C - 1 = 0$; therefore $A = \frac{1}{3}$, $B = \frac{2 - 3A}{3} = \frac{1}{2}$, $C = 1 - A - B = \frac{1}{6}$,

and conſequently $1 + 4 + 9 + 16 \ldots\ldots n^2 = \frac{n^3}{3} + \frac{n^2}{2} + \frac{n}{6}$, or $\frac{n \cdot \overline{n+1} \cdot \overline{2n+1}}{6}$.

What is the ſum of the ten firſt terms of the ſeries $1^2 + 2^2 + 3^2$, &c.?

Here $n = 10$, then $\frac{n \cdot \overline{n+1} \cdot \overline{2n+1}}{6} = \frac{10 \times 11 \times 21}{6} = 385$.

3. Required the ſum of the ſeries $1^3 + 2^3 + 3^3 + 4^3 \ldots\ldots n^3$, or $1 + 8 + 27 + 64 \ldots\ldots n^3$?

By putting $An^4 + Bn^3 + Cn^2 + Dn = 1 + 8 + 27 + 64 \ldots\ldots n^3$; and proceeding as above, we ſhall have $4An^3 + 6An^2 + 4An + A + 3Bn^2 + 3Bn + B + 2Cn + C + D \ (= \overline{n+1}|^3) = n^3 + 3n^2 + 1$, and therefore $4A - 1 \times n^3 + 6A + 3B - 3 \times n^2 + 4A + 3B + 2C - 3 \times n + A + B + C + D - 1 = 0$. Hence $A = \frac{1}{4}$, $B \left(= \frac{3 - 6A}{3}\right) = \frac{1}{4}$, $C \left(= \frac{3 - 4A - 3B}{2}\right) = \frac{1}{4}$, $D \ (= 1 - A - B - C) = 0$; and therefore $1^3 + 2^3 + 3^3 + 4^3 \ldots\ldots n^3 = \frac{n^4}{4} + \frac{n^3}{2} + \frac{n^2}{4}$, or $= \frac{n^2 \times \overline{n+1}|^2}{4}$.

In the very ſame manner it will be found, that

$1^4 + 2^4 + 3^4 \ldots\ldots n^4 = \frac{n^5}{5} + \frac{n^4}{2} + \frac{n^3}{3} - \frac{n}{30}$

$1^5 + 2^5 + 3^5 \ldots\ldots n^5 = \frac{n^6}{6} + \frac{n^5}{2} + \frac{5n^4}{12} - \frac{n^2}{12}$

$1^6 + 2^6 + 3^6 \ldots\ldots n^6 = \frac{n^7}{7} + \frac{n^6}{2} + \frac{n^5}{2} - \frac{n^3}{6} + \frac{n}{42}$.

What is the ſum of the ten firſt terms of the ſeries $1^3 + 2^3 + 3^3$, &c.?

$n = 10$, then $\frac{n^2 \times \overline{n+1}|^2}{4} = \frac{100 \times 121}{4} = 25 \times 121 = 3025$.

4. Required the ſum of n terms of the ſeries of triangular numbers 0, 1, 3, 6, 10.....n?

Let $An^3 + Bn^2 + Cn = 0, 1, 2, 3 \ldots\ldots n, = s$.—Now the $\overline{n+1}$th term of this ſeries, by Example 2. is $\frac{n^2}{2} + \frac{n}{2}$. Then $A \cdot \overline{n+1}|^3 + B \cdot \overline{n+1}|^2 \cdot C \cdot \overline{n+1} = s + \frac{n^2}{2} + \frac{n}{2}$. Now, the firſt equation being ſubtracted from this, we have, $3An^2 + \overline{3A+2B} \times n + A + B + C = \frac{n^2}{2} + \frac{n}{2}$. Or, $3An^2 + 3An +$

A

Series. $A + C = \frac{n^2}{2} + \overline{\frac{1}{2} - 2B} \times n - B.$

Whence, by equating the homologous terms, we have $3A = \frac{1}{2}$, and $A = \frac{1}{6}$: $\frac{1}{2} - 2B = 3A$; whence $2B = \frac{1}{2} - \frac{1}{2} = 0$, $A + C = -B$. Hence $C = -\frac{1}{6}$. Now, theſe values being ſubſtituted in the above equation, gives the ſum $= \frac{n^3}{6} - \frac{n}{6} =$ $\frac{n \cdot \overline{n-1} \cdot \overline{n+1}}{1 \cdot 2 \cdot 3}$; and if $n + 1$ be put for n, the ſum of n terms of this ſeries will be $\frac{n \cdot \overline{n+1} \cdot \overline{n+2}}{1 \cdot 2 \cdot 3}$.

By proceeding in the ſame manner, the ſum of n terms of pyramidal numbers, 1, 4, 10, 20, 35, &c. .... n will be found $= \frac{n \cdot \overline{n+1} \cdot \overline{n+2} \cdot \overline{n+3}}{1 \cdot 2 \cdot 3 \cdot 4}$. And the ſum of any ſeries of figurate numbers, is determined by a like formula, the law of continuation being obvious.

What is the ſum of the ten firſt terms of triangular numbers 1, 3, 6, 10, 15, &c.?

Here $n = 10$; then $\frac{n \cdot \overline{n+1} \cdot \overline{n+2}}{1 \cdot 2 \cdot 3} = \frac{10 \times 11 \times 12}{6}$ $= 220$.

5. Let the ſum of the ſeries $\frac{1}{R} + \frac{2}{R^2} + \frac{3}{R^3}$ continued to n terms, be required?

If we multiply this ſeries indefinitely continued by $\overline{R-1}|^2$, or $R^2 - 2R + 1$, the product is R; therefore the amount of the indefinite ſeries is $\frac{R}{\overline{R-1}|^2}$, and the ſum of n terms may be found by ſubtracting the terms after the nth from that amount. Now, the terms after the nth are $\frac{n+1}{R^{n+1}} + \frac{n+2}{R^{n+2}}$, &c. which may be divided into the two following ſeries:

Firſt, $\frac{n}{R^n} \times \overline{\frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}}$, &c. $= \frac{n}{R^n} \times \frac{1}{R-1}$.

Second, $\frac{1}{R^n} \times \overline{\frac{1}{R} + \frac{2}{R^2} + \frac{3}{R^3}}$, &c. $= \frac{1}{R^n} \times \frac{R}{\overline{R-1}|^2}$.

Now, if we write a for $\frac{1}{R^n}$, and r for $R - 1$, and ſubtract the ſum of theſe two ſeries from the amount of the propoſed ſeries indefinitely continued, the remainder will be found $= \frac{1-a}{r} \times R - \frac{na}{r}$.

6. Let the ſum of the ſeries $\frac{n-1}{nR} + \frac{n-2}{nR^2} + \frac{n-3}{nR^3}$ &c. be required?

This ſeries is equal to the difference of the two following.

Firſt, $\frac{n}{nR} + \frac{n}{nR^2} + \frac{n}{nR^3}$, &c. $= \frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}$, &c. $= \frac{1-a}{r}$.

Second, $\frac{1}{nR} + \frac{2}{nR^2} + \frac{3}{nR^3}$, &c. $= \frac{1}{n} \times \overline{\frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}}$, &c. $= \frac{1}{n} \times \frac{1-a}{r} \times R - \frac{a}{r}$.

The difference of theſe ſeries is $\frac{1-a}{r} - \frac{R}{n} \times \frac{1-a}{r} + \frac{a}{r}$, which reduced becomes $\frac{\overline{n+a-1} \times r + a - 1}{nr^2}$. Seringapatam.

To proceed farther would lead us far beyond the limits aſſigned for this article; we muſt therefore refer thoſe who require more information on this ſubject to the following authors.—Bertrand's *Developpement*, &c. Vol. I; Dodſon's Mathematical Repoſitory, Vol. I.; Emerſon's Algebra; Appendix to Graveſend's Algebra; Hutton's Paper on Cubic Equations and Infinite Series, in the Philoſophical Tranſactions for 1780; Maclaurin's Fluxions; Malcom's Arithmetic; Maſere's Annuities; and *Scriptores Logarithmici*, &c.; De Moivre's Doctrine of Chances, and a Paper by the ſame author in the Philoſophical Tranſactions, N° 240; Simpſon's Algebra, Eſſays, Fluxions, and Miſcellanies; Sterling's *Summatio et Interpolatio Serierum*; *Syntagma Matheſios*, &c.

SERINGAPATAM, the capital of Myſore, the dominions of Tippoo Sultan, is ſituated in an iſland of the Cavery river, about 290 or 300 miles from Madras. The iſland, upon ſurvey, appeared to be about four miles in length by one and a half in breadth, acroſs the middle, where it is likewiſe higheſt, whence it gradually falls and narrows towards the extremities. The weſt end of the iſland, on which there is a fort of conſiderable ſtrength, ſlopes more, eſpecially towards the north; and the ground riſing on the oppoſite ſide of the river commands a diſtinct view of every part of the fort. The fort and outworks occupy about a mile of the weſt end of the iſland, and are diſtinguiſhed by magnificent buildings, and ancient Hindoo pagodas, contraſted with the more lofty and ſplendid monuments lately raiſed in honour of the Mahometan faith. The great garden, called the *Laul Baug*, covers about as much of the eaſt end of the iſland as the fort and outworks do of the weſt, and the whole intermediate ſpace, except a ſmall encloſure on the north bank near the fort, was, before the laſt war, filled with houſes, and formed an extenſive ſuburb, of which the greateſt part was deſtroyed by Tippoo to make room for batteries, to defend the iſland when attacked by the combined forces of Earl Cornwallis and the Mahratta chiefs in February 1792. This ſuburb, or town of modern ſtructure, is about half a mile ſquare, divided into regular croſs ſtreets, all wide, and ſhaded on each ſide by trees. It is ſurrounded by a ſtrong mud wall, contains many good houſes, and ſeems to have been preſerved by the ſultan for the accommodation of merchants, and for the convenience of troops ſtationed on that part of the iſland for its defence. A little to the eaſtward of the town is the entrance to the great garden, which was laid out in regular ſhady walks of large cypreſs trees, and abounding with fruit trees, flowers, and vegetables of every deſcription. It poſſeſſed all the beauty and elegance of a country retirement, and was dignified by the mauſoleum of Hyder the late ſultan, and a ſuperb new palace built by his ſon. This noble garden was devoted to deſtruction; and the trees which had ſhaded their proud maſter, and contributed to his pleaſures, were formed into the means of protecting his enemies in ſubverting his empire. Before that event, ſo glorious to the arms of England, this inſulated metropolis

Seringham || Seriphus.

(ſays Major Dirom) muſt have been the richeſt, moſt convenient, and beautiful ſpot poſſeſſed in the preſent age by any native prince in India; but when the allies left it, the Sultan's fort and city only remained in repair amidſt all the wrecks of his former grandeur, the iſland preſenting nothing but the appearance of wretched barrenneſs. Tippoo is a man of talents, enterpriſe, and great wealth; but, in the opinion of our author, the remaining years of his ill-fated life will be unequal to renew the beauties of his terreſtrial paradiſe. N. Lat. 12° 31′ 45″. E. Long. 96° 46′ 45″.

SERINGHAM, an iſland of Indoſtan, formed about ſix miles north-weſt of Trinchinopoly by the river Cavery, which divides itſelf into two branches: that to the northward takes the name of *Coleroon*, but the ſouthern branch preſerves its old name the *Cavery*. Both theſe rivers, after a courſe of about 90 miles, empty themſelves into the ſea; the Coleroon at Devicottah, and the Cavery near Tranquebar, at about 20 miles diſtance from one another. In this iſland, facing Trinchinopoly, ſtood a famous pagoda ſurrounded by ſeven ſquare walls of ſtone, 25 feet high and four feet thick. The ſpace between the outward and ſecond walls meaſured 310 feet, and ſo proportionably of the reſt. Each incloſure had four large gates, with a high tower; which were placed, one in the middle of each ſide of the incloſure, and oppoſite to the four cardinal points. The outward wall was about four miles in circumference, and its gateway to the ſouth was ornamented with pillars, ſome of which were ſingle ſtones 33 feet in length and five in diameter; while thoſe that formed the roof were ſtill larger; and in the inmoſt incloſure were the chapels. About half a mile to the eaſt was another large pagoda called *Jumbukiſtna*, which had but one incloſure.

The pagoda of Seringham was held in great veneration, from a belief that it contained the identical image of the god Wiſtnou worſhipped by Brama; and pilgrims came here from all parts of India with offerings of money to procure abſolution. A large part of the revenue of the iſland was allotted for the maintenance of the Bramins who inhabited the pagoda; and theſe, with their families, formerly amounted to no fewer than 40,000 perſons, all maintained by the ſuperſtitious liberality of the adjacent country.

SERIOLA, in botany: A genus of plants belonging to the order of polygamia æqualis, and to the claſs of ſyngeneſia; and in the natural ſyſtem ranged under the 49th order, *Compoſitæ*. The receptacle is paleaceous; the calyx ſimple; and the pappus is ſomewhat plumoſe. There are four ſpecies; 1. The levigata. 2. Æthnenſis. 3. Cretenſis. 4. Urens. The firſt is a native of the iſland of Candia, and flowers in July and Auguſt; the ſecond is a native of Italy; and the fourth is a native of the ſouth of Europe.

SERIPHIUM, in botany: a genus of plants belonging to the order of monogamia, and to the claſs of ſyngeneſia. The calyx is imbricated: the corolla is monopetalous and regular, with one oblong ſeed under it. There is only one ſpecies, the *cinereum*, which is a native of the Cape of Good Hope.

SERIPHUS (anc. geog.), one of the Cyclades or iſlands in the Ægean ſea, called *Saxum Seriphium* by Tacitus, as if all a rock; one of the uſual places of baniſhment among the Romans. The people *Seriphii*; who, together with the Siphnii, joined Greece againſt Xerxes, were almoſt the only iſlanders who refuſed to give him earth and water in token of ſubmiſſion, (Herodotus). *Seriphia Rana*, a proverbial ſaying concerning a perſon who can neither ſing nor ſay; frogs in this iſland being ſaid to be dumb, (Pliny).

Sermon || Serpens.

SERMON, a diſcourſe delivered in public, for the purpoſe of religious inſtruction and improvement.

Funeral SERMON. See *FUNERAL Orations*.

SERON OF ALMONDS, is the quantity of two hundred weight; of aniſe ſeed, it is from three to four hundred; of Caſtile ſoap, from two hundred and a half to three hundred and three quarters.

SEROSITY, in medicine, the watery part of the blood.

SERPENS, in aſtronomy, a conſtellation in the northern hemiſphere, called more particularly *Serpens Ophiuchi*. The ſtars in the conſtellation Serpens, in Ptolemy's catalogue, are 18; in Tycho's, 13; in Hevelius's, 22; and in the Britannic catalogue, 64.

SERPENS *Biceps*, or *Double-headed Snake*, a monſter of the ſerpent kind, there being no permanent ſpecies of this conformation. That repreſented on Plate CCCCXLIX. and copied from Edwards, came from the iſland of Barbadoes; and was ſaid to have been taken out of an egg of the ſize of a ſmall pullet's egg by a man who found it under ground as he was digging. The heads were not in a horizontal poſition when the ſnake lay on its belly, but inclined to each other on their under ſides, leaving an opening for the throat to come in between the two heads underneath, as is expreſſed at A. The upper ſide, for the whole length, was covered with ſmall ſcales, falling one over another; the belly was covered with ſingle ſcales running acroſs it, in the form of half rings. It was all over of a yellowiſh colour, without any ſpots or variation. Mr Edwards alſo informs us, that a perſon brought to him a common Engliſh ſnake, which had two heads quite ſeparate from each other, the necks parting about an inch from the head.

SERPENS, *Serpent*, in the Linnæan ſyſtem of zoology, an order of animals belonging to the claſs of *amphibia*, and comprehending ſix genera, viz, the *crotalus*, or rattle-ſnake; the *boa*, including ten ſpecies; the *coluber*, or viper; the *anguis*, or ſnake; the *amphiſbæna*, or annulated ſnake, the body and tail of which are compoſed of angular ſegments; and the *cæcilia*, or tentaculated ſnake, the body and tail of which are wrinkled, without ſcales, and the upper part furniſhed with two feelers: and including two ſpecies. See an account of theſe genera under their reſpective names.

1 Diſtinguiſhing character of ſerpents.

The characters of ſerpents, according to Linnæus, are theſe: They are amphibious animals, breathing through the mouth by means of lungs only; having a tapering body, no diſtinct neck; the jaws not articulated, but dilatable; and deſtitute of feet, fins, and ears.

2 General obſervations.

The ſerpent has from the beginning been the enemy of man; and it has hitherto continued to terrify and annoy him, notwithſtanding all the arts which have been practiſed to deſtroy it. Formidable in itſelf, it deters the invader from the purſuit; and from its figure, capable of finding ſhelter in a little ſpace, it is not eaſily diſcovered by thoſe who would venture to encounter it. Thus poſſeſſed at once of potent arms, and inacceſſible or ſecure retreats, it baffles all the arts

Serpens Biceps.

arts of man, though ever ſo earneſtly bent upon its deſtruction. For this reaſon, there is ſcarce a country in the world that does not ſtill give birth to this poiſonous brood, that ſeems formed to quell human pride, and repreſs the boaſts of ſecurity. Mankind have driven the lion, the tiger, and the wolf, from their vicinity; but the ſnake and the viper ſtill defy their power.

Their numbers, however, are thinned by human aſſiduity; and it is poſſible ſome of the kinds are wholly deſtroyed. In none of the countries of Europe are they ſufficiently numerous to be truly terrible. The various malignity that has been aſcribed to European ſerpents of old is now utterly unknown; there are not above three or four kinds that are dangerous, and their poiſon operates in all in the ſame manner. The drowſy death, the ſtarting of the blood from every pore, the inſatiable and burning thirſt, the melting down the ſolid maſs of the whole form into one heap of putrefaction, ſaid to be occaſioned by the bites of African ſerpents, are horrors with which we are entirely unacquainted.

But though we have thus reduced theſe dangers, having been incapable of wholly removing them, in other parts of the world they ſtill rage with all their ancient malignity. In the warm countries that lie within the tropics, as well as in the cold regions of the north, where the inhabitants are few, the ſerpents propagate in equal proportion. But of all countries thoſe regions have them in the greateſt abundance where the fields are unpeopled and fertile, and where the climate ſupplies warmth and humidity. All along the ſwampy banks of the river Niger or Oroonoko, where the ſun is hot, the foreſts thick, and the men but few, the ſerpents cling among the branches of the trees in infinite numbers, and carry on an unceaſing war againſt all other animals in their vicinity. Travellers have aſſured us, that they have often ſeen large ſnakes twining round the trunk of a tall tree, encompaſſing it like a wreath, and thus riſing and deſcending at pleaſure.—We are not, therefore, to reject as wholly fabulous the accounts left us by the ancients of the terrible devaſtations committed by a ſingle ſerpent. It is probable, in early times, when the arts were little known, and mankind were but thinly ſcattered over the earth, that ſerpents, continuing undiſturbed poſſeſſors of the foreſt, grew to an amazing magnitude; and every other tribe of animals fell before them. It then might have happened, that ſerpents reigned the tyrants of a diſtrict for centuries together. To animals of this kind, grown by time and rapacity to 100 or 150 feet in length, the lion, the tiger, and even the elephant itſelf, were but feeble opponents. That horrible fœtor, which even the commoneſt and the moſt harmleſs ſnakes are ſtill found to diffuſe, might, in theſe larger ones, become too powerful for any living being to withſtand; and while they preyed without diſtinction, they might thus alſo have poiſoned the atmoſphere around them. In this manner, having for ages lived in the hidden and unpeopled foreſt, and finding, as their appetites were more powerful, the quantity of their prey decreaſing, it is poſſible they might venture boldly from their retreats into the more cultivated parts of the country, and carry conſternation among mankind, as they had before deſolation among the lower ranks of nature. We have many hiſtories of antiquity, preſenting us ſuch a picture, and exhibiting a whole nation ſinking under the ravages of a ſingle ſerpent. At that time man had not learned the art of uniting the efforts of many to effect one great purpoſe. Oppoſing multitudes only added new victims to the general calamity, and increaſed mutual embarraſſment and terror. The animal was therefore to be ſingly oppoſed by him who had the greateſt ſtrength, the beſt armour, and the moſt undaunted courage. In ſuch an encounter, hundreds muſt have fallen; till one, more lucky than the reſt, by a fortunate blow, or by taking the monſter in its torpid interval, and ſurcharged with ſpoil, might kill, and thus rid his country of the deſtroyer. Such was the original occupation of heroes; and thoſe who firſt obtained that name, from their deſtroying the ravagers of the earth, gained it much more deſervedly than their ſucceſſors, who acquired their reputation only for their ſkill in deſtroying each other. But as we deſcend into more enlightened antiquity, we find theſe animals leſs formidable, as being attacked in a more ſucceſsful manner. We are told, that while Regulus led his army along the banks of the river Bagrada in Africa, an enormous ſerpent diſputed his paſſage over. We are aſſured by Pliny, that it was 120 feet long, and that it had deſtroyed many of the army. At laſt, however, the battering engines were brought out againſt it; and theſe aſſailing it at a diſtance, it was ſoon deſtroyed. Its ſpoils were carried to Rome, and the general was decreed an ovation for his ſucceſs. There are, perhaps, few facts better aſcertained in hiſtory than this: an ovation was a remarkable honour; and was given only for ſome ſignal exploit that did not deſerve a triumph: no hiſtorian would offer to invent that part of the ſtory at leaſt, without being ſubject to the moſt ſhameful detection. The ſkin was kept for ſeveral years after in the Capitol; and Pliny ſays he ſaw it there. At preſent, indeed, ſuch ravages from ſerpents are ſcarce ſeen in any part of the world; not but that, in Africa and America, ſome of them are powerful enough to brave the aſſaults of men to this day.

Nequent expleri corda tuendo
Terribiles oculos villoſaque ſetis pectora.

If we take a ſurvey of ſerpents in general, they have marks by which they are diſtinguiſhed from all the reſt of animated nature. They have the length and the ſuppleneſs of the eel, but want fins to ſwim with; they have the ſcaly covering and pointed tail of the lizard, but they want legs to walk with; they have the crawling motion of the worm, but, unlike that animal, they have lungs to breathe with: like all the reptile kind, they are reſentful when offended; and nature has ſupplied them with terrible arms to revenge every injury.

3 Conformation of their mouth.

Though they are poſſeſſed of very different degrees of malignity, yet they are all formidable to man, and have a ſtrong ſimilitude of form to each other. With reſpect to their conformation, all ſerpents have a very wide mouth in proportion to the ſize of the head; and what is very extraordinary, they can gape and ſwallow the head of another animal which is three times as big as their own. However, it is noway ſurpriſing that the ſkin of the ſnake ſhould ſtretch to receive ſo large a morſel; the wonder ſeems how the jaws could take it in.

Serpens. in. To explain this, it muſt be obſerved, that the jaws of this animal do not open as ours, in the manner of a pair of hinges, where bones are applied to bones, and play upon one another: on the contrary, the ſerpent's jaws are held together at the roots by a ſtretching muſcular ſkin; by which means they open as widely as the animal chooſes to ſtretch them, and admit of a prey much thicker than the ſnake's own body. The throat, like ſtretching leather, dilates to admit the morſel; the ſtomach receives it in part, and the reſt remains in the gullet, till putrefaction and the juices of the ſerpent's body unite to diſſolve it.

4 Their teeth. Some ſerpents have fangs or canine teeth, and others are without them. The teeth in all are crooked and hollow; and, by a peculiar contrivance, are capable of being erected or depreſſed at pleaſure.

5 Eyes. The eyes of all ſerpents are ſmall, if compared to the length of the body; and though differently coloured in different kinds, yet the appearance of all is malign and heavy; and, from their known qualities, they ſtrike the imagination with the idea of a creature meditating miſchief. In ſome, the upper eyelid is wanting, and the ſerpent winks only with that below; in others, the animal has a nictitating membrane or ſkin, reſembling that which is found in birds, which keeps the eye clean and preſerves the ſight. The ſubſtance of the eye in all is hard and horny; the cryſtalline humour occupying a great part of the globe.

The holes for hearing are very viſible in all: but there are no conduits for ſmelling; though it is probable that ſome of them enjoy that ſenſe in tolerable perfection.

6 Tongue. The tongue in all theſe animals is long and forky. It is compoſed of two long fleſhy ſubſtances, which terminate in ſharp points, and are very pliable. At the root it is connected very ſtrongly to the neck by two tendons that give it a variety of play. Some of the viper kind have tongues a fifth part of the length of their bodies; they are continually darting them out; but they are entirely harmleſs, and only terrify thoſe who are ignorant of the real ſituation of their poiſon.

7 Gullet. If from the jaws we go on to the gullet, we ſhall find it very wide for the animal's ſize, and capable of being diſtended to a great degree; at the bottom of this lies the ſtomach, which is not ſo capacious, and receives only a part of the prey, while the reſt continues in the gullet for digeſtion. When the ſubſtance in the ſtomach is diſſolved into chyle, it paſſes into the inteſtines, and from thence goes to nouriſhment, or to be excluded by the vent.

8 Lungs and heart. Like moſt other animals, ſerpents are furniſhed with lungs, which we ſuppoſe are ſerviceable in breathing, though we cannot perceive the manner in which this operation is performed; for though ſerpents are often ſeen apparently to draw in their breath, yet we cannot find the ſmalleſt ſigns of their ever reſpiring it again. Their lungs, however, are long and large, and doubtleſs are neceſſary to promote their languid circulation. The heart is formed as in the tortoiſe, the frog, and the lizard kinds, ſo as to work without the aſſiſtance of the lungs. It is ſingle; the greateſt part of the blood flowing from the great vein to the great artery by the ſhorteſt courſe. By this contrivance of nature we eaſily gather two conſequences; that ſnakes are amphibious, being equally capable of living on land and in the water; and that they are alſo torpid in winter, like the bat, the lizard, and other animals formed in the ſame manner.

Serpe

9 Mode of generat The vent in theſe animals ſerves for the emiſſion of the urine and the fæces, and for the purpoſes of generation. The inſtrument of generation in the male is double, being forked like the tongue: the ovaries in the female are double alſo; and the aperture is very large, in order to receive the double inſtrument of the male. They copulate in their retreats; and it is ſaid by the ancients, that in this ſituation they appear like one ſerpent with two heads.

10 Numbe joints i the bac bone. As the body of the animal is long, ſlender, and capable of bending in every direction, the number of joints in the back bone are numerous beyond what one would imagine. In the generality of quadrupeds, they amount to not above 30 or 40; in the ſerpent kind they amount to 145 from the head to the vent, and 25 more from that to the tail. The number of theſe joints muſt give the back bone a ſurpriſing degree of pliancy; but this is ſtill increaſed by the manner in which each of theſe joints is locked into the other. In man and quadrupeds, the flat ſurfaces of the bones are laid one againſt the other, and bound tight by ſinews; but in ſerpents, the bones play one within the other like ball and ſocket, ſo that they have full motion upon each other in every direction.

11 Numbe ribs. Though the number of joints in the back bone is great, yet that of the ribs is ſtill greater; for, from the head to the vent, there are two ribs to every joint, which makes their number 290 in all. Theſe ribs are furniſhed with muſcles, four in number; which being inſerted into the head, run along to the end of the tail, and give the animal great ſtrength and agility in all its motions.

12 Scales The ſkin alſo contributes to its motions, being compoſed of a number of ſcales, united to each other by a tranſparent membrane, which grows harder as it grows older, until the animal changes, which is generally done twice a-year. This cover then burſts near the head, and the ſerpent creeps from it by an undulatory motion, in a new ſkin, much more vivid than the former. If the old ſlough be then viewed, every ſcale will be diſtinctly ſeen like a piece of net-work, and will be found greateſt where the part of the body they covered was largeſt.

There is much geometrical neatneſs in the diſpoſal of the ſerpent's ſcales, for aſſiſting the animal's ſinuous motion. As the edges of the foremoſt ſcales lie over the ends of their following ſcales, ſo thoſe edges, when the ſcales are erected, which the animal has a power of doing in a ſmall degree, catch in the ground, like the nails in the wheel of a chariot, and ſo promote and facilitate the animal's progreſſive motion. The erecting theſe ſcales is by means of a multitude of diſtinct muſcles with which each is ſupplied, and one end of which is tacked each to the middle of the foregoing.

In ſome of the ſerpent kind there is the exacteſt ſymmetry in theſe ſcales; in others they are diſpoſed more irregularly. In ſome there are larger ſcales on the belly, and often anſwering to the number of ribs; in others, however, the animal is without them. Upon this ſlight difference, Linnæus has founded his diſtinctions of the various claſſes of the ſerpent tribe.

13 Their f When we come to compare ſerpents with each other, the

ens. the firſt great diſtinction appears in their ſize; no other tribe of animals differing ſo widely in this particular. This tribe of animals, like that of fiſhes, ſeems to have no bounds put to their growth: their bones are in a great meaſure cartilaginous, and they are conſequently capable of great extenſion: the older, therefore, a ſerpent becomes, the larger it grows; and as they ſeem to live to a great age, they arrive at an enormous ſize.

Leguat aſſures us, that he ſaw one in Java that was 50 feet long. Carli mentions their growing to above 40 feet; and we have now the ſkin of one in the Britiſh Muſeum that meaſures 32. Mr Wentworth, who had large concerns in the Berbices in America, aſſures us, that in that country they grow to an enormous length. He one day ſent out a ſoldier, with an Indian, to kill wild fowl for the table; and they accordingly went ſome miles from the fort: in purſuing their game, the Indian, who generally marched before, beginning to tire, went to reſt himſelf upon the fallen trunk of a tree, as he ſuppoſed it to be; but when he was juſt going to ſit down, the enormous monſter began to move; and the poor ſavage perceiving that he had approached a *boa*, the greateſt of all the ſerpent kind, dropped down in an agony. The ſoldier, who perceived at ſome diſtance what had happened, levelled at the ſerpent's head, and by a lucky aim ſhot it dead: however, he continued his fire until he was aſſured that the animal was killed; and then going up to reſcue his companion, who was fallen motionleſs by its ſide, he, to his aſtoniſhment, found him dead likewiſe, being killed by the fright. Upon his return to the fort, and telling what had happened, Mr Wentworth ordered the animal to be brought up, when it was meaſured, and found to be 36 feet long. He had the ſkin ſtuffed, and then ſent to Europe as a preſent to the prince of Orange, in whoſe cabinet it was lately to be ſeen at the Hague: but the ſkin is ſhrunk, by drying, two or three feet. In the Eaſt Indies they grow alſo to an enormous ſize, particularly in the iſland of Java, where, we are aſſured, that one of them will deſtroy and devour a buf-
14 falo. See Boa.
tony, But it is happy for mankind that the rapacity of theſe frightful creatures is often their puniſhment; for whenever any of the ſerpent kind have gorged themſelves in this manner, whenever their body is ſeen particularly diſtended with food, they then become torpid, and may be approached and deſtroyed with ſafety. Patient of hunger to a ſurpriſing degree, whenever they ſeize and ſwallow their prey, they ſeem, like ſurfeited gluttons, unwieldy, ſtupid, helpleſs, and ſleepy: they at that time ſeek ſome retreat, where they may lurk for ſeveral days together, and digeſt their meal in ſafety: the ſmalleſt effort at that time is capable of deſtroying them; they can ſcarce make any reſiſtance: and they are equally unqualified for flight or oppoſition: that is the happy opportunity of attacking them with ſucceſs; at that time the naked Indian himſelf does not fear to aſſail them. But it is otherwiſe when this ſleepy interval of digeſtion is over; they then iſſue, with famiſhed appetites, from their retreats, and with accumulated terrors, while every animal of the foreſt flies
15 before them.
ſtiti- But though theſe animals are of all others the moſt
e. voracious, and though the morſel which they ſwallow without chewing is greater than what any other creature, either by land or water, can devour; yet no animals upon earth bear abſtinence ſo long as they. A ſingle meal, with many of the ſnake kind, ſeems to be the adventure of a ſeaſon; it is an occurrence, of which they have been for weeks, nay ſometimes for months, in patient expectation. When they have ſeized their prey, their induſtry for ſeveral weeks is entirely diſcontinued; the fortunate capture of an hour often ſatisfies them for the remaining period of their annual activity. As their blood is colder than that of moſt other terreſtrial animals, and as it circulates but ſlowly through their bodies, ſo their powers of digeſtion are but feeble. Their prey continues, for a long time, partly in the ſtomach, partly in the gullet, and is often ſeen in part hanging out of the mouth. In this manner it digeſts by degrees; and in proportion as the part below is diſſolved, the part above is taken in. It is not therefore till this tedious operation is entirely performed, that the ſerpent renews its appetite and its activity. But ſhould any accident prevent it from iſſuing once more from its cell, it ſtill can continue to bear famine for weeks, months, nay for years together. Vipers * are often kept in boxes for ſix or eight months, without any food whatever; and there are little ſerpents ſometimes ſent over to Europe from Grand Cairo, that live for ſeveral years in glaſſes, and never eat at all, nor even ſtain the glaſs with their excrements. * See *Abſtinence.*

16 Food. Other creatures have a choice in their proviſion; but the ſerpent indiſcriminately preys upon all; the buffalo, the tyger, and the gazelle. One would think that the porcupine's quills might be ſufficient to protect it; but whatever has life ſerves to appeaſe the hunger of theſe devouring creatures: porcupines, with all their quills, have frequently been found in their ſtomachs when killed and opened; nay, they very frequently are ſeen to devour each other.

17 Places which they frequent. A life of ſavage hoſtility in the foreſt offers the imagination one of the moſt tremendous pictures in nature. In thoſe burning countries, where the ſun dries up every brook for hundreds of miles round; when what had the appearance of a great river in the rainy ſeaſon, becomes, in ſummer, one dreary bed of ſand; in thoſe countries, a lake that is never dry, or a brook that is perennial, is conſidered by every animal as the greateſt convenience of nature. When they have diſcovered this, no dangers can deter them from attempting to ſlake their thirſt. Thus the neighbourhood of a rivulet, in the heart of the tropical continents, is generally the place where all the hoſtile tribes of nature draw up for the engagement. On the banks of this little envied ſpot, thouſands of animals of various kinds are ſeen venturing to quench their thirſt, or preparing to ſeize their prey. The elephants are perceived in a long line, marching from the darker parts of the foreſt; the buffaloes are there, depending upon numbers for ſecurity; the gazelles relying ſolely upon their ſwiftneſs; the lion and tyger waiting a proper opportunity to ſeize; but chiefly the larger ſerpents are upon guard there, and defend the acceſſes of the lake. Not an hour paſſes without ſome dreadful combat; but the ſerpent, defended by its ſcales, and naturally capable of ſuſtaining a multitude of wounds, is, of all others, the moſt formidable. It is the moſt wakeful alſo; for the whole tribe ſleep with their eyes open, and are conſequently for ever upon the watch: ſo that, till their rapacity is ſatisfied,

few

Serpens. few other animals will venture to approach their ſtation.

18 The ſound which they utter.

In comparing ſerpents as to their voices, ſome are found ſilent, ſome have a peculiar cry; but hiſſing is the ſound which they moſt commonly ſend forth, either as a call to their kind, or as a threat to their enemies. In the countries where they abound, they are generally ſilent in the middle of the day, when they are obliged to retire from the heat of the climate; but as the cool of the evening approaches, they are then heard iſſuing from their cells with continued hiſſings; and ſuch is the variety of their notes, that ſome have aſſured us they very much reſemble the muſic of an Engliſh grove. This ſome will hardly credit; at any rate, ſuch notes, however melodious, can give but very little delight, when we call to mind the malignity of the minſtrel. If conſidered, indeed, as they anſwer the animal's own occaſions, they will be found well adapted to its nature, and fully anſwering the purpoſes of terrifying ſuch as would venture to offend it.

19 How they move.

With reſpect to motion, ſome ſerpents, particularly thoſe of the viper kind, move ſlowly; while others dart with amazing ſwiftneſs. The motion in all is ſimilar; but the ſtrength of body in ſome gives a very different appearance. The viper, that is but a ſlow feeble-bodied animal, makes way in a heavy undulating manner; advancing its head, then drawing up its tail behind, and bending the body into a bow; then from the ſpot where the head and tail were united, advancing the head forward as before. This, which is the motion of all ſerpents, is very different from that of the earthworm, or the naked ſnail. The ſerpent, as was ſaid above, has a back bone, with numerous joints; and this bone the animal has a power of bending in every direction, but without being able to ſhorten or lengthen it at pleaſure. The earthworm, on the other hand, has no back bone; but its body is compoſed of rings, which, like a barber's puff it can lengthen or ſhorten as it finds neceſſary. The earthworm, therefore, in order to move forward, lengthens the body; then by the fore part clings to the ground where it has reached, and then contracts and brings up its rear: then, when the body is thus ſhortened, the fore part is lengthened again for another progreſſion, and ſo on. The ſerpent, inſtead of ſhortening the body, bends it into an arch; and this is the principal difference between ſerpentine and vermicular progreſſion.

We have inſtanced this motion in the viper, as moſt eaſily diſcerned; but there are many ſerpents that dart with ſuch amazing ſwiftneſs, that they appear rather to leap than crawl. It is moſt probable, however, that no ſerpent can dart upon even ground farther than its own length at one effort. Our fears indeed may increaſe the force of their ſpeed, which is ſometimes found ſo fatal. We are told by ſome, that they will dart to a very great diſtance; but this we have never been able to aſcertain. The manner of progreſſion in the ſwifteſt ſerpent we know, which is the jaculus, is by inſtantly coiling itſelf upon its tail, and darting from thence to its full extent: then carrying the tail, as quick as lightning to the head; coiling and darting again; and by this means proceeding with extreme rapidity, without ever quitting the ground. Indeed, if we conſider the length and the weakneſs of the back bone in all theſe animals; if we regard the make of the vertebræ, in which we ſhall find the junctures all formed to give play, and none to give power; we cannot be of opinion that they have a faculty of ſpringing from the ground, as they entirely want a *fulcrum*, if we may ſo expreſs it, from whence to take their ſpring; the whole body being compoſed of unſupported muſcles and joints that are yielding.

Serpens.

20 Though amphibi yet they die whe immerſe in wate

Though all ſerpents are amphibious, ſome are much fonder of the water than others; and though deſtitute of fins or gills, remain at the bottom, or ſwim along the ſurface with great eaſe. From their internal ſtructure, we ſee how well adapted they are for either element: and how capable their blood is of circulating at the bottom as freely as in the frog or the tortoiſe. They can, however, endure to live in freſh water only; for ſalt is an effectual bane to the whole tribe. The greateſt ſerpents are moſt uſually found in freſh water, either chooſing it as their favourite element, or finding their prey in ſuch places in the greateſt abundance. But that all will live and ſwim in liquids, appears from an experiment of Redi; who put a ſerpent into a large glaſs veſſel of wine, where it lived ſwimming about ſix hours; though, when it was by force immerſed and put under that liquid, it lived only one hour and a half. He put another in common water, where it lived three days; but when it was kept under water, it lived only about 12 hours. Their motion there, however, is perfectly the reverſe of what it is upon land; for, in order to ſupport themſelves upon an element lighter than their bodies, they are obliged to increaſe their ſurface in a very artificial manner. On earth their windings are perpendicular to the ſurface; in water they are parallel to it: in other words, if a perſon ſhould wave his hand up and down, it will give an idea of the animal's progreſs on land; if to the right and left, it will give ſome idea of its progreſs on the water.

21 Fœtor

Some ſerpents have a moſt horrible fœtor attending them, which is alone capable of intimidating the brave. This proceeds from two glands near the vent, like thoſe in the weaſel or polecat; and, like thoſe animals, in proportion as they are excited by rage or by fear the ſcent grows ſtronger. It would ſeem, however, that ſuch ſerpents as are moſt venomous are leaſt offenſive in this particular; ſince the rattleſnake and the viper have no ſmell whatever; nay, we are told, that at Calicut and Cranganon, in the Eaſt Indies, there are ſome very noxious ſerpents, who are ſo far from being diſagreeable, that their excrements are ſought after, and kept as the moſt pleaſing perfume. The Eſculapian ſerpent is alſo of this number.

22 Some vi viparous, others ov parous.

Some ſerpents bring forth their young alive, as the viper; ſome bring forth eggs, which are hatched by the heat of their ſituation, as the common black ſnake, and the majority of the ſerpent tribe. When a reader, ignorant of anatomy, is told, that ſome of thoſe animals produce their young alive, and that ſome produce eggs only, he is apt to ſuppoſe a very great difference in the internal conformation, which makes ſuch a variety in the manner of bringing forth. But this is not the caſe: theſe animals are internally alike, in whatever manner they produce their young; and the variety in their bringing forth is rather a ſlight than a real diſcrimination. The only difference is, that the viper hatches her eggs, and brings them to maturity, within her body; the ſnake is more premature in her productions,

tions, and ſends her eggs into the light ſome time before the young ones are capable of leaving the ſhell. Thus, if either are opened, the eggs will be found in the womb, covered with their membranous ſhell, and adhering to each other like large beads on a ſtring. In the eggs of both, the young ones will be found, though at different ſtages of maturity: thoſe of the viper will crawl and bite in the moment the ſhell that encloſes them is broke open: thoſe of the ſnake are not yet arrived at their perfect form.

Father Labat took a ſerpent of the viper kind that was nine feet long, and ordered it to be opened in his preſence. He then ſaw the manner in which the eggs of theſe animals lie in the womb. In this creature there were ſix eggs, each of the ſize of a gooſe egg, but longer, more pointed, and covered with a membranous ſkin, by which alſo they were united to each other. Each of theſe eggs contained from 13 to 15 young ones, about ſix inches long, and as thick as a gooſequill. Though the female from whence they were taken was ſpotted, the young ſeemed to have a variety of colours very different from the parent; and this led the traveller to ſuppoſe that the colour was no characteriſtic mark among ſerpents. Theſe little miſchievous animals were no ſooner let looſe from the ſhell, than they crept about, and put themſelves into a threatening poſture, coiling themſelves up and biting the ſtick with which he was deſtroying them. In this manner he killed 74 young ones; thoſe that were contained in one of the eggs eſcaped at the place where the female was killed, by the burſting of the egg and their getting among the buſhes.

The faſcinating power aſcribed to ſerpents, eſpecially to rattleſnakes, by which they are ſaid to draw animals to them, is very curious. It has been deſcribed by ſo many different perſons, who affirmed that they had ſeen inſtances of it, and has been believed by ſo many men of penetration and diſcernment, that it deſerves at leaſt to be mentioned. The rattleſnake fixes its eyes upon any animal, ſuch as a bird or ſquirrel. When the animal ſpies the ſnake, it ſkips from ſpray to ſpray, hovering and approaching nearer the enemy; deſcending, with diſtracted geſtures and cries, from the top of the loftieſt trees to the mouth of the ſnake, who opens his jaws, and in an inſtant ſwallows the unfortunate animal.

The following inſtances of faſcination have ſo much the appearance of fiction, that it would require a very uncommon degree of evidence to render them credible. They are extracted from a paper in the Gentleman's Magazine for the year 1765, p. 511. which was communicated by Mr Peter Collinſon from a correſpondent in Philadelphia.

"A perſon of good credit was travelling by the ſide of a creek or ſmall river, where he ſaw a ground ſquirrel running to and fro between the creek and a great tree a few yards diſtant; the ſquirrel's hair looking very rough, which ſhowed he was ſcared, and his returns being ſhorter and ſhorter, the man ſtood to obſerve the cauſe, and ſoon ſpied the head and neck of a rattleſnake pointing at the ſquirrel through a hole of the great tree, it being hollow; the ſquirrel at length gave over running, and laid himſelf quietly down with his head cloſe to the ſnake's; the ſnake then opened his mouth wide, and took in the ſquirrel's head; upon which the man gave the ſnake a whip acroſs the neck, and ſo the ſquirrel being releaſed, he ran into the creek. Serpent.

"When I was about 13 years old, I lived with William Atkinſon, an honeſt man in Bucks county, who, returning from a ride in warm weather, told us, that while his horſe was drinking at a run, he heard the cry of a blackbird, which he ſpied on the top of a ſapling, fluttering and ſtraining the way he ſeemed unwilling to fly, and holding ſo faſt the ſprigs he was perched upon that the ſappling top bent. After he had viewed the bird a few minutes, it quitted the place, and made a circle or two higher in the air, and then reſumed its former ſtanding, fluttering and crying: Thereupon William rode the way the bird ſtrained, and ſoon ſpied a large black ſnake in coil, ſteadily eyeing the bird. He gave the ſnake a laſh with his whip, and this taking off the ſnake's eye from his prey, the charm was broken, and away fled the bird, changing its note to a ſong of joy.

"Mr Nicholas Scull, a ſurveyor, told me, that when he was a young man, as he happened once to be leaning upon a fence, and looking over it, he ſaw a large rattleſnake in coil, looking ſtedfaſtly at him. He found himſelf ſurpriſed and liſtleſs immediately, and had no power for about a minute (as he thinks) but to look at the ſnake, and then he had the reſolution to puſh himſelf from the fence, and turn away, feeling ſuch horror and confuſion as he would not undergo again for any conſideration.

"Doctor Chew tells me, a man in Maryland was found fault with by his companion that he did not come along; the companion ſtepping towards him, obſerved that his eyes were fixed upon a rattleſnake which was gliding ſlowly towards him, with his head raiſed as if he was reaching up at him; the man was leaning towards the ſnake, and ſaying to himſelf, *he will bite me! he will bite me!* Upon which his companion caught him by the ſhoulder, and pulled him about, and cried out, *What the devil ails you? He will bite you ſure enough!* This man found himſelf very ſick after his enchantment."

The faſcinating power of ſerpents was believed by Dr Mead and other eminent men, who certainly thought they had ſufficient evidence for admitting it. Incredible therefore as it appears, it ought not to be rejected without examination; though being of a very extraordinary nature, it cannot be received without unqueſtionable evidence. Sceptiſiſm is no leſs abſurd than incredulity; and the true philoſopher will carefully avoid both. Human knowledge is founded on obſervation and experience; not, however, on every man's perſonal obſervation and experience, but on the united obſervation and experience of all mankind. But this preſuppoſes the credibility of human teſtimony in every caſe that does not involve an impoſſibility. All the laws of nature are not yet known, nor all the wonderful powers of which ſhe is poſſeſſed. It is not more incredible *à priori*, that the eye of a ſerpent ſhould attract an animal than that a magnet ſhould attract a piece of iron, or a piece of iron attract electrical matter. The evidence of theſe facts reſts entirely on perſonal obſervation or authentic teſtimony. The only thing requiſite with reſpect to objects of teſtimony is, when the fact is ſo extraordinary as has not fallen within the obſervation of the generality of men, the ſtrength

Serpent. of the evidence muſt be in proportion to the extraordinary nature of the fact. To apply this to the preſent caſe: We have the teſtimony of many perſons that ſome ſerpents have a power of faſcination; but the generality of men have never obſerved this; it is therefore an extraordinary fact, and requires extraordinary evidence. But the evidence is not ſatisfactory; therefore we do not receive it as a fact: on the other hand, it is unphiloſophical to reject it *à priori*.

43 How their poiſon operates.

No ſubject has excited more philoſophical controverſy than the poiſon of ſerpents, with regard to its nature and mode of operating. Antiquity has not been ſparing in conjecture and fiction upon this ſubject, and its errors have been retained with the moſt reverential obſtinacy by the vulgar: among theſe we are to reckon the fictitious ſting fixed in the tail of the ſerpent, as the painters ſometimes have groundleſsly enough repreſented it; ſome have invented a ſimilar fiction of a black forked tongue, which the ſerpent vibrates on both ſides, and have aſcribed its power of producing ſuch noxious effects to this; while others, affecting an air of ſuperior diſcernment, have, upon equally good reaſons, aſcribed it to the teeth in general: theſe are all errors of a magnitude that the moſt deſultory attention to the ſubject would have been ſufficient to have removed. There is a very ſmall bone cloſely fixed to the upper jaw, in the inſide of the lip of a poiſonous ſerpent, which has a power of moving backward or forward; to this two or three fangs are annexed larger than the teeth, which the ſerpent, by its aſſiſtance, when enraged, darts forward, or withdraws and conceals at his pleaſure, in a ſimilar manner to the claws of a cat: theſe fangs, which the common people name the large teeth of the ſerpent, are excellently deſcribed by Tyſon in the anatomy of the rattleſnake, which he has given in the Philoſophical Tranſactions. "In theſe (the fangs) we obſerved a conſiderable cavity near the baſe; and near the point a very diſcernible fiſſure of ſome length like the ſlit of a pen: the part of the tooth from the fiſſure to the root was manifeſtly channelled, which we firſt diſcovered by lightly preſſing the gums; we then ſaw the poiſon aſcend through the cavity of the fang and flow out of the fiſſure; and as theſe fangs are ſo very acute, ſo firm and ſolid toward the point (the fiſſure being on the external and convex, not the internal ſide); nothing could be conceived more convenient either for inflicting a wound, or to enſure the infuſion of the poiſon." Each of the fangs is ſurrounded with a vehicle furniſhed with glands ſecreting a certain fluid; which, upon the veſicle being preſſed, ſeems to flow out of the point of the fang. The ſerpent when incenſed, raiſing his head, extends the ſmall bone armed with the fangs mentioned above; and attacking his enemy with a force combined of the weight of his body and the action of the muſcles, he wounds him with the expanded fangs, and the veſicle being compreſſed the poiſon immediately flows into the wound: this is clear from the experience of thoſe who, having broken off their fangs with a pair of forceps, handled the ſerpent thus diſarmed without any hurt. The North Americans, after carefully extracting theſe venomous fangs, ſuffer the rattleſnake to bite and gnaw them with his teeth till the blood flows freely, with total impunity.

Antiquity amuſed itſelf with a fable deſtitute of all appearance of truth, that anger was excited by black bile: they applied this fiction without heſitation to the preſent ſubject, and founded an hypotheſis upon it, to account for the effects of the bite of an incenſed ſerpent; pretending to have diſcovered an ideal canal which conducted the bile from its veſicle to the mouth of the ſerpent, whence it flowed to the part bitten, and produced the moſt fatal ſymptoms. But toward the end of the laſt century, this ſubject was greatly illuſtrated under the auſpices of Ferdinand II. great duke of Tuſcany: This prince, deſirous of inquiring into that myſterious queſtion, the nature of ſerpents, invited Steno, Rhedi, and ſome other philoſophers of the firſt eminence, to his court; and a multitude of the moſt poiſonous ſerpents being collected, Rhedi made ſeveral experiments upon them, which diſcovered to him a number of particulars before unknown; of which the following ſeem to have the beſt claim to our attention. When he either cauſed a living viper to bite a dog, or wounded him with the teeth of one newly dead (the poiſonous veſicle remaining unbroken), the event was the ſame. If the bite was repeated, its effect became weaker, and at laſt was loſt, the poiſon contained in the veſicle being totally exhauſted. That the teeth of ſerpents, when extended to bite, were moiſtened over with a certain liquor; and when the veſicle at the baſe was preſſed, a drop of poiſon flowed to the point of the fang. When the poiſon thus flowing from the veſicle was received in ſoft bread or a ſponge, an animal bitten by the ſerpent received no more harm from the wound than from being pricked with a needle, till after a few days, when the venom was reſtored afreſh: but when an animal was wounded with the point of a needle dipped in the poiſon, it was tormented with the ſame pains as if it had been bitten by the viper itſelf. Preſerving ſome of this poiſon in a glaſs, and totally evaporating the moiſture in the ſun, when the reſiduum was diluted again with water, and the point of a needle dipped in the ſolution, Rhedi found to his great ſurpriſe that it had the ſame effect as when recent. But the boldneſs of Tozzi, one who charmed vipers, ſtung all theſe men who were deeply verſed in natural philoſophy into the utmoſt aſtoniſhment. They happening to fall into diſcourſe (while the prince was preſent) upon the certain death which would attend any perſon's ſwallowing this poiſon of the viper by miſtake, inſtead of ſpirit of wine or water; Tozzi, confiding in his art, drank a conſiderable portion of it without heſitation: they were all aſtoniſhed at his apparent raſhneſs, and predicted inſtant death to the man; however, he eſcaped as ſafely as if he had drunk only ſo much water. This event, which ſtruck the prince and his illuſtrious aſſociates in theſe philoſophical inquiries by its novelty, was well known to the ancients. Lucan, in the 9th book of the Pharſalia, ſpeaking of the ſerpent, ſays,

Noxia ſerpentum eſt admiſto ſanguine peſtis
Morſu virus habent et futum dente minantur,
Pocula morte carent. Phar. l. 9. v. 614.

Mix'd with the blood that venom ſlays alone,
His bite is poiſon; death is in his fang;
Yet is the draught innoxious.

Nor muſt we omit obſerving, that barbarous nations are perfectly acquainted with the property of the poiſon of ſerpents by which it retains its deadly power af-

ter-

ter it has been long kept: they have been poſſeſſed of this fatal ſecret for ages paſt; it being their cuſtom to tinge the points of their arrows with the juice of ſpurge, putrid fleſh, or oil of tobacco, but more particularly with the poiſon of vipers. Some modern Indians continue the practice to this day; and we have the teſtimony of Pliny, in his Natural Hiſtory, that the Scythians had long ago the ſame cuſtom: "The Scythians (ſays that author) dip their arrows in the poiſon of vipers and human blood; a horrid practice, as the ſlighteſt wound inflicted by one of them defies all the art of medicine."

The poiſon of ſerpents produces fatal effects only by mixing with the blood. To confirm this principle, the Florentine philoſophers collected a quantity of poiſon, and gave it to different animals without producing the leaſt inconvenience; but when applied to an external wound, every one of thoſe horrid ſymptoms which accompany the real bite followed, viz. inflammatory and malignant fevers, ending in death, unleſs nature, by a ſpontaneous hemorrhage, or ſome other evacuation, diſcharged this poiſon. With reſpect to the experiments of Rhedi, every one of his obſervations prove, that the liquid preſſed out of the veſicle which moiſtens the fangs of the ſerpents is only noxious by being conveyed into the blood, by means of a puncture or wound; and the caſe of Tozzi, who drank a conſiderable quantity of this poiſon without ſuffering injury, proves that it hurts the blood only when externally mixed with it.

24 ptoms ding ite of rent nts.

The ſymptoms of the bite of the viper have already been deſcribed under MEDICINE, N°408, with the cures recommended by Dr Mead for the bite of ſerpents in general. Under the article POISON, p. 269, we have mentioned the Abbé Fontana's method of cure, viz. ligatures, and the beneficial effects of the volatile alkali. We ſhall now therefore ſupply what has been omitted in theſe articles, by deſcribing the ſymptoms which accompany the bite of other ſerpents.

The ſymptoms attending the bite of the *coluber preſter*, a native of Sweden, are, pain in the wound, tumor, thirſt, aſthma, anxieties, convulſions, and death.

There is a ſerpent ſtill more dreadful than any of the former, found in Sweden, called *coluber curcia*. The bite of this is followed by immediate change of colour, coldneſs, ſtupor, palpitation of the heart, acute pain all over the body, and death. Linnæus tried oil in this caſe, but it proved ineffectual.

The *crotalus horridus* of Linnæus, the rattleſnake, kills in a very ſudden manner; his bite uſually producing death within twelve hours.

The following account of the poiſon ſerpent of the Eaſt Indies is given by M. d'Obſonville: "Among the ſerpents of India, that which I believe to be moſt formidable is but about two feet long, and very ſmall. Its ſkin is freckled with little traits of brown or pale red, and contraſted with a ground of dirty yellow: it is moſtly found in dry and rocky places, and its bite mortal in leſs than one or two minutes. In the year 1759, and in the province of Cadapet, I ſaw ſeveral inſtances of it; and among others, one very ſingular, in the midſt of a corps of troops commanded by M. de Buſſy. An Indian Gentoo merchant perceived a Mahometan ſoldier of his acquaintance going to kill one of theſe reptiles, which he had found ſleeping under his packet, the Gentoo flew to beg its life, proteſting it would do no hurt if it was not firſt provoked; paſſing at the ſame time his hand under its belly to carry it out of the camp, when ſuddenly it twiſted round, and bit his little finger; upon which this unfortunate martyr of a fanatic charity gave a ſhriek, took a few ſteps, and fell down inſenſible. They flew to his aſſiſtance, applied the ſerpent-ſtone, fire, and ſcarifications, but they were all ineffectual, his blood was already coagulated. About an hour after, I ſaw the body as they were going to burn it, and I thought I perceived ſome indications of a complete diſſolution of the blood.

"The *ſerpens brulans*, or burning ſerpent, is nearly of the ſame form with the laſt mentioned; its ſkin is not quite of ſo deep a brown, and is ſpeckled with dark green ſpots; its poiſon is almoſt as dangerous, but it is leſs active, and its effects are very different: in ſome perſons it is a devouring fire, which, as it circulates through the veins, preſently occaſions death; the blood diſſolves into a lymphatic liquor, reſembling thin broth, without apparently having paſſed through the intermediate ſtate of coagulation, and runs from eyes, noſe, and ears, and even through the pores. In other ſubjects, the poiſon ſeems to have changed the very nature of the humours in diſſolving them; the ſkin is chapped and becomes ſcaly, the hair falls off, the members are tumefied, the patient feels all over his body the moſt racking pains, numbneſs, and is not long in periſhing. It is ſaid, however, that people have been cured by remedies well and ſoon applied. Be that as it may, it ſeems to me that the poiſon of theſe different reptiles is in general more powerful the more they live in hot and dry places, where they feed upon inſects that are full of ſaline, volatile, and acrimonious particles."

We are ignorant of what ſpecies the *hemorrhois* was, which is deſcribed by Lucan as cauſing by its bite a flux of blood from every part of the body. But the bite of an American ſerpent named *de la crux* kills in the ſame manner.

The *dipſas* is at preſent likewiſe unknown. Lucan informs us, that the perſon wounded by it was attacked by an unquenchable thirſt. This is finely painted by him; where A. Tuſcus, ſtandard-bearer of Cato, is deſcribed as bitten by that ſerpent:

Non decus imperii, non mæſti jura Catonis
Ardentem tenuere virum, quin ſpargere ſigna
Auderet, totiſque furens exquireret agris
Quas poſcebat aquas ſitiens in corde venenum.

Pharſal. l. 9.

His wild impatience, not his honour'd ſtate,
Nor ſorrowing Cato's high command, reſtrain;
Furious, diſhonour'd in the duſt, he flings
His ſacred eagle, and o'er all the fields
Rapid he burſts to ſeek the cooling ſtream,
To quench the thirſty poiſon in his breaſt.

And a few verſes after:

Scrutatur venas penitus ſqualentis arenæ
Nunc redit ad Syrtes, et fluctus accipit ore,
Aquoreaſque placet, ſed non ſibi ſufficit humor,
Nec ſentit fatique genus, mortemque veneni,
Sed putat eſſe ſitim; ferroque aperire tumentes
Suſtinuit venas, atque os implere cruore.

Serpent. Now tearing up the ſands, ſome latent vein
Fruſtrate he ſeeks; now to the Syrtes ſhore
Return'd, he ſwallows down the briny flood
Mix'd with its rolling ſands; nor knows his fate
And the ſad poiſon's death, but calls it thirſt;
Then with his ſword opens his ſpouting veins,
And drinks the burſting blood.——

The *phytas*, or *amodytes* of Linnæus, or, according to others, the *coluber aſpis*, ſeems to have been the ſerpent made uſe of by Cleopatra to deſtroy herſelf. This woman, to terminate a diſſipated life with an eaſy death, ordered her phyſicians to prepare a poiſon for her which might beſt effect this purpoſe. Having tried a number of different experiments upon condemned criminals, they at laſt diſcovered this ſpecies of aſp, which brings on death without any previous appearance of diſtemper or hiccough: the face ſeems in a ſlight perſpiration, an eaſy inſenſibility and lethargy creeps upon the whole frame, and the perſon bitten ſeems almoſt totally ignorant of his approaching diſſolution. Having acquainted the queen with their diſcovery, ſhe applied the aſp either to her boſom or her arms; or, according to ſome authors, dipping the point of a needle in the poiſon, and pricking herſelf with it, ſhe expired in an eaſy ſleep.

The bite of the *naja* is ſo fatal, that a man dies by it in the ſpace of an hour, his fleſh entirely falling off his bones in a ſemidiſſolved putrid ſtate: this makes it probable that it is the ſame ſerpent which the ancients named the *ſepe*.

The experiments of Rhedi, have not, in the opinion of ſome celebrated philoſophers, ſo far cleared the theory of the operation of the poiſon of the viper, as to leave nothing further to be deſired upon that ſubject. Fontana and Carminati have endeavoured to inveſtigate its operations more clearly. Carminati, from 11 experiments, deduces the following concluſions: 1. That if poiſon be inſtilled into a nerve, the animal wounded dies almoſt inſtantly; and the whole nervous ſyſtem, to which it is rapidly conveyed, is deprived of its quality called *ſenſibility*. 2. If a muſcle be wounded, it is deprived of its irritability. This is confirmed by the experiments of Fontana. 3. The poiſon injected into a wounded muſcle or tendon is conſiderably longer in killing an animal than that introduced into a nerve. 4. The ſymptoms which precede the death of the animal bitten are, a ſtupor, lethargy, tremors, convulſions, paralyſis of the legs (part wounded), entire diſſolution of the limbs. The blood is not always coagulated, nor its craſis diſſolved. Marks of inflammation are ſometimes diſcovered in certain parts of the animal after death, ſometimes not: theſe are the effects of ſpaſms and convulſions, not of the poiſon. 5. Not the leaſt ſign of the jaundice was diſcoverable in the eyes of any of the animals upon which Carminati made his experiments. 6. The ſtomach in every one of them was very much inflated; a ſymptom remarked only by Fallopius and Albertini. 7. A ligature applied inſtantly above the part bitten, if it be ſo placed as to admit one, was found by ſome experiments a good preventive againſt the diffuſion of the poiſon: its compreſſion ſhould be conſiderable, but not exceſſive.

A few ſerpents, comparatively ſpeaking, are poiſonous; it may be intereſting to our readers to know what are the characteriſtics which diſtinguiſh poiſonous from harmleſs ſerpents. The external characteriſtics of the poiſonous tribe are theſe: Serpent.

25
How to diſtinguiſh poiſonous ſerpents.

"1. A broad head, covered with ſmall ſcales, though it be not a certain criterion of venomous ſerpents, is, with ſome few exceptions, a general character of them.

"2. A tail under one-fifth of the whole length is alſo a general character of venomous ſerpents; but, ſince many of thoſe which are not venomous have tails as ſhort, little dependence can be placed upon that circumſtance alone. On the other hand, a tail exceeding that proportion, is a pretty certain mark that the ſpecies to which it belongs is not venomous.

"3. A thin and acute tail is by no means to be conſidered as peculiar to venomous ſerpents; though a thick and obtuſe one is only to be found among thoſe which are not venomous.

"4. Carinated ſcales are, in ſome meaſure, characteriſtic of venomous ſerpents, ſince in them they are more common than ſmooth ones, in the proportion of nearly four to one; whereas ſmooth ſcales are, in thoſe ſerpents which are not venomous, more common, in the proportion of nearly three to one.

"Upon the whole, therefore, it appears, that though a pretty certain conjecture, may, in many inſtances, be made from the external characters, yet, in order to determine with certainty whether a ſerpent be venomous or not, it becomes neceſſary to have recourſe to ſome certain diagnoſtic. This can only be ſought for in the mouth: we muſt therefore next conſider how the fangs, with which the mouths of venomous ſerpents are furniſhed, are to be diſtinguiſhed from common teeth.

"To thoſe who form their ideas of the fangs of a venomous ſerpent, from thoſe of the rattleſnake, or even from thoſe of the Engliſh viper, it will appear ſtrange that there ſhould be any difficulty in diſtinguiſhing thoſe weapons from common teeth; and indeed the diſtinction would really be very eaſy, were all venomous ſerpents furniſhed with fangs as large as thoſe of the fore-mentioned ſpecies. But the fact is, that in many ſpecies the fangs are full as ſmall as common teeth, and conſequently cannot, by their ſize, be known from them; this is the caſe with the *coluber laticaudatus*, *lacteus*, and ſeveral others."

Linnæus thought that the fangs might be diſtinguiſhed by their mobility and ſituation; but other naturaliſts have not found it a general fact that fangs are looſe in their ſockets, nor have they obſerved any difference in ſituation between the fangs of venomous ſerpents and the teeth of others. The following diſtinction is eſtabliſhed by Dr Gray in a paper inſerted in the Philoſophical Tranſactions, Vol. LXXIX. *All venomous ſerpents have only two rows of teeth in the upper jaw, and all others have four.* Phil. Tran. Vol. LXXIX.

In the preface to the *Muſeum Regis*, and in the introduction to the claſs amphibia in the *Syſtema Naturæ*, Linnæus ſays, that the proportion of venomous ſerpents to others is one in ten; yet, in the *Syſtema Naturæ*, in which the ſum total of ſpecies is 131, he has marked 23 as venomous, which is ſomewhat more than one in ſix. How he came to be ſo much at variance with himſelf, it is not eaſy to ſay; but the laſt-mentioned proportion ſeems to be not far from the truth, as Dr Gray, after examining 154 ſpecies of ſerpents, found only 26 that ſeemed to be venomous.

The

The *coluber ſtolatus* and *myſterizans*, though marked by Linnæus, we are aſſured by Dr Gray are not poiſonous: he thinks the ſame may be ſaid of the *leberis* and *dypſas*. On the other hand, he obſerves, that the *boa contortrix*, *coluber*, *ceraſtes*, *laticaudatus*, and *coluber fulvus*, none of which are marked in the *Syſtema Naturæ*, are all poiſonous. Serpent.

In addition to the method of cure mentioned in the articles referred to above, we ſhall ſubjoin the preſcription of a new author, Dr Moſeley *, who ſpent 12 years in the Weſt Indies, and whoſe abilities and extenſive practice very juſtly entitle his opinion to a place in this work, to the attention of the public, and to all medical gentlemen going to the Weſt Indies.

"The bites and ſtings of all venomous animals are cured by the ſame local means; which are very ſimple, if they were always at hand. The injured part muſt be inſtantly deſtroyed or be cut out. Deſtroying it is the moſt ſafe, and equally certain: and the beſt application for that purpoſe is the lapis infernalis or the butter of antimony.—Theſe are preferable to a hot iron, which the ancients uſed, becauſe a hot iron forms a cruſt, which acts as a defence to the under parts, inſtead of deſtroying them. The lapis infernalis is much better than any other cauſtic, as it melts and penetrates during its application. The bitten part muſt be deſtroyed to the bottom, and where there is any doubt that the bottom of the wound is not ſufficiently expoſed, butter of antimony ſhould be introduced into it on the following day, as deep as poſſible; and inciſions ſhould be made to lay every part open to the action of theſe applications. Beſides deſtroying, burning, or cutting out the part, inciſions ſhould be made round the wound, to prevent the communication of the virus. The wound is to be dreſſed for ſome time with poultices, to aſſuage the inflammation cauſed by the cauſtics; and afterwards with acrid dreſſings and hot digeſtives to drain the injured parts.

"Where the above-mentioned cauſtics cannot be procured, corroſive ſublimate, oil of vitriol, aquafortis, ſpirit of ſalt, common cauſtic, or a plaſter made of quicklime, and ſoap, may be applied to the wound. Gunpowder laid on the part, and fired, has been uſed with ſucceſs. When a perſon is bitten remote from any aſſiſtance, he ſhould make a tight ligature above the part, until proper application can be made. The Spaniſh writers ſay, that the *habilla de Carthagena*, or Carthagena bean, is a ſpecific for poiſonous bites, taken inwardly.

"Ulloa ſays, it is 'one of the moſt effectual antidotes known in that country (Carthagena) againſt the bites of vipers and ſerpents: for a little of it being eaten immediately after the bite, it preſently ſtops the effects of the poiſon; and accordingly all who frequent the woods, either for felling trees or hunting, never fail to eat a little of this habilla faſting, and repair to their work without any apprehenſion.

"The natives tell you, that this habilla being hot in the higheſt degree, much of it cannot be eaten; that the common doſe of it is leſs than the fourth part of a kernel; and that no hot liquor, as wine, brandy, &c. muſt be drunk immediately after taking it.'

"The Carthagena bean, or habilla, is found in great abundance in the Weſt Indian iſlands, where it is generally known by the name of *Antidote*, or *Cocoon*, or *Antidote Cocoon*. In ſmall doſes it is ſtomachic and diaphoretic; and in large doſes emetic and purgative. In ſeveral diſorders it is a powerful remedy; but its virtues are not ſufficiently known, except among the Indians and negroes, who chiefly uſe an infuſion or tincture of it made in rum. This is externally as well as internally uſed for many complaints (A).

"I have been informed by ſome intelligent Indians, that any of the red peppers, ſuch as bird pepper, or bell pepper, or what is called *Cayenne pepper*, powdered and taken in a glaſs of rum as much as the ſtomach can poſſibly bear, ſo as to cauſe, and keep up for ſome time, great heat and inflammation in the body and a vigorous circulation, will ſtop the progreſs of the poiſon of ſerpents, even after its effects are viſible; and that the bitten part only afterwards mortifies and ſeparates, and that the patient, with bark, wine, and cordials, ſoon recovers.

"This fiery practice is certainly agreeable to that of the ancients, and probably the only internal treatment that can have any good effect; as in theſe caſes the powers of life, and the action of the heart, are ſuddenly enfeebled, and the pulſe in ſtrength and frequency obſerves almoſt a regular declenſion from the time of the bite until it entirely ceaſes in death."

27 Why ſome ſerpents are poiſonous.

Polygala ſenega, or rattleſnake root, was formerly conſidered as a ſovereign remedy for the bite of the rattleſnake; but this opinion is now exploded.

If it be aſked for what purpoſe were ſerpents created with ſuch deſtructive weapons? we anſwer, that they were given for ſelf-defence. Without theſe, ſerpents, of all other animals, would be the moſt expoſed and defenceleſs; without feet for eſcaping a purſuit, without teeth capable of inflicting a dangerous wound, or without ſtrength for reſiſtance; incapable, from their ſize, of finding ſecurity in very ſmall retreats like the earthworm, and diſguſting all from their deformity, nothing was left for them but a ſpeedy extirpation. But furniſhed as they are with powerful poiſon, every rank of animals approach them with dread, and never ſeize them but at an advantage. Nor is this all the benefit they derive from it. The malignity of a few ſerves for the protection of all. Though not above a tenth of their number are actually venomous, yet the ſimilitude they all bear to each other excites a general terror of the whole tribe; and the uncertainty of their enemies about what ſerpents are poiſonous, makes even the moſt harmleſs formidable. Thus Providence ſeems to have acted with double precaution: it has given ſome of them poiſon for the general defence of a tribe naturally feeble; but it has thinned the numbers of thoſe which are venomous, leſt they ſhould become too powerful for the reſt of animated nature.

From

(A) "This bean is the ſeed of the *Fevillea* foliis cordatis of Plumier, Ed. Burmanni, p. 203. Tab. 209. *Fevillea* foliis cordatis, angulatis, of Linnæus, Spec. P. *Fevillea* foliis craſſioribus, glabris, quandoque cordatis, quandoque trilobis, or *Antidote Cocoon*, of Brown, p. 374."

Serpent.

From theſe noxious qualities in the ſerpent kind, it is no wonder that not only man, but beaſts and birds, carry on an unceaſing war againſt them. The ichneumon of the Indians, and the peccary * of America, deſtroy them in great numbers. Theſe animals have the art of ſeizing them near the head; and it is ſaid that they can ſkin them with great dexterity. The vulture and the eagle alſo prey upon them in great abundance; and often, ſouſing down from the clouds, drop upon a long ſerpent, which they ſnatch up ſtruggling and writhing in the air. Dogs alſo are bred up to oppoſe them. Father Feuillée tells us, that being in the woods of Martinico, he was attacked by a large ſerpent, which he could not eaſily avoid, when his dog immediately came to his relief, and ſeized the aſſailant with great courage. The ſerpent entwined him, and preſſed him ſo violently, that the blood came out of his mouth, and yet the dog never ceaſed till he had torn it to pieces. The dog was not ſenſible of his wounds during the fight; but ſoon after his head ſwelled prodigiouſly, and he lay on the ground as dead. But his maſter having found a banana tree hard by, he applied its juice mixed with treacle to the wounds, which recovered the dog, and quickly healed his ſores.

28 Enemies of ſerpents.

* See VIVERRA and SUS.

The Pſylli of old were famous for charming and deſtroying ſerpents †. Some moderns pretend to the ſame art. Caſaubon ſays, that he knew a man who could at any time ſummon 100 ſerpents together, and draw them into the fire. Upon a certain occaſion, when one of them, bigger than the reſt, would not be brought in, he only repeated his charm, and it came forward, like the reſt, to ſubmit to the flames. Philoſtratus deſcribes particularly how the Indians charm ſerpents: "They take a ſcarlet robe, embroidered with golden letters, and ſpread it before a ſerpent's hole.—The golden letters have a faſcinating power; and by looking ſtedfaſtly, the ſerpent's eyes are overcome and laid aſleep." Theſe and many other feats have been often practiſed upon theſe animals by artful men, who had firſt prepared the ſerpents for their exerciſe, and then exhibited them as adventitiouſly aſſembled at their call. In India there is nothing ſo common as dancing ſerpents, which are carried about in a broad flat veſſel, ſomewhat reſembling a ſieve. Theſe erect and put themſelves in motion at the word of command. When their keeper ſings a ſlow tune, they ſeem by their heads to keep time; when he ſings a quicker meaſure, they appear to move more briſk and lively. All animals have a certain degree of docility; and we find that ſerpents themſelves can be brought to move and approach at the voice of their maſter. From this trick, ſucceſsfully practiſed before the ignorant, it is moſt probable, have ariſen moſt of the boaſted pretenſions which ſome have made to charming of ſerpents; an art to which the native Americans pretend at this very day, but the exiſtence of which we are aſſured of by Mr Haſſelquiſt amongſt the native Egyptians.

† See PSYLLI.

29 Some perſons famous for charming them.

30 Regarded with veneration in ſome countries.

Though the generality of mankind regard this formidable race with horror, yet there have been ſome nations, and there are ſome at this day, that conſider them with veneration and regard. The adoration paid by the ancient Egyptians to a ſerpent is well known: many of the nations at preſent along the weſtern coaſt of Africa retain the ſame unaccountable veneration. Upon the gold and ſlave coaſts, a ſtranger, upon entering the cottages of the natives, is often ſurpriſed to ſee the roof ſwarming with ſerpents, that cling there without moleſting and unmoleſted by the natives. But his ſurpriſe will increaſe upon going farther ſouthward to the kingdom of Widah, when he finds that a ſerpent is the god of the country. This animal, which travellers deſcribe as a huge overgrown creature, has its habitation, its temple, and its prieſts. Theſe impreſs the vulgar with an opinion of its virtues; and numbers are daily ſeen to offer not only their goods, their proviſions, and their prayers, at the ſhrine of their hideous deity, but alſo their wives and daughters. Theſe the prieſts readily accept of, and after ſome days of penance return them to their ſuppliants, much benefited by the ſerpent's ſuppoſed embraces.

Serp

SERPENT, a muſical inſtrument, ſerving as a baſs to the cornet, or *ſmall ſhawm*, to ſuſtain a chorus of ſingers in a large edifice. It has its name *ſerpent* from its figure, as conſiſting of ſeveral folds or wreaths, which ſerve to reduce its length, which would otherwiſe be ſix or ſeven feet.

It is uſually covered with leather, and conſiſts of three parts, a mouth-piece, a neck, and a tail. It has ſix holes, by means whereof it takes in the compaſs of two octaves.

Merſennus, who has particularly deſcribed this inſtrument, mentions ſome peculiar properties of it, *e. gr.* that the ſound of it is ſtrong enough to drown 20 robuſt voices, being animated merely by the breath of a boy, and yet the ſound of it may be attempered to the ſoftneſs of the ſweeteſt voice. Another peculiarity to this inſtrument is, that great as the diſtance between the third and fourth hole appears, yet whether the third hole be open or ſhut, the difference is but a tone.

SERPENT, in mythology, was a very common ſymbol of the ſun, and he is repreſented biting his tail, and with his body formed into a circle, in order to indicate the ordinary courſe of this luminary, and under this form it was an emblem of time and eternity. The ſerpent was alſo the ſymbol of medicine, and of the gods which preſided over it, as of Apollo and Æſculapius: and this animal was the object of very ancient and general worſhip, under various appellations and characters. In moſt of the ancient rites we find ſome alluſion to the ſerpent, under the ſeveral titles of Ob, Ops, Python, &c. This idolatry is alluded to by Moſes, (Lev. xx. 27.) The woman at Endor who had a familiar ſpirit is called Oub, or Ob, and it is interpreted Pythoniſſa. The place where ſhe reſided, ſays the learned Mr Bryant, ſeems to have been named from the worſhip then inſtituted; for Endor is compounded of *En-ador*, and ſignifies *fons Pythonis*, "the fountain of light, the oracle of the god Ador, which oracle was probably founded by the Canaanites, and had never been totally ſuppreſſed. His pillar was alſo called *Abbadir*, or *Abadir*, compounded of *Ab* and *adir*, and meaning the ſerpent deity Addir, the ſame as Adorus.

In the orgies of Bacchus, the perſons who partook of the ceremony uſed to carry ſerpents in their hands, and with horrid ſcreams call upon Eva! Eva! Eva being, according to the writer juſt mentioned, the ſame as ephia, or opha, which the Greeks rendered *ophis*, and by it denoted a ſerpent. Theſe ceremonies and this

this ſymbolic worſhip began among the Magi, who were the ſons of Chus; and by them they were propagated in various parts. Wherever the Amonians founded any places of worſhip, and introduced their rites, there was generally ſome ſtory of a ſerpent. There was a legend about a ſerpent at Colchis, at Thebes, and at Delphi; and likewiſe in other places. The Greeks called Apollo himſelf Python, which is the ſame as Opis, Oupis, and Oub.

In Egypt there was a ſerpent named Thermuthis, which was looked upon as very ſacred; and the natives are ſaid to have made uſe of it as a royal tiara, with which they ornamented the ſtatues of Iſis. The kings of Egypt wore high bonnets, terminating in a round ball, and ſurrounded with figures of aſps; and the prieſts likewiſe had the repreſentation of ſerpents upon their bonnets.

Abadon, or Abaddon, mentioned in the Revelation xx. 2. is ſuppoſed by Mr Bryant to have been the name of the Ophite god, with whoſe worſhip the world had been ſo long infected. This worſhip began among the people of Chaldea, who built the city of Ophis upon the Tigris, and were greatly addicted to divination, and to the worſhip of the ſerpent. From Chaldea the worſhip paſſed into Egypt, where the ſerpent deity was called Canoph, Can-eph, and C'neph. It had alſo the name of Ob or Oub, and was the ſame as the Baſiliſcus or royal ſerpent, the ſame as the Thermuthis, and made uſe of by way of ornament to the ſtatues of their gods. The chief deity of Egypt is ſaid to have been Vulcan, who was ſtyled Opas. He was the ſame as Oſiris, the Sun, and hence was often called Ob-el, or Pytho-ſol; and there were pillars ſacred to him, with curious hieroglyphical inſcriptions bearing the ſame name; whence among the Greeks, who copied from the Egyptians, every thing gradually tapering to a point was ſtyled obelos, or obeliſcus.

As the worſhip of the ſerpent began among the ſons of Chus, Mr Bryant conjectures, that from thence they were denominated Ethiopians and Aithiopians, from Ath-ope or Ath-opea, the god whom they worſhipped, and not from their complexion: the Ethiopes brought theſe rites into Greece, and called the iſland where they firſt eſtabliſhed them *Ellopia*, *Solis Serpentis inſula*, the ſame with *Eubœa*, or *Oubaia*, i. e. "the ſerpent iſland." The ſame learned writer diſcovers traces of the ſerpent worſhip among the Hyperboreans, at Rhodes, named Ophiuſa, in Phrygia, and upon the Helleſpont, in the iſland Cyprus, in Crete, among the Athenians, in the name of Cecrops, among the natives of Thebes in Bœotia, among the Lacedemonians, in Italy, in Syria, &c. and in the names of many places, as well as of the people where the Ophites ſettled. One of the moſt early hereſies introduced into the Chriſtian church was that of the Ophitæ. Bryant's Analyſis of Ancient Mythology, Vol. I. p. 43, &c. p. 473, &c.

Serpent Stones. See *Cornu Ammonis.*

Sea-Serpent. See *Sea-Serpent.*

SERPENTARIA, SNAKE-ROOT; a ſpecies of ARISTOLOCHIA.

SERPENTARIUS, in aſtronomy, a conſtellation of the northern hemiſphere, called alſo Ophiuchus, and anciently Æſculapius. The ſtars in the conſtellation Serpentarius, in Ptolemy's catalogue, are 29; in Tycho's 15; in Hevelius's 40; in the Britannic catalogue they are 74.

SERPENTINE, in general, denotes any thing that reſembles a ſerpent; hence the worm or pipe of a ſtill, twiſted in a ſpiral manner, is termed a *ſerpentine worm*. Serpentine.

Serpentine-Stone, a genus of magneſian earths, of which there are different ſpecies: 1. The fibroſus, compoſed of fibrous and coherent particles. This reſembles the aſbeſtos ſo much that it might be confounded with it, were not the fibres of the ſerpentine ſo cloſely coherent, that they cannot be diſtinguiſhed when the ſtone is cut or poliſhed. The fibres themſelves are large, and ſeem to be twiſted. There are two varieties, a dark green and a light one; the former from Germany, the latter from Sweden. 2. The zoeblitz ſerpentine, found near that place, of many different colours, as black, deep green, light green, red, bluiſh-gray, and white; but the green colour is moſt predominant. 3. Porcelain earth mixed with iron. It is met with either diffuſible in water or indurated. The former is found of a red colour from China and Montmartre. The water-clinkers, imported from ſome places in Germany, ſeem to be made of this kind of earth. There are two varieties of the indurated kind, viz. the martial ſoap earth, of a red colour, from Jaſberg and other places in Norway, or black from ſome parts of Sweden. 4. The telgſton of the Swedes, the ſame with the lapis ollaris. It is found in various places of Norway, as light gray, dark gray, whitiſh-yellow, and dark green. It is employed with great advantage for building fire-places, furnaces, &c. the extremities of the ſtrata being turned towards the fire when it is ſlaty.

M. Magellan obſerves, that there is a great variety of colour as well as compoſition in this kind of ſtones; it being found either white, green, brown, yellow, light-blue, black, ſpotted, or ſtreaked with veins of different colours. Its texture is either indiſtinct, obſcurely laminar, or fibrous. The ſpecific gravity is from 2400 to 2650; and it is harder than ſoap-rock or ſteatites; though not hard enough to ſtrike fire with ſteel; being leſs ſmooth to the touch than ſteatites, but ſuſceptible of a good poliſh, looking like marble; and is often met with in thin ſemitranſparent plates. It melts in a ſtrong heat without addition, and corrodes the crucibles, but hardens in a lower degree of heat. It is ſlowly and partially ſoluble in acids, but does not effervеſce with them. According to Bayon's analyſis, 100 parts of it contain about 41 of ſilex, or rather mica; 33 of magneſia; 40 of argillaceous earth; 12 of water, and about 3 of iron. That brought from Corſica contains a greater proportion of argil, and a ſmaller one of ſilex. The ſerpentine commonly ſo called, according to Fabroni, is a true lapis ollaris; but has its name from being variegated with green, yellowiſh, and brown ſpots, like the ſkin of ſome ſerpents; great quantities of it are found in Italy and Switzerland, where it is frequently worked into diſhes and other veſſels.

SERPENTINE *verſes*, are ſuch as begin and end with the ſame word. As,

Ambo florentes ætatibus, Arcades amlo.

SERPENTINE, in the *Manege*. A horſe is ſaid to have a ſerpentine tongue, if it is always friſking and moving, and ſometimes paſſing over the bit, inſtead of keeping

Serpicula ‖ Ferratula.

keeping in the void ſpace, called the liberty of the tongue.

SERPICULA, in botany; a genus of plants belonging to the claſs of monœcia, and to the order of tetrandia. The male calyx is quadridentate, and the corolla conſiſts of four petals: The female calyx is divided into four parts, and the pericarpium is a tomentoſe nut. There are two ſpecies, the verticillata and repens.

SERPIGO, in ſurgery, a kind of herpes, popularly called a *tetter* or ringworm. See SURGERY.

SERPULA, in natural hiſtory; a genus belonging to the claſs of vermes, and to the order of teſtacea. The ſhell is ſingle, tubular, and adhering to other bodies. The animal which inhabits it is the terebella.

SERRANUS (Joannes), or John de Serres, a learned French Proteſtant, was born about the middle of the ſixteenth century. He acquired the Greek and Latin languages at Lauſanne, and grew very fond of the philoſophy of Ariſtotle and Plato. On his return to France he ſtudied divinity. He began to diſtinguiſh himſelf in 1572 by his writings, but was obliged to forſake his country after the dreadful maſſacre of St Bartholomew. He became miniſter of Niſmes in 1582, but was never regarded as a very zealous Calviniſt: he has even been ſuſpected, though without reaſon, of having actually abjured the Proteſtant religion. He was one of the four clergymen whom Henry IV. conſulted about the Romiſh religion, and who returned for anſwer, *that Catholics might be ſaved.* He wrote afterwards a treatiſe in order to reconcile the two communions, entitled *De fide Catholica, ſive de principiis religionis Chriſtianæ, communi omnium Chriſtianorum conſenſu, ſemper et ubique ratis.* This work was diſliked by the Catholics, and received with ſuch indignation by the Calviniſts of Geneva, that many writers have affirmed that they poiſoned the author. It is certain at leaſt that he died at Geneva in 1598, at the age of 50. His principal works are, 1. A Latin tranſlation of Plato, publiſhed by Henry Stephens, which owes much of its reputation to the elegance of the Greek copy which accompanies it. 2. A Treatiſe on the Immortality of the Soul. 3. *De ſtatu religionis et reipublicæ in Francia.* 4. *Memoire de la 3me guerre civile et derniers troubles de France ſous Charles IX. &c.* 5. *Inventaire general de l'Hiſtoire de France, illuſtré par la conference de l'Egliſe et de l'Empire, &c.* 6. *Recueil de choſe memorable avenue en France ſous Henri II. François II. Charles IX. Henri III.* Theſe three hiſtorical treatiſes have been juſtly accuſed of partiality and paſſion; faults which it is next to impoſſible for a contemporary writer to avoid, eſpecially if he bore any part in the tranſactions which he deſcribes. His ſtyle is exceedingly incorrect and inelegant; his miſtakes, too, and miſſtatements of facts, are very numerous.

SERRATED, in general, ſomething indented or notched in the manner of a ſaw; a term much uſed in the deſcription of the leaves of plants. See BOTANY.

SERRATULA, SAW-WORT, in botany: A genus of plants belonging to the claſs of ſyngeneſia, and to the order of polygamia æqualis. In the natural ſyſtem it is ranged under the 49th order, *Compoſitæ.* The calyx is ſubcylindrical, imbricated; the ſcales of it pointed, but not ſpinous. There are 15 ſpecies: The tinctoria, alpina, arvenſis, coronata, japonica, ſalicifolia, multiflora, noveboracenſis, præalta, glauca, ſquarroſa, ſcariola, ſpicata, amara, and centauroides. The three firſt ſpecies are Britiſh. 1. The *tinctoria* is diſtinguiſhed by a ſtem erect and ſlender, branched at the top, and three feet high. The leaves are ſmooth, pinnatifid, and ſerrated. The flowers are purple, in umbels, and terminal. The down of the ſeed is gloſſy, with a brown or gold tinge. It grows in woods and wet paſtures. It dyes cloth of an exceeding fine yellow colour, which ſtands well when fixed with alum. Goats eat this plant; horſes are not fond of it; cattle, ſwine, and ſheep, leave it untouched. 2. The *alpina*, or mountain ſaw-wort. The root and ſtem are woody; the latter being from one to two feet high. The leaves are numerous, triangular, long, pointed, ſubſtantial, dark green above, white beneath, and ſerrated, with round intervals between the teeth, on footſtalks. The flowers are purple. The ſcales of the calyx are very ſhort and downy. It grows on high mountains, and flowers commonly in July or Auguſt. 3. The *arvenſis*, corn ſaw-wort, or way-thiſtle. The ſtem is generally erect, branched, and two or three feet high. The leaves are ſinuated, ſerrated, and ſpinous; thoſe above being almoſt entire. The flowers are of a pale purple; the down is very long. This plant grows in cultivated grounds and by wayſides, and flowers in July or Auguſt. When burned it yields good aſhes for making glaſs or fixed alkali.

Serratus ‖ Servandoni

SERRATUS, in anatomy, a name given to ſeveral muſcles, from their reſemblance to a ſaw. See ANATOMY, *Table of the Muſcles.*

SERTORIUS (Quintus), an eminent Roman general. See SPAIN; under the hiſtory of which his exploits are related.

SERTULARIA, in natural hiſtory, a genus belonging to the claſs of vermes, and to the order of zoophyta. The ſtem is radicated, fibrous, naked, and jointed; the flowets are hydræ, and there is one at each joint. This genus comprehends 42 ſpecies of corallines.

SERVAL, mountain cat. See FELIS, xvi.

SERVANDONI (John Nicolas), was born at Florence in 1695. He rendered himſelf famous by his exquiſite taſte in architecture, and by his genius for decorations, fetes, and buildings. He was employed and rewarded by moſt of the princes in Europe. He was honoured in Portugal with the order of Chriſt: In France he was architect and painter to the king, and member of the different academies eſtabliſhed for the advancement of theſe arts. He received the ſame titles from the kings of Britain, Spain, Poland, and from the duke of Wirtemberg. Notwithſtanding theſe advantages, his want of economy was ſo great, that he left nothing behind him. He died at Paris in 1766. Paris is indebted to him for many of its ornaments. He made decorations for the theatres of London and Dreſden. The French king's theatre, called *la ſalle des Machines*, was under his management for ſome time. He was permitted to exhibit ſhows conſiſting of ſimple decorations: Some of theſe were aſtoniſhingly ſublime; his "Deſcent of Æneas into Hell" in particular, and his "Enchanted Foreſt," are well known. He built and embelliſhed a theatre at Chamboid for Mareſchal Saxe; and furniſhed the plan and the model of the theatre royal at Dreſden. His genius for fetes was remarkable; he had the management of a great number in Paris, and even London. He conducted one at Liſbon given on account of a victory gained by the duke of Cumberland. He was employed frequently by the king of Portugal,

Portugal, to whom he preſented ſeveral elegant plans and models. The prince of Wales, too, father to the preſent king, engaged him in his ſervice; but the death of that prince prevented the execution of the deſigns which had been projected. He preſided at the magnificent *fête* given at Vienna on account of the marriage of the archduke Joſeph and the infanta of Parma. But it would be endleſs to attempt an enumeration of all his performances and exhibitions.

SERVANT, a term of relation, ſignifying a perſon who owes and pays obedience for a certain time to another in quality of a maſter.

As to the ſeveral ſorts of ſervants: It was obſerved under the article LIBERTY, that pure and proper ſlavery does not, nay, cannot, ſubſiſt in Britain, ſuch we mean whereby an abſolute and unlimited power is given to the maſter over the life and fortune of the ſlave. And indeed it is repugnant to reaſon, and the principles of natural law, that ſuch a ſtate ſhould ſubſiſt anywhere. See SLAVERY.

The law of England therefore abhors, and will not endure the exiſtence of ſlavery within this nation; ſo that when an attempt was made to introduce it, by ſtatute 1 Edw. VI. c. 3. which ordained, that all idle vagabonds ſhould be made ſlaves, and fed upon bread, water, or ſmall drink, and refuſe meat; ſhould wear a ring of iron round their necks, arms, or legs; and ſhould be compelled, by beating, chaining, or otherwiſe, to perform the work aſſigned them, were it ever ſo vile: the ſpirit of the nation could not brook this condition, even in the moſt abandoned rogues; and therefore this ſtatute was repealed in two years afterwards. And now it is laid down, that a ſlave or negro, the inſtant he lands in Britain, becomes a free man; that is, the law will protect him in the enjoyment of his perſon and his property. Yet, with regard to any right which the maſter may have lawfully acquired to the perpetual ſervice of John or Thomas, this will remain exactly in the ſame ſtate as before: for this is no more than the ſame ſtate of ſubjection for life which every apprentice ſubmits to for the ſpace of ſeven years or ſometimes for a longer term. Hence, too, it follows, that the infamous and unchriſtian practice of withholding baptiſm from negro ſervants, leſt they ſhould thereby gain their liberty, is totally without foundation, as well as without excuſe. The law of England acts upon general and extenſive principles; it gives liberty, rightly underſtood, that is, protection to a Jew, a Turk, or a Heathen, as well as to thoſe who profeſs the true religion of Chriſt; and it will not diſſolve a civil obligation between maſter and ſervant, on account of the alteration of faith in either of the parties; but the ſlave is entitled to the ſame protection in England before as after baptiſm; and, whatever ſervice the Heathen negro owed of right to his American maſter by general, not by local law, the ſame (whatever it be) is he bound to render when brought to England and made a Chriſtian.

1. The firſt ſort of ſervants, therefore acknowledged by the laws of England are *menial ſervants*; ſo called from being *intra mœnia*, or domeſtics. The contract between them and their maſters, riſes upon the hiring. If the hiring be general, without any particular time limited, the law conſtrues it to be a hiring for a year: upon a principle of natural equity, that the ſervant ſhall ſerve, and the maſter maintain him, throughout all the revolutions of the reſpective ſeaſons; as well when there is work to be done, as when there is not: but the contract may be made for any larger or ſmaller term. All ſingle men between 12 years old and 60, and married ones under 30 years of age, and all ſingle women between 12 and 40, not having any viſible livelihood, are compellable by two juſtices to go out to ſervice in huſbandry or certain ſpecific trades, for the promotion of honeſt induſtry; and no maſter can put away his ſervant, or ſervant leave his maſter, after being ſo retained either before or at the end of his term, without a quarter's warning; unleſs upon reaſonable cauſe, to be allowed by a juſtice of the peace: but they may part by conſent, or make a ſpecial bargain.

2. Another ſpecies of ſervants are called *apprentices* (from *apprendre*, to learn); and are uſually bound for a term of years, by deed indented or indentures, to ſerve their maſters, and be maintained and inſtructed by them. This is uſually done to perſons of trade, in order to learn their art and myſtery; and ſometimes very large ſums are given with them as a premium for ſuch their inſtruction: but it may be done to huſbandmen, nay to gentlemen and others. And children of poor perſons may be apprenticed out by the overſeers, with conſent of two juſtices, till 24 years of age, to ſuch perſons as are thought fitting; who are alſo compellable to take them; and it is held that gentlemen of fortune, and clergymen, are equally liable with others to ſuch compulſion: for ſuch purpoſes our ſtatutes have made the indentures obligatory, even though ſuch pariſh-apprentice be a minor. Apprentices to trades may be diſcharged on reaſonable cauſe, either at the requeſt of themſelves or maſters at the quarter-ſeſſions, or by one juſtice, with appeal to the ſeſſions; who may, by the equity of the ſtatute, if they think it reaſonable, direct reſtitution of a rateable ſhare of the money given to the apprentice: and pariſh apprentices may be diſcharged in the ſame manner by two juſtices. But if an apprentice, with whom leſs than 10 pounds hath been given, runs away from his maſter, he is compellable to ſerve out his time of abſence, or make ſatisfaction for the ſame, at any time within ſeven years after the expiration of his original contract. See APPRENTICE and APPRENTICESHIP.

3 A third ſpecies of ſervants are *labourers*, who are only hired by the day or the week, and do not live *intra mœnia*, as part of the family; concerning whom the ſtatutes before cited have made many very good regulations: 1. Directing that all perſons who have no viſible effects may be compelled to work: 2. Defining how long they muſt continue to work in ſummer and in winter: 3. Puniſhing ſuch as leave or deſert their work: 4. Empowering the juſtices at ſeſſions, or the ſheriff of the county, to ſettle their wages: and, 5. Inflicting penalties on ſuch as either give or exact more wages than are ſo ſettled.

4. There is yet a fourth ſpecies of ſervants, if they may be ſo called, being rather in a ſuperior, a miniſterial capacity; ſuch as *ſtewards*, *factors*, and *bailiffs*; whom, however, the law conſiders as ſervants *pro tempore*, with regard to ſuch of their acts as affect their maſter's or employer's property.

As to the manner in which this relation affects the maſter, the ſervant himſelf, or third parties, ſee the article *MASTER and Servant*.

Servetiſts, Servetus.

For the condition of ſervants by the law of Scotland, ſee LAW.

SERVETISTS, a name given to the modern Antitrinitarians, from their being ſuppoſed to be the followers of Michael Servetus; who, in the year 1553, was burnt as Geneva, together with his books.

SERVETUS (Michael), a learned Spaniſh phyſician, was born at Villanueva, in Arragon, in 1509. He was ſent to the univerſity of Toulouſe to ſtudy the civil law. The Reformation, which had awakened the moſt poliſhed nations of Europe, directed the attention of thinking men to the errors of the Romiſh church and to the ſtudy of the Scriptures. Among the reſt Servetus applied to this ſtudy. From the love of novelty, or the love of truth, he carried his inquiries far beyond the other reformers, and not only renounced the falſe opinions of the Roman Catholics, but went ſo far as to queſtion the doctrine of the Trinity. Accordingly, after ſpending two or three years at Toulouſe, he determined to go into Germany to propagate his new opinions, where he could do it with moſt ſafety. At Baſil he had ſome conferences with Oecolampadius. He went next to Straſburg to viſit Bucer and Capito, two eminent reformers of that town. From Straſburg he went to Hagenau, where he printed a book, entitled *De Trinitatis Erroribus*, in 1531. The enſuing year he publiſhed two other treatiſes on the ſame ſubject: in an advertiſement to which, he informs the reader that it was not his intention to retract any of his former ſentiments, but only to ſtate them in a more diſtinct and accurate manner. To theſe two publications he had the courage to put his name, not ſuſpecting that in an age when liberty of opinion was granted, the exerciſe of that liberty would be attended with danger. After publiſhing theſe books, he left Germany, probably finding his doctrines not ſo cordially received as he expected. He went firſt to Baſil, and thence to Lyons, where he lived two or three years. He then removed to Paris, where he ſtudied medicine under Sylvius, Fernelius, and other profeſſors, and obtained the degree of maſter of arts and doctor of medicine. His love of controverſy involved him in a ſerious diſpute with the phyſicians of Paris; and he wrote an Apology, which was ſuppreſſed by an edict of the parliament. The miſunderſtanding which this diſpute produced with his colleagues, and the chagrin which ſo unfavourable a termination occaſioned, made him leave Paris in diſguſt. He ſettled two or three years in Lyons, and engaged with the Frellons, eminent printers of that age, as a corrector to their preſs. At Lyons he met with Pierre Palmier, the archbiſhop of Vienne, with whom he had been acquainted at Paris. That prelate, who was a great encourager of learned men, preſſed him to accompany him to Vienne, offering him at the ſame time an apartment in his palace. Servetus accepted the offer, and might have lived a tranquil and happy life at Vienne, if he could have confined his attention to medicine and literature. But the love of controverſy, and an eagerneſs to eſtabliſh his opinions, always poſſeſſed him. At this time Calvin was at the head of the reformed church at Geneva. With Servetus he had been acquainted at Paris, and had there oppoſed his opinions. For 16 years Calvin kept up a correſpondence with him, endeavouring to reclaim him from his errors. Servetus had read the works of Calvin, but did not think they merited the high eulogies of the reformers, nor were they ſufficient to convince him of his errors. He continued, however, to conſult him; and for this purpoſe ſent from Lyons to Geneva three queſtions which reſpected the divinity of Jeſus Chriſt, regeneration, and the neceſſity of baptiſm. To theſe Calvin returned a civil anſwer. Servetus treated the anſwer with contempt, and Calvin replied with warmth. From reaſoning he had recourſe to abuſive language; and this produced a polemical hatred, the moſt implacable diſpoſition in the world. Calvin having obtained ſome of Servetus's papers, by means, it is ſaid, not very honourable, ſent them to Vienne along with the private letters which he had received in the courſe of their correſpondence. The conſequence was, that Servetus was arreſted; but having eſcaped from priſon, he reſolved to retire to Naples, where he hoped to practice medicine with the ſame reputation which he had ſo long enjoyed at Vienne. He imprudently took his route through Geneva, though he could not but know that Calvin was his mortal enemy. Calvin informed the magiſtrates of his arrival; Servetus was apprehended, and appointed to ſtand trial for hereſy and blaſphemy. It was a law at Geneva, that every accuſer ſhould ſurrender himſelf a priſoner, that if the charge ſhould be found falſe, the accuſer ſhould ſuffer the puniſhment in which he meant to involve the accuſed. Calvin not chooſing to go to priſon himſelf, ſent one of his domeſtics to preſent the impeachment againſt Servetus. The articles brought againſt him were collected from his writings with great care; an employment which took up three days. One of theſe articles was, "that Servetus had denied that Judæa was a beautiful, rich, and fertile country; and affirmed, on the authority of travellers, that it was poor, barren, and diſagreeable." He was alſo charged with "corrupting the Latin Bible, which he was employed to correct at Lyons, by introducing impertinent, trifling, whimſical, and impious notes of his own through every page." But the main article, which was certainly fatal to him, was, "that in the perſon of Mr Calvin, miniſter of the word of God in the church of Geneva, he had defamed the doctrine that is preached, uttering all imaginable injurious, blaſphemous words againſt it."

Servetus.

Calvin viſited Servetus in priſon, and had frequent conferences with him; but finding that, in oppoſition to all the arguments he could employ, the priſoner remained inflexible in his opinions, he left him to his fate. Before ſentence was paſſed, the magiſtrates of Geneva conſulted the miniſters of Bale, of Bern, and Zurich; and, as another account informs us, the magiſtrates of the Proteſtant cantons of Switzerland. And to enable them to form a judgment of the criminality of Servetus, they tranſmitted the writings of Calvin, with his anſwers. The general opinion was, that Servetus ought to be condemned to death for blaſphemy. He was accordingly ſentenced to be burnt alive on the 27th of October 1553. As he continued alive in the midſt of the flames more than two hours, it is ſaid, finding his torment thus protracted, he exclaimed, "Unhappy wretch that I am! Will the flames be inſufficient to terminate my miſery! What then! Will the hundred pieces of gold, and the rich collar which they took from me, not purchaſe wood enough to conſume me more quickly!" Though the ſentence of death was paſſed againſt Servetus by the magiſtrates of Geneva, with the approbation

approbation of a great number of the magiſtrates and miniſters of Switzerland, yet it is the opinion of moſt hiſtorians that this dreadful ſentence was impoſed at the inſtigation of Calvin. This act of ſeverity for holding a ſpeculative opinion, however erroneous and abſurd, has left a ſtain on the character of this illuſtrious reformer, which will attend the name of Calvin as long as hiſtory ſhall preſerve it from oblivion. The addreſs and art which he uſed in apprehending Servetus, his inhumanity to him during his trial, his diſſimulation and malevolence after his condemnation, prove that he was as much influenced by perſonal hatred as by a deſire to ſupport the intereſt of religion, though probably, during the trial, Calvin believed he was performing a very pious action. This intolerant ſpirit of Calvin and the magiſtrates of Geneva gave the Roman Catholics a favourable opportunity to accuſe the Proteſtants of inconſiſtency in their principles, which they did not fail to embrace. "How could the magiſtrates (ſays the author of the *Dictionnaire des Hereſies*), who acknowledge no infallible interpretation of the Scriptures, condemn Servetus to death becauſe he explained them differently from Calvin; ſince every man has the privilege to expound the Scriptures according to his own judgment, without having recourſe to the church? It is a great injuſtice to condemn a man becauſe he will not ſubmit to the judgment of an enthuſiaſt, who may be wrong as well as himſelf."

Servetus was a man of great acuteneſs and learning, and well verſed in the arts and ſciences. In his own profeſſion his genius exerted itſelf with ſucceſs. In his tract entitled *Chriſtianiſmi Reſtitutio*, publiſhed in 1553, he remarks, that the whole maſs of blood paſſes through the lungs by the pulmonary artery and vein, in oppoſition to the opinion which was then univerſally entertained, that the blood paſſes through the partition which divides the two ventricles. This was an important ſtep towards the diſcovery of the circulation of the blood.

His works conſiſt of Controverſial Writings concerning the Trinity; an edition of Pagninus's Verſion of the Bible, with a preface and notes, publiſhed under the name of Michael Villanevanus; an Apology to the Phyſicians of Paris; and a book entitled *Ratio Syruporum*. Moſheim has written in Latin a Hiſtory of the Hereſy and Misfortunes of Servetus, which was publiſhed at Helmſtadt, in 4to, in 1728. From the curious details which it gives it is extremely intereſting.

SERVIA, a province of Turkey in Europe, bounded on the north by the rivers Danube and Save, which ſeparate it from Hungary; on the eaſt, by Bulgaria; on the weſt, by Boſnia; and on the ſouth, by Albania and Macedonia. It is about 190 miles in length from eaſt to weſt; 95 in breadth from north to ſouth; and is divided into four ſangiacates. Two of theſe were ceded to the Chriſtians in 1718, who united them into one. This continued till 1739, when the Turks were victorious; and then they were abandoned to the Turks by the treaty of Belgrade. Belgrade is the capital town.

SERVICE, in law, is a duty which a tenant, on account of his fee, owes to his lord.

There are many diviſions of ſervices; as, 1. Into perſonal, where ſomething is to be done by the tenant in perſon, as homage and fealty. 2. Real, ſuch as wards, marriages, &c. 3. Accidental, including heriots, reliefs, and the like. 4. Entire, where, on the alienation of any part of the lands by a tenant, the ſervices become multiplied. 5. Frank-ſervice, which was performed by freemen, who were not obliged to perform any baſe ſervice, but only to find a man and horſe to attend the lord into the army or to court. 6. Knight's ſervice, by which lands were anciently held of the king, on paying homage, ſervice in war, &c. Service.

As in every free and well regulated ſociety there muſt be a diverſity of ranks, there muſt be a great number of perſons employed in ſervice, both in agriculture and domeſtic affairs. In this country, ſervice is a contract into which the ſervant voluntarily enters; and the maſter's authority extends no farther than to the performance of that ſpecies of labour for which the agreement was made.

"The treatment of ſervants (ſays that reſpectable moraliſt Mr Paley), as to diet, diſcipline, and accommodation, the kind and quantity of work to be required of them, the intermiſſion, liberty, and indulgence to be allowed them, muſt be determined in a great meaſure by cuſtom; for where the contract involves ſo many particulars, the contracting parties expreſs a few perhaps of the principal, and by mutual underſtanding refer the reſt to the known cuſtom of the country in like caſes. *Paley's Moral and Political Philoſophy*, p. 259.

"A ſervant is not bound to obey the unlawful commands of his maſter; to miniſter, for inſtance, to his unlawful pleaſures; or to aſſiſt him in unlawful practices in his profeſſion; as in ſmuggling or adulterating the articles which he deals in. For the ſervant is bound by nothing but his own promiſe; and the obligation of a promiſe extends not to things unlawful.

"For the ſame reaſon, the maſter's authority does not juſtify the ſervant in doing wrong; for the ſervant's own promiſe, upon which that authority is founded, would be none.

"Clerks and apprentices ought to be employed entirely in the profeſſion or trade which they are intended to learn. Inſtruction is their wages; and to deprive them of the opportunities of inſtruction, by taking up their time with occupations foreign to their buſineſs, is to defraud them of their wages.

"The maſter is reſponſible for what a ſervant does in the ordinary courſe of his employment; for it is done under a general authority committed to him, which is in juſtice equivalent to a ſpecific direction. Thus, if I pay money to a banker's clerk, the banker is accountable: but not if I had paid it to his butler or his footman, whoſe buſineſs it is not to receive money. Upon the ſame principle, if I once ſend a ſervant to take up goods upon credit, whatever goods he afterwards takes up at the ſame ſhop, ſo long as he continues in my ſervice, are juſtly chargeable to my account.

"The law of this country goes great lengths in intending a kind of concurrence in the maſter, ſo as to charge him with the conſequences of his ſervant's conduct. If an innkeeper's ſervant rob his gueſts, the innkeeper muſt make reſtitution; if a farrier's ſervant lame your horſe, the farrier muſt anſwer for the damage; and ſtill farther, if your coachman or carter drive over a paſſenger in the road, the paſſenger may recover from you a ſatisfaction for the hurt he ſuffers. But theſe determinations ſtand, I think, rather upon the authority of the law, than any principle of natural juſtice."

There is a grievance which has long and juſtly

Service. been complained of, the giving of good characters to bad ſervants. This is perhaps owing to careleſſneſs, to a deſire of getting rid of a bad ſervant, or to miſtaken compaſſion. But ſuch careleſſneſs is inexcuſable. When a man gives his ſanction to the character of a bad ſervant, he ought to reflect on the nature and conſequences of what he is doing. He is giving his name to a falſehood; he is deceiving the honeſt man who confides in his veracity; and he is deliberately giving a knave an opportunity of cheating an honeſt man. To endeavour to get quit of a bad ſervant in this way, is ſurely not leſs criminal than concealing the faults and diſadvantages of an eſtate which is advertiſed for ſale, and aſcribing to it advantages which it does not poſſeſs. In this caſe, we know the ſale would be reduced, and the adverti ſer diſgraced. Many maſters give characters to ſervants out of compaſſion; but it is to this miſtaken compaſſion that the diſorderly behaviour of ſervants is perhaps principally owing: for if the puniſhment of diſhoneſty be only a change of place (which may be a reward inſtead of a puniſhment), it ceaſes to be a ſervant's intereſt to be true to his truſt.

We have ſaid above that a maſter's authority over his ſervant extends no farther than the terms of contract; by which we meant, that a maſter could give no unreaſonable orders to his ſervant, or ſuch as were inconſiſtent with the terms of contract. But the relation between a maſter and ſervant is certainly cloſer than the mere terms of a contract: it is a moral as well as a legal relation. A maſter of a family ought to ſuperintend the morals of his ſervants, and to reſtrain them from vices. This he may do by his example, by his influence, and authority. Indeed every man poſſeſſed of authority is guilty of criminal negligence if he does not exert his authority for promoting virtue in his inferiors; and no authority is ſo well adapted for this purpoſe as that of maſters of families, becauſe none operates with an influence ſo immediate and conſtant. It is wonderful how much good a nobleman or gentleman of fortune can do to his domeſtics by attending to their morals; and every maſter may be a bleſſing to individuals and to ſociety, by exerting prudently that influence which his ſituation gives him over the conduct of his ſervant.

Choral SERVICE, in church hiſtory, denotes that part of religious worſhip which conſiſts in chanting and ſinging. The advocates for the high antiquity of ſinging, as a part of church muſic, urge the authority of St Paul in its favour (Epheſ. chap. v. ver. 19. and Coloſ. chap. iii. ver. 16.) On the authority of which paſſages it is aſſerted, that ſongs and hymns were, from the eſtabliſhment of the church, ſung in the aſſemblies of the faithful; and it appears from undoubted teſtimony, that ſinging, which was practiſed as a ſacred rite among the Egyptians and Hebrews, at a very early period, and which likewiſe conſtituted a conſiderable part of the religious ceremonies of the Greeks and Romans, made a part of the religious worſhip of Chriſtians, not only before churcheswere built, and their religion eſtabliſhed by law, but from the firſt profeſſion of Chriſtianity. However, the era from whence others have dated the introduction of muſic into the ſervice of the church, is that period during which Leontius governed the church of Antioch, *i. e.* between the year of Chriſt 347 and 356. See ANTIPHONY.

From Antioch the practice ſoon ſpread through the other churches of the Eaſt; and in a few ages after its firſt introduction into the divine ſervice, it not only received the ſanction of public authority, but thoſe were forbid to join in it who were ignorant of muſic. A canon to this purpoſe was made by the council of Laodicea, which was held about the year 372; and Zonaras informs us, that theſe canonical ſingers were reckoned a part of the clergy. Singing was introduced into the weſtern churches by St Ambroſe about the year 374, who was the inſtitutor of the Ambroſian chant eſtabliſhed at Milan about the year 386; and Euſebius (Lib. II. cap. 17.) tells us, that a regular choir, and method of ſinging the ſervice, were firſt eſtabliſhed, and hymns uſed, in the church at Antioch during the reign of Conſtantine, and that St Ambroſe, who had long reſided there, had his melodies thence. This was about 230 years afterwards amended by Pope Gregory the Great, who eſtabliſhed the Gregorian chant; a plain, uniſonous kind of melody, which he thought conſiſtent with the gravity and dignity of the ſervice to which it was to be applied. This prevails in the Roman church even at this day: it is known in Italy by the name of *canto fermo*; in France by that of *plain chant*; and in Germany and moſt other countries by that of *cantus Gregorianus*. Although no ſatisfactory account has been given of the ſpecific difference between the Ambroſian and Gregorian chants, yet all writers on this ſubject agree in ſaying, that St Ambroſe only uſed the four authentic modes, and that the four plagal were afterwards added by St Gregory. Each of theſe had the ſame final, or key-note, as its relative authentic; from which there is no other difference, than that the melodies in the four authentic or principal modes are generally confined within the compaſs of the eight notes above the key-note, and thoſe in the four plagal or relative modes, within the compaſs of the eight notes below the fifth of the key. See MODE.

Eccleſiaſtical writers ſeem unanimous in allowing that Pope Gregory, who began his pontificate in 590, collected the muſical fragments of ſuch ancient pſalms and hymns as the firſt fathers of the church had approved and recommended to the firſt Chriſtians; and that he ſelected, methodized, and arranged them in the order which was long continued at Rome, and ſoon adopted by the chief part of the weſtern church. Gregory is alſo ſaid to have baniſhed from the church the *canto figurato*, as too light and diſſolute; and it is added, that his own chant was called *canto fermo*, from its gravity and ſimplicity.

It has been long a received opinion, that the eccleſiaſtical tones were taken from the reformed modes of Ptolemy; but Dr Burney obſerves, that it is difficult to diſcover any connexion between them, except in their names; for their number, upon examination, is not the ſame; thoſe of Ptolemy being ſeven, the eccleſiaſtical eight; and indeed the Greek names given to the eccleſiaſtical modes do not agree with thoſe of Ptolemy in the ſingle inſtance of key, but with thoſe of higher antiquity. From the time of Gregory to that of Guido, there was no other diſtinction of keys than that of authentic and plagal; nor were any ſemitones uſed but thoſe from E to F, B to C, and occaſionally A to B *b*.

With reſpect to the muſic of the primitive church, it may

ice. may be obſerved, that though it conſiſted in the ſinging of pſalms and hymns, yet it was performed in many different ways; ſometimes the pſalms were ſung by one perſon alone, whilſt the reſt attended in ſilence; ſometimes they were ſung by the whole aſſembly; ſometimes alternately, the congregation being divided into ſeparate choirs; and ſometimes by one perſon, who repeated the firſt part of the verſe, the reſt joining in the cloſe of it. Of the four different methods of ſinging now recited, the ſecond and third were properly diſtinguiſhed by the names of *ſymphony* and *antiphony*: and the latter was ſometimes called *reſponſaria*, in which women were allowed to join. St Ignatius, who, according to Socrates (Lib. VI. cap. 8.), converſed with the apoſtles, is generally ſuppoſed to have been the firſt who ſuggeſted to the primitive Chriſtians in the Eaſt the method of ſinging hymns and pſalms alternately, or in dialogue; and the cuſtom ſoon prevailed in every place where Chriſtianity was eſtabliſhed; though Theodoret in his hiſtory (Lib. II. cap. 24) tells us, that this manner of ſinging was firſt practiſed at Antioch. It likewiſe appears, that almoſt from the time when muſic was firſt introduced into the ſervice of the church, it was of two kinds, and conſiſted in a gentle inflection of the voice, which they termed plain ſong, and a more elaborate and artificial kind of muſic, adapted to the hymns and ſolemn offices contained in its ritual: and this diſtinction has been maintained even to the preſent day.

Although we find a very early diſtinction made between the manner of ſinging the hymns and chanting the pſalms, it is, however, the opinion of the learned Martini, that the muſic of the firſt five or ſix ages of the church conſiſted chiefly in a plain and ſimple chant of uniſons and octaves, of which many fragments are ſtill remaining in the *canto fermo* of the Romiſh miſſals. For with reſpect to muſic in parts, as it does not appear, in theſe early ages, that either the Greeks or Romans were in poſſeſſion of harmony or counterpoint, which has been generally aſcribed to Guido, a monk of Arezzo in Tuſcany, about the year 1022, though others have traced the origin of it to the eighth century, it is in vain to ſeek it in the church. The choral muſic, which had its riſe in the church of Antioch, and from thence ſpread through Greece, Italy, France, Spain, and Germany, was brought into Britain by the ſingers who accompanied Auſtin the monk, when he came over, in the year 596, charged with a commiſſion to convert the inhabitants of this country to Chriſtianity. Bede tells us, that when Auſtin and the companions of his miſſion had their firſt audience of King Ethelbert, in the iſle of Thanet, they approached him in proceſſion, ſinging litanies; and that afterwards, when they entered the city of Canterbury, they ſung a litany, and at the end of it Allelujah. But though this was the firſt time the Anglo-Saxons had heard the Gregorian chant, yet Bede likewiſe tells us, that our Britiſh anceſtors had been inſtructed in the rites and ceremonies of the Gallican church by St Germanus, and heard him ſing Allelujah many years before the arrival of St Auſtin. In 680, John, precentor of St Peter's in Rome, was ſent over by Pope Agatho to inſtruct the monks of Weremouth in the art of ſinging; and he was prevailed upon to open ſchools for teaching muſic in other places in Northumberland. Benedict Biſcop, the preceptor of Bede, Adrian the monk, and many others, contributed to diffe-

minate the knowledge of the Roman chant. At length the ſucceſſors of St Gregory, and of Auſtin his miſſionary, having eſtabliſhed a ſchool for eccleſiaſtical muſic at Canterbury, the reſt of the iſland was furniſhed with maſters from that ſeminary. The choral ſervice was firſt introduced in the cathedral church of Canterbury; and till the arrival of Theodore, and his ſettlement in that ſee, the practice of it ſeems to have been confined to the churches of Kent; but after that, it ſpread over the whole kingdom; and we meet with records of very ample endowments for the ſupport of this part of public worſhip. This mode of religious worſhip prevailed in all the European churches till the time of the Reformation: the firſt deviation from it is that which followed the Reformation by Luther, who, being himſelf a lover of muſic, formed a liturgy, which was a muſical ſervice, contained in a work entitled *Pſalmodia*, h. e. *Cantica ſacra Veteris Eccleſiæ ſelecta*, printed at Norimberg in 1553, and at Wittemberg in 1561. But Calvin, in his eſtabliſhment of a church in Geneva, reduced the whole of divine ſervice to prayer, preaching, and ſinging; the latter of which he reſtrained. He excluded the offices of the antiphon, hymn, and motet, of the Romiſh ſervice, with that artificial and elaborate muſic to which they were ſung; and adopted only that plain metrical pſalmody, which is now in general uſe among the reformed churches, and in the parochial churches of our own country. For this purpoſe he made uſe of Marot's verſion of the Pſalms, and employed a muſician to ſet them to eaſy tunes only of one part. In 1553, he divided the Pſalms into pauſes or ſmall portions, and appointed them to be ſung in churches. Soon after they were bound up with the Geneva catechiſm; from which time the Catholics, who had been accuſtomed to ſing them, were forbid the uſe of them, under a ſevere penalty. Soon after the Reformation commenced in England, complaints were made by many of the dignified clergy and others of the intricacy and difficulty of the church muſic of thoſe times: in conſequence of which it was once propoſed, that organs and curious ſinging ſhould be removed from our churches. Latimer, in his dioceſe of Worceſter, went ſtill farther, and iſſued injunctions to the prior and convent of St Mary, forbidding in their ſervice all manner of ſinging. In the reign of Edward VI. a commiſſion was granted to eight biſhops, eight divines, eight civilians, and eight common lawyers, to compile a body of ſuch eccleſiaſtical laws as ſhould in future be obſerved throughout the realm. The reſult of this commiſſion was a work firſt publiſhed by Fox the martyrologiſt, in 1571, and afterwards in 1640, under the title of *Reformatio Legum Eccleſiaſticarum*. Theſe 32 commiſſioners, inſtead of reprobating church-muſic, merely condemned figurative and operoſe muſic, or that kind of ſinging which abounded with fugues, reſponſive paſſages, and a commixture of various and intricate proportions; which, whether extemporary or written, is by muſicians termed *deſcant*. However, notwithſtanding the objections againſt choral muſic, and the practice of ſome of the reformed churches, the compilers of the Engliſh liturgy in 1548, and the king himſelf, determined to retain muſical ſervice. Accordingly the ſtatute 2 and 3 Edw. VI. cap. 1. though it contains no formal obligation on the clergy, or others, to uſe or join in any vocal or inſtrumental muſic in the common prayer, does clearly recognize the practiſe of ſinging; Service.

and

Service of Serum.

and in leſs than two years after the compiling of King Edward's liturgy, a formula was compoſed, which continues, with ſcarce any variation, to be the rule for choral ſervice even at this day. The author of this work was John Marbecke, or Marbeike; and it was printed by Richard Grafton, in 1550, under the title of the Book of Common Prayer, noted. Queen Mary laboured to re eſtabliſh the Romiſh choral ſervice; but the acceſſion of Elizabeth was followed by the act of uniformity; in conſequence of which, and of the queen's injunctions, the Book of Common Prayer, noted by Marbecke, was conſidered as the general formula of choral ſervice. In 1560, another muſical ſervice, with ſome additions and improvements, was printed by John Day; and in 1565, another collection of offices, with muſical notes. Many objections were urged by Cartwright and other Puritans againſt the form and manner of cathedral ſervice, to which Hooker replied in his Eccleſiaſtical Polity. In 1664, the ſtatutes of Edward VI. and Elizabeth, for uniformity in the Common Prayer, were repealed; and the Directory for Public Worſhip, which allows only of the ſinging of pſalms, eſtabliſhed. But upon the reſtoration of Charles II. choral ſervice was again revived, and has ſince uniformly continued. See on this ſubject Hawkins's Hiſtory of Muſic. Vol. I. p. 404. Vol. II. p. 264. Vol. III. p. 58—468, &c. Vol. IV. p. 44—347.

Service Tree. See Sorbus.

SERVITES, a religious order in the church of Rome, founded about the year 1233, by ſeven Florentine merchants, who, with the approbation of the biſhop of Florence, renounced the world, and lived together in a religious community on Mount Senar, two leagues from that city.

SERVITOR, in the univerſity of Oxford, a ſtudent who attends on another for his maintenance and learning. See Sizar.

SERVITUDE, the condition of a ſervant, or rather ſlave.

Under the decenſion of the Roman empire, a new kind of ſervitude was introduced, different from that of the ancient Romans; it conſiſted in leaving the lands of ſubjugated nations to the firſt owners, upon condition of certain rents, and ſervile offices, to be paid in acknowledgement. Hence the name of *ſervi cenſiti, aſcriptitii*, and *addicti glebæ*; ſome whereof were taxable at the reaſonable diſcretion of the lord; others at a certain rate agreed on; and others were mainmortable, who, having no legitimate children, could not make a will to above the value of five pence, the lord being heir of all the reſt; and others were prohibited marrying, or going to live out of the lordſhip. Moſt of theſe ſervices exiſted lately in France; but they were long ago aboliſhed in England. Such, however, was the original of our tenures, &c. See Slave.

Servitude, in Scots law. See Law, Part III. Sect. ix.

SERVIUS (Maurus Honoratus), a celebrated grammarian and critic of antiquity, who flouriſhed about the time of Arcadius and Honorius; now chiefly known by his Commentaries on Virgil. There is alſo extant a piece of Servius upon the feet of verſes and the quantity of ſyllables, called *Centimetrum*.

SERUM, a thin, tranſparent, ſaltiſh liquor, which makes a conſiderable part of the maſs of blood. See Anatomy, N° 126. and Blood.

Sesamoides, Seſamum.

SESAMOIDEA ossa, certain ſmall bones ſomewhat reſembling the ſeeds of ſeſamum, whence their name. They are placed at the under part of the bones of the laſt joints of the fingers and toes.

SESAMUM, oily grain, in botany: A genus of plants belonging to the claſs of didynamia, and to the order of angioſpermia; and in the natural ſyſtem ranging under the 20th order, *Luridæ*. The calyx is divided into five parts. The corolla is campanulated, the tube of which is nearly the length of the calyx; the throat is inflated, and very large; the border is divided into five parts, four of which are ſpreading and nearly equal; the fifth is the loweſt and largeſt. There are four filaments, and the rudiments of a fifth. The ſtigma is lanceolated, and the capſule has four cells. There are only two ſpecies, the *oriental* and *indicum*. 1. The oriental has ovate, oblong, entire leaves. It is an annual, and grows naturally on the coaſt of Malabar and in the iſland of Ceylon; riſing with an herbaceous four-cornered ſtalk, two feet high, ſending out a few ſhort ſide-branches; the leaves are oblong, oval, a little hairy, and ſtand oppoſite. The flowers terminate the ſtalks in looſe ſpikes; they are ſmall, of a dirty white colour, ſhaped ſomewhat like thoſe of the fox-glove. After the flowers are paſt, the germen turns to an oval acute-pointed capſule with four cells, filled with oval compreſſed ſeeds, which ripen in autumn. 2. The indicum, with triſid lower leaves, grows naturally in India: this is alſo an annual plant; the ſtalk riſes taller than that of the former; the lower leaves are cut into three parts, which is the only difference between them.

The firſt ſort is frequently cultivated in all the eaſtern countries, and alſo in Africa, as a pulſe; and of late years the ſeeds have been introduced into Carolina by the African negroes, where they ſucceed extremely well. The inhabitants of that country make an oil from the ſeed, which will keep good many years, without having any rancid ſmell or taſte, but in two years become quite mild; ſo that when the warm taſte of the ſeed, which is in the oil when firſt drawn, is worn off, they uſe it as ſalad-oil, and for all the purpoſes of ſweet oil. The ſeeds of this plant are alſo uſed by the negroes for food which ſeeds they parch over the fire, and then mix them with water, and ſtew other ingredients with them, which makes a hearty food. Sometimes a ſort of pudding is made of theſe ſeeds, in the ſame manner as with millet or rice, and is by ſome perſons eſteemed, but is rarely uſed for theſe purpoſes in Europe. This is called *benny* or *bonny* in Carolina. In England theſe plants are preſerved in botanic gardens as curioſities. Their ſeeds muſt be ſown in the ſpring upon a hot-bed; and when the plants are come up, they muſt be tranſplanted into a freſh hot-bed to bring them forward. After they have acquired a tolerable degree of ſtrength, they ſhould be planted into pots, and plunged into another hot-bed, managing them as hath been directed for amaranths; for if theſe plants are not thus brought forward in the former part of the ſummer, they will not produce good ſeeds in this country.

From nine pounds of this ſeed which came from Carolina,

rolina, there were upwards of two quarts of oil drawn, which is as great a quantity as hath been obtained from any vegetable whatever. This might occaſion its being called the *oily grain*.

SESELI, MEADOW SAXIFRAGE, in botany: A genus of plants belonging to the claſs of pentandria, and to the order of digynia; and in the natural ſyſtem ranging under 45th order, *Umbellatæ*. The umbels are globular; the involucrum conſiſts of one or two leaflets: the fruit is egg-ſhaped and ſtreaked. There are 11 ſpecies, the *pimpinelloides*, *montanum*, *glaucum*, *annuum*, *ammoides*, *tortuoſum*, *turbith*, *hyppomarathrum pyrenæum*, *ſaxifragum*, and *elatum*. The montanum grows naturally in France and Italy; the glaucum is a native of France; the ammoides and tortuoſum grow in the ſouth of Europe; and the hyppomarathrum is a native of Auſtria.

SESOSTRIS, king of Egypt. See EGYPT, p. 368.

SESQUI, a Latin particle, ſignifying a whole and a half; which joined with *altera*, *terza*, *quarta*, &c, is much uſed in the Italian muſic to expreſs a kind of ratios, particularly ſeveral ſpecies of triples.

Sesqui-Alterate, in geometry or arithmetic, is a ratio between two lines, two numbers, or the like, where one of them contains the other once, with the addition of a half.

Thus 6 and 9 are in a ſeſqui-alterate ratio; ſince 9 contains 6 once, and 3, which is half of 6, over; and 20 and 30 are in the ſame; as 30 contains 20, and half 20 or 10.

Sesqui-Duplicate ratio, is when two of terms the greater contains the leſs twice, and half the leſs remains; as 15 and 6; 50 and 20.

Sesqui-Tertional proportion, is when any number or quantity contains another once and one third.

SESSILE, among botaniſts. See BOTANY.

SESSION, in general, denotes each ſitting or aſſembly of a council, &c.

Session of Parliament, is the ſeaſon or ſpace from its meeting to its propagation. See PARLIAMENT.

Kirk Session, the name of a petty eccleſiaſtical court in Scotland. See *Kirk-Seſſion*.

SESSIONS for weights and meaſures. In London, four juſtices from among the mayor, recorder, and aldermen (of whom the mayor or recorder is to be one), may hold a ſeſſion to inquire into the offences of ſelling by falſe weights and meaſures, contrary to the ſtatutes; and to receive indictments, puniſh offenders, &c. Char. King Charles I.

Court of Session. See Law, Part III. Sect. II.

Court of Quarter Sessions, an Engliſh court that muſt be held in every county once in every quarter of a year; which, by ſtatute 2 Hen. V. c. 4. is appointed to be in the firſt week after Michaelmas day, the firſt week after the Epiphany, the firſt week after the cloſe of Eaſter, and in the week after the tranſlation of St Thomas the martyr, or the 7th of July. It is held before two or more juſtices of the peace, one of which muſt be of the quorum. The juriſdiction of this court, by 34. Edw. III. c. 1. extends to the trying and determining all felonies and treſpaſſes whatſoever: though they ſeldom, if ever, try any greater offence than ſmall felonies within the benefit of clergy; their commiſſion providing, that if any caſe of difficulty ariſes, they ſhall not proceed to judgment, but in the preſence of one of the juſtices of the courts of king's-bench or common pleas, or one of the judges of aſſize: and therefore murders, and other capital felonies, are uſually remitted for a more ſolemn trial to the aſſizes. They cannot alſo try any new created offence, without expreſs power given them by the ſtatute which creates it. But there are many offences and particular matters which, by particular ſtatutes, belong properly to this juriſdiction, and ought to be proſecuted in this court; as, the ſmaller miſdemeanors againſt the public or commonwealth, not amounting to felony; and eſpecially offences relating to the game, highways, alehouſes, baſtard children, the ſettlement and proviſion for the poor, vagrants, ſervants wages, and Popiſh recuſants. Some of theſe are proceeded upon by indictment: others in a ſummary way, by motion, and order thereupon; which order may for the moſt part, unleſs guarded againſt by particular ſtatutes, be removed into the court of king's-bench by writ of *certiorari facias*, and be there either quaſhed or confirmed. The records or rolls of the ſeſſions are committed to the cuſtody of a ſpecial officer, denominated *cuſtos rotulorum*, who is always a juſtice of the quorum; and among them of the quorum (ſaith Lambard) a man for the moſt part eſpecially picked out, either for wiſdom, countenance, or credit. The nomination of the *cuſtos rotulorum* (who is the principal officer in the country, as the lord-lieutenant is chief in military command) is by the king's ſign-manual: and to him the nomination of the clerk of the peace belongs; which office he is expreſsly forbidden to ſell for money. Seſſion, Seſterce.

In moſt corporation-towns there are quarter-ſeſſions kept before juſtices of their own, within their reſpective limits; which have exactly the ſame authority as the general quarter-ſeſſions of the county, except in a very few inſtances; one of the moſt conſiderable of which is the matter of appeals from orders of removal of the poor, which though they be from the orders of corporation-juſtices, muſt be to the ſeſſions of the county, by ſtatutes 8 and 9 W. III. c. 30. In both corporations and counties at large, there is ſometimes kept a ſpecial or petty ſeſſion, by a few juſtices, for deſpatching ſmaller buſineſs in the neighbourhood between the times of the general ſeſſions; as for licenſing alehouſes, paſſing the account of pariſh-officers, and the like.

SESTERCE, SESTERTIUS a ſilver coin, in uſe among the ancient Romans, called alſo ſimply *nummus*, and ſometimes *nummus ſeſtertius*. The ſeſtertius was the fourth part of the denarius, and originally contained two aſſes and a half. It was at firſt denoted by LLS; the two L's ſignifying two libræ, and the S half. But the librarii, afterwards converting the two L's into an II, expreſſed the ſeſtertius by HS. The word *ſeſtertius* was firſt introduced by way of abbreviation for *ſemiſtertius*, which ſignifies two, and a half of a third, or, literally, only half a third; for in expreſſing half a third, it was underſtood that there were two before.

Some authors make two kinds of ſeſterces; the leſs called *ſeſtertius* in the maſculine gender; and the great one, called *ſeſtertium*, in the neuter: the firſt, that we have already deſcribed; the latter containing a thouſand of the other. Others will have any ſuch diſtinction of great and little ſeſterces unknown to the Romans: *ſeſtertius* ſay they, was an adjective, and ſignified *as ſeſter-*

tius,

Seſterce. *tius*, or two aſſes and a half; and when uſed in the plural, as in *quinquaginta ſeſtertium*, or *ſeſtertia*, it was only by way of abbreviation, and there was always underſtood *centena*, *millia*, &c.

This matter has been accurately ſtated by Mr Raper, in the following manner. The ſubſtantive to which ſeſtertius referred is either *as*, or *pondus*; and *ſeſtertius as* is two aſſes and a half; *ſeſtertium pondus*, two pondera and a half, or two hundred and fifty denarii. When the denarius paſſes for ten aſſes, the ſeſtertius of two aſſes and a half was a quarter of it; and the Romans continued to keep their accounts in theſe ſeſterces long after the denarius paſſed for ſixteen aſſes; till, growing rich, they found it more convenient to reckon by quarters of the denarius, which they called *nummi*, and uſed the words *numnus* and *ſeſtertius* indifferently, as ſynonymous terms, and ſometimes both together, as *ſeſtertius nummus*; in which caſe the word *ſeſtertius*, having loſt its original ſignification, was uſed as a ſubſtantive; for *ſeſtertius nummus* was not two nummi and a half, but a ſingle nummus of four aſſes. They called any ſum under two thouſand ſeſterces ſo many *ſeſtertii* in the maſculine gender; two thouſand ſeſterces they called *duo* or *bina ſeſtertia*, in the neuter; ſo many quarters making five hundred denarii, which was twice the ſeſtertium; and they ſaid *dena*, *vicena*, &c. *ſeſtertia*, till the ſum amounted to a thouſand ſeſtertia, which was a million of ſeſterces. But to avoid ambiguity, they did not uſe the neuter *ſeſtertium* in the ſingular number, when the whole ſum amounted to no more than a thouſand ſeſterces, or one ſeſtertium. They called a million of ſeſterces *decies nummum*, or *decies ſeſtertium*, for *decies centena millia nummorum*, or *ſeſtertiorum* (in the maſculine gender), omitting *centena millia* for the ſake of brevity. They likewiſe called the ſame ſum *decies ſeſtertium* (in the neuter gender) for *decies centies ſeſtertium*, omitting *centies* for the ſame reaſon; or ſimply *decies*, omitting *centena millia ſeſtertium*, or *centies ſeſtertium*; and with the numeral adverbs *decies*, *vicies*, *centies*, *millies*, and the like, either *centena millia* or *centies* was always underſtood. Theſe were their moſt uſual forms of expreſſion; though for *bina*, *dena*, *vicena ſeſtertia*, they frequently ſaid *bina*, *dena*, *vicena millia nummum*. If the conſular denarius contained 60 troy grains of fine ſilver, it was worth ſomewhat more than eight-pence farthing and a half ſterling; and the as, of 16 to the denarius, little more than a half-penny. To reduce the ancient ſeſterces of two aſſes and a half, when the denarius paſſed for 16, to pounds ſterling, multiply the given number by 5454, and cut off ſix figures on the right hand for decimals. To reduce *nummi ſeſtertii*, or quarters of the denarius, to pounds ſterling; if the given ſum be conſular money, multiply it by 8727, and cut off ſix figures on the right hand for decimals; and for imperial money diminiſh the ſaid product by one-eighth of itſelf. Phil. Tranſ. Vol. LXI. Part II. art. 48.

To be qualified for a Roman knight, an eſtate of 400,000 *ſeſterces* was required; and for a ſenator, of 800,000.

Authors alſo mention a copper *ſeſterce*, worth about one third of a penny Engliſh.

Sesterce, or *ſeſtertius*, was alſo uſed by the ancients for a thing containing two wholes and a half of another, as *as* was taken for any whole or integer.

SESTOS, a noted fortreſs of European Turkey, ſituated at the entrance of the Helleſpont or Dardanelles, 24 miles ſouth-weſt of Gallipoli. This place is famous for the loves of HERO and LEANDER, ſung by the poet Muſæus. Seſtos

SESUVIUM, in botany; a genus of plants belonging to the claſs of icoſandria, and to the order of trigynia. The calyx is coloured and divided into five parts; there are no petals; the capſule is egg-ſhaped, three-celled, opening horizontally about the middle, and containing many ſeeds. There is only one ſpecies, the *portulacaſtrum*, purſlane-leaved ſeſuvium, which is a native of the Weſt Indies.

SET, or SETS, a term uſed by the farmers and gardeners to expreſs the young plants of the white thorn and other ſhrubs, with which they uſe to raiſe their quick or quick-ſet hedges. The white thorn is the beſt of all trees for this purpoſe; and, under proper regulations, it ſeldom fails of anſwering the farmer's utmoſt expectations.

Set-off, in law, is an act whereby the defendant acknowledges the juſtice of the plaintiff's demand on the one hand: but, on the other, ſets up a demand of his own, to counterbalance that of the plaintiff, either in the whole, or in part: as, if the plaintiff ſues for 10*l.* due on a note of hand, the defendant may ſet off 9*l.* due to himſelf for merchandiſe ſold to the plaintiff; and, in caſe he pleads ſuch ſet-off, muſt pay the remaining balance into court. This anſwers very nearly to the *compenſatio* or ſtoppage of the civil law, and depends upon the ſtatutes 2 Geo. II. cap. 22. and 1 Geo. II. cap. 24.

SETACEOUS WORM, in natural hiſtory, a name given by Dr Liſter to that long and ſlender water-worm, which ſo much reſembles a horſe-hair, that it has been ſuppoſed by the vulgar to be an animated hair of that creature. Theſe creatures, ſuppoſed to be living hairs are a peculiar ſort of inſects, which are bred and nouriſhed within the bodies of other inſects, as the worms of the ichneumon flies are in the bodies of the caterpillars. Setaceous

Aldrovand deſcribes the creature, and tells us it was unknown to the ancients; but called *ſeta aquatica*, and *vermis ſetarius* by the moderns, either from its figure reſembling that of hair, or from the ſuppoſition of its once having been the hair of ſome animal. We generally ſuppoſe it, in the imaginary ſtate of the hair, to have belonged to a horſe; but the Germans ſay it was once the hair of a calf, and call it by a name ſignifying *vitulus aquaticus*, or the "water calf."

Albertus, an author much reverenced by the common people, has declared that this animal is generated of a hair; and adds, that any hair thrown into ſtanding water, will, in a very little time, obtain life and motion. Other authors have diſſented from this opinion, and ſuppoſed them generated of the fibrous roots of water-plants; and others, of the parts of graſshoppers falling into the water. This laſt opinion is rejected by Aldrovand as the moſt improbable of all. Standing and foul waters are moſt plentifully ſtored with them; but they are ſometimes found in the cleareſt and pureſt ſprings, and ſometimes out of the water, on the leaves of trees and plants, as on the fruit-trees in our gardens, and the elms in hedges. They are from three to five inches long, of the thickneſs of a large hair; and are brown,

Seth
||
Severance.

brown upon the back, and white under the belly, and the tail is white on every part.

SETH, the third ſon of Adam, the father of Enos, was born 3874 B. C. and lived 912 years.

SETHIANS, in church hiſtory, Chriſtian heretics; ſo called becauſe they paid divine worſhip to Seth, whom they looked upon to be Jeſus Chriſt the ſon of God, but who was made by a third divinity, and ſubſtituted in the room of the two families of Abel and Cain, which had been deſtroyed by the deluge. Theſe heretics appeared in Egypt in the ſecond century; and as they were addicted to all ſorts of debauchery, they did not want followers; and continued in Egypt above 200 years.

SETIMO, a town of Italy, in the province of Piedmont, ſituated on the river Po, eight miles north of Turin.

SETON, in ſurgery, a few horſe hairs, ſmall threads, or large packthread, drawn through the ſkin, chiefly the neck, by means of a large needle or probe, with a view to reſtore or preſerve health.

We find by experience, that ſetons are very uſeful in catarrhs, inflammations, and other diſorders, particularly thoſe of the eyes, as a gutta ſerena, cataract, and incipient ſuffuſion; to theſe we may add intenſe headachs, with ſtupidity, drowſineſs, epilepſies, and even the apoplexy itſelf.

SETTEE, in ſea language, a veſſel very common in the Mediterranean, with one deck and a very long and ſharp prow. They carry ſome two maſts, ſome three, without top-maſts. They have generally two maſts, equipped with triangular ſails, commonly called *latteen ſails*. The leaſt of them are of 60 tons burden. They ſerve to tranſport cannon and proviſions for ſhips of war and the like. Theſe veſſels are peculiar to the Mediterranean ſea, and are uſually navigated by Italians, Greeks, or Mahometans.

SETTING, in aſtronomy, the withdrawing of a ſtar or planet, or its ſinking below the horizon. Aſtronomers and poets make three different kinds of ſetting of the ſtars, viz. the COSMICAL, ACRONYCAL, and HELIACAL. See theſe articles.

SETTING, in the ſea language. To ſet the land or the ſun by the compaſs, is to obſerve how the land bears on any point of the compaſs, or on what point of the compaſs the ſun is. Alſo when two ſhips ſail in ſight of one another, to mark on what point the chaſe bears, is termed *ſetting the chaſe by the compaſs*.

SETTING, among ſportſmen, a term uſed to expreſs the manner of taking partridges by means of a dog peculiarly trained to that purpoſe. See SHOOTING.

ACT OF SETTLEMENT, in Britiſh hiſtory, a name given to the ſtatute 12 and 13 W. III. cap. 2. whereby the crown was limited to his preſent majeſty's illuſtrious houſe; and ſome new proviſions were added, at the ſame fortunate era, for better ſecuring our religion, laws, and liberties; which the ſtatute declares to be the birthright of the people of England, according to the ancient doctrine of the common law.

SEVENTH, in muſic, an interval called by the Greeks *heptachordon*. See INTERVAL.

SEVERANCE, in law, the ſingling or ſevering two or more that join or are joined in the ſame writ or action. As if two join in a writ, *de libertate probanda*, and the one be afterwards nonſuited; here ſeverance is permitted, ſo as notwithſtanding the nonſuiting the one, the other may ſeverally proceed.

Severia
||
Severn.

There is alſo ſeverance of the tenants in aſſize; when one, two, or more diſſeiſees appear upon the writ, and not the other. And ſeverance in debt, where two executors are named plaintiffs, and the one refuſes to proſecute. We alſo meet with ſeverance of ſummons, ſeverance in attaints, &c. An eſtate in joint tenancy may be ſevered and deſtroyed by deſtroying any of its unities. 1. That of time, which reſpects only the original commencement of the joint eſtate, cannot indeed (being now part) be affected by any ſubſequent tranſaction. But, 2. The joint-tenants eſtate may be deſtroyed without any alienation, by merely diſuniting their poſſeſſion. 3. The jointure may be deſtroyed, by deſtroying the unity of title. And, 4. By deſtroying the unity of intereſt.

SEVERIA, a province of the Ruſſian empire, with the title of a duchy, bounded on the north by Smolenſko and Muſcovy, on the eaſt by Vorotinſki and the country of the Coſſacks, on the ſouth by the ſame, and on the weſt by Zernegovia. It is a country overrun with woods, and on the ſouth part is a foreſt of great length. Novogrodec, or Novogorod, is the capital town.

ST SEVERINA, a town of Italy, in the kingdom of Naples, and in Lower Calabria, with an archbiſhop's ſee. It is very well fortified, and ſeated on a craggy rock, on the river Neeto; in E. Long. 17. 14. N. Lat. 39. 15.

SEVERINO, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a biſhop's ſee. It has fine vineyards, and is ſeated between two hills on the river Petenza, in E. Long. 13. 6. N. Lat. 43. 16.

SEVERN, a river which riſes near Plinlimmon Hill in Montgomeryſhire, and before it enters Shropſhire receives about 30 ſtreams, and paſſes down to Laudring, where it receives the Merda, that flows from Oſweſtry. When it arrives at Monford, it receives the river Mon, paſſing on to Shrewſbury, which it almoſt ſurrounds, then to Bridgeworth; afterwards it runs through the ſkirts of Staffordſhire, enters Worceſterſhire, and paſſes by Worceſter; then it runs to Tewkeſbury, where it joins the Avon, and from thence to Glouceſter, keeping a north-weſterly courſe, till it falls into the Briſtol Channel. It begins to be navigable for boats at Welchpool, in Montgomeryſhire, and takes in ſeveral other rivers in its courſe, beſides thoſe already mentioned, and *is the ſecond in England*. By the late inland navigation, it has communication with the rivers Merſey, Dee, Ribble, Ouſe, Trent, Derwent, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaſter, Weſtmoreland, Cheſter, Stafford, Warwick, Leiceſter, Oxford, Worceſter, &c. A canal from Stroud Water, a branch of the Severn, to join the Thames, has lately been undertaken, by which great undertaking of conveying a tunnel 16 feet high and 16 feet wide, under Sapperton Hill and Hayley Wood (very high ground), for two miles and a quarter in length, through a very hard rock, lined and arched with brick, is entirely completed, and boats paſſed through it the 21ſt of May 1789. By this opening, a communication is made between the river Severn at

Lucombe's English Gazetteer.

Severus. Framiload and the Thames near Lechlade, and will be continued over the Thames near Inglesham, into deep water in the Thames below St John-Bridge, and so to Oxford, &c. and London, for conveyance of coals, goods, &c. It is now navigable from the Severn to Thamsford, by way of Stroud, Cirencester, Cricklade, &c. being filled with water for that purpose near 40 miles.

SEVERUS (Cornelius), an ancient Latin poet of the Augustan age; whose *Ætna*, together with a fragment *De morte Ciceronis*, were published with notes and a prose interpretation, by Le Clerc, 12mo, Amsterdam, 1703. They were before inserted among the *Cataletta Virgilii* published by Scaliger; whose notes, with others, Le Clerc has received among his own.

SEVERUS (Septimus), a Roman emperor, who has been so much admired for his military talents, that some have called him the most warlike of the Roman emperors. As a monarch he was cruel, and it has been observed that he never did an act of humanity or forgave a fault. In his diet he was temperate, and he always showed himself an open enemy to pomp and splendour. He loved the appellation of a man of letters, and he even composed a history of his own reign, which some have praised for its correctness and veracity. However cruel Severus may appear in his punishments and in his revenge, many have endeavoured to exculpate him, and observed that there was need of severity in an empire where the morals were so corrupted, and where no less than 3000 persons were accused of adultery during the space of 17 years. Of him, as of Augustus, some were fond to say, that it would have been better for the world if he had never been born, or had never died. See ROME, N° 372.

SEVERUS's Wall, in British topography, the fourth and last barrier erected by the Romans against the incursions of the North Britons. See the articles ADRIAN, and *ANTONINUS's Wall*.

We learn from several hints in the Roman historians, that the country between the walls of Hadrian and Antoninus continued to be a scene of perpetual war and subject of contention between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimus Severus in Britain, A. D. 206. This last emperor having subdued the Mæatæ, and repulsed the Caledonians, determined to erect a stronger and more impenetrable barrier than any of the former, against their future incursions.

Though neither Dio nor Herodian make any mention of a wall built by Severus in Britain for the protection of the Roman province, yet we have abundant evidence from other writers of equal authority, that he really built such a wall. "He fortified Britain (says Spartian) with a wall drawn cross the island from sea to sea; which is the greatest glory of his reign. After the wall was finished, he retired to the next station (York), not only a conqueror, but the founder of an eternal peace." To the same purpose, Aurelius Victor and Orosius, to say nothing of Eutropius and Cassiodorus: "Having repelled the enemy in Britain, he fortified the country, which was suited to that purpose, with a wall drawn cross the island from sea to sea."—"Severus drew a great ditch, and built a strong wall, fortified with several turrets, from sea to sea, to protect that part of the island which he had recovered from the yet unconquered nations." As the residence of the emperor Severus in Britain was not quite four years, it is probable that the two last of them were employed in building this wall; according to which account, it was begun A. D. 209, and finished A. D. 210. Severus.

This wall of Severus was built nearly on the same tract with Hadrian's rampart, at the distance only of a few paces north. The length of this wall, from Cousins' house near the mouth of the river Tyne on the east, to Boulness on the Solway frith on the west, hath been found, from two actual mensurations, to be a little more than 68 English miles, and a little less than 74 Roman miles. To the north of the wall was a broad and deep ditch, the original dimensions of which cannot now be ascertained, only it seems to have been larger than that of Hadrian. The wall itself, which stood on the south brink of the ditch, was built of free stone, and where the foundation was not good, it is built on piles of oak; the interstices between the two faces of this wall is filled with broad thin stones, placed not perpendicularly, but obliquely on their edges; the running mortar or cement was then poured upon them, which, by its great strength and tenacity, bound the whole together, and made it firm as a rock. But though these materials are sufficiently known, it is not easy to guess where they were procured, for many parts of the wall are at a great distance from any quarry of free stone; and, though stone of another kind was within reach, yet it does not appear to have been anywhere used. The height of this wall was 12 feet besides the parapet, and its breadth 8 feet, according to Bede, who lived only at a small distance from the east end of it, and in whose time it was almost quite entire in many places. Such was the wall erected by the command and under the direction of the emperor Severus in the north of England; and, considering the length, breadth, height, and solidity, it was certainly a work of great magnificence and prodigious labour. But the wall itself was but a part, and not the most extraordinary part, of this work. The great number and different kinds of fortresses which were built along the line of it for its defence, and the military ways with which it was attended, are still more worthy of our admiration, and come now to be described.

The fortresses which were erected along the line of Severus's wall for its defence, were of three different kinds, and three different degrees of strength; and were called by three different Latin words, which may be translated *stations*, *castles*, and *turrets*. Of each of these in their order.

The *stationes*, stations, were so called from their stability and the stated residence of garrisons. They were also called *castra*, which hath been converted into *chesters*, a name which many of them still bear. These were by far the largest, strongest, and most magnificent of the fortresses which were built upon the wall, and were designed for the head-quarters of the cohorts of troops which were placed there in garrison, and from whence detachments were sent into the adjoining castles and turrets. These stations, as appears from the vestiges of them which are still visible, were not all exactly of the same figure nor of the same dimensions; some of them being exactly squares, and others oblong, and some of them a little larger than others. These variations were no doubt occasioned by the difference of situation

Severus. tuation and other circumſtances. The ſtations were fortified with deep ditches and ſtrong walls, the wall itſelf coinciding with and forming the north wall of each ſtation. Within the ſtations were lodgings for the officers and ſoldiers in garriſon; the ſmalleſt of them being ſufficient to contain a cohort, or 600 men. Without the walls of each ſtation was a town, inhabited by labourers, artificers, and others, both Romans and Britons, who choſe to dwell under the protection of theſe fortreſſes. The number of the ſtations upon the wall was exactly 18; and if they had been placed at equal diſtances, the interval between every two of them would have been four miles and a few paces: but the intervention of rivers, marſhes, and mountains; the conveniency of ſituations for ſtrength, proſpect, and water; and many other circumſtances to us unknown, determined them to place theſe ſtations at unequal diſtances. The ſituation which was always choſen by the Romans, both here and everywhere elſe in Britain where they could obtain it, was the gentle declivity of a hill, near a river, and facing the meridian ſun. Such was the ſituation of the far greateſt part of the ſtations on this wall. In general, we may obſerve, that the ſtations ſtood thickeſt near the two ends and in the middle, probably becauſe the danger of invaſion was greateſt in theſe places. But the reader will form a clearer idea of the number of theſe ſtations, their Latin and Engliſh names, their ſituation and diſtance from one another, by inſpecting the following table, than we can give him with equal brevity in any other way. The firſt column contains the number of the ſtation, reckoning from eaſt to weſt; the ſecond contains its Latin, and the third its Engliſh name; and the three laſt its diſtance from the next ſtation to the weſt of it, in miles, furlongs, and chains.

N°	Latin Name.	Engliſh Name.	M.	F.	C
1	Segedunum	Couſins'-houſe	3	5	1½
2	Pons Ælii	Newcaſtle	2	0	9
3	Condercum	Bexwell hill	6	6	5
4	Vindobala	Rutcheſter	7	0	3½
5	Hunnum	Halton-cheſters	5	1	7
6	Cilurnum	Walwick-cheſters	3	1	8
7	Procolitia	Carrawbrugh	4	5	3
8	Borcovicus	Houſeſteeds	1	3	8
9	Vindolana	Little-cheſters	3	6	4
10	Ætica	Great-cheſters	2	1	6½
11	Magna	Carrvoran	2	6	0
12	Amboglanna	Burdoſwald	6	2	8
13	Petriana	Cambeck	2	6	6
14	Aballaba	Watchcroſs	5	1	9
15	Congavata	Stanwix	3	3	4
16	Axelodunum	Brugh	4	0	9
17	Gabroſentum	Brumbrugh	3	4	1
18	Tunnocelum	Boulneſs	0	0	0
		Length of the wall	68	31	3

The *caſtella*, or caſtles, were the ſecond kind of fortifications which were built along the line of this wall for its defence. Theſe caſtles were neither ſo large nor ſtrong as the ſtations, but much more numerous, being no fewer than 81. The ſhape and dimenſions of the caſtles, as appears from the foundations of many of them which are ſtill viſible, were exact ſquares of 66 feet every way. They were fortified on every ſide with thick and lofty walls, but without any ditch, except on the north ſide; on which the wall itſelf, raiſed much above its uſual height, with the ditch attending it, formed the fortification. The caſtles were ſituated in the intervals between the ſtations, at the diſtance of about ſeven furlongs from each other; though particular circumſtances ſometimes occaſioned a little variation. In theſe caſtles guards were conſtantly kept by a competent number of men detached from the neareſt ſtations. Severus.

The *turres*, or turrets, were the third and laſt kind of fortifications on the wall. Theſe were ſtill much ſmaller than the caſtles, and formed only a ſquare of about 12 feet, ſtanding out of the wall on its ſouth ſide. Being ſo ſmall, they are more entirely ruined than the ſtations and caſtles, which makes it difficult to diſcover their exact number. They ſtood in the intervals between the caſtles; and from the faint veſtiges of a few of them, it is conjectured that there were four of them between every two caſtles, at the diſtance of about 300 yards from one another. According to this conjecture, the number of the turrets amounted to 324. They were deſigned for watch towers and places for ſentinels, who, being within hearing of one another, could convey an alarm or piece of intelligence to all parts of the wall in a very little time.

Such were the ſtations, caſtles, and turrets, on the wall of Severus; and a very conſiderable body of troops was conſtantly quartered in them for its defence. The uſual complement allowed for this ſervice was as follows:

1. Twelve cohorts of foot, conſiſting of 600 men each,	7,200
2. One cohort of mariners in the ſtation at Boulneſs, - -	600
3. One detachment of Moors, probably equal to a cohort, - -	600
4. Four alæ or wings of horſe, conſiſting, at the loweſt computation, of 400 each, -	1,600
	10,000

For the conveniency of marching theſe troops from one part of the wall to another, with the greater eaſe and expedition, on any ſervice, it was attended with two military ways, paved with ſquare ſtones, in the moſt ſolid and beautiful manner. One of theſe ways was ſmaller, and the other larger. The ſmaller military way run cloſe along the ſouth ſide of the wall, from turret to turret, and caſtle to caſtle for the uſe of the ſoldiers in relieving their guards and centinels, and ſuch ſervices. The larger way did not keep ſo near the wall, nor touch at the turrets or caſtles, but purſued the moſt direct courſe from one ſtation to another, and was deſigned for the conveniency of marching larger bodies of troops.

It is to be regretted, that we cannot gratify the reader's curioſity, by informing him by what particular bodies of Roman troops the ſeveral parts of this great work were executed; as we were enabled to do with regard to the wall of Antoninus Pius from inſcriptions. For though it is probable that there were

Severus. stones with inscriptions of the same kind, mentioning the several bodies of troops, and the quantity of work performed by each of them, originally inserted in the face of this wall, yet none of them are now to be found. There have indeed been discovered, in or near the ruins of this wall, a great number of small square stones, with very short, and generally imperfect inscriptions upon them; mentioning particular legions, cohorts and centuries; but without directly asserting that they had built any part of the wall, or naming any number of paces. Of these inscriptions, the reader may see no fewer than twenty-nine among the Northumberland and Cumberland inscriptions in Mr Horsley's Britannia Romana. As the stones on which these inscriptions are cut are of the same shape and size with the other facing-stones of this wall, it is almost certain that they have been originally placed in the face of it. It is equally certain, from the uniformity of these inscriptions, that they were all intended to intimate some one thing, and nothing so probable as that the adjacent wall was built by the troops mentioned in them. This was, perhaps, so well understood, that it was not thought necessary to be expressed; and the distance of these inscriptions from one another showed the quantity of work performed. If this was really the case, we know in general, that this great work was executed by the second and sixth legions, these being the only legions mentioned in these inscriptions. Now, if this prodigious wall, with all its appendages of ditches, stations, castles, turrets, and military ways, was executed in the space of two years by two legions only, which, when most complete, made no more than 12,000 men, how greatly must we admire the skill, the industry, and excellent discipline of the Roman soldiers, who were not only the valiant guardians of the empire in times of war, but its most active and useful members in times of peace?

This wall of Severus, and its fortresses, proved an impenetrable barrier to the Roman territories for near 200 years. But about the beginning of the 5th century, the Roman empire being assaulted on all sides, and the bulk of their forces withdrawn from Britain, the Mæatæ and Caledonians, now called *Scots* and *Picts*, became more daring; and some of them breaking through the wall, and others sailing round the ends of it, they carried their ravages into the very heart of Provincial Britain. These invaders were indeed several times repulsed after this by the Roman legions sent to the relief of the Britons. The last of these legions, under the command of Gallio of Ravenna, having, with the assistance of the Britons, thoroughly repaired the breaches of Severus's wall and its fortresses, and exhorted the Britons to make a brave defence, took their final farewell of Britain. It soon appeared, that the strongest walls and ramparts are no security to an undisciplined and dastardly rabble, as the unhappy Britons then were. The Scots and Picts met with little resistance in breaking through the wall, while the towns and castles were tamely abandoned to their destructive rage. In many places they levelled it with the ground, that it might prove no obstruction to their future inroads.—From this time no attempts were ever made to repair this noble work. Its beauty and grandeur procured it no respect in the dark and tasteless ages which succeeded. It became the common quarry for more than a thousand years, out of which all the towns and villages around were built; and is now so entirely ruined, Sevigné. that the most penetrating eyes of the most poring and patient antiquarian, can hardly trace its vanishing foundations.

SEVIGNÉ (Marie de Rabutin, Marquisse de), a French lady, was born in 1626. When only a year old she lost her father, who was killed in the descent of the English on the isle of Rhé, where he commanded a company of volunteers. In 1644 she married the Marquis of Sevigné, who was slain in a duel by the Chevalier d'Albret, in 1651. She had by him a son and a daughter, to the education of whom she afterwards religiously devoted herself. Her daughter was married in 1669 to the count of Grignan, who conducted her to Provence. Madame de Sevigné consoled herself by writing frequent letters to her daughter. She fell at last the victim to her maternal tenderness. In one of her visits to Grignan, she fatigued herself so much during the sickness of her daughter, that she was seized with a fever, which carried her off on the 14th of January 1696. We have two portraits of Madame de Sevigné; the one by the Compte de Bussi, the other by Madame de la Fayette. The first exhibits her defects; the second her excellencies. Bussi describes her as a lively gay coquette, a lover of flattery, fond of titles, honour, and distinction: M. de la Fayette as a woman of wit and good sense, as possessed of a noble soul, formed for dispensing benefits, incapable of debasing herself by avarice, and blessed with a generous, obliging, and faithful heart. Both these portraits are in some measure just. That she was vain-glorious, appears evident from her own letters, which, on the other hand, exhibit undoubted proofs of her virtue and goodness of heart.

This illustrious lady was acquainted with all the wits of her age. It is said that she decided the famous dispute between Perrault and Boileau concerning the preference of the ancients to the moderns, thus, "The ancients are the finest, and we are the prettiest." She left behind her a most valuable collection of letters, the best edition of which is that of 1775, in 8 vols. 12mo. "These letters (says Voltaire) are filled with anecdotes, written with freedom, and in a natural and animated style; are an excellent criticism upon studied letters of wit, and still more upon those fictitious letters which aim at the epistolary style, by a recital of false sentiments and feigned adventures to an imaginary correspondent." It were to be wished that a proper selection had been made of these letters. It is difficult to read 8 volumes of letters, which, though inimitably written, present frequent repetitions, and are often filled with trifles. What makes them in general perhaps so interesting is, that they are in part historical. They may be looked upon as a relation of the manners, the ton, the genius, the fashions, the etiquette, which reigned in the court of Louis XIV. They contain many curious anecdotes nowhere else to be found: But these excellencies would be still more striking, were they sometimes stripped of that multitude of domestic affairs and minute incidents which ought naturally to have died with the mother and the daughter. A volume entitled *Sevigniana* was published at Paris in 1756, which is nothing more than a collection of the fine sentiments, literary and historical anecdotes, and moral apothegms, scattered throughout these letters.

Siecle de Louis XIV. Tom. II.

SEVILLE,

Seville. SEVILLE, a large and populous city of Spain, ſtands on the banks of the Guadalquiver, in the midſt of a rich, and to the eye a boundleſs, plain; in W. Long 5°. 5′. N. Lat. 37°. 20′. This city is ſuppoſed to have been founded by the Phœnicians, who gave it the name of *Hiſpalis*. When it fell under the power of the Romans, it was called *Julia;* and at laſt, after a variety of corruptions, was called *Sebilla* or *Sevilla;* both of which names are retained by the Spaniards. The Romans embelliſhed it with many magnificent edifices; of which ſcarce any veſtige now remains. The Gothic kings for ſome time made it their reſidence: but in proceſs of time they removed their court to Toledo; and Seville was taken by ſtorm ſoon after the victory obtained at Xeres over the Gothic king Rodrigo.—In 1027, Seville became an independent monarchy; but was conquered 70 years afterwards by Yuſef Almoravides, an African prince. At laſt it was taken by Ferdinand III. after a year's ſiege; and 300,000 Moors were then obliged to leave the place. Notwithſtanding this prodigious emigration, Seville continued to be a great and populous city, and ſoon after it was enlarged and adorned with many magnificent buildings, the chief of which is the cathedral. Seville arrived at its utmoſt pitch of grandeur a little after the diſcovery of America, the reaſon of which was, that all the valuable productions of the Weſt Indies were carried thither. Its court was then the moſt ſplendid in Europe; but in the courſe of a few years all this grandeur diſappeared, owing to the impediments in navigating the Guadalquiver. The ſuperior excellence of the port of Cadiz induced government to order the galeons to be ſtationed there in time to come.

Seville is of a circular form, and is ſurrounded by a wall about five miles and a half in circumference, containing 176 towers. The ditch in many places is filled up. The ſtreets of Seville are crooked and dirty, and moſt of them ſo narrow that two carriages can ſcarcely paſs one another abreaſt.

Seville is ſaid to contain 80,268 ſouls, and is divided into 30 pariſhes. It has 84 convents, with 24 hoſpitals.

Townſend's Travels, Vol. II. Of the public edifices of this city the cathedral is the moſt magnificent. Its dimenſions are 420 feet in length, 263 in breadth within the walls, and 126 feet in height. It has nine doors, 80 altars, at which 500 maſſes are daily celebrated, and 80 windows of painted glaſs, each of which coſt 1000 ducats. At one angle ſtands a tower of Mooriſh workmanſhip 350 feet high. On the top of it is the giralda, or large brazen image, which, with its palm branch, weighs near one ton and a half, yet turns as a weather-cock with the ſlighteſt variation of the wind. The whole work is brick and mortar. The paſſage to the top is an inclined plane, which winds about in the inſide in the manner of a ſpiral ſtaircaſe, ſo eaſy of aſcent that a horſe might trot from the bottom to the top; at the ſame time it is ſo wide that two horſemen may ride abreaſt. What appears very unaccountable, the ſolid maſonry in the upper half is juſt as thick again as that in the lower, tho' on the outſide the tower is all the way of the ſame dimenſions. In the opinion of Mr Swinburne, this cathedral is inferior to Yorkminſter. Its treaſures are ineſtimable; one altar with all its ornaments is ſolid ſilver; of the ſame metal are the images of St Iſidore and St Leander, which are as large as the life; and a tabernacle for the hoſt more than four yards high, adorned with eight and forty columns. Before the choir of the cathedral is the tomb of the celebrated Chriſtopher Columbus, the diſcoverer of America. His monument conſiſts of one ſtone only, on which theſe words are inſcribed, *A Caſtilla y Arragon otro mundo dio Colon;* that is, "To Caſtile and Aragon Columbus gave another world:" an inſcription ſimple and expreſſive, the juſtneſs of which will be acknowledged by thoſe who have read the adventures of this illuſtrious but unfortunate man. The cathedral was begun by Don Sancho the Brave, about the cloſe of the 13th century, and finiſhed by John II. about a hundred years after. To the cathedral belongs a library of 20,000 volumes, collected by Hernando the ſon of Columbus; but, to the diſgrace of the Spaniards, it has ſcarcely received any addition ſince the death of the founder. The organ in this cathedral is a very ingenious piece of mechaniſm *. "I was much pleaſed (ſays Mr Townſend in his intereſting travels) with the conſtruction of a new organ, containing 5300 pipes, with 110 ſtops, which latter, as the builder told me, is 50 more than are in the famous one of Haarlem; yet, ſo ample are the bellows, that when ſtretched they ſupply the full organ 15 minutes. The mode of filling them with air is ſingular; for inſtead of working with his hands, a man walks backwards and forwards along an inclined plane of about 15 feet in length, which is balanced in the middle on its axis; under each end is a pair of bellows, of about ſix feet by three and a half. Theſe communicate with five other pair united by a bar; and the latter are ſo contrived, that when they are in danger of being overſtrained, a valve is lifted up, and gives them relief. Paſſing 10 times along the inclined plane fills all theſe veſſels."

Bourgoanne's Travels, Vol. II.

* Vol. II. p. 318.

Swinburne's Travel, p. 283. The Canos de Carmone, or great aqueduct of Seville, is reckoned by the hiſtorians of this city one of the moſt wonderful works of antiquity. Mr Swinburne, however, remarks, that it is ugly, crooked, the arches unequal, and the architecture neglected. The conduit is ſo leaky, that a rivulet is formed by the waſte water. Nevertheleſs, it ſtill conveys to the city an ample ſupply of water ſufficient to turn ſeveral mills, and to give almoſt every houſe in town the benefit of it.

Many of the convents are remarkable for the beauty of their architecture; but in Seville the eye covets only pictures, of which there is a wonderful profuſion. Among theſe are the works of the famous painter Murillo, with many others univerſally admired.

The convent of the Franciſcans contains 15 cloiſters, with apartments for 200 monks, though, when Mr Townſend viſited them, they amounted only to 140. The annual expenditure of theſe, who are all fed on charity, is about 4000l. ſterling. "In the principal cloiſter (ſays the ſame intelligent traveller), which is entirely encloſed by a multitude of little chapels, are repreſented, in 14 pictures, each called a *ſtation*, all the ſufferings of the Redeemer. Theſe are ſo arranged as to mark given diſtances by walking round the cloiſter from the firſt to the ſecond, and ſo in order to the reſt. Over them is mentioned the number of ſteps taken by our Lord between the ſeveral incidents of his paſſion in his way to Calvary; and theſe preciſely are the paces meaſured

Townſend's Travels, Vol. II. p. 326.

Seville.

measured for the penitents in their progress from one station to another. Over one is the following inscription: 'This station consists of 1087 steps. Here the blessed Redeemer fell a second time under the weight of his cross, and here is to be gained the indulgence of seven years and forty quarantines. Mental prayer, the Paternoster, and the Ave Maria.' This may serve as an example for the rest."

The principal manufacture of Seville is snuff. Mr Townsend, who paid particular attention to it, informs us, that the building in which it is carried on is elegant and simple in its form, and is about 600 feet by 480, and not less than 60 feet in height, with four regular fronts, enclosing 28 quadrangles. It cost 37,000,000 of reals, or about 370,000l. At present (1787), no more than 1700 workmen are employed, and 100 horses or mules; but formerly 3000 men were engaged, and near 400 horses. This falling off is attributed by Mr Swinburne to a practice which the directors followed of adulterating the tobacco with the red earth of Almazarron. When Mr Townsend visited this manufacture, they had changed their system. From the year 1780, he informs us, the annual sale of tobacco from Brazil has been 1,500,000 pounds, purchased from the Portuguese at three reals a pound; and of snuff from the produce of their own colonies 1,600,000 pounds, besides *cigars* (A) to a very considerable amount. They have lying by them more than 5,000,000 of pounds of snuff unsold; but as it will not suffer by age, they are not uneasy at this accumulation. Besides the peculiar kind of snuff with which Spain was accustomed to supply the market, they have lately introduced the manufacture of rappee. In this branch alone are employed 220 persons, old and young, with 16 mules.

"All the workmen (continues Mr Townsend) deposite their cloaks at the door; and when they go out are so strictly examined, that they have little chance of being able to conceal tobacco; yet they sometimes venture to hide it about their persons. An officer and a guard is always attending to take delinquents into custody; and that they may prevent resistance, no workman is permitted to enter with a knife. Were it not for this precaution, the consequence of a detection might be fatal. The whole business is conducted by a director, with a salary of 40,000 reals a-year, and 54 superior officers, assisted by as many subordinate to them. For grinding their snuff, they have 40 mills, each consisting of a stone roller, moved by a large horse or mule, with the traces fastened to a beam of eight feet in length, in the angle of 45 degrees, consequently losing precisely half his force."

Before Mr Townsend left Seville, according to his usual practice, which was truly laudable, he inquired into the prices of labour and provisions. As a piece of curious and useful information, and as an example to other travellers, we present them to our readers. They are as follow:

Day-labourers -	4½ reals,	about L.	0	0	10¼
Carpenters from 7 to 11	——				
Joiners, if good workmen, -	24	—— or -	0	4	9
Weavers, if good workmen, 15 reals, about - - -		L.	0	3	0
Bread, for 3 lb. of 16 oz. or 16 quartos, or			0	0	4 1/2
—— sometimes 28 quartos, or			0	0	7 7/8
Beef, 30 quartos for 32 oz. per lb. about			0	0	4 5/8
Mutton, 38 do. do. - -			0	0	5 11/16
Kid, 24 do. - -			0	0	3 3/8
Pork from 36 to 42 quartos, do.		or	0	0	5 1/16
		to	0	0	5 13/16

The price of wheat has at different periods been very remarkable. In 1652, it sold at the rate of 15s. 3½d. the bushel; and in 1657, it fell so low as 1s. 4½d. per bushel, reckoning the fanega at 109½ lb. and the bushel at 70.

SEVUM MINERALE, mineral tallow; a substance somewhat resembling tallow, found on the sea coasts of Finland in the year 1736. It burns with a blue flame, and smell of grease, leaving a black viscid matter which cannot easily be consumed. It is extremely light; being only of the specific gravity of 0.770; whereas tallow is not less than 0.969. It is partly soluble in highly rectified spirit of wine; but entirely so in expressed oils when boiling. It is met with in some of the rocky parts of Persia, but there it appears to be mixed with petroleum. Dr Herman of Strasburg mentions a spring in the neighbourhood of that city which contains a substance of this sort diffused through it, separating, and capable of being collected on ebullition.—A fat mineral matter resembling butter or tallow has lately been extracted from peat in Lancashire. See PEAT.

SEWAURY, a Hindoo word used in Bengal, and signifying the train of attendants that accompany a nabob or great man.

SEWER, *in the Household*, an officer who arranges on the table the dishes of a king or nobleman.

SEWER is also a passage or gutter made to carry water into the sea or a river, whereby to preserve the land, &c. from inundations and other annoyances.

Court of Commissioners of SEWERS *in England*, a temporary tribunal, erected by virtue of a commission under the great seal; which formerly used to be granted *pro re nata* at the pleasure of the crown, but now at the discretion and nomination of the lord chancellor, lord treasurer, and chief justices, pursuant to the statute 23 Hen. VIII. c. 5. Their jurisdiction is to overlook the repairs of sea banks and sea walls, and the cleansing of rivers, public streams, ditches, and other conduits, whereby any waters are carried off; and is confined to such county or particular district as the commission shall expressly name. The commissioners are a court of record, and may fine and imprison for contempts; and in the execution of their duty may proceed by jury, or upon their own view, and may take order for the removal of any annoyances, or the safeguard and conservation of the sewers within their commission, either according to the laws and customs of Romney marsh, or otherwise at their own discretion. They may also assess such rates or scots upon the owners of lands within their district as they shall judge necessary: and if any person refuses to pay them, the commissioners may levy the

Sewer

(A) These are little rolls of tobacco which the Spaniards smoke without a pipe.

Sewer. the ſame by diſtreſs of his goods and chattels: or they may, by ſtatute 23 Hen. VIII. c. 5. ſell his freehold-lands (and by the 7 Ann. c. 10. his copyhold alſo), in order to pay ſuch ſcots or aſſeſſments. But their conduct is under the controul of the court of King's bench, which will prevent or puniſh any illegal or tyrannical proceedings. And yet in the reign of King James I. (8th Nov. 1616.), the privy council took upon them to order, that no action or complaint ſhould be proſecuted againſt the commiſſioners unleſs before that board; and committed ſeveral to priſon who had brought ſuch actions at common law, till they ſhould releaſe the ſame: and one of the reaſons for diſcharging Sir Edward Coke from his office of lord chief juſtice, was for countenancing thoſe legal proceedings. The pretence for theſe arbitrary meaſures was no other than the tyrant's plea of the *neceſſity* of unlimited powers in works of evident utility to the public, "the ſupreme reaſon above all reaſons, which is the ſalvation of the king's lands and people." But now it is clearly held, that this (as well as all other inferior juriſdictions) is ſubject to the diſcretionary coercion of his majeſty's court of King's bench.

Common SEWERS, in Rome, were executed at a great expence. It was propoſed that they ſhould be of ſufficient dimenſions to admit a waggon loaded with hay. When theſe common ſewers came to be obſtructed, or out of repair, under the republic, the cenſors contracted to pay a thouſand talents, or about 193,000l. for clearing and repairing them. They were again in diſrepair at the acceſſion of Auguſtus Cæſar, and the reinſtating them is mentioned among the great works of Agrippa. He is ſaid to have turned the courſe of ſeven rivers into theſe ſubterraneous paſſages, to have made them navigable, and to have actually paſſed in barges under the ſtreets and buildings of Rome. Theſe works are ſtill ſuppoſed to remain; but as they exceed the power and reſources of the preſent city to keep them in repair, they are quite concealed, except at one or two places. They were in the midſt of the Roman greatneſs, and ſtill are reckoned among the wonders of the world; and yet they are ſaid to have been works of the elder Tarquin, a prince whoſe territory did not extend, in any direction, above 16 miles; and, on this ſuppoſition, they muſt have been made to accommodate a city that was calculated chiefly for the reception of cattle, herdſmen, and banditti. Rude nations ſometimes execute works of great magnificence, as fortreſſes and temples, for the purpoſes of war and ſuperſtition; but ſeldom palaces, and ſtill more ſeldom works of mere convenience and cleanlineſs, in which for the moſt part they are long defective. It is not unreaſonable, therefore, to queſtion the authority of tradition in reſpect to this ſingular monument of antiquity, which ſo greatly exceeds what the beſt accommodated city of modern Europe could undertake for its own convenience. And as thoſe works are ſtill entire, and may continue ſo for thouſands of years, it may be ſuſpected that they were even prior to the ſettlement of Romulus, and may have been the remains of a more ancient city, on the ruins of which the followers of Romulus ſettled, as the Arabs now hut or encamp on the ruins of Palmyra and Balbeck. Livy owns, that the common ſewers were not accommodated to the plan of Rome, as it was laid out in his time; they were carried in directions acroſs the ſtreets, and paſſed under buildings of the greateſt antiquity. This derangement indeed he imputes to the haſty rebuilding of the city after its deſtruction by the Gauls; but haſte, it is probable, would have determined the people to build on their old foundations, or at leaſt not to change them ſo much as to croſs the direction of former ſtreets.

Ferguſon's Roman Hiſt.

Sex. SEX, the property by which any animal is male or female.

Lavater has drawn the following characteriſtic diſtinctions between the male and female of the human ſpecies.

"The primary matter of which women are conſtituted appears to be more flexible, irritable, and elaſtic, than that of man. They are formed to maternal mildneſs and affection; all their organs are tender, yielding, eaſily wounded, ſenſible, and receptible. Among a thouſand females there is ſcarcely one without the generic feminine ſigns; the flexible, the circular, and the irritable.

"They are the counterpart of man, taken out of man, to be ſubject to man; to comfort him like angels, and to lighten his cares. "She ſhall be ſaved in childbearing, if they continue in faith, and charity, and holineſs, with ſobriety" (1 Tim. ii. 15). This tenderneſs, this ſenſibility, this light texture of their fibres and organs, this volatility of feeling, render them ſo eaſy to conduct and to tempt; ſo ready of ſubmiſſion to the enterpriſe and power of the man; but more powerful through the aid of their charms than man with all his ſtrength. The man was not firſt tempted, but the woman; afterward the man by the woman. And, not only eaſy to be tempted, ſhe is capable of being formed to the pureſt, nobleſt, moſt ſeraphic virtue; to every thing which can deſerve praiſe or affection. Highly ſenſible of purity, beauty, and ſymmetry, ſhe does not always take time to reflect on internal life, internal death, internal corruption. 'The woman ſaw that the tree was good for food, and that it was pleaſant to the eyes, and a tree to be deſired to make one wiſe, and ſhe took of the fruit thereof.' (Gen. iii. 6.)

"The female thinks not profoundly; profound thought is the power of the man. Women feel more. Senſibility is the power of woman. They often rule more effectually, more ſovereignly, than man. They rule with tender looks, tears, and ſighs; but not with paſſion and threats; for if, or when, they ſo rule, they are no longer women but abortions. They are capable of the ſweeteſt ſenſibility, the moſt profound emotion, the utmoſt humility, and the exceſs of enthuſiaſm. In their countenance are the ſigns of ſanctity and inviolability, which every feeling man honours, and the effects of which are often miraculous. Therefore, by the irritability of their nerves, their incapacity for deep inquiry and firm deciſion, they may eaſily from their extreme ſenſibility become the moſt irreclaimable, the moſt rapturous enthuſiaſts. Their love, ſtrong and rooted as it is, is very changeable; their hatred almoſt incurable, and only to be effaced by continued and artful flattery. Men are moſt profound; women are more ſublime.

"Men moſt embrace the whole; women remark individually, and take more delight in ſelecting the minutiæ which form the whole. Man hears the burſting thunder,

Sex. thunder, views the deſtructive bolt with ſerene aſpect, and ſtands erect amidſt the fearful majeſty of the ſtreaming clouds. Woman trembles at the lightning, and the voice of diſtant thunder; and ſhrinks into herſelf, or ſinks into the arms of man. Man receives a ray of light ſingle, woman delights to view it through a priſm in all its dazzling colours. She contemplates the rainbow as the promiſe of peace; he extends his inquiring eye over the whole horizon. Woman laughs, man ſmiles; woman weeps, man remains ſilent. Woman is in anguiſh when man weeps, and in deſpair when man is in anguiſh; yet has ſhe often more faith than man. Man without religion, is a diſeaſed creature, who would perſuade himſelf he is well, and needs not a phyſician; but woman without religion, is raging and monſtrous. A woman with a beard is not ſo diſguſting as a woman who acts the freethinker; her ſex is formed to piety and religion; to them Chriſt firſt appeared; but he was obliged to prevent them from too ardently, and too haſtily, embracing him: 'Touch me not.' They are prompt to receive and ſeize novelty, and become its enthuſiaſts. The whole world is forgotten in the emotion cauſed by the preſence and proximity of him they love. They ſink into the moſt incurable melancholy, as they alſo riſe to the moſt enraptured heights.

"Male ſenſation is more imagination, female more heart. When communicative, they are more communicative than man; when ſecret, more ſecret. In general they are more patient, long-ſuffering, credulous, benevolent, and modeſt. Woman is not a foundation on which to build. She is the gold, ſilver, precious ſtones, wood, hay, ſtubble (1 Cor. iii. 12.); the materials for building on the male foundation. She is the leaven, or more expreſſively the oil to the vinegar of man: the ſecond part of the book of man.

"Man ſingly is but half man; at leaſt but half human; a king without a kingdom. Woman, who feels properly what ſhe is, whether ſtill or in motion, reſts upon the man; nor is man what he may and ought to be, but in conjunction with woman: therefore, 'it is not good that man ſhould be alone, but that he ſhould leave father and mother, and cleave to his wife, and they two ſhall be one fleſh.'"

They differ alſo in their exterior form and appearance.

"Man is the moſt firm; woman the moſt flexible. Man is the ſtraighteſt; woman the moſt bending. Man ſtands ſtedfaſt; woman gently retreats. Man ſurveys and obſerves; woman glances and feels. Man is ſerious: woman is gay. Man is the talleſt and broadeſt; woman the ſmalleſt and weakeſt. Man is rough and hard; woman ſmooth and ſoft. Man is brown; woman is fair. Man is wrinkly; woman is not. The hair of man is more ſtrong and ſhort; of woman more long and pliant. The eyebrows of man are compreſſed; of woman leſs frowning. Man has moſt convex lines; woman moſt concave. Man has moſt ſtraight lines; woman moſt curved. The countenance of man taken in profile is more ſeldom perpendicular than that of the woman. Man is moſt angular; woman moſt round."

Fitzoſborn's Letters.

In determining the comparative merit of the two ſexes, it is no derogation from female excellency that it differs in kind from that which diſtinguiſhes the male part of our ſpecies: and if, in general, it ſhould be found (what upon an impartial inquiry will moſt certainly be found (that women fill up their appointed circle of action with greater regularity than men, the claim of preference cannot juſtly be decided in our favour. In the prudential and economical parts of life, it is undeniable that they riſe far above us: and if true fortitude of mind is beſt diſcovered by a cheerful reſignation to the meaſures of Providence, we ſhall not find reaſon, perhaps to claim that moſt ſingular of the human virtues as our peculiar privilege. There are numbers of the other ſex who, from the natural delicacy of their conſtitution, paſs through one continued ſcene of ſuffering from their cradles to their graves, with a firmneſs of reſolution that would deſerve ſo many ſtatues to be erected to their memories, if heroiſm were not eſteemed more by the ſplendour than the merit of actions.

But whatever real difference there may be between the moral or intellectual powers of the male and female mind, Nature does not ſeem to have marked the diſtinction ſo ſtrongly as our vanity is willing to imagine; and after all, perhaps, education will be found to conſtitute the principal ſuperiority. It muſt be acknowledged, at leaſt, that in this article we have every advantage over the ſofter ſex that art and induſtry can poſſibly ſecure to us. The moſt animating examples of Greece and Rome are ſet before us, as early as we are capable of any obſervation; and the nobleſt compoſitions of the ancients are given into our hands almoſt as ſoon as we have ſtrength to hold them; while the employments of the other ſex, at the ſame period of life, are generally the reverſe of every thing that can open and enlarge their minds, or fill them with juſt and rational notions. The truth of it is, female education is ſo much worſe than none, as it is better to leave the mind to its natural and uninſtructed ſuggeſtions, than to lead it into falſe purſuits, and contract its views, by turning them upon the loweſt and moſt triſling objects. We ſeem, indeed, by the manner in which we ſuffer the youth of that ſex to be trained, to conſider women agreeably to the opinion of certain Mahometan doctors, and treat them as if we believed they had no ſouls: why elſe are they

> Bred only, and completed to the taſte
> Of luſtful appetence, to ſing, to dance,
> To dreſs, and troul the tongue, and roll the eye.
>
> MILTON.

This ſtrange neglect of cultivating the female mind can hardly be allowed as good policy, when it is conſidered how much the intereſt of ſociety is concerned in the rectitude of their underſtandings. That ſeaſon of every man's life which is moſt ſuſceptible of the ſtrongeſt impreſſions, is neceſſarily under female direction; as there are few inſtances, perhaps, in which that ſex is not one of the ſecret ſprings which regulate the moſt important movements of private or public tranſactions. What Cato obſerves of his countrymen is in one reſpect true of every nation under the ſun: "The Romans (ſaid he) govern the world, but it is the women that govern the Romans."

If it be true then (as true beyond all peradventure it is) that female influence is thus extenſive, nothing certainly can be of more importance than to give it a proper tendency, by the aſſiſtance of a well directed education. Far are we from recommending any attempts

to

Sex ‖ Sextius.

to render women learned; yet ſurely it is neceſſary they ſhould be raiſed above ignorance. Such a general tincture of the moſt uſeful ſciences as may ſerve to free the mind from vulgar prejudices, and give it a reliſh for the rational exerciſe of its powers, might very juſtly enter into a plan of female erudition. That ſex might be taught to turn the courſe of their reflections into a proper and advantageous channel, without any danger of rendering them too elevated for the feminine duties of life. In a word, they ought to be conſidered as deſigned by Providence for uſe as well as ſhow, and trained up, not only as women, but as rational creatures.

Sex of Bees. See Bee.

Sex of Plants. See Botany, p. 448.

SEXAGENARY, ſomething relating to the number ſixty: thus ſexagenary or ſexageſimal arithmetic is a method of computation proceeding by ſixties; ſuch is that uſed in the diviſion of a degree into ſixty minutes, of the minute into ſixty ſeconds, of the ſecond into ſixty thirds, &c. Alſo ſexagenary tables are tables of proportional parts, ſhowing the product of two ſexagenaries that are to be multiplied, or the quotient of the two that are to be divided.

SEXAGESIMA, the ſecond Sunday before Lent, or the next to Shrove Sunday, ſo called as being about the 60th day before Eaſter.

SEXAGESIMALS, or *Sexagesimal Fractions*, fractions whoſe denominators proceed in a ſexagecuple ratio; that is, a prime, or the firſt minute, $= \frac{1}{60}$: a ſecond $= \frac{1}{3600}$; a third $= \frac{1}{216000}$. Anciently, there were no other than ſexageſimals uſed in aſtronomy; and they are ſtill retained in many caſes, though decimal arithmetic begins to grow in uſe now in aſtronomical calculations. In theſe fractions, which ſome call *aſtronomical fractions*, the denominator being always 60, or a multiple thereof, is uſually omitted, and the numerator only written down: thus, 4°, 59′, 32″, 50‴, 16⁗, is to be read, 4 degrees, 59 minutes, 32 ſeconds, 50 thirds, 16 fourths, &c.

SEXTANS, Sextant, a ſixth part of certain things, The Romans having divided their *as* into 12 ounces or unciæ, the ſixth part of that, or two ounces, was the ſextans.—*Sextans* was alſo a meaſure which contained two ounces of liquor, or two cyathi.

Sextans, in aſtronomy, a conſtellation of the ſouthern hemiſphere made by Hevelius out of unformed ſtars. In Hevelius's catalogue it contains 11, but in the Britannic catalogue 41 ſtars.

SEXTANT, in mathematics, denotes the ſixth part of a circle, or an arch comprehending 60 degrees.

The word *ſextant* is more particularly uſed for an aſtronomical inſtrument made like a quadrant, excepting that its limb only comprehends 60 degrees. The uſe and application of the ſextant is the ſame with that of the quadrant. See Quadrant; and Navigation, p. 737, &c.

SEXTILE, *ſextilis*, the poſition or aſpect of two planets when at 60 degrees diſtance, or at the diſtance of two ſigns from one another. It is marked thus (⚹). See Aspect.

SEXTIUS (Quintus), a Pythagorean philoſopher, flouriſhed in the time of Auguſtus. He ſeemed formed to riſe in the republic; but he ſhrunk from civil honours, and declined accepting the rank of ſenator when it was offered him by Julius Cæſar, that he might have time to apply to philoſophy. It appears that he wiſhed to eſtabliſh a ſchool at Rome, and that his tenets, though chiefly drawn from the doctrines of Pythagoras, in ſome particulars reſembled thoſe of the Stoics.

Sexton ‖ Sextus.

He ſoon found himſelf involved in many difficulties. His laws were tinctured with great ſeverity; and in an early period of his eſtabliſhment, he found his mind ſo haraſſed, and the harſhneſs of the doctrines which he wiſhed to eſtabliſh ſo repulſive to his feelings, that he had nearly worked himſelf up to ſuch a height of deſperation as to reſolve on putting a period to his exiſtence.

Of the ſchool of Sextius were Fabianus, Sotion, Flavianus, Craſſitius, and Celſus. Of his works only a few fragments remain; and whether any of them formed a part of the work which Seneca admired ſo much, cannot now be determined. Some of his maxims are valuable. He recommended an examination of the actions of the day to his ſcholars when they retired to reſt; he taught, that the road to Heaven (*ad aſtra*) was by frugality, temperance, and fortitude. He uſed to recommend holding a looking-glaſs before perſons diſordered with paſſion. He enjoined his ſcholars to abſtain from animal food.

SEXTON, a church-officer, thus called by corruption of the Latin *ſacriſta*, or Saxon *ſegerſtone*, which denotes the ſame. His office is to take care of the veſſels, veſtments, &c. belonging to the church; and to attend the miniſter, church-warden, &c. at church. He is uſually choſen by the parſon only. Sextons, as well as pariſh-clerks, are regarded by the common law as perſons who have freehold in their offices; and, therefore, though they may be puniſhed, yet they cannot be deprived, by eccleſiaſtical cenſures.

The office of ſexton in the pope's chapel is appropriated to the order of the hermits of St Auguſtine. He is generally a biſhop, though ſometimes the pope only gives a biſhopric, *in partibus*, to him on whom he confers the poſt. He takes the title of *Preſect of the Pope's Sacriſty*, and has the keeping the veſſels of gold and ſilver, the relics, &c. When the pope ſays maſs, the ſexton always taſtes the bread and wine firſt. If it be in private he ſays maſs, his holineſs, of two wafers, gives him one to eat; and, if in public, the cardinal, who aſſiſts the pope in quality of deacon, of three wafers, gives him two to eat. When the pope is deſperately ſick, he adminiſters to him the ſacrament of extreme unction, &c. and enters the conclave in quality of firſt conclaviſt.

The office of a ſexton in Sweden is ſomewhat ſingular. During M. Outhier's ſtay at Stockholm in 1736 he viſited the church of St Clara, and during divine ſervice he obſerved a ſexton going about with a long rod, waking thoſe perſons who had fallen aſleep.

SEXTUPLE, in muſic, denotes a mixed ſort of triple, which is beaten in double time.

SEXTUS Empiricus, a famous Pyrrhonian philoſopher, lived in the ſecond century, under the reign of Antoninus Pius. He was a phyſician of the ſect of the Empirics, and is ſaid to have been one of the preceptors of Antoninus the Philoſopher. There are ſtill extant his Pyrrhonian Inſtitutions, and a large work againſt the mathematicians, &c. The beſt edition of Sextus Expiricus is that of Fabricius in Greek and Latin, printed at Leipſic in 1718, folio.

Sexualiſtæ ‖ Sforza.

SEXUALISTÆ, among botanical writers, thoſe who have eſtabliſhed the claſſes of plants upon the differences of the ſexes and parts of fructification in plants, according to the modern method; as Linnæus, &c.

SEZAWUL, a Hindoo word, uſed in Bengal to expreſs an officer employed at a monthly ſalary to collect the revenues.

SFORZA (James), was the founder of the illuſtrious houſe of Sforza, which acted ſo conſpicuous a part in Italy during the 15th and 16th centuries, which gave ſix dukes to Milan, and contracted alliances with almoſt every ſovereign in Europe. James Sforza was born on the 28th of May 1369, at Catignola, a ſmall town in Italy, lying between Imola and Faenza. His father was a day-labourer, or, according to Commines, a ſhoemaker. A company of ſoldiers happening one day to paſs through Catignola, he was ſeized with the deſire of accompanying them to the wars. "I will go (ſaid he to himſelf), and dart my hatchet againſt that tree, and if it ſtick faſt in the wood, I will immediately become a ſoldier." The hatchet accordingly ſtuck faſt, and our adventurer enliſted; and becauſe, ſays the Abbé de Choiſi, he had thrown the axe with all his force, he aſſumed the name of Sforza; for his true name was Giacomuzzo, or James Attendulo. He roſe rapidly in the army, and ſoon became commander of 7000 men. He defended the cauſe of Jane II. queen of Naples for many years, and was made conſtable of her kingdom. He was created count of Catignola by Pope John XXII. by way of paying a debt of 14000 ducats which the church of Rome owed him. His exploits became every day more illuſtrious: he obliged Alphonſo king of Arragon to raiſe the ſiege of Naples; and reduced ſeveral places that had revolted in Abruzzo and Le Labour; but while in purſuit of his enemies he was unfortunately drowned in the river Aterno on the 3d January 1424, at the age of 54 years. His heroic qualities and the continual wars in which he was engaged, did not hinder him from forming an attachment to the fair ſex. In his youth he fell in love with a woman called *Lucia Trezana*, whom he married after ſhe had born him ſeveral children. He married afterwards Antoinette Salembini, who brought him ſeveral excellent eſtates; ſhe bore him Boſio Sforza, count of Santa-Flor, a warrior and governor of Orvietta for Pope Martin V. His third wife was Catharine Alopa, ſiſter of Rodolpho, grand chamberlain to the ſovereign of Naples. His laſt wife, for he was four times married, was Mary Marzana, daughter to the duke of Seſſa. She bore him Charles Sforza, who was general of the order of Auguſtines, and archbiſhop of Milan.

SFORZA (Francis), the ſon of James Sforza by Lucia Trezana, was born in 1401, and trained up by his father to the profeſſion of arms. At the age of 23 he defeated the troops of Braccio, who diſputed with him the paſſage of the Aterno. In this action his father was drowned, and Francis, though illegitimate, ſucceeded him. He fought ſucceſsfully againſt the Spaniards, and contributed a great deal both towards raiſing the ſiege of Naples, and to the victory which was gained over the troops of Braccio near Aquila in 1425, where that general was killed. After the death of Queen Jane, in 1435, he eſpouſed the intereſts of the duke of Anjou, to whom ſhe had left her crown, and by his courage and abilities ably ſupported that unfortunate prince. He made himſelf maſter of ſeveral places in Ancona, from which he was driven by Pope Eugenius IV. who defeated and excommunicated him; but he ſoon re-eſtabliſhed his affairs by a victory. His reputation was now ſo great that the pope, the Venetians, and the Florentines, choſe him for their general againſt the duke of Milan. Sforza had already conducted Venetian armies againſt that prince, though he had eſpouſed his daughter. The duke dying in 1447, the inhabitants of Milan invited Sforza, his ſon-in-law, to lead them againſt that duke. But, after ſome exertions in their favour, he turned his arms againſt themſelves, laid ſiege to Milan, and obliged them to receive him as duke, notwithſtanding the rights of Charles duke of Orleans, the ſon of Valentine of Milan. In 1464, Louis XI. who hated Orleans, gave up to Sforza the rights which the crown of France had over Genoa, and even put into his hands Savona, a town belonging to that republic. The duke of Milan ſoon after made himſelf maſter of Genoa. He died in 1466, with the reputation of a man who was willing to ſell his blood to the beſt purchaſer, and who was not too ſcrupulous an obſerver of his word. His ſecond wife was Blanche Marie, natural daughter of Philip Marie duke of Milan. She bore him Galeas Marie, and Ludovic Marie, dukes of Milan, Philip Marie count of Pavia, Sforza Marie duke of Bari, Aſcagne Marie biſhop of Pavia and Cremona, and a cardinal. He was taken priſoner by the troops of Louis XII. and confined for ſome time in the tower of Bourges. He was a cunning man, and deceived Cardinal d'Amboiſe when that prelate aſpired at the papacy. His daughters were Hyppolita, married to Alphonſo of Arragon, afterwards king of Naples; and Elizabeth, married to William marquis of Montferrat. He had beſides ſeveral natural children.

Sforza ‖ Shadow

SHACK, in ancient cuſtoms, a liberty of winter-paſturage. In the counties of Norfolk and Suffolk, the lord of the manor has ſhack, i. e. a liberty of feeding his ſheep at pleaſure in his tenants lands during the ſix winter months. In Norfolk, ſhack alſo extends to the common for hogs, in all men's grounds, from the end of harveſt till ſeed-time. Whence to go *a-ſhack*, is to feed at large.

SHACKLES, aboard a ſhip, are thoſe oblong iron rings, bigger at one end than at the other, with which the ports are ſhut faſt, by thruſting the wooden bar of the port through them. There is alſo a ſort of ſhackles to lift the hatches up with, of a like figure, but ſmaller. They are faſtened at the corners of the hatches.

SHAD, in ichthyology, a ſpecies of CLUPEA.

SHADDOCK, a ſpecies of CITRUS.

SHADOW, in optics, a privation or diminution of light by the interpoſition of an opake body: or it is a plane where the light is either altogether obſtructed, or greatly weakened by the interpoſition of ſome opake body between it and the luminary.

SHADOW, in painting, an imitation of a real ſhadow effected by gradually heightening and darkening the colours of ſuch figures as by their diſpoſitions cannot receive any direct rays from the luminary that is ſuppoſed to enlighten the piece.

SHADOW, in perſpective, the appearance of an opake body, and a luminous one, whoſe rays diverge (*e. gr.* a candle, lamp, &c.), being given; to find the juſt appearance

Shadwell ‖ Shaftesbury.

pearance of the ſhadow, according to the laws of perſpective. The method is this: From the luminous body, which is here conſidered as a point, let fall a perpendicular to the perſpective plane or table; *i. e.* find the appearance of a point upon which a perpendicular, drawn from the middle of the luminary, falls on the perſpective plane; and from the ſeveral angles, or raiſed points of the body, let fall perpendiculars to the plane. Theſe points, whereon the perpendiculars fall, connect by right lines, with the point upon which the perpendicular let fall from the luminary falls; and continue the lines to the ſide oppoſite to the luminary. Laſtly, Through the raiſed points draw lines through the centre of the luminary, interſecting the former; the points of interſection are the terms or bounds of the ſhadow.

SHADWELL (Thomas), deſcended of an ancient family in Staffordſhire, was born in 1640, and educated at Caius college, Cambridge. He then was placed in the Middle Temple to ſtudy the laws; where having ſpent ſome time, he travelled abroad. Upon his return home, he became acquainted with the moſt celebrated perſons of wit in that age. He applied himſelf chiefly to dramatic writing, in which he had great ſucceſs; and upon the Revolution was made poet laureat and hiſtoriographer to King William and Queen Mary, in the room of Mr Dryden. Theſe employments he enjoyed till his death, which happened in 1692. Beſide his dramatic writings, he compoſed ſeveral other pieces of poetry; the chief of which are his congratulatory poem on the prince of Orange's coming to England; another on Queen Mary; his tranſlation of Juvenal's 10th ſatire, &c. Mr Dryden treats him with great contempt, in his ſatire called *Mac-Flecknoe*. The beſt judges of that age, however, gave their teſtimony in favour of his comedies; which have in them fine ſtrokes of humour; the characters are often original, ſtrongly marked, and well ſuſtained. An edition of his works, with ſome account of his life and writings prefixed, was publiſhed in 1720, in 4 vols. 8vo.

SHAFT *of a* Column, in building, is the body thereof between the baſe and capital; ſo called from its ſtraightneſs. See Architecture.

Shaft, in mining, is the pit or hollow entrance into the mine. In the tin mines, after this is ſunk about a fathom, they leave a little, long, ſquare place, which is called a *ſhamble*.

Shafts are ſunk ſome ten, ſome twenty fathoms deep into the earth, more or leſs. Of theſe ſhafts, there is the landing or working ſhaft, where they bring up the work or ore to the ſurface; but if it be worked by a horſe engine or whim, it is called a *whim-ſhaft*; and where the water is drawn out of the mine, it is indifferently named an *engine-ſhaft*, or the *rod-ſhaft*. See Mine.

Shaft, in ornithology. See Trochilus.

SHAFTESBURY, a town of Dorſetſhire in England, in W. Long. 2. 20. N. Lat. 51. 0. It ſtands on a high hill, and is built in the form of a bow. It enjoys a ſerene wholeſome air, and has a fine proſpect. It is a good thoroughfare, is governed by a mayor, and ſends two members to parliament. This town is ſuppoſed to have been built in the 8th century, and to have been enlarged by King Alfred, and had 12 churches, beſides a Benedictine monaſtery, in the time of the Saxons, but has now only three. St Edward the martyr was buried here. It had three mints before the Conqueſt, and, in the reign of Henry VIII. was the ſee of a ſuffragan biſhop. It was incorporated by Queen Elizabeth and Charles II. and is governed by a mayor, recorder, twelve aldermen, bailiffs, and a common council. It contains about 320 houſes, many of which are of freeſtone. Water is ſo ſcarce, that it uſed to be ſupplied from Motcomb; but it was obtained more commodiouſly in 1718, by means of engines, which raiſed the water above 300 feet perpendicular, and conveyed it to a large ciſtern in the middle of the town, from the diſtance of two miles. Yet even this is laid aſide, and they have dug ſeveral pits, in which they preſerve the rain water; and the poor get their living to this day by fetching it in pails or on horſes. It gives the title of earl to the noble family of Cooper.

Shaftesbury ‖ Shakeſpeare.

Shaftesbury (earl of). See Cooper.

SHAG, in ornithology. See Pelicanus.

SHAGREEN, or Chagreen, in commerce, a kind of grain leather prepared of the ſkin of a ſpecies of Squalus, much uſed in covering caſes, books, &c.

Manner of preparing Shagreen. The ſkin, being flayed off, is ſtretched out, covered over with muſtard ſeed, and the ſeed bruiſed on it; and thus it is expoſed to the weather for ſome days, and then tanned.

The beſt is that brought from Conſtantinople, of a browniſh colour; the white is the worſt. It is extremely hard; yet, when ſteeped in water, it becomes very ſoft and pliable; whence it is of great uſe among caſe-makers. It takes any colour that is given it, red, green, yellow, or black. It is frequently counterfeited by morocco, formed like ſhagreen; but this laſt is diſtinguiſhed by its peeling off, which the firſt does not.

SHAIK properly ſignifies an old man. In the eaſt it is uſed to denote a lord or chief, a man of eminence and property. See Schiechs.

SHAKE, in ſinging. See Trill.

SHAKESPEARE or Shakspeare (William), the prince of dramatic writers, was born at Stratford upon Avon in Warwickſhire, on the 23d of April 1564. From the regiſter of that town, it appears that a plague broke out there on the 30th of June following, which raged with great violence; but fortunately it did not reach the houſe in which this infant prodigy lay. His father, John Shakeſpeare, enjoyed a ſmall patrimonial eſtate, and was a conſiderable dealer in wool; his mother was the daughter and heireſs of Robert Arden of Wellingcote. Our illuſtrious poet being deſigned for the buſineſs of his father, received no better education than the inſtructions which the free ſchool of Stratford could afford. After applying ſome time to the ſtudy of Latin, he was called home to aſſiſt his father, who ſeems by ſome accident to have been reduced in his circumſtances. Before arriving at the age of 19, he married the daughter of Mr Hathaway, a ſubſtantial yeoman in the neighbourhood of Stratford. This lady was eight years older than her huſband. Having the misfortune to fall into bad company, he was ſeduced into ſome profligate actions, which drew on him a criminal proſecution, and at length forced him to take refuge in the capital. In concert with his aſſociates, he broke into a park belonging to Sir Thomas Lucy of Charlecote, and carried off ſome of his deer. Every admirer of Shakeſpeare will regret that ſuch a blemiſh ſhould have ſtained his character:

Shakeſpeare.

but, perhaps, if any thing can extenuate his guilt, we might aſcribe it to the opinions of the age, which, perhaps, as was formerly the caſe in Scotland, might not diſtinguiſh the killing of deer by any mark of diſgrace, or any charge of criminality. One thing at leaſt is certain, that Shakeſpeare himſelf thought that the proſecution which Sir Thomas raiſed againſt him was carried on with too great ſeverity; an opinion which he could not have entertained had this action been at that time viewed in the ſame criminal light as it is at preſent. Shakeſpeare teſtified his reſentment againſt Sir Thomas, by writing a ſatirical ballad, which exaſperated him ſo much, that the proceſs was carried on with redoubled violence; and the young poet, in order to avoid the puniſhment of the law, was obliged to make his eſcape. This ballad would be conſidered as a curious relic, on account of its being the firſt production of Shakeſpeare; it would alſo be intereſting to peruſe a poem which could irritate the baronet to ſo high a degree. Tradition has preſerved the firſt ſtanza:

A parliamente member, a juſtice of peace,
At home a poor ſcare-crow, at London an aſſe.
If lowſie is Lucy, as ſome volke miſcalle it,
Then Lucy is lowſie whatever befall it:
He thinks himſelf greate,
Yet an aſſe in his ſtate,
We allowe by his ears, but with aſſes to mate.
If Lucy is lowſie, as ſome volke miſcalle it,
Sing lowſie Lucy whatever befall it.

If the reſt of the ballad was of a piece with this ſtanza, it might aſſiſt us to form ſome opinion of the irritability of the baronet, but will enable us to form no idea of the opening genius of Shakeſpeare.

Thus expelled from his native village, he repaired to London, where he was glad to accept a ſubordinate office in the theatre. It has been ſaid that he was firſt engaged, while the play was acting, in holding the horſes of thoſe who rode to the theatre: but this ſtory reſts on a ſlender foundation. As his name is found printed among thoſe of the other players before ſome old plays, it is probable that he was ſome time employed as an actor; but we are not informed what characters he played; we are only told, that the part which he acted beſt was that of the Ghoſt in Hamlet; and that he appeared in the character of Adam in *As you Like it*. If the names of the actors prefixed to Ben Jonſon's play of *Every Man in his Humour* were arranged in the ſame order as the perſons repreſented, which is very probable, Shakeſpeare played the part of Old Knowell. We have reaſon therefore to ſuppoſe, as far as we can argue from theſe few facts, that he generally repreſented old men. See Malone's Chronology, in his edition of Shakeſpeare.

But though he was not qualified to ſhine as an actor, he was now in the ſituation which could moſt effectually rouſe thoſe latent ſparks of genius which afterwards burſt forth with ſo reſplendent a flame. Being well acquainted with the mechanical buſineſs of the theatre and the taſte of the times; poſſeſſed of a knowledge of the characters of men reſembling intuition, an imagination that ranged at large through nature, ſelecting the grand, the ſublime, and the beautiful; a judicious caution, that diſpoſed him to prefer thoſe plots which had already been found to pleaſe; an uncommon fluency and force of expreſſion; he was qualified at once to eclipſe all who had gone before him.

Shakeſpeare.

Notwithſtanding the unrivalled genius of Shakeſpeare, moſt of his plots were the invention of others; which, however, he certainly much improved, if he did not entirely new-model. We are aſſured, that prior to the theatrical compoſitions of Shakeſpeare, dramatic pieces were written on the following ſubjects, viz. King John, King Richard II. and III. King Henry IV. and V. King Henry VIII. King Lear, Antony and Cleopatra, Meaſure for Meaſure, the Merchant of Venice, the Taming of a Shrew, and the Comedy of Errors.

Among his patrons, the earl of Southampton is particularly honoured by him, in the dedication of two poems, Venus and Adonis, and Lucrece; in the latter eſpecially, he expreſſed himſelf in ſuch terms as gives countenance to what is related of that patron's diſtinguiſhed generoſity to him. In the beginning of King James I.'s reign (if not ſooner) he was one of the principal managers of the playhouſe, and continued in it ſeveral years afterwards; till, having acquired ſuch a fortune as ſatisfied his moderate wiſhes and views in life, he quitted the ſtage, and all other buſineſs, and paſſed the remainder of his time in an honourable eaſe, at his native town of Stratford, where he lived in a handſome houſe of his own purchaſing, to which he gave the name of *New Place*; and he had the good fortune to ſave it from the flames in the dreadful fire that conſumed the greateſt part of the town in 1614.

In the beginning of the year 1616, he made his will, wherein he teſtified his reſpect to his quondam partners in the theatre: he appointed his youngeſt daughter, jointly with her huſband, his executors, and bequeathed to them the beſt part of his eſtate, which they came into the poſſeſſion of not long after. He died on the 23d of April following, being the 53d year of his age; and was interred among his anceſtors on the north ſide of the chancel, in the great church of Stratford, where there is a handſome monument erected for him, inſcribed with the following elegiac diſtich in Latin:—

Judicio Pylium, genio Socratem, arte Maronem,
Terra tegit, Populus mæret, Olympus habet.

In the year 1740, another very noble one was raiſed to his memory, at the public expence, in Weſtminſter Abbey; an ample contribution for this purpoſe being made upon exhibiting his tragedy of Julius Cæſar, at the theatre-royal in Drury-Lane, April 28. 1738.

Nor muſt we omit mentioning another teſtimony of the veneration paid to his manes by the public in general, which is, that a mulberry tree planted upon his eſtate by the hands of this revered bard, was cut down not many years ago; and the wood being converted to ſeveral domeſtic uſes, was all eagerly bought at a high price, and each ſingle piece treaſured up by its purchaſer as a precious memorial of the planter.

The character of Shakeſpeare as a dramatic writer has been often drawn, but perhaps never with more accuracy than by the pen of Dr Johnſon: "Shakeſpeare (ſays he) is above all writers, at leaſt above all modern writers, the poet of nature; the poet that holds up to his readers a faithful mirror of manners and of life. His

Shakeſpeare.

His characters are not modified by the cuſtoms of particular places, unpractiſed by the reſt of the world; by the peculiarities of ſtudies or profeſſions, which can operate but upon ſmall numbers; or by the accidents of tranſient faſhions or temporary opinions: they are the genuine progeny of common humanity, ſuch as the world will always ſupply, and obſervation will always find. His perſons act and ſpeak by the influence of thoſe general paſſions and principles by which all minds are agitated, and the whole ſyſtem of life is continued in motion. In the writings of other poets, a character is too often an individual; in thoſe of Shakeſpeare, it is commonly a ſpecies.

"It is from this wide extenſion of deſign that ſo much inſtruction is derived. It is this which fills the plays of Shakeſpeare with practical axioms and domeſtic wiſdom. It was ſaid of Euripides, that every verſe was a precept; and it may be ſaid of Shakeſpeare, that from his works may be collected a ſyſtem of civil and economical prudence. Yet his real power is not ſhown in the ſplendour of particular paſſages, but by the progreſs of his fable, and the tenor of his dialogue; and he that tries to recommend him by ſelect quotations, will ſucceed like the pedant in Hierocles, who, when he offered his houſe to ſale; carried a brick in his pocket as a ſpecimen.

"Upon every other ſtage the univerſal agent is love, by whoſe power all good and evil is diſtributed, and every action quickened or retarded. But love is only one of many paſſions; and as it has no great influence upon the ſum of life, it has little operation in the dramas of a poet who caught his ideas from the living world, and exhibited only what he ſaw before him. He knew that any other paſſion, as it was regular or exorbitant, was a cauſe of happineſs or calamity.

"Characters thus ample and general were not eaſily diſcriminated and preſerved; yet perhaps no poet ever kept his perſonages more diſtinct from each other.

"Other dramatiſts can only gain attention by hyperbolical or aggravated characters, by fabulous and unexampled excellence or depravity, as the writers of barbarous romances invigorated the reader by a giant and a dwarf; and he that ſhould form his expectations of human affairs from the play, or from the tale, would be equally deceived. Shakeſpeare has no heroes, his ſcenes are only occupied by men, who act and ſpeak as the reader thinks that he ſhould himſelf have ſpoken or acted on the ſame occaſion: Even where the agency is ſupernatural, the dialogue is level with life. Other writers diſguiſe the moſt natural paſſions and moſt frequent incidents; ſo that he who contemplates them in the book will not know them in the world: Shakeſpeare approximates the remote, and familarizes the wonderful; the event which he repreſents will not happen, but if it were poſſible, its effects would probably be ſuch as he has aſſigned; and it may be ſaid, that he has not only ſhown human nature as it acts in real exigencies, but as it would be found in trials to which it cannot be expoſed.

"This therefore is the praiſe of Shakeſpeare, that his drama is the mirror of life; that he who has mazed his imagination, in following the phantoms which other writers raiſe up before him, may here be cured of his delirious ecſtaſies, by reading human ſentiments in human language; by ſcenes from which a hermit may eſtimate the tranſactions of the world, and a confeſſor predict the progreſs of the paſſions."

Shakeſpeare.

The learning of Shakeſpeare has frequently been a ſubject of inquiry. That he poſſeſſed much claſſical knowledge does not appear, yet he was certainly acquainted with the Latin poets, particularly with Terence, as Colman has juſtly remarked, which appears from his uſing the word *thraſonical*. Nor was he unacquainted with French and Italian. We are indeed told, that the paſſages in which theſe languages occur might be impertinent additions of the players; but is it probable, that any of the players ſo far ſurpaſſed Shakeſpeare?

That much knowledge is ſcattered over his works is very juſtly obſerved by Pope; but it is often ſuch knowledge as books did not ſupply. "There is, however, proof enough (ſays Dr Johnſon) that he was a very diligent reader; nor was our language then ſo indigent of books, but that he might very liberally indulge his curioſity without excurſion into foreign literature. Many of the Roman authors were tranſlated, and ſome of the Greek; the Reformation had filled the kingdom with theological learning; moſt of the topics of human diſquiſition had found Engliſh writers; and poetry had been cultivated, not only with diligence, but ſucceſs. This was a ſtock of knowledge ſufficient for a mind ſo capable of appropriating and improving it."

The works of Shakeſpeare conſiſt of 35 dramatic pieces. The following is the chronological order which Mr Malone has endeavoured to eſtabliſh, after a minute inveſtigation, in which he has in general been ſucceſsful:

1.	Firſt Part of King Henry VI.	1589
2.	Second Part of King Henry VI.	1591
3.	Third Part of King Henry VI.	1591
4.	A Midſummer Night's Dream	1592
5.	Comedy of Errors	1593
6.	Taming of the Shrew	1594
7.	Love's Labour Loſt	1594
8.	Two Gentlemen of Verona	1595
9.	Romeo and Juliet	1595
10.	Hamlet	1596
11.	King John	1596
12.	King Richard II.	1597
13.	King Richard III.	1597
14.	Firſt Part of King Henry IV.	1597
15.	Second Part of King Henry IV.	1598
16.	The Merchant of Venice	1598
17.	All's Well that Ends Well	1598
18.	King Henry V.	1599
19.	Much Ado About Nothing	1600
20.	As You Like It	1600
21.	Merry Wives of Windſor	1601
22.	King Henry VIII.	1601
23.	Troilus and Creſſida	1602
24.	Meaſure for Meaſure	1603
25.	The Winter's Tale	1604
26.	King Lear	1605
27.	Cymbelline	1605
28.	Macbeth	1606
29.	Julius Cæſar	1607
30.	Antony and Cleopatra	1608
31.	Timon of Athens	1609
32.	Coriolanus	1610
33.	Othello	

Shakeſpeare.

33. Othello - - - 1611
34. The Tempeſt - - - 1612
35. Twelfth Night - - - 1614

The three firſt of theſe, Mr Malone thinks, there is very ſtrong reaſon to believe are not the original productions of Shakeſpeare; but that he probably altered them, and added ſome new ſcenes.

In the firſt folio edition in 1623, theſe plays were entitled "Mr William Shakeſpeare's Comedies, Hiſtories, and Tragedies." They have been publiſhed by various editors. The firſt folio edition by Iſaac Jaggard and Edward Blount; the ſecond, folio, 1632, by Thomas Cotes for Robert Allot; the third, 1664, for P. C.; the fourth, 1685, for H. Herringman, E. Brewſter, and R. Bentley. Rowe publiſhed an 8vo edition in 1709, in 7 vols. and a 12mo edition in 1714, in 9 vols.; for which he received 36l. 10s. Pope publiſhed a 4to edition in 1725, in 6 vols. and a 12mo in 1728, in 10 vols.; for which he was paid 217l. 12s. Theobald gave a new edition in 8vo in 1733, in 7 vols. another in 12mo in 1740, in 8 vols.; and received for his labour 652l. 10s. Sir Thomas Hanmer publiſhed an edition in 1744, in 6 vols. 4to. Dr Warburton's 8vo edition came out in 1747, in 8 vols.; for which he was paid 560l. The editions publiſhed ſince that time, are Dr Johnſon's in 1765, in 8 vols. 8vo. Stevens's in 1766, in 4 vols. 8vo. Capell's in 1768, in 10 vols. crown 8vo; for this the author was paid 300l. A ſecond edition of Hammer's in 1771, 6 vols. Johnſon's and Stevens's in 1773, in 10 vols. 8vo; a ſecond edition in 1778; a third by Reed in 1785; and Malone's crown 8vo edition in 1789, in 10 vols.

The moſt authentic of the old editions is that of 1623. "At laſt (ſays Dr Johnſon) an edition was undertaken by Rowe; not becauſe a poet was to be publiſhed by a poet, for Rowe ſeems to have thought very little on correction or explanation, but that our author's works might appear like thoſe of his fraternity, with the appendages of a life and recommendatory preface. Rowe has been clamorouſly blamed for not performing what he did not undertake, and it is time that juſtice be done him, by confeſſing, that though he ſeems to have had no thoughts of corruption beyond the printer's errors, yet he has made many emendations, if they were not made before, which his ſucceſſors have received without acknowledgment, and which, if they had produced them, would have filled pages with cenſures of the ſtupidity by which the faults were committed, with diſplays of the abſurdities which they involved, with oſtentatious expoſitions of the new reading, and ſelf-congratulations on the happineſs of diſcovering it."

The nation had been for many years content enough with Mr Rowe's performance, when Mr Pope made them acquainted with the true ſtate of Shakeſpeare's text, ſhowed that it was extremely corrupt, and gave reaſon to hope that there were means of reforming it. Mr Pope's edition, however, he obſerves, fell below his own expectations; and he was ſo much offended, when he was found to have left any thing for others to do, that he paſſed the latter part of his life in a ſtate of hoſtility with verbal criticiſm.

The only taſk in the opinion of Mr Malone, for which Pope was eminently and indiſputably qualified, was to mark the faults and beauties of his author.—When he undertook the office of a commentator, every anomaly of language, and every expreſſion that was currently in uſe, were conſidered as errors or corruptions, and the text was altered or amended, as it was called, at pleaſure. Pope is openly charged with being one of the great corrupters of Shakeſpeare's text.

Pope was ſucceeded by Theobald, who collated the ancient copies, and rectified many errors. He was however, a man of narrow comprehenſion and of little learning, and what is worſe, in his report of copies and editions, he is not to be truſted without examination. From the liberties taken by Pope, the edition of Theobald was juſtly preferred, becauſe he profeſſed to adhere to the ancient copies more ſtrictly, and illuſtrated a few paſſages by extracts from the writers of our poet's age. Still, however, he was a conſiderable innovator; and while a few arbitrary changes made by Pope were detected, innumerable ſophiſtications were ſilently adopted.

Sir Thomas Hanmer, who comes next, was a man of critical abilities, and of extenſive learning. His corrections are commonly juſt, but ſometimes capricious. He is cenſurable, too, for receiving without examination almoſt all the innovations of Pope.

The original and predominant error of Warburton's commentary, is acquieſcence in his firſt thoughts; that precipitation which is produced by conſciouſneſs of quick diſcernment; and that confidence which preſumes to do, by ſurveying the ſurface, what labour only can perform, by penetrating to the bottom. His notes exhibit ſometimes perverſe interpretations, and ſometimes improbable conjectures; he at one time gives the author more profundity of meaning than the ſentence admits, and at another diſcovers abſurdities where the ſenſe is plain to every other reader. But his emendations are likewiſe often happy and juſt; and his interpretation of obſcure paſſages learned and ſagacious.

It has indeed been ſaid by his defenders, that his great object was to diſplay his own learning; and certainly, in ſpite of the clamour raiſed againſt him for ſubſtituting his own chimerical conceits inſtead of the genuine text of Shakeſpeare, his work increaſed his reputation. But as it is of little value as a commentary on Shakeſpeare, ſince Warburton is now gone, his work will probably ſoon ſink into oblivion.

In 1765 Dr Johnſon's edition, which had long been impatiently expected, was given to the public. His vigorous and comprehenſive underſtanding threw more light on his author than all his predeceſſors had done. The character which he gave of each play is generally juſt. His refutation of the falſe gloſſes of Theobald and Warburton, and his numerous explications of involved and difficult paſſages, entitle him to the gratitude of every admirer of Shakeſpeare.

The laſt editor is Mr Malone, who was eight years employed in preparing his edition. By collating the moſt authentic copies, he has been careful to purify the text. He has been ſo induſtrious, in order to diſcover the meaning of the author, that he has ranſacked many volumes, and truſts that, beſides his additional illuſtrations, not a ſingle valuable explication of any obſcure paſſage in theſe plays has ever appeared, which he has not inſerted in his edition. He rejects Titus Andronicus, as well as the three plays formerly mentioned, as

Shake-ſpeare ‖ hamans.

not being the authentic productions of Shakeſpeare. To the whole he has added an appendix, and a copious gloſſary. Of this work a leſs expenſive edition has been publiſhed in 7 vols. 12mo, in which the general introductory obſervations prefixed to the different plays are preſerved, and the numerous notes abridged.

This judicious commentator has certainly done more for the elucidation and correction of Shakeſpeare than all who came before him, and has followed with indefatigable patience the only road which a commentator of Shakeſpeare ought to obſerve.

Within 50 years after our poet's death, Dryden ſays that he was become "a little obſolete;" and in the beginning of the preſent century Lord Shafteſbury complains of his rude unpoliſhed ſtyle, and his antiquated phraſe and wit. Theſe complaints were owing to the great revolution which the Engliſh language has undergone, and to the want of an enlightened commentator. Theſe complaints are now removed, for an enlightened commentator has been found in Mr Malone.

We have only farther to add, that in the year 1790 a copious index to the remarkable paſſages and words in the plays of Shakeſpeare was publiſhed by the Reverend Mr Ayſcough; a gentleman to whom the literary world is much indebted for ſeveral very valuable keys of knowledge. In fine, the admirers of Shakeſpeare are now, by the labours of ſeveral eminent men, furniſhed with every help that can enable them to underſtand the ſenſe and to taſte the beauties of this illuſtrious poet.

SHAKLES. See SHACKLES.

SHALE, in natural hiſtory, a ſpecies of SCHISTUS. It is a black ſlaty ſubſtance, or a clay hardened into a ſtony conſiſtence, and ſo much impregnated with bitumen that it becomes ſomewhat like a coal. The acid emitted from ſhale, during its calcination, uniting itſelf to the argillaceous earth of the ſhale, forms alum. About 120 tons of calcined ſhale will make one ton of alum. The ſhale, after being calcined, is ſteeped in water, by which means the alum, which is formed during the calcination of the ſhale, is diſſolved: this diſſolved alum undergoes various operations before it is formed into the alum of the ſhops. Watſon's Chemical Eſſays, Vol. II. p. 315. See ALUM.

This kind of ſlate forms large ſtrata in Derbyſhire; and that which lies near the ſurface of the earth is of a ſofter and more ſhivery texture than that which lies deeper. It is alſo found in large ſtrata, generally above the coal, in moſt coal counties of this kingdom. Dr Short informs us, that the ſhale waſtes the lead ore near it, by its ſtrong acid; and that it corrodes and deſtroys all minerals near it except iron or coal, of whoſe vitriol it partakes.

SHALLOP, SHALLOOP, or SLOOP, is a ſmall light veſſel, with only a ſmall main-maſt, and fore-maſt, and lug-ſails, to hale up, and let down, on occaſion.—Shallops are commonly good ſailors, and are therefore often uſed as tenders upon men of war.

SHALLOT, or ESCHALOT. See ALLIUM.

SHAMANS are wizards or conjurers, in high repute among ſeveral idolatrous nations inhabiting different parts of Ruſſia. By their enchantments they pretend to cure diſeaſes, to divert misfortunes, and to foretel futurity. They are great obſervers of dreams, by the interpretation of which they judge of their good or bad fortune. They pretend likewiſe to chiromancy, and to foretel a man's good or ill ſucceſs by the lines of his hand. By theſe and ſuch like means they have a very great aſcendency over the underſtandings, and a great influence on the conduct, of thoſe people.

Shambles, Shamois.

SHAMBLES, among miners, a ſort of niches or landing places, left at ſuch diſtances in the adits of the mines, that the ſhovel-men may conveniently throw up the ore from ſhamble to ſhamble, till it comes to the top of the mine.

SHAMOIS, CHAMOIS, or SHAMMY, a kind of leather, either dreſſed in oil or tanned, much eſteemed for its ſoftneſs, pliancy, &c. It is prepared from the ſkin of the chamois, or ſhamois, a kind of rupicapra, or wild goat, called alſo iſard, inhabiting the mountains of Dauphiny, Savoy, Piedmont, and the Pyrenees. Beſides the ſoftneſs and warmth of the leather, it has the faculty of bearing ſoap without damage; which renders it very uſeful on many accounts.

In France, &c. ſome wear the ſkin raw, without any preparation. Shammy leather is uſed for the purifying of mercury, which is done by paſſing it through the pores of this ſkin, which are very cloſe. The true chamois leather is counterfeited with common goat, kid, and even with ſheep-ſkins, the practice of which makes a particular profeſſion, called by the French *chamoiſure*. The laſt, though the leaſt eſteemed, is yet ſo popular, and ſuch vaſt quantities of it are prepared, eſpecially about Orleans, Marſeilles, and Thouloufe, that it may not be amiſs to give the method of preparation.

Manner of ſhamoiſing, or of preparing ſheep, goat, or kid ſkins in oil, in imitation of ſhammy. The ſkins, being waſhed, drained, and ſmeared over with quicklime on the fleſhy ſide, are folded in two lengthwiſe, the wool outwards, and laid on heaps, and ſo left to ferment eight days, or, if they had been left to dry after flaying, then fifteen days.

Then they are waſhed out, drained, and half dried; laid on a wooden leg, or horſe, the wool ſtripped off with a round ſtaff for that purpoſe, and laid in a weak pit, the lime whereof had been uſed before, and has loſt the greateſt part of its force.

After 24 hours they are taken out, and left to drain 24 more; they are then put in another ſtronger pit. This done, they are taken out, drained, and put in again, by turns; which begins to diſpoſe them to take oil; and this practice they continue for ſix weeks in ſummer, or three months in winter: at the end whereof they are waſhed out, laid on the wooden leg, and the ſurface of the ſkin on the wool ſide peeled off, to render them the ſofter; then made into parcels, ſteeped a night in the river, in winter more, ſtretched ſix or ſeven over one another on the wooden leg, and the knife paſſed ſtrongly on the fleſh ſide, to take off any thing ſuperfluous, and render the ſkin ſmooth. Then they are ſteeped, as before, in the river, and the ſame operation is repeated on the wool ſide; they are then thrown into a tub of water, with bran in it, which is brewed among the ſkins till the greateſt part ſticks to them, and then ſeparated into diſtinct tubs, till they ſwell, and riſe of themſelves above the water. By this means the remains of the lime are cleared out; they are then wrung out, hung up to dry on ropes, and ſent to the mill, with the quantity of oil neceſſary to ſcour them: the beſt oil is that of ſtock-fiſh. Here they are firſt thrown in bundles

Shamois Shannon.

bundles into the river for 12 hours, then laid in the mill-trough, and fulled without oil till they be well ſoftened; then oiled with the hand, one by one, and thus formed into parcels of four ſkins each; which are milled and dried on cords a ſecond time; then a third; and then oiled again, and dried. This proceſs is repeated as often as neceſſity requires; when done, if there be any moiſture remaining, they are dried in a ſtove, and made up into parcels wrapped up in wool; after ſome time they are opened to the air, but wrapped up again as before, till ſuch time as the oil ſeems to have loſt all its force, which it ordinarily does in 24 hours. The ſkins are then returned from the mill to the chamoiſer to be ſcoured: which is done by putting them in a lixivium of wood-aſhes, working and beating them in it with poles, and leaving them to ſteep till the ley hath had its effect; then they are wrung out, ſteeped in another lixivium, wrung again: and this is repeated till all the greaſe and oil be purged out. When this is done, they are half dried, and paſſed over a ſharp-edged iron inſtrument, placed perpendicular in a block, which opens, ſoftens, and makes them gentle. Laſtly, They are thoroughly dried, and paſſed over the ſame inſtrument again; which finiſhes the preparation, and leaves them in form of ſhammy.

Kid and goat ſkins are ſhamoiſed in the ſame manner as thoſe of ſheep, excepting that the hair is taken off without the uſe of any lime; and that when brought from the mill they undergo a particular preparation called *ramalling*, the moſt delicate and difficult of all the others. It conſiſts in this, that, as ſoon as brought from the mill, they are ſteeped in a fit lixivium, taken out, ſtretched on a round wooden leg, and the hair is ſcraped off with the knife; this makes them ſmooth, and in working to caſt a kind of fine knap. The difficulty is in ſcraping them evenly.

SHANK, or *Shank Painter*, in a ſhip, is a ſhort chain faſtened under the foremaſt ſhrouds by a bolt, to the ſhip's ſides, having at the other end a rope faſtened to it. On this ſhank painter the whole weight of the aft part of the anchor reſts, when it lies by the ſhip's ſide. The rope, by which it is hauled up, is made faſt about a timber head.

Shank, in the manege, that part of a horſe's fore leg which lies between the knee and the fetlock.

SHANKER, or Chancre, in medicine, a malignant ulcer, uſually occaſioned by ſome venereal diſorder. See Medicine, N° 350.

SHANNON, the largeſt river in Ireland, and one of the fineſt in the Britiſh dominions, not only on account of its rolling 200 miles, but alſo of its great depth in moſt places, and the gentleneſs of its current, by which it might be made exceedingly ſerviceable to the improvement of the country, the communication of its inhabitants, and conſequently the promoting of inland trade, through the greateſt part of its long courſe. But the peculiar prerogative of the Shannon is its ſituation, running from north to ſouth, and ſeparating the province of Connaught from Leinſter and Munſter, and of conſequence dividing the greateſt part of Ireland into what lies on the eaſt and that on the weſt of the river; watering in its paſſage the valuable county of Leitrim, the plentiful ſhire of Roſcommon, the fruitful county of Galway, and the pleaſant county of Clare; the ſmall but fine ſhire of Longford, the King's county, and fertile county of Meath in Leinſter, the populous county of Tipperary, the ſpacious ſhire of Limerick, and the rough but pleaſant county of Kerry in Munſter; viſiting 10 counties in its paſſage, and having on its banks the following remarkable places, viz. Leitrim, Jameſtown, Lanesborough, Athlone, Clonfert, Killaloe, and Limerick; at 20 leagues below the latter it ſpreads gradually ſeveral miles in extent, ſo that ſome have conſidered its expanſion as a lake. It at laſt joins its waters to the ſea, being navigable all that way for the largeſt veſſels.

Shan Sha

SHANSCRIT, the language of the Bramins of Hindoſtan. See Philology, Sect. V.

SHARE *of a Plough*, that part which cuts the ground; the extremity forwards being covered with a ſharp pointed iron, called the *point of the ſhare*, and the end of the wood behind the *tail of the ſhare*.

SHARK, in ichthyology. See Squalus.

SHARON, a name common to three cantons of Paleſtine. The firſt lay between Mount Tabor and the ſea of Tiberias; the ſecond between the city of Cæſarea of Paleſtine, and Joppa; and the third lay beyond Jordan. To give an idea of perfect beauty, Iſaiah ſaid, the glory of Lebanon and the beauty of Carmel muſt be joined to the abundance of Sharon, (Iſaiah xxxiii. 9. xxxi. 2.) The plains of Sharon are of vaſt extent; and, when ſurveyed by the Abbé Mariti a few years ago, they were ſown with cucumbers; and he informs us, that ſuch a number is annually produced, as not only to ſupply the whole neighbourhood, but alſo all the coaſts of Cyprus and the city of Damietta. In the middle of the plain, between Arſus and Lydda, riſes a ſmall mountain, upon the ridge of which there is a ſmall village called Sharon, from the name of the ancient city whoſe king was conquered by Joſhua.

SHARP (James), archbiſhop of St Andrew's, was born of a good family in Banffſhire in 1618. He devoted himſelf very early to the church, and was educated for that purpoſe in the Univerſity of Aberdeen. When the ſolemn league and covenant was framed in 1638, the learned men in that ſeminary, and young Sharp in particular, declared themſelves decidedly againſt it. To avoid the inſults and indignities to which he was ſubjected in conſequence of this conduct, he retired to England, where he contracted an acquaintance with ſome of the moſt celebrated divines in that country.

At the commencement of the civil wars he returned to Scotland. During his journey thither, he accidentally met with Lord Oxenford, who was ſo charmed with his converſation, that he invited him to his houſe. While he reſided with that nobleman, he became known to the earl of Rothes, who procured him a profeſſorſhip at St Andrew's. By the intereſt of the earl of Crawford he was ſoon after appointed miniſter of Crail; where he conducted himſelf, it is ſaid, in an exemplary manner.

Sharp had always inclined to the cauſe of royalty, and had for ſome time kept up a correſpondence with his exiled prince. After the death of the protector he began to declare himſelf more openly, and ſeems to have enjoyed a great ſhare of the confidence of Monk, who was at that time planning the reſtoration of Charles II. When that general marched to London, the Preſbyterians ſent Sharp to attend him in order to ſupport their intereſts. At the requeſt of General Monk and the chief Preſbyterians in Scotland, Mr Sharp was ſoon after

Sharp. ter ſent over to the king at Breda to procure from him, if poſſible, the eſtabliſhment of Preſbyterianiſm. On his return, he aſſured his friends that "he had found the king very affectionate to Scotland, and reſolved not to wrong the ſettled government of the church: but he apprehended they were miſtaken who went about to eſtabliſh the Preſbyterian government."

Charles was ſoon after reſtored without any terms. All the laws paſſed in Scotland ſince the year 1633 were repealed; the king and his miniſters reſolved at all hazards to reſtore Prelacy. Mr Sharp, who had been commiſſioned by the Scotch Preſbyterians to manage their intereſts with the king, was prevailed upon to abandon the party; and, as a reward for his compliance, he was made archbiſhop of St Andrew's. This conduct rendered him very odious in Scotland; he was accuſed of treachery and perfidy, and reproached by his old friends as a traitor and a renegado. The abſurd and wanton cruelties which were afterwards committed, and which were imputed in a great meaſure to the archbiſhop, rendered him ſtill more deteſted. Nor is it probable that theſe accuſations were without foundation: the very circumſtance of his having been formerly of the Preſbyterian party would induce him, afterforſaking them, to treat them with ſeverity. Beſides, it is certain, that when after the rout at Pentland hills he received an order from the king to ſtop the executions, he kept it for ſome time before he produced it to council.

There was one Mitchell a preacher, and a deſperate fanatic, who had formed the deſign of taking vengeance for theſe cruelties by aſſaſſinating the archbiſhop. He fired a piſtol at him as he was ſitting in his coach; but the biſhopof Orkney, lifting up his hand at the moment, intercepted the ball. Though this happened in the midſt of Edinburgh, the primate was ſo much deteſted, that nobody ſtopped the aſſaſſin; who, having walked leiſurely home, and thrown off his diſguiſe, returned, and mixed unſuſpected with the crowd. Some years after, the archbiſhop obſerving a man eyeing him with keenneſs, ſuſpected that he was the aſſaſſin, and ordered him to be brought before him. It was Mitchell. Two loaded piſtols were found in his pocket. The primate offered him a pardon if he would confeſs the crime: the man complied: but Sharp, regardleſs of his promiſe, conducted him to the council. The council alſo gave him a ſolemn promiſe of pardon if he would confeſs his guilt, and diſcover his accomplices. They were much diſappointed to hear that only one man was privy to his purpoſe, who was ſince dead. Mitchell was then brought before a court of juſtice, and ordered to make a third confeſſion, which he refuſed. He was impriſoned for ſeveral years, and then tried. His own confeſſion was urged againſt him. It was in vain for him to plead the illegality of that evidence, and to appeal to the promiſe of pardon previouſly given. The council took an oath that they had given no ſuch promiſe; and Mitchell was condemned. Lauderdale, who at that time governed Scotland, would have pardoned him, but the primate inſiſted on his execution; obſerving, that if aſſaſſins were permitted to go unpuniſhed, his life muſt be continually in danger. Mitchell was accordingly executed. Sharp

Sharp had a ſervant, one Carmichael, who by his cruelty had rendered himſelf particularly odious to the zealots. Nine men formed the reſolution of waylaying him in Magus-muir, about three miles from St Andrew's. While they were waiting for this man, the primate himſelf appeared with very few attendants. This they looked upon as a declaration of heaven in their favour; and calling out, "the Lord hasdelivered him intoour hands," they ran up to the carriage. They fired at him without effect; a circumſtance which was afterwards imputed to magic. They then deſpatched him with their ſwords, regardleſs of the tears and entreaties of his daughter, who accompanied him (A).

Thus fell Archbiſhop Sharp, whoſe memory is even at preſent deteſted by the common people of Scotland. His abilities were certainly good, and in the early part of his life he appears with honour and dignity. But his conduct afterwards was too cruel and inſincere to merit approbation. His treatment of Mitchell was mean and vindictive. How far he contributed to the meaſures adopted againſt the Preſbyterians is not certain. They were equally cruel and impolitic; nor did their effects ceaſe with the meaſures themſelves. The unheard-of cruelties exerciſed by the miniſters of Charles II. againſt the adherents of the covenant, raiſed ſuch a flame of enthuſiaſm and bigotry as is not yet entirely extinguiſhed.

Sharp (Dr John), archbiſhop of York, was deſcended from the Sharps of Little Norton, a family of Bradford Dale in Yorkſhire; and was ſon of an eminent tradeſman of Bradford, where he was born in 1644. He was educated at Cambridge, and in 1667 entered into orders. That ſame year he became domeſtic chaplain to Sir Heneage Finch, then attorney general. In 1672 he was collated to the archdeaconry of Berkſhire. In 1675 he was inſtalled a prebendary in the cathedral church of Norwich; and the year following was inſtituted into the rectory of St Bartholomew near the Royal Exchange, London. In 1681 he was, by the intereſt of his patron Sir Heneage Finch, then lord high chancellor of England, made dean of Norwich; but in 1686 was ſuſpended for taking occaſion, in ſome of his ſermons, to vindicate the doctrine of the church of England in oppoſition to Popery. In 1688 he was ſworn chaplain to King James II. being then probably reſtored after his ſuſpenſion; for it is certain that he was chaplain to King Charles II. and attended as a court chaplain

(A) Such is the account given by all the hiſtorians of the murder of Archbiſhop Sharp; and that he fell by the hands of fanatics, whom he perſecuted, is certain. A tradition, however, has been preſerved in different families deſcended from him, which may be mentioned, and is in itſelf certainly not incredible. The primate, it ſeems, who, when miniſter of Crail, was peculiarly ſevere in puniſhing the ſin of fornication, had, in the plenitude of his archiepiſcopal authority, taken notice of a criminal amour carried on between a nobleman high in office and a lady of ſome faſhion who lived within his dioceſe. This interference was in that licentious age deemed very impertinent; and the archbiſhop's deſcendants believe that the proud peer inſtigated the deluded rabble to murder their anceſtor.

Sharp, Shaſter. plain at the coronation of King James II. In 1689 he was declared dean of Canterbury; but never could be perſuaded to fill up any of the vacancies made by the deprived biſhops. Upon the death of Dr Lamplugh, he was promoted to the ſee of York. In 1702 he preached the ſermon at the coronation of Queen Anne; and the ſame year was ſworn of the privy council, and made lord almoner to her majeſty. He died at Bath in 1713; and was interred in the cathedral of York, where a monument is erected to his memory.—His ſermons, which were collected after his death and publiſhed in 7 vols. 8vo, are juſtly admired.

SHARP, in muſic. See INTERVAL.

SHASTER, or BEDANG, the name of a ſacred book, in high eſtimation among the idolaters of Hindoſtan, containing all the dogmas of the religion of the bramins, and all the ceremonies of their worſhip; and ſerving as a commentary on the VEDAM.

The term *Shaſter* denotes "ſcience" or "ſyſtem;" and is applied to other works of aſtronomy and philoſophy, which have no relation to the religion of the Indians. None but the bramins and rajahs of India are allowed to read the Vedam; the prieſts of the Banians, called *ſhuderers*, may read the Shaſter; and the people, in general, are allowed to read only the Paran or Pouran, which is a commentary on the Shaſter.

The Shaſter is divided into three parts: the firſt containing the moral law of the Indians; the ſecond, the rites and ceremonies of their religion; and the third, the diſtribution of the people into tribes or claſſes, with the duties pertaining to each claſs.

The principal precepts of morality contained in the firſt part of the Shaſter are the following: that no animal be killed, becauſe the Indians attribute ſouls to brute animals as well as to mankind; that they neither hear nor ſpeak evil, nor drink wine, nor eat fleſh, nor touch any thing that is unclean; that they obſerve the feaſts, prayers, and waſhings, which their law preſcribes; that they tell no lies, nor be guilty of deceit in trade; that they neither oppreſs nor offer violence to one another; that they celebrate the ſolemn feaſts and faſts, and appropriate certain hours of ordinary ſleep to cultivate a diſpoſition for prayer; and that they do not ſteal or defraud one another.

The ceremonies contained in the ſecond part of the Shaſter are ſuch as theſe: that they waſh often in the rivers, hereby obtaining the pardon of their ſins; that they mark their forehead with red, in token of their relation to the Deity; that they preſent offerings and prayers under certain trees, ſet apart for this purpoſe; that they pray in the temples, make oblations to their pagodas, or idols, ſing hymns, and make proceſſions, &c.; that they make pilgrimages to diſtant rivers, and eſpecially to the Ganges, there to waſh themſelves and make offerings; that they make vows to particular ſaints, according to their reſpective departments; that they render homage to the Deity at the firſt ſight of the ſun; that they pay their reſpect to the ſun and moon, which are the two eyes of the Deity; and that they treat with particular veneration thoſe animals that are deemed more pure than others; as the cow, buffalo, &c.; becauſe the ſouls of men have tranſmigrated into theſe animals.

The third part of the Shaſter records the diſtribution of the people into four claſſes; the firſt being that of the bramins or prieſts, appointed to inſtruct the people; the ſecond, that of the kutteris or nobles, who are the magiſtrates; the third, that of the ſhudderis or merchants; and the fourth, that of the mechanics. Each perſon is required to remain in the claſs in which he was born, and to purſue the occupation aſſigned to him by the Shaſter. According to the bramins, the Shaſter was imparted by God himſelf to Brahma, and by him to the bramins; who communicated the contents of it to the people. Shaſter

Modern writers have given us very different accounts of the antiquity and importance of the Shaſter. Mr Holwell, who had made conſiderable progreſs in the tranſlation of this book, apprehends, that the mythology as well as the coſmogony of the Egyptians, Greeks, and Romans, were borrowed from the doctrines of the bramins, contained in it, even to the copying of their exteriors of worſhip, and the diſtribution of their idols, though groſsly mutilated and adulterated. With reſpect to the Vedam and Shaſter, or ſcriptures of the Gentoos, this writer informs us, that *Vedam*, in the Malabar language, ſignifies the ſame as *Shaſter* in the Shanſcrit; and that the firſt book is followed by the Gentoos of the Malabar and Coromandel coaſts, and alſo of the iſland of Ceylon. The Shaſter is followed by the Gentoos of the provinces of Bengal, and by all the Gentoos of the reſt of India, commonly called *India Proper*, along the courſe of the rivers Ganges and Jumna to the Indus. Both theſe books (he ſays) contain the inſtitutes of their reſpective religion and worſhip, as well as the hiſtory of their ancient rajahs and princes, often couched under allegory and fable. Their antiquity is contended for by the partizans of each; but he thinks, that the ſimilitude of their names, idols, and great part of their worſhip, leaves little room to doubt, nay plainly evinces, that both theſe ſcriptures were originally one. He adds, if we compare the great purity and chaſte manners of the Shaſter with the great abſurdities and impurities of the Vedam, we need not heſitate to pronounce the latter a corruption of the former.

With regard to the high original of theſe ſcriptures, the account of the bramins is as follows: Brahma (that is, "Mighty Spirit"), about 4866 years ago, aſſumed the form of man and the government of Indoſtan. He tranſlated the divine law (deſigned for the reſtoration of mankind, who had offended in a pre-exiſtent ſtate, and who are now in their laſt ſcene of probation, to the dignity from which they were degraded) out of the language of angels into the well known Shanſcrit language, and called his tranſlation the *Chartah Bhade Shaſtah of Birmah*, or *the Six Scriptures of Divine Words of the Mighty Spirit*. He appointed the bramins, deriving their name from him, to preach the word of God; and the doctrines of the Shaſter were accordingly preached in their original purity 1000 years. About this time there was publiſhed a paraphraſe on the Chartah Bhade; and about 500 years afterwards, a ſecond expoſition, called the *Aughtorrah Bhade Shaſta*, or *Eighteen Books of Divine Words*, written in a character compounded of the common Indoſtan and the Shanſcrit. This innovation produced a ſchiſm among the Gentoos; on which occaſion, it is ſaid, thoſe of Coromandel and Malabar formed a ſcripture of their own, which they pretended to be founded on the Chartah Bhade

Shaſter. Bhade of Brahma, and called it *the Vedam of Birmah*, or *Divine Words of the Mighty Spirit*. The original Chartah Bhade was thrown aſide, and at length wholly unknown, except to a few families; who can ſtill read and expound it in the Shanſerit character. With the eſtabliſhment of the Aughtorrah Bhade, and Vedam, which according to the Gentoo account, is 3366 years ago, their polytheiſm commenced; and the principles of religion became ſo obſcure, and their ceremonies ſo numerous, that every head of a family was obliged to keep a bramin as a guide both in faith and practice. Mr Holwell is of opinion, that the Chartah Bhade, or Original Scriptures, are not copied from any other ſyſtem of theology, promulgated to or obtruded upon mankind. The Gentoos do not attribute them to Zoroaſter; and Mr Holwell ſuppoſes, that both Zoroaſter and Pythagoras viſited Indoſtan, not to inſtruct, but to be inſtructed.

From the account of Mr Dow, we learn, that the books which contain the religion and philoſophy of the Hindoos are diſtinguiſhed by the name of *Bedas;* that they are four in number, and, like the ſacred writings of other nations, ſaid to be penned by the Divinity. Beda, he ſays, in the Shanſerit language, literally ſignifies *ſcience;* and theſe books treat not only of religion and moral duties, but of every branch of philoſophic knowledge. The bramins maintain, that the Bedas are the divine laws, which Brimha, at the creation of the world, delivered for the inſtruction of mankind; but they affirm, that their meaning was perverted in the firſt age by the ignorance and wickedneſs of ſome princes, whom they repreſent as evil ſpirits, who then haunted the earth.

The firſt credible account we have of the Bedas is, that about the commencement of the Cal Jug, of which era the year 1768 was the 4886th year, they were written, or rather collected, by a great philoſopher and reputed prophet, called *Beäſs Muni*, or *Leäſs the Inſpired*.

The Hindoos, ſays Mr Dow, are divided into two great religious ſects: the followers of the doctrine of Bedang, which is the original Shaſter, or commentary upon the Bedas; and thoſe who adhere to the principles of the Neadirſen. The original Shaſter is called *Bedang*, and is a commentary upon the Bedas. This book, he ſays, is erroneouſly called in Europe, the *Vedam*. It is aſcribed to Beäſs Muni, and is ſaid to have been reviſed ſome years after by one Serrider Swami, ſince which it has been reckoned ſacred, and not ſubject to any farther alterations.

Almoſt all the Hindoos of the Decan, and thoſe of the Malabar and Coromandel coaſts, are of this ſect. The followers of the Bedang Shaſter do not allow that any phyſical evil exiſts; they maintain that God created all things perfectly good; but that man, being a free agent, may be guilty of moral evil, which may be injurious to himſelf, but can be of no detriment to the general ſyſtem of nature. God, they ſay, being perfectly benevolent, never puniſhed the wicked otherwiſe than by the pain and affliction which are the natural conſequences of evil actions; and hell, therefore, is no other than a conſciouſneſs of evil.

The Neadirſen Shaſter is ſaid to have been written by a philoſopher called *Goutam*, near four thouſand years ago. The bramins, from Mr Dow's account of their ſacred books, appear to believe invariably in the unity, eternity, omniſcience, and omnipotence of God; and the polytheiſm of which they have been accuſed is no more than a ſymbolical worſhip of the divine attributes, which they divide into three claſſes. Under the name of *Brimha*, they worſhip the wiſdom and creative power of God; under the appellation of *Biſhen*, his providential and preſerving quality; and under that of *Shibah*, that attribute which tends to deſtroy. Shaſter.

As few of our readers may have an opportunity of peruſing the Shaſter, we ſhall, by way of ſpecimen ſubjoin a paſſage from it, which, though it contains ſome metaphyſical myſteries concerning the creation, yet diſcovers views of God ſo enlightened that they would not diſgrace more refined nations. The paſſage which we ſhall quote is the firſt chapter of the Shaſter, which is a dialogue between Brimha the Wiſdom of the Divinity, and Narud or Reaſon, who is repreſented as the ſon of Brimha. Narud deſires to be inſtructed by his father; and for that purpoſe puts the following queſtions to him:

"*Narud.* O father! thou firſt of God, thou art ſaid to have created the world, and thy ſon Narud, aſtoniſhed at what he beholds, is deſirous to be inſtructed how all theſe things were made.

"*Brimha.* Be not deceived, my ſon! do not imagine that I was the creator of the world, independent of the Divine Mover, who is the great original eſſence and creator of all things. Look, therefore, only upon me as the inſtrument of the great *will*, and a part of his being, whom he called forth to execute his eternal deſigns.

"*Narud.* What ſhall we think of God?

"*Brimha.* Being immaterial, he is above all conception; being inviſible, he can have no form; but, from what we behold in his works, we may conclude that he is eternal, omnipotent, knowing all things, and preſent everywhere.

"*Narud.* How did God create the world?

"*Brimha.* Affection dwelt with God from all eternity. It was of three different kinds; the creative, the preſerving, and the deſtructive. This firſt is repreſented by Brimha, the ſecond by Biſhen, and the third by Shibah. You, O Narud! are taught to worſhip all the three in various ſhapes and likeneſſes, as the Creator, the Preſerver, and the Deſtroyer. The affection of God then produced power, and power, at a proper conjunction of time and fate, embraced goodneſs and produced matter. The three qualities then acting upon matter, produced the univerſe in the following manner: From the oppoſite actions of the creative and deſtructive quality in matter, ſelf-motion firſt aroſe. Self-motion was of three kinds; the firſt inclining to plaſticity, the ſecond to diſcord, and the third to reſt. The diſcordant actions then produced the Akaſh (a kind of celeſtial element), which inviſible element poſſeſſed the quality of conveying ſound; it produced air, a palpable element; fire, a viſible element; water, a fluid element; and earth, a ſolid element.

"The Akaſh diſperſed itſelf abroad. Air formed the atmoſphere; fire, collecting itſelf, blazed forth in the hoſt of heaven; water roſe to the ſurface of the earth, being forced from beneath by the gravity of the latter element. Thus broke forth the world from the veil of darkneſs, in which it was formerly comprehend-

Shaſter. ed by God. Order roſe over the univerſe. The ſeven heavens were formed, and the ſeven worlds were fixed in their places; there to remain till the great diſſolution, when all things ſhall be abſorbed into God.

"God ſeeing the earth in full bloom, and that vegetation was ſtrong from its ſeeds, called forth for the firſt time intellect, which he endued with various organs and ſhapes, to form a diverſity of animals upon the earth. He endued the animals with five ſenſes; feeling, ſeeing, ſmelling, taſting, and hearing; but to man he gave reflection, to raiſe him above the beaſts of the field.

"The creatures were created male and female, that they might propagate their ſpecies upon the earth. Every herb bore the ſeed of its kind, that the world might be clothed with verdure, and all animals provided with food.

"*Narud.* What doſt thou mean, O father! by Intellect?

"*Brimha.* It is a portion of the *great ſoul* of the univerſe breathed into all creatures, to animate them for a certain time.

"*Narud.* What becomes of it after death?

"*Brimha.* It animates other bodies, or returns, like a drop, into that unbounded ocean from which it firſt aroſe.

"*Narud.* Shall not then the ſouls of good men receive rewards? nor the ſouls of the bad meet with puniſhment?

"*Brimha.* The ſouls of men are diſtinguiſhed from thoſe of other animals; for the firſt are endued with reaſon, and with a conſciouſneſs of right and wrong. If therefore man ſhall adhere to the firſt, as far as his powers ſhall extend, his ſoul, when diſengaged from the body by death, ſhall be abſorbed into the divine eſſence, and ſhall never more reanimate fleſh: But the ſouls of thoſe who do evil are not, at death, diſengaged from all the elements. They are immediately clothed with a body of fire, air, and akaſh, in which they are for a time puniſhed in hell. After the ſeaſon of their grief is over, they reanimate other bodies; but till they ſhall arrive at a ſtate of purity they can never be abſorbed into God.

"*Narud.* What is the nature of that abſorbed ſtate which the ſouls of good men enjoy after death?

"*Brimha.* It is a participation of the divine nature, where all paſſions are utterly unknown, and where conſciouſneſs is loſt in bliſs.

Narud. Thou ſayeſt, O father, that unleſs the ſoul is perfectly pure it cannot be abſorbed into God: now, as the actions of the generality of men are partly good and partly bad, whither are their ſpirits ſent immediately after death?

"*Brimha.* They muſt atone for their crimes in hell, where they muſt remain for a ſpace proportioned to the degree of their iniquities; then they riſe to heaven to be rewarded for a time for their virtues; and from thence they will return to the world to reanimate other bodies.

"*Narud.* What is time?

"*Brimha.* Time exiſted from all eternity with God: but it can only be eſtimated ſince motion was produced, and only be conceived by the mind, from its own conſtant progreſs.

"*Narud.* How long ſhall this world remain?

"*Brimha.* Until the four Jugs ſhall have revolved. Then Rudden (the ſame with *Shibah*, the deſtroying quality of God), with the ten ſpirits of diſſolution, ſhall roll a comet under the moon, that ſhall involve all things in fire, and reduce the world into aſhes. God ſhall then exiſt alone, for matter will be totally annihilated."

Shaw || Sheading.

Thoſe who deſire more information on this ſubject may conſult *Dow's Hiſtory of Indoſtan*, and *Holwell's Intereſting Hiſtorical Events*.

SHAW (Dr Thomas), known to the learned world by his travels to Barbary and the Levant, was born at Kendal in Weſtmorland about the year 1692. He was appointed chaplain to the Engliſh conſul at Algiers, in which ſtation he continued for ſeveral years; and from thence took proper opportunities of travelling into different parts. He returned in 1733; was elected fellow of the Royal Society; and publiſhed the account of his travels at Oxford, folio, 1738. In 1740 he was nominated principal of St Edmond-hall, which he raiſed from a ruinous ſtate by his munificence; and was regius profeſſor of Greek at Oxford until his death, which happened in 1751. Dr Clayton, Bp. of Clogher, having attacked theſe Travels in his Deſcription of the Eaſt, Dr Shaw publiſhed a ſupplement by way of vindication, which is incorporated into the ſecond edition of his Travels, prepared by himſelf, and publiſhed in 4to, 1757.

SHAWLS, are woollen handkerchiefs, an ell wide, and near two long. The wool is ſo fine and ſilky, that the whole handkerchief may be contained in the two hands cloſed. It is the produce of a Tibet ſheep; but ſome ſay that no wool is employed but that of lambs torn from the belly of their mother before the time of birth. The moſt beautiful ſhawls come from Caſhmire: their price is from 150 livres (about ſix guineas) to 1200 livres (or 50l. ſterling.)

In the Tranſactions of the Society for Encouraging Arts, Manufactures, &c. for the year 1792, we are informed that a ſhawl counterpane, four yards ſquare, manufactured by Mr P. J. Knights of Norwich, was preſented to the Society; and that, upon examination, it appeared to be of greater breadth than any goods of equal fineneſs and texture that had ever before been preſented to the Society, or to their know ledge woven in this country. The ſhawls of Mr Knights' manufacture, it is ſaid, can ſcarcely be diſtinguiſhed from Indian ſhawls, though they can be afforded at one twentieth part of the price. When the ſhawl is 16 quarters ſquare, Mr Knights ſays it may be retailed at 20l.; if it conſiſted of 12 quarters, and embroidered as the former, it will coſt 15l. if plain, with a fringe only, a ſhawl of 16 quarters ſquare may be ſold at 8l. 8s.; if 12 quarters and fringed, at 6l. 6s.

Mr Knights maintains, that his counterpane of four yards ſquare is equal in beauty, and ſuperior in ſtrength, to the Indian counterpanes which are ſold at 200 guineas. The principal conſumption of this cloth is in train-dreſſes for ladies; as likewiſe for long ſcarfs, in imitation of the real Indian ſcarfs, which are ſold from 60l. to 80l. whereas ſcarfs of this fabric are ſold for as many ſhillings, and the ladies ſquare ſhawls in proportion.

SHEADING, a riding, tything, or diviſion, in the Iſle of Man; the whole iſland being divided into ſix ſheadings; in every one of which is a coroner or chief conſtable,

earbill. heep.

conſtable, appointed by the delivery of a rod at the annual convention.

SHEARBILL, the *Rhynchops Nigra* of Linnæus, the *Black Skimmer* of Pennant and Latham, and *Cutwater* of Cateſby. Its bill is much compreſſed; the edges are ſharp; the lower mandible is four inches and a half long; the upper only three; the baſe red; the reſt is black: the forehead, chin, front of the neck, the breaſt, and belly, are white: the head and whole upper part of the body are black: the wings are of the ſame colour: the lower part of the inner webs of the primaries is white: the tail is ſhort, and a little forked; the middle feathers are duſky; the others are white on their ſides; the legs are weak and red: the length is one foot eight inches: the extent is three feet ſeven inches. It inhabits America from New York to Guiana. It ſkims nimbly along the water, with its under mandible juſt beneath the ſurface, feeding on the inſects and ſmall fiſh as it proceeds. It frequents alſo oyſter-banks; its bill being partly like that of the oyſter-catcher, adapted for preying on thoſe ſhell-fiſh.

SHEATHING, in the ſea-language, is the caſing that part of a ſhip which is to be under water with firboard of an inch thick; firſt laying hair and tar mixed together upon the boards, and then nailing them on, in order to prevent worms from eating the ſhip's bottom.—Ships of war are now generally ſheathed with copper: but copper ſheathing is liable to be corroded by the action of ſalt water, and ſomething is ſtill wanting to effect this purpoſe. It is very probable that tar might anſwer very well.

In the Corniſh mines, copper or braſs pumps are often placed in the deepeſt parts, and are conſequently expoſed to the vitriolic or other mineral waters with which ſome of theſe mines abound, and which are known to have a much ſtronger effect on copper than ſea-water. Theſe pumps are generally about ſix feet long, and are ſcrewed together, and made tight by the interpoſition of a ring of lead, and the joinings are afterwards tarred. One of theſe pumps was ſo much corroded as to render it unfit for uſe; but the ſpots of tar, which by accident had dropped on it, preſerved the parts they covered from the action of the water. Theſe projected in ſome places more than a quarter of an inch; and the joints were ſo far defended by the thin coat of tar, that it was as perfect as when it came from the hands of the manufacturer. If tar thus effectually defends copper from theſe acrimonious waters, can there remain a doubt of its preſerving it from the much milder waters of the ſea?

SHEATS, in a ſhip, are ropes bent to the clews of the ſails; ſerving in the lower ſails to haul aft the clews of the ſail; but in topſails they ſerve to haul home the clew of the ſail cloſe to the yard-arm.

SHEEP, in zoology. See Ovis and Wool.

Among the various animals with which Divine Providence has ſtored the world for the uſe of man, none is to be found more innocent, more uſeful, or more valuable, than the ſheep. The ſheep ſupplies us with food and clothing, and finds ample employment for our poor at all times and ſeaſons of the year, whereby a variety of manufactures of woollen cloth is carried on without interruption to domeſtic comfort and loſs to friendly ſociety or injury to health, as is the caſe with many other occupations. Every lock of wool that grows on its back becomes the means of ſupport to ſtaplers, dyers, pickers, ſcourers, ſcriblers, carders, combers, ſpinners, ſpoolers, warpers, queelers, weavers, fullers, tuckers, burlers, ſhearmen, preſſers, clothiers, and packers, who, one after another, tumble and toſs, and twiſt, and bake, and boil, this raw material, till they have each extracted a livelihood out of it; and then comes the merchant, who, in his turn, ſhips it (in its higheſt ſtate of improvement) to all quarters of the globe, from whence he brings back every kind of riches to his country, in return for this valuable commodity which the ſheep affords. Sheep.

Sheep ſerve a wonderful variety of purpoſes.

Beſides this, the uſeful animal, after being deprived of his coat, produces another againſt the next year; and when we are hungry, and kill him for food, he gives us his ſkin to employ the fell-mongers and parchment-makers, who ſupply us with a durable material for ſecuring our eſtates, rights, and poſſeſſions; and if our enemies take the field againſt us, ſupplies us with a powerful inſtrument for rouſing our courage to repel their attacks. When the parchment-maker has taken as much of the ſkin as he can uſe, the glue-maker comes after and picks up every morſel that is left, and therewith ſupplies a material for the carpenter and cabinet-maker, which they cannot do without, and which is eſſentially neceſſary before we can have elegant furniture in our houſes; tables, chairs, looking-glaſſes, and a hundred other articles of convenience: and when the winter nights come on, while we are deprived of the cheering light of the ſun, the ſheep ſupplies us with an artificial mode of light, whereby we preſerve every pleaſure of domeſtic ſociety, and with whoſe aſſiſtance we can continue our work, or write or read, and improve our minds, or enjoy the ſocial mirth of our tables. Another part of the ſlaughtered animal ſupplies us with an ingredient neceſſary for making good common ſoap, a uſeful ſtore for producing cleanlineſs in every family, rich or poor. Neither need the horns be thrown away; for they are converted by the button-makers and turners into a cheap kind of buttons, tips for bows, and many uſeful ornaments. From the very trotters an oil is extracted uſeful for many purpoſes, and they afford good food when baked in an oven.

Even the bones are uſeful alſo; for by a late invention of Dr Higgins, they are found, when reduced to aſhes to be an uſeful and eſſential ingredient in the compoſition of the fineſt artificial ſtone in ornamental work for chimney-pieces, cornices of rooms, houſes, &c. which renders the compoſition more durable by effectually preventing its cracking (A).

If it is objected to the meek inoffenſive creature, that he

(A) Any curious perſon would be much entertained to ſee the manufactory of bone-aſh, now carried on by Mr Monſh of Whitechapel, New Road, wherein the bones of ſheep and cows undergo many ingenious proceſſes. 1. There is a mill to break them; 2. A caldron to extract their oil, marrow, and fat; 3. A reverberatory to heat them red hot; 4. An oven for thoſe bones to moulder to aſhes; 5. A ſtill to collect the fumes of the burnt bones

Sheep. he is expenſive while living, in eating up our graſs, &c. it may be anſwered that it is quite the contrary; for he can feed where every other animal has been before him and grazed all they could find; and that if he takes a little graſs on our downs or in our fields, he amply repays us for every blade of graſs in the richneſs of the manure which he leaves behind him. He protects the hands from the cold wintry blaſt, by providing them with the ſofteſt leather gloves. Every gentleman's library is alſo indebted to him for the neat binding of his books, for the ſheath of his ſword, and for caſes for his inſtruments; in ſhort, not to be tedious in mentioning the various uſes of leather, there is hardly any furniture or utenſil of life but the ſheep contributes to render either more uſeful, convenient, or ornamental.

As the ſheep is ſo valuable an animal, every piece of information concerning the proper method of managing it muſt be of importance. It will not therefore be uſeleſs nor unentertaining to give ſome account of the manner of managing ſheep in Spain, a country famous for producing the beſt wool in the world.

2 Account of the Spaniſh ſheep

In Spain there are two kinds of ſheep: the coarſe-woolled ſheep, which always remain in their native country, and are houſed every night in winter; and the fine-woolled ſheep, which are always in the open air, and travel in the ſummer from the cool mountains of the northern parts of Spain, to feed in winter on the ſouthern warm plains of Andaluſia, Mancha, and Eſtremadura. Of theſe latter, it appears from accurate computations, that there are about five millions (B); and that the wool and fleſh of a flock of 10,000 ſheep produce yearly about 24 reals a-head, or about the value of 12 Engliſh ſixpences, one of which belongs to the owner, three to the king, and the other eight are allowed for the expences of paſture, tythes, ſhepherds, dogs, ſalt, ſhearing, &c. Ten thouſand ſheep form a flock, which is divided into ten tribes, under the management of one perſon, who has abſolute dominion over fifty ſhepherds and fifty dogs.

3 of Segovia,

M. Bourgoanne, a French gentleman, who reſided many years in Spain, and directed his inquiries chiefly to the civil government, trade, and manufactures, of that country, gives the following account of the wandering ſheep of Segovia. "It is (ſays he) in the neighbouring mountains that a part of the wandering ſheep feed during the fine ſeaſon. They leave them in the month of October, paſs over thoſe which ſeparate the two Caſtiles, croſs New Caſtile, and diſperſe themſelves in the plains of Eſtremadura and Andaluſia. For ſome years paſt thoſe of the two Caſtiles, which are within reach of the Sierra-Morena, go thither to paſs the winter; which, in that part of Spain, is more mild; the length of their day's journey is in proportion to the paſture they meet with. They travel in flocks from 1000 to 1200 in number, under the conduct of two ſhepherds; one of whom is called the *Mayoral*, the other the *Zagal*. When arrived at the place of their deſtination, they are diſtributed in the paſtures previouſly aſſigned them. They return in the month of April; and whether it be habit or natural inſtinct that draws them towards the climate, which at this ſeaſon becomes moſt proper for them, the inquietude which they manifeſt might, in caſe of need, ſerve as an almanack to their conductors."

Bourgoanne's Travels, Vol. I. p. 53.

Mr Arthur Young, in that patriotic work which he conducted with great induſtry and judgment, the Annals of Agriculture, gives us a very accurate and intereſting account of the Pyrenean or Catalonian ſheep.

4 of Catalonia. *Annals of Agriculture* Vol VIII. p. 195.

"On the northern ridge, bearing to the weſt, are the paſtures of the Spaniſh flocks. This ridge is not, however, the whole; there are two other mountains, quite in a different ſituation, and the ſheep travel from one to another as the paſturage is ſhort or plentiful. I examined the ſoil of theſe mountain paſtures, and found it in general ſtony; what in the weſt of England would be called a *ſtone braſh*, with ſome mixture of loam, and in a few places a little peaty. The plants are many of them untouched by the ſheep; many ferns, narciſſus, violets, &c. but burnet (*poterium ſanguiſorba*) and the narrow-leaved plantain (*plantago lanceolata*) were eaten, as may be ſuppoſed, cloſe. I looked for trefoils, but found ſcarcely any; it was very apparent that ſoil and peculiarity of herbage had little to do in rendering theſe heights proper for ſheep. In the northern parts of Europe, the tops of mountains half the height of theſe (for we were above ſnow in July) are bogs; all are ſo which I have ſeen in our iſlands, or at leaſt the proportion of dry land is very trifling to that which is extremely wet: Here they are in general very dry. Now a great range of dry land, let the plants be what they may, will in every country ſuit ſheep. The flock is brought every night to one ſpot, which is ſituated at the end of the valley on the river I have mentioned, and near the port or paſſage of Picada: it is a level ſpot ſheltered from all winds. The ſoil is 8 or 9 inches deep of old dung, not at all encloſed: from the freedom from wood all around, it ſeems to be choſen partly for ſafety againſt wolves and bears. Near it is a very large ſtone, or rather rock fallen from the mountain. This the ſhepherds have taken for a ſhelter, and have built a hut againſt it; their beds are ſheep ſkins, and their door ſo ſmall that they crawl in. I ſaw no place for fire; but they have it, ſince they dreſs here the fleſh of their ſheep, and

---

bones into a brown fluid, from whence hartſhorn is made; 6. Furnaces for making parts thereof into Glauber's ſalts; 7. A ſand heat containing twelve jars, for collecting a cryſtallizing vapour into ſal-ammoniac.

(B) In the 16th century the travelling ſheep were eſtimated at ſeven millions: under Philip III. the number was diminiſhed to two millions and a half. Uſtariz, who wrote at the beginning of this century, made it amount to four millions. The general opinion is, that at preſent it does not exceed five millions. If to this number the eight millions of ſtationary ſheep be added, it will make nearly thirteen millions of animals, all managed contrary to the true intereſts of Spain, for the advantage of a few individuals. For the proprietors of ſtationary flocks alſo have privileges which greatly reſemble thoſe of the members of the Meſta. According to Arriquebar, Spain contains eight millions of fine-woolled ſheep, ten millions of coarſe-woolled, and five hundred thouſand bulls, oxen, and cows.

Sheep. and in the night ſometimes keep off the bears, by whirling fire-brands: four of them belonging to the flock mentioned above lie here. I viewed their flock very carefully, and by means of our guide and interpreter, made ſome inquiries of the ſhepherds, which they anſwered readily, and very civilly. A Spaniard at Venaſque, a city in the Pyrenees, gives 600 livres French (the livre is 10½d. Engliſh) a-year for the paſturage of this flock of 2000 ſheep. In the winter he ſends them into the lower parts of Catalonia, a journey of 12 or 13 days, and when the ſnow is melted in the ſpring, they are conducted back again. They are the whole year kept in motion, and moving from ſpot to ſpot, which is owing to the great range they everywhere have of paſture. They are always in the open air, never houſed or under cover, and never taſte of any food but what they can find on the hills.

"Four ſhepherds, and from four to ſix large Spaniſh dogs, have the care of this flock: the latter are in France called of the *Pyrenees breed*; they are black and white, of the ſize of a large wolf, a large head and neck, armed with collars ſtuck with iron ſpikes. No wolf can ſtand againſt them; but bears are more potent adverſaries: if a bear can reach a tree, he is ſafe; he riſes on his hind legs, with his back to the tree, and ſets the dogs at defiance. In the night the ſhepherds rely entirely on their dogs; but on hearing them bark are ready with fire arms, as the dogs rarely bark if a bear is not at hand. I was ſurpriſed to find that they are fed only with bread and milk. The head ſhepherd is paid 120 livres a-year wages and bread; the others 80 livres and bread. But they are allowed to keep goats, of which they have many which they milk every day. Their food is milk and bread, except the fleſh of ſuch ſheep or lambs as accidents give them. The head ſhepherd keeps on the mountain top, or an elevated ſpot, from whence he can the better ſee around while the flock traverſes the declivities. In doing this the ſheep are expoſed to great danger in places that are ſtony; for by walking among the rocks, and eſpecially the goats, they move the ſtones, which, rolling down the hills, acquire an accelerated force enough to knock a man down, and ſheep are often killed by them; yet we ſaw how alert they were to avoid ſuch ſtones, and cautiouſly on their guard againſt them. I examined the ſheep attentively. They are in general polled, but ſome have horns; which in the rams turn backwards behind the ears and project half a circle forward; the ewes horns turn alſo behind the ears, but do not project: the legs white or reddiſh; ſpeckled faces, ſome white, ſome reddiſh; they would weigh fat, I reckon, on an average, from 15 lb. to 18 lb. a quarter. Some tails ſhort, ſome left long. A few black ſheep among them: ſome with a very little tuft of wool on their foreheads. On the whole they reſemble thoſe on the South Downs; their legs are as ſhort as thoſe of that breed; a point which merits obſervation, as they travel ſo much and ſo well. Their ſhape is very good; round ribs and flat ſtraight backs; and would with us be reckoned handſome ſheep; all in good order and fleſh. In order to be ſtill better acquainted with them, I deſired one of the ſhepherds to catch a ram for me to feel, and examine the wool, which I found very thick and good of the carding ſort, as may be ſuppoſed. I took a ſpecimen of it, and alſo of a hoggit, or lamb of laſt year. In regard to the mellow ſoftneſs under the ſkin, which, in Mr Bakewell's opinion, is a ſtrong indication of a good breed, with a diſpoſition to fatten, he had it in a much ſuperior degree to many of our Engliſh breeds, to the full as much ſo as the South Downs, which are for that point the beſt ſhort-woolled ſheep which I know in England. The fleece was on his back, and weighed, as I gueſſed, about 8 lb. Engliſh; but the average, they ſay, of the flock is from four to five, as I calculated by reducing the Catalonian pound of 12 oz. to ours of 16, and is all ſold to the French at 30s. the lb. French. This ram had the wool of the back part of his neck tied cloſe, and the upper tuft tied a ſecond knot by way of ornament; nor do they ever ſhear this part of the fleece for that reaſon: we ſaw ſeveral in the flock with this ſpecies of decoration. They ſaid that this ram would ſell in Catalonia for 20 livres. A circumſtance which cannot be too much commended, and deſerves univerſal imitation, is the extreme docility they accuſtom them to. When I deſired the ſhepherd to catch one of his rams, I ſuppoſed he would do it with his crook, or probably not be able to do it at all; but he walked into the flock, and ſingling out a ram and a goat, bid them follow him, which they did immediately; and he talked to them while they were obeying him, holding out his hand as if to give them ſomething. By this method he brought me the ram, which I caught, and held without difficulty."

What ſheep produce the beſt wool. 5

The beſt ſort of ſheep for fine wool are thoſe bred in Herefordſhire, Devonſhire, and Worceſterſhire; but they are ſmall, and black-faced, and bear but a ſmall quantity. Warwick, Leiceſterſhire, Buckingham, and Northamptonſhire, breed a large-boned ſheep, of the beſt ſhape and deepeſt wool we have. The marſhes of Lincolnſhire breed a very large kind of ſheep, but their wool is not good, unleſs the breed be mended by bringing in ſheep of other counties among them, which is a ſcheme of late very profitably followed there. In this county, it is no uncommon thing to give fifty guineas for a ram, and a guinea for the admiſſion of a ewe to one of theſe valuable males, or twenty guineas for the uſe of it for a certain number of ewes during one ſeaſon. Suffolk alſo breeds a very valuable kind of ſheep. The northern counties in general breed ſheep with long but hairy wool: however, the wool which is taken from the neck and ſhoulders of the Yorkſhire ſheep is uſed for mixing with Spaniſh wool in ſome of their fineſt cloths.

Wales bears a ſmall hardy kind of ſheep, which has the beſt taſted fleſh, but the worſt wool of all. Nevertheleſs it is of more extenſive uſe than the fineſt Segovian fleeces; for the benefit of the flannel manufacture is univerſally known. The ſheep of Ireland vary like thoſe of Great Britain: thoſe of the ſouth and eaſt being large and their fleſh rank: thoſe of the north and the mountainous parts ſmall and their fleſh ſweet. The fleeces in the ſame manner differ in degrees of value. Scotland breeds a ſmall kind, and their fleeces are coarſe.

But the new Leiceſterſhire breed is the moſt faſhionable, and of courſe the moſt profitable breed in the iſland. Joſeph Altom of Cliſton, who raiſed himſelf from a plough-boy, was the firſt who diſtinguiſhed himſelf

Sheep. ſelf in the midland counties of England for a ſuperior breed of ſheep. How he improved his breed is not known; but it was cuſtomary for eminent farmers in his time to go to Clifton in ſummer to chooſe and purchaſe ram-lambs, for which they paid two or three guineas. This man was ſucceeded by Mr Bakewell; and it may reaſonably be ſuppoſed that the breed, by means of Altom's ſtock, had paſſed the firſt ſtage of improvement before Mr Bakewell's time. Still, however, it muſt be acknowledged, that the Leiceſterſhire breed of ſheep owes its preſent high ſtate of improvement to the ability and care of Mr Bakewell.

6 Account of Mr Bakewell's breed. *Marſhall's Midland Counties*, Vol. I. p. 382.

"The manner in which Mr Bakewell raiſed his ſheep to the degree of celebrity in which they deſervedly ſtand, is, notwithſtanding the recentneſs of the improvement, and its being done in the day of thouſands now living, a thing in diſpute; even among men high in the profeſſion, and living in the very diſtrict in which the improvement has been carried on!

7 How it is ſuppoſed he improved it.

"Some are of opinion that he effected it by a croſs with the Wiltſhire breed; an improbable idea, as their form altogether contradicts it: others, that the Ryeland breed were uſed for this purpoſe; and with ſome ſhow of probability. If any croſs whatever was uſed, the Ryeland breed, whether we view the form, the ſize, the wool, the fleſh, or the fatting quality, is the moſt probable inſtrument of improvement.

"Theſe ideas, however, are regiſtered merely as matters of opinion. It is more than probable that Mr Bakewell alone is in poſſeſſion of the ſeveral minutiæ of improvement; and the public can only hope that at a proper time the facts may be communicated for the direction of future improvers.

"Whenever this ſhall take place, it will moſt probably come out that no croſs with any alien breed whatever has been uſed; but that the improvement has been effected by ſelecting individuals from kindred breeds; from the ſeveral breeds or varieties of long-woolled ſheep, with which Mr Bakewell was ſurrounded on almoſt every ſide, and by breeding, *inandin* (c), with this ſelection: ſolicitouſly ſeizing the ſuperior accidental varieties produced; aſſociating theſe varieties; and ſtill continuing to ſelect, with judgment, the ſuperior individuals.

8 Deſcription of his ewes and wedders.

"It now remains to give a deſcription of the ſuperior claſs of individuals of this breed, eſpecially ewes and wedders, in full condition, but not immoderately fat. The rams will require to be diſtinguiſhed afterwards.

"The head is long, ſmall, and hornleſs, with ears ſomewhat long, and ſtanding backward, and with the noſe ſhooting forward. The neck thin, and clean toward the head; but taking a conical form; ſtanding low, and enlarging every way at the baſe; the fore-end altogether ſhort. The boſom broad, with the ſhoulders, ribs, and chine extraordinary full. The loin broad, and the back level. The haunches comparatively full towards the hips, but light downwards; being altogether ſmall in proportion to the fore parts. The legs, at preſent, of a moderate length; with the bone extremely fine. The bone throughout remarkably light. The carcaſs, when fully fat, takes a remarkable form; much wider than it is deep, and almoſt as broad as it is long. Full on the ſhoulder, wideſt on the ribs, narrowing with a regular curve towards the tail; approaching the form of the turtle nearer perhaps than any other animal. The pelt is thin, and the tail ſmall. The wool is ſhorter than long wools in general, but much longer than the middle wools; the ordinary length of ſtaple five to ſeven inches, varying much in fineneſs and weight."

9 Fatten remarkably well.

This breed ſurpaſſes every other in beauty of form; they are full and weighty in the fore quarters; and are remarkable for ſmallneſs of bone. Mr Marſhall, who has been of ſo much benefit to agriculture and his country by his publications, informs us, in his Rural Economy of the Midland Counties, that he has ſeen a rib of a ſheep of this breed contraſted with one of a Norfolk ſheep: the diſparity was ſtriking; the latter nearly twice the ſize; while the meat which covered the former was three times the thickneſs: conſequently the proportion of meat to bone was in the one incomparably greater than in the other. Therefore, in this point of view, the improved breed has a decided preference: for ſurely while mankind continue to eat fleſh and throw away bone, the former muſt be, to the conſumer at leaſt, the more valuable.

The criterions of good and bad fleſh while the animal is alive differ in different ſpecies, and are not properly ſettled in the ſame ſpecies. One ſuperior breeder is of opinion, that if the fleſh is not looſe, it is of courſe good; holding, that the fleſh of ſheep is never found in a ſtate of hardneſs, like that of ill-fleſhed cattle: while others make a fourfold diſtinction of the fleſh of ſheep; as looſeneſs, mellowneſs, firmneſs, hardneſs: conſidering the firſt and the laſt equally exceptionable, and the ſecond and third equally deſirable; a happy mixture of the two being deemed the point of perfection.

The fleſh of ſheep, when ſlaughtered, is well known to be of various qualities. Some is compoſed of large coarſe grains, interſperſed with wide empty pores like a ſponge: others, of large grains, with wide pores filled with fat; others, of fine cloſe grains, with ſmaller pores filled with fat: and a fourth, of cloſe grains, without any intermixture of fatneſs.

The fleſh of ſheep, when dreſſed, is equally well known to poſſeſs a variety of qualities: ſome mutton is coarſe, dry, and inſipid; a dry ſponge, affording little or no gravy of any colour. Another ſort is ſomewhat firmer, imparting a light-coloured gravy only. A third plump, ſhort, and palatable; affording a mixture of white and red gravy. A fourth likewiſe plump and well-flavoured, but diſcharging red gravy, and this in various quantities.

It is likewiſe obſervable, that ſome mutton, when dreſſed, appears covered with a thick, tough, parchment-like integument; others with a membrane comparatively fine and flexible. But theſe, and ſome of the other qualities of mutton, may not be wholly owing to breed, but in part to the age and the ſtate of fatneſs at the time of ſlaughter. Examined in this light, whether

(c) *Inandin* is a term uſed in the midland counties of England to expreſs breeding from the ſame family.

Sheep. ther we conſider the degree of fatneſs, or their natural propenſity to a ſtate of fatneſs, even at an early age, the improved breed of Leiceſterſhire ſheep appear with many ſuperior advantages.

The degree of fatneſs to which the individuals of this breed are capable of being raiſed, will perhaps appear incredible to thoſe who have not had an opportunity of being convinced by their own obſervation. "I have ſeen wedders (ſays Mr Marſhall) of only two ſhear (two to three years old) ſo loaded with fat as to be ſcarcely able to make a run; and whoſe fat lay ſo much without the bone, it ſeemed ready to be ſhaken from the ribs on the ſmalleſt agitation.

"It is common for the ſheep of this breed to have ſuch a projection of fat upon the ribs, immediately behind the ſhoulder, that it may be eaſily gathered up in the hand, as the flank of a fat bullock. Hence it has gained, in technical language, the name of the *fore flank*; a point which a modern breeder never fails to touch in judging of the quality of this breed of ſheep.

"What is, perhaps, ſtill more extraordinary, it is not rare for the rams, at leaſt of this breed, to be 'cracked on the back;' that is, to be cloven along the top of the chine, in the manner fat ſheep generally are upon the rump. This mark is conſidered as an evidence of the beſt blood.

"Extraordinary, however, as are theſe appearances while the animals are living, the facts are ſtill more ſtriking after they are ſlaughtered. At Litchfield, in February 1785, I ſaw a fore quarter of mutton, fatted by Mr Princep of Croxall, and which meaſured upon the ribs four inches of fat. It muſt be acknowledged, however, that the Leiceſterſhire breed do not produce ſo much wool as moſt other long wooled ſheep."

As the practice of letting rams by the ſeaſon is now become profitable, it may be uſeful to mention the method of rearing them.

10 "The principal ram breeders ſave annually twenty, thirty, or perhaps forty ram lambs; caſtration being ſeldom applied, in the firſt inſtance, to the produce of a valuable ram: for in the choice of theſe lambs they are led more by blood, or parentage, than by form; on which, at an early age, little dependence can be placed. Their treatment from the time they are weaned, in July or Auguſt, until the time of ſhearing, the firſt week in June, conſiſts in giving them every indulgence of keep, in order to puſh them forward for the ſhow; it being the common practice to let ſuch as are fit to be let the firſt ſeaſon, while they are yet yearlings—provincially 'ſharhogs.'

"Their firſt paſture, after weaning, is pretty generally, I believe, clover that has been mown early, and has got a ſecond time into head; the heads of clover being conſidered as a moſt forcing food of ſheep. After this goes off, turnips, cabbages, colewort, with hay, and (report ſays) with corn. But the uſe of this the breeders ſeverally deny, though collectively they may be liable to the charge.

"Be this as it may, ſomething conſiderable depends on the *art of making up*, not lambs only, but rams of all ages. Fat, like charity, covers a multitude of faults; and beſides, is the beſt evidence of their fatting quality which their owners can produce (*i. e.* their natural propenſity to a ſtate of fatneſs), while in the fatneſs of the ſharhogs is ſeen their degree of inclination to fat at an early age. Sheep.

"Fatting quality being the one thing needful in grazing ſtock, and being found, in ſome conſiderable degree at leaſt, to be hereditary, the fatteſt rams are of courſe the beſt; though other attachments, well or ill placed, as to form or faſhionable points, will perhaps have equal or greater weight in the minds of ſome men, even in this enlightened age. Such ſhearlings as will not make up ſufficiently as to form and fatneſs, are either kept on to another year to give them a fair chance, or are caſtrated, or butchered while ſharhogs."

11 What ſums Mr Bakewell received for letting them. From the firſt letting, about 40 years ago, to the year 1780, the prices kept gradually riſing from fifteen ſhillings to a guinea, and from one to ten. In 1780 Mr Bakewell let ſeveral at ten guineas each; and, what is rather inexplicable, Mr Parkinſon of Quarndon let one the ſame year for twenty five guineas; a price which then aſtoniſhed the whole country.

From that time to 1786 Mr Bakewell's ſtock roſe rapidly from ten to a hundred guineas; and that year he let two thirds of one ram (reſerving one third of the uſual number of ewes to himſelf) to two principal breeders, for a hundred guineas each, the entire ſervices of the ram being rated at three hundred guineas! Mr Bakewell making that year, by letting twenty rams only, more than a thouſand pounds!

Since that time the prices have been ſtill riſing. Four hundred guineas have been repeatedly given. Mr Bakewell, this year (1789) makes, ſays Mr Marſhall, twelve hundred guineas by three rams (brothers, we believe); two thouſand of ſeven; and of his whole letting, full three thouſand guineas!

Beſides this extraordinary ſum made by Mr Bakewell, there are ſix or ſeven other breeders who make from five hundred to a thouſand guineas each. The whole amount of monies produced that year in the Midland Counties, by letting rams of the modern breed for one ſeaſon only, is eſtimated, by thoſe who are adequate to the ſubject, at the almoſt incredible ſum of ten thouſand pounds.

12 The treatment of the rams and choice of the ewes. Rams previous to the ſeaſon are reduced from the cumbrous fat ſtate in which they are ſhown. The uſual time of ſending them out is the middle of September. They are conveyed in carriages of two wheels with ſprings, or hung in ſlings, 20 or 30 miles a-day, ſometimes to the diſtance of 200 or 300 miles. They are not turned looſe among the ewes, but kept apart in a ſmall encloſure, where a couple of ewes only are admitted at once. When the ſeaſon is over every care is taken to make the rams look as fat and handſome as poſſible.

In the choice of ewes the breeder is led by the ſame criterions as in the choice of rams. Breed is the firſt object of conſideration. Excellency, in any ſpecies or variety of live ſtock, cannot be attained with any degree of certainty, let the male be ever ſo excellent, unleſs the females employed likewiſe inherit a large proportion of the genuine blood, be the ſpecies or variety what it may. Hence no prudent man ventures to give the higher prices for the Diſhley rams, unleſs his ewes are deeply tinctured with the Diſhley blood. Next to breed is fleſh, fat, form, and wool.

After the lambs are weaned, the ewes are kept in common feeding places, without any alteration of paſ-

Sheep. ture, previous to their taking the ram. In winter they are kept on graſs, hay, turnips, and cabbages. As the heads of the modern breed are much finer than moſt others, the ewes lamb with leſs difficulty.

The female lambs, on being weaned, are put to good keep, but have not ſuch high indulgence ſhown them as the males, the prevailing practice being to keep them from the ram the firſt autumn.

At weaning time, or previouſly to the admiſſion of the ram, the ewes are culled, to make room for the thaves or ſhearlings, whoſe ſuperior blood and faſhion entitle them to a place in the breeding flock. In the work of culling, the ram-breeder and the mere grazier go by ſomewhat different guides. The grazier's guide is principally age, ſeldom giving his ewes the ram after they are four ſhear. The ram-breeder, on the contrary, goes chiefly by merit; an ewe that has brought him a good ram or two is continued in the flock ſo long as ſhe will breed. There are inſtances of ewes having been prolific to the tenth or twelfth year; but in general the ewes of this breed go off at ſix or ſeven ſhear.

In the practice of ſome of the principal ram-breeders, the culling ewes are never ſuffered to go out of their hands until after they are ſlaughtered, the breeders not only fatting them, but having them butchered, on their premiſes. There are others, however, who ſell them; and ſometimes at extraordinary prices. Three, four, and even ſo high as ten, guineas each have been given for theſe outcaſts.

There are in the flocks of ſeveral breeders ewes that would fetch at auction twenty guineas each. Mr Bakewell is in poſſeſſion of ewes which, if they were now put up to be ſold to the beſt bidder, would, it is eſtimated, fetch no leſs than fifty each, and perhaps, through the preſent ſpirit of contention, much higher prices.

13 Inſtructions for purchaſing ſheep.

The following inſtructions for purchaſing ſheep, we hope, will be acceptable to our country readers.—The farmers ſhould always buy his ſheep from a worſe land than his own, and they ſhould be big-boned, and have a long greaſy wool, curling cloſe and well. Theſe ſheep always breed the fineſt wool, and are alſo the moſt approved of by the butcher for ſale in the market. For the choice of ſheep to breed, the ram muſt be young, and his ſkin of the ſame colour with his wool, for the lambs will be of the ſame colour with his ſkin. He ſhould have a large long body; a broad forehead, round, and well riſing; large eyes; and ſtraight and ſhort noſtrils. The polled ſheep, that is, thoſe which have no horns, are found to be the beſt breeders. The ewe ſhould have a broad back; a large bending neck; ſmall, but ſhort, clean, and nimble legs; and a thick, deep wool covering her all over.

To know whether they be ſound or not, the farmer ſhould examine the wool that none of it be wanting, and ſee that the gums be red, the teeth white and even, and the briſket-ſkin red, the wool firm, the breath ſweet, and the feet not hot. Two years old is the beſt time for beginning to breed; and their firſt lambs ſhould not be kept too long, to weaken them by ſuckling, but be ſold as ſoon as conveniently may be. They will breed advantageouſly till they are ſeven years old. The farmers have a method of knowing the age of a ſheep, as a horſe is known, by the mouth. When a ſheep is one ſhear, as they expreſs it, it has two broad teeth before: when it is two ſhear, it will have four; when three, ſix; and when four, eight. After this their mouths begin to break. Sheep.

The difference of land makes a very great difference in the ſheep. The fat paſtures breed ſtraight tall ſheep, and the barren hills and downs breed ſquare ſhort ones; woods and mountains breed tall and ſlender ſheep; but the beſt of all are thoſe bred upon new-ploughed land and dry grounds. On the contrary, all wet and moiſt lands are bad for ſheep, eſpecially ſuch as are ſubject to be overflowed, and to have ſand and dirt left on them. The ſalt marſhes are, however, an exception to this general rule, for their ſaltneſs makes amends for their moiſture; ſalt, by reaſon of its drying quality, being of great advantage to ſheep.

14 When rams ought to be admitted to the ewes.

As to the time of putting the rams to the ewes, the farmer muſt conſider at what time of the ſpring his graſs will be fit to maintain them and their lambs, and whether he has turnips to do it till the graſs comes; for very often both the ewes and lambs are deſtroyed by the want of food; or if this does not happen, if the lambs are only ſtinted in their growth by it, it is an accident that they never recover. The ewe goes 20 weeks with lamb, and according to this it is eaſy to calculate the proper time. The beſt time for them to yean is in April, unleſs the owner has very forward graſs or turnips, or the ſheep are field ſheep. Where you have not encloſures to keep them in, then it may be proper they ſhould yean in January, that the lambs may be ſtrong by May-day, and be able to follow the dam over the fallows and water-furrows; but then the lambs that come ſo early muſt have a great deal of care taken of them, and ſo indeed ſhould all other lambs at their firſt falling, elſe while they are weak the crows and magpies will pick their eyes out.

When the ſheep are turned into fields of wheat or rye to feed, it muſt not be too rank at firſt, for if it be, it generally throws them into ſcourings. Ewes that are big ſhould be kept but bare, for it is very dangerous to them to be fat at the time of their bringing forth their young. They may be well fed, indeed, like cows, a fortnight beforehand, to put them in heart. Mortimer's Huſbandry, p. 243.

The feeding ſheep with turnips is one great advantage to the farmers. When they are made to eat turnips they ſoon fatten, but there is ſome difficulty in bringing this about. The old ones always refuſe them at firſt, and will ſometimes faſt three or four days, till almoſt famiſhed; but the young lambs fall to at once. The common way, in ſome places, of turning a flock of ſheep at large into a field of turnips, is very diſadvantageous, for they will thus deſtroy as many in a fortnight as would keep them a whole winter. There are three other ways of feeding them on this food, all of which have their ſeveral advantages.

1. The firſt way of feeding ſheep with turnip

The firſt way is to divide the land by hurdles, and allow the ſheep to come upon ſuch a portion only at a time as they can eat in one day, and ſo advance the hurdles farther into the ground daily till all be eaten. This is infinitely better than the former random method; but they never eat them clean even this way, but leave the bottoms and outſides ſcooped in the ground: the people pull up theſe indeed with iron crooks, and lay them before the ſheep again, but they are commonly

ly ſo fouled with the creature's dung and urine, and with the dirt from their feet, that they do not care for them; they eat but little of them, and what they do eat does not nouriſh them like the freſh roots.

The ſecond way is by encloſing the ſheep in hurdles, as in the former; but in this they pull up all the turnips which they ſuppoſe the ſheep can eat in one day, and daily remove the hurdles over the ground whence they have pulled up the turnips: by this means there is no waſte, and leſs expence, for a perſon may in two hours pull up all thoſe turnips; the remaining ſhells of which would have employed three or four labourers a-day to get up with their crooks out of the ground trodden hard by the feet of the ſheep; and the worſt is, that as in the method of pulling up firſt, the turnips are eaten up clean; in this way, by the hook, they are waſted, the ſheep do not eat any great part of them, and when the ground comes to be tilled afterwards for a crop of corn, the fragments of the turnips are ſeen in ſuch quantities on the ſurface, that half the crop at leaſt ſeems to have been waſted.

The third manner is to pull up the turnips and remove them in a cart or waggon to ſome other place, ſpreading them on a freſh place every day; by this method the ſheep will eat them up clean, both root and leaves. The great advantage of this method is, when there is a piece land not far off which wants dung more than that where the turnips grew, which perhaps is alſo too wet for the ſheep in winter, and then the turnips will, by the too great moiſture and dirt of the ſoil, ſometimes ſpoil the ſheep, and give them the rot. Yet ſuch ground will often bring forth more and larger turnips than dry land, and when they are carried off, and eaten by the ſheep on ploughed land, in dry weather, and on green ſward in wet weather, the ſheep will ſucceed much better; and the moiſt ſoil where the turnips grew not being trodden by the ſheep, will be much fitter for a crop of corn than if they had been fed with turnips on it. The expence of hurdles, and the trouble of moving them, are ſaved in this caſe, which will counterbalance at leaſt the expence of pulling the turnips and carrying them to the places where they are to be eaten. They muſt always be carried off for oxen.

The diſeaſes to which ſheep are ſubject are theſe, rot, red-water, foot-rot and hoving, ſcab, dunt, rickets, fly-ſtruck, flux, and burſting. Of each of theſe we ſhall give the beſt deſcription in our power, with the moſt approved remedies.

The *rot*, which is a very pernicious diſeaſe, has of late engaged the attention of ſcientific farmers. But neither its nature nor its cauſe has yet been fully aſcertained. Some valuable and judicious obſervations have, however, been made upon it, which ought to be circulated, as they may perhaps, in many caſes, furniſh an antidote for this malignant diſtemper, or be the means of leading others to ſome more efficacious remedy. Some have ſuppoſed the rot owing to the quick growth of graſs or herbs that grow in wet places. Without premiſing, that all bounteous Providence has given to every animal its peculiar taſte, by which it diſtinguiſhes the food proper for its preſervation and ſupport, ifnot vitiated by fortuitous circumſtances, it ſeems very difficult to diſcover on philoſophical principles why the quick growth of graſs ſhould render it noxious, or why any herb ſhould at one ſeaſon produce fatal effects, by the admiſſion of pure water only into its component parts, which at other times is perfectly innocent, although brought to its utmoſt ſtrength and maturity by the genial influence of the ſun. Beſides, the conſtant practice of moſt farmers in the kingdom, who with the greateſt ſecurity feed their meadows in the ſpring, when the graſs ſhoots quick and is full of juices, militates directly againſt this opinion. Sheep.

Mr Arthur Young, to whom agriculture is much indebted, aſcribes this diſeaſe to moiſture. In confirmation of this opinion, which has been generally adopted, we are informed, in the Bath Society papers *, by a correſpondent, that there was a paddock adjoining to his park which had for ſeveral years cauſed the rot in moſt of the ſheep which were put into it. In 1769 he drained it, and from that time his ſheep were free from this malady. But there are facts which render it doubtful that moiſture is the ſole cauſe. We are told, the dry limed land in Derbyſhire will produce the rot as well as water meadows and ſtagnant marſhes; and that in ſome wet grounds ſheep ſuſtain no injury for many weeks. * Vol. I. Art. xlvi.

20

Without attempting to enumerate other hypotheſes which the ingenious have formed on this ſubject, we ſhall purſue a different method in order to diſcover the cauſe. On different ſheep that die of this diſorder, a great number of inſects called *flukes* (ſee FASCIOLA) are found in the liver. That theſe flukes are the cauſe of the rot, therefore, is evident; but to explain how they come into the liver is not ſo eaſy. It is probable that they are ſwallowed by the ſheep along with their food while in the egg ſtate. The eggs depoſited in the tender germ are conveyed with the food into the ſtomach and inteſtines of the animals, whence they are received into the lacteal veſſels, carried off in the chyle, and paſs into the blood; nor do they meet with any obſtruction until they arrive at the capillary veſſels of the liver. Here, as the blood filtrates through the extreme branches, anſwering to thoſe of the *vena porta* in the human body, the ſecerning veſſels are too minute to admit the impregnated ova, which, adhering to the membrane, produce thoſe animalculæ that feed upon the liver and deſtroy the ſheep. They much reſemble the flat fiſh called plaice, are ſometimes as large as a ſilver two-pence, and are found both in the liver and in the pipe (anſwering to that of the *vena cava*) which conveys the blood from the liver to the heart. Its cauſe,

The common and moſt obvious objection to that opinion is, that this inſect is never found but in the liver, or in ſome parts of the viſcera, of ſheep that are diſeaſed more or leſs; and that they muſt therefore be bred there. But this objection will loſe its force, when we conſider that many inſects undergo ſeveral changes, and exiſt under forms extremely different from each other. Some of them may therefore appear and be well known under one ſhape, and not known to be the ſame under a ſecond or third. The fluke may be the laſt ſtate of ſome aquatic animal which we at preſent very well know under one or other of its previous forms.

If this be admitted, it is eaſy to conceive that ſheep may, on wet ground eſpecially, take multitudes of theſe ova or eggs in with their food; and that the ſtomach and viſcera of the ſheep being a proper *nidus* for them, they of courſe hatch, and appearing in their fluke

Sheep. or laſt ſtate, feed on the liver of the animal, and occaſion this diſorder.

It is a ſingular fact, "that no ewe ever has the rot while ſhe has a lamb by her ſide." The reaſon of this may be, that the impregnated ovum paſſes into the milk, and never arrives at the liver. The rot is fatal to ſheep, hares, and rabbits, and ſometimes to calves; but never infeſts animals of a larger ſize.

21 and moſt approved cures. Miller ſays that parſley is a good remedy for the rot in ſheep. Perhaps a ſtrong decoction of this plant, or the oil extracted from its ſeeds, might be of ſervice. Salt is alſo a uſeful remedy. It ſeems to be an acknowledged fact that ſalt marſhes never produce the rot. Salt indeed is pernicious to moſt inſects. Common ſalt and water expel worms from the human body; and ſea-weed, if laid in a garden, will drive away inſects; but if the ſalt is ſeparated by ſteeping it in the pureſt ſpring-water for a few days, it abounds with animalculæ of various ſpecies.

Liſle, in his book of huſbandry, informs us of a farmer who cured his whole flock of the rot by giving each ſheep a handful of Spaniſh ſalt for five or ſix mornings ſucceſſively. The hint was probably taken from the Spaniards, who frequently give their ſheep ſalt to keep them healthy. On ſome farms perhaps the utmoſt caution cannot always prevent this diſorder. In wet and warm ſeaſons the prudent farmer will remove his ſheep from the lands liable to rot. Thoſe who have it not in their power to do this may give each ſheep a ſpoonful of common ſalt, with the ſame quantity of flour, in a quarter of a pint of water, once or twice a-week. When the rot is recently taken, the ſame remedy given four or five mornings ſucceſſively will in all probability effect a cure. The addition of the flour and water (in the opinion of Mr Price of Saliſbury, to whoſe excellent paper in the Bath Society's Tranſactions we own ourſelves much indebted) will not only abate the pungency of the ſalt, but diſpoſe it to mix with the chyle in a more gentle and efficacious manner.

A farmer of a conſiderable lordſhip in Bohemia viſiting the hot-wells of Cariſbad, related how he preſerved his flock of ſheep from the mortal diſtemper which raged in the wet year 1769, of which ſo many periſhed. His preſervative was very ſimple and very cheap: "He fed them every night, when turned under a ſhed, cover, or ſtables, with haſhed fodder ſtraw; and, by eating it greedily, they all eſcaped."

22 Red-water. "*Red-water* is a diſorder moſt prevalent on wet grounds. I have heard (ſays Mr Arthur Young) that it has ſometimes been cured by tapping, as for a dropſy. This operation is done on one ſide of the belly towards the flank, juſt below the wool.

23 Foot rot. "*The foot-rot* and *hoving*, which is very common on low fenny grounds, is cured by keeping the part clean, and lying at reſt in a dry paſture."

24 Scab. The *ſcab* is a cutaneous diſeaſe owing to an impurity of the blood, and is moſt prevalent in wet lands or in rainy ſeaſons. It is cured by tobacco-water, brimſtone, and alum, boiled together, and then rubbed over the ſheep. If only partial, tar and greaſe may be ſufficient. But the ſimpleſt and moſt efficacious remedy for this diſeaſe was communicated to the Society for the Encouragement of Arts, &c. by Sir Joſeph Banks.

25 Remedy communicated by Sir Joſeph Banks. "Take one pound of quickſilver, half a pound of Venice turpentine, half a pint of oil of turpentine, and four pounds of hogs lard (c). Let them be rubbed in a mortar till the quickſilver is thoroughly incorporated with the other ingredients; for the proper mode of doing which, it may be proper to take the advice, or even the aſſiſtance, of ſome apothecary or other perſon uſed to make ſuch mixtures.

"The method of uſing the ointment is this: Beginning at the head of the ſheep, and proceeding from between the ears along the back to the end of the tail, the wool is to be divided in a furrow till the ſkin can be touched; and as the furrow is made, the finger ſlightly dipped in the ointment is to be drawn along the bottom of it, where it will leave a blue ſtain on the ſkin and adjoining wool: from this furrow ſimilar ones muſt be drawn down the ſhoulders and thighs to the legs, as far as they are woolly; and if the animal is much infected, two more ſhould be drawn along each ſide parallel to that on the back, and one down each ſide between the fore and hind legs.

"Immediately after being dreſſed, it is uſual to turn the ſheep among other ſtock, without any fear of the infection being communicated; and there is ſcarcely an inſtance of a ſheep ſuffering any injury from the application. In a few days the blotches dry up, the itching ceaſes, and the animal is completely cured: it is generally, however, thought proper not to delay the operation beyond Michaelmas.

"The *hippoboſca ovina*, called in Lincolnſhire *ſheep fagg*, an animal well known to all ſhepherds, which lives among the wool, and is hurtful to the thriving of ſheep both by the pain its bite occaſions and the blood it ſucks, is deſtroyed by this application, and the wool is not at all injured. Our wool-buyers purchaſe the fleeces on which the ſtain of the ointment is viſible, rather in preference to others, from an opinion that the uſe of it having preſerved the animal from being vexed either with the ſcab or faggs, the wool is leſs liable to the defects of joints or knots; a fault obſerved to proceed from every ſudden ſtop in the thriving of the animal, either from want of food or from diſeaſe.

"This mode of curing was brought into that part of Lincolnſhire where my property is ſituated about 12 years ago, by Mr Stephenſon of Mareham, and is now ſo generally received, that the ſcab, which uſed to be the terror of the farmers, and which frequently deterred the more careful of them from taking the advantage of paſturing their ſheep in the fertile and extenſive commons with which that diſtrict abounds, is no longer regarded with any apprehenſion: by far the moſt of them have their flock anointed in autumn, when they return from the common, whether they ſhow any ſymptoms of ſcab or not; and having done ſo, conclude them

(c) By ſome unaccountable miſtake the laſt ingredient, the four pounds of hogs lard, is omitted in the receipt publiſhed in the Tranſactions of the Society; a circumſtance that might be productive of bad effects.—The leaf which contained the receipt has ſince been cancelled, and a new one printed.

Sheep. them safe for some time from either giving or receiving infection. There are people who employ themselves in the business, and contract to anoint our large sheep at five shillings a score, ensuring for that price the success of the operation; that is, agreeing, in case many of the sheep break out afresh, to repeat the operation gratis even some months afterwards."

26 The *dunt* is a distemper caused by a bladder of wa-
he dunt, ter gathering in the head. No cure for this has yet been discovered.

27 The *rickets* is a hereditary disease for which no anti-
ickets, dote is known. The first symptom is a kind of light-headedness, which makes the affected sheep appear wilder than usual when the shepherd or any person approaches him. He bounces up suddenly from his lair, and runs to a distance, as though he were pursued by dogs. In the second stage the principal symptom is the sheep rubbing himself against trees, &c. with such fury as to pull off his wool and tear away his flesh. "The distressed animal has now a violent itching in his skin, the effect of a highly inflamed blood; but it does not appear that there is ever any cutaneous eruption or salutary critical discharge. In short, from all circumstances, the fever appears now to be at its height." The last stage of this disease "seems only to be the progress of dissolution, after an unfavourable crisis. The poor animal, is condemned by Nature, appears stupid, walks irregularly (whence probably the name *rickets*), generally lies, and eats little: these symptoms increase in degree till death, which shows a general consumption, as appears upon dissection of the carcass; the juices and even solids having suffered a great dissolution."

In order to discover the seat and nature of this disease, sheep that die of it ought to be dissected. This is said to have been done by one gentlemen, Mr Beal; and he found in the brain or membranes adjoining a maggot about a quarter of an inch long, and of a brownish colour. A few experiments might easily determine this fact.

28 The *fly-struck*, is cured by clipping the wool off as
ly-struck, far as infected, and rubbing the parts dry with lime or wood-ashes; curriers oil will heal the wounds, and prevent their being struck any more; or they may be cured with care without clipping, with oil of turpentine, which will kill all the vermine where it goes; but the former is the surest way.

29 The *flux* is another disease to which sheep are sub-
flux, ject. The best remedy is said to be, to house the sheep immediately when this distemper appears, to keep them very warm, and feed them on dry hay, giving them frequent glisters of warm milk and water. The cause of that distemper is either their feeding on wet lands, or on grass that is become mossy by the lands having been fed many years without being ploughed. When the farmer perceives his sheep-walks to become mossy, or to produce bad grass, he should either plough or manure with hot lime, making kilns either very near or in the sheep walks, because the hotter the lime is put on, the sweeter the grass comes up, and that early in the year.

30 *Bursting*, or as it is called in some places the *blast*, at-
and burst- tacks sheep when driven into fresh grass or young clo-
ing. ver. They overeat themselves, foam at the mouth, swell exceedingly, breathe very quick and short, then jump up, and instantly fall down dead. In this case, the only chance of saving their life is by stabbing them in the maw with an instrument made for the purpose. The instrument is a hollow tube, with a pointed weapon passing through it. A hole is made with the pointed weapon; which is immediately withdrawn, and the hole is kept open by inserting the tube till the wind is discharged. Sheep.

31 Account of the nose-worms which infest sheep. Sheep are infested with worms in their nose called *æstrus oves*, and produced from the egg of a large two-winged fly. The frontal sinuses above the nose in sheep and other animals are the places where these worms live and attain their full growth. These sinuses are always full of a white soft matter, which furnishes these worms with a proper nourishment, and are sufficiently large for their habitation; and when they have here acquired their destined growth, in which they are fit to undergo their changes for the fly-state, they leave their old habitation, and, falling to the earth, bury themselves there; and when these are hatched into flies, the female, when she has been impregnated by the male, knows that the nose of a sheep or other animal is the only place for her to deposite her eggs in order to their coming to maturity. Mr Vallisnieri, to whom the world owes so many discoveries in the insect class, is the first who has given any true account of the origin of these worms. But though their true history had been till that time unknown, the creatures themselves were very early discovered, and many ages since were esteemed great medicines in epilepsies.

The fly produced from this worm has all the time of its life a very lazy disposition, and does not like to make any use either of its legs or wings. Its head and corselet together are about as long as its body, which is composed of five rings, streaked on the back; a pale yellow or brown are there disposed in irregular spots; the belly is of the same colours, but they are there more regularly disposed, for the brown here makes three lines, one in the middle, and one on each side, and all the intermediate spaces are yellow. The wings are nearly of the same length with the body, and are a little inclined in their position, so as to lie upon the body: they do not, however, cover it; but a naked space is left between them. The ailerons or petty wings which are found under each of the wings are of a whitish colour, and perfectly cover the balances, so that they are not to be seen without lifting up these.

The fly will live two months after it is first produced, but will take no nourishment of any kind; and possibly it may be of the same nature with the butterflies, which never take any food during the whole time of their living in that state. Reamur, Hist. Ins. Vol. IV. p. 552, &c.

32 Composition for marking sheep. To find a proper composition for marking sheep is a matter of great importance, as great quantities of wool are every year rendered useless by the pitch and tar with which they are usually marked. The requisite qualities for such a composition are, that it be cheap, that the colour be strong and lasting, so as to bear the changes of weather, and not to injure the wool. Dr Lewis recommends for this purpose melted tallow, with so much charcoal in fine powder stirred into it as is sufficient to make it of a full black colour, and of a thick consistence. This mixture, being applied warm with a marking iron on pieces of flannel, quickly fixed or hardened, bore moderate rubbing, resisted the sun and rain,

and

Sheep || Sheffie d

and yet could be waſhed out freely with ſoap, or ley, or ſtale urine. In order to render it ſtill more durable, and prevent its being rubbed off, with the tallow may be melted an eighth, ſixth, or fourth, of its weight of tar, which will readily waſh out along with it from the wool. Lewis's Com. Phil. Techn. p. 361,

Sheep-Stealing. See Theft.

SHEERING, in the ſea-language. When a ſhip is not ſteered ſteadily, they ſay ſhe ſheers, or goes ſheering; or when, at anchor, ſhe goes in and out by means of the current of the tide, they alſo ſay ſhe ſheers.

SHEERNESS, a fort in Kent, ſeated on the point where the river Medway falls into the Thames. It was built by King Charles II. after the inſult of the Dutch, who burnt the men of war at Chatham. The buildings belonging to it, in which the officers lodge, make a pretty little neat town; and there is alſo a yard and a dock, a chapel and chaplain. Mr Lyons, who ſailed with the Honourable Captain Phipps in his voyage towards the pole, fixed the longitude of Sheerneſs to 0. 48′. E. its latitude 51° 25′.

SHEERS, a name given to an engine uſed to hoiſt or diſplace the lower maſts of a ſhip. The ſheers employed for this purpoſe in the royal navy are compoſed of ſeveral long maſts, whoſe heels reſt upon the ſide of the hulk, and having their heads declining outward from the perpendicular, ſo as to hang over the veſſel whoſe maſts are to be fixed or replaced. The tackles, which extend from the head of the maſt to the ſheer-heads, are intended to pull in the latter toward the maſt-head, particularly when they are charged with the weight of a maſt after it is raiſed out of any ſhip, which is performed by ſtrong tackles depending from the ſheer-heads. The effort of theſe tackles is produced by two capſterns, fixed on the deck for this purpoſe.

In merchant ſhips this machine is compoſed of the maſts or props, erected in the ſame veſſel wherein the maſt is to be planted, or from whence it is to be removed. The lower ends of theſe props reſt on the oppoſite ſides of the deck, and their upper parts are faſtened acroſs, ſo as that a tackle which hangs from the interſection may be almoſt perpendicularly above the ſtation of the maſt to which the mechanical powers are applied. Theſe ſheers are ſecured by ſtays, which extend forward and aft to the oppoſite extremities of the veſſel.

SHEET-Lead. See Plumbery.

Sheet, in ſea language, a rope faſtened to one or both the lower corners of a ſail, to extend and retain it in a particular ſtation. When a ſhip ſails with a lateral wind, the lower corners of the main and fore ſail are faſtened by a tack and a ſheet; the former being to windward, and the latter to leeward; the tack, however, is entirely diffuſed with a ſtern wind, whereas the ſail is never ſpread without the aſſiſtance of one or both of the ſheets. The ſtay ſails and ſtudding-ſails have only one tack and one ſheet each: the ſtay-ſail tacks are always faſtened forward, and the ſheet drawn aft; but the ſtudding-ſail tack draws the under clue of the ſail to the extremity of the boom, whereas the ſheet is employed to extend the inmoſt.

SHEFFIELD, a town in the weſt riding of Yorkſhire, about 162 miles from London, is a large, thriving, populous town on the borders of Derbyſhire; has a fine ſtone bridge over the Don, and another over the Sheaf, and a church built in the reign of Henry I. It had a caſtle built in the reign of Henry III. in which, or elſe in the manor houſe of the Park, Mary Queen of Scots was priſoner 16 or 17 years; but after the death of Charles I. it was, with ſeveral others, by order of parliament demoliſhed. In 1673 an hoſpital was erected here, and endowed with 200l. a year. There is a charity-ſchool for 30 boys, and another for 30 girls. This town has been noted ſeveral hundred years for cutlers and ſmiths manufactures, which were encouraged and advanced by the neighbouring mines of iron, particularly for files and knives, or whittles; for the laſt of which eſpecially it has been a ſtaple for above 300 years; and it is reputed to excel Birmingham in theſe wares, as much as it is ſurpaſſed by it in locks, hinges, nails, and poliſhed ſteel. The firſt mills in England for turning grindſtones were alſo ſet up here. The houſes look black from the continual ſmoke of the forges. Here are 600 maſter cutlers, incorporated by the ſtyle of the *Cutlers of Hallamſhire* (of which this is reckoned the chief town), who employ not leſs than 40,000 perſons in the iron manufactures; and each of the maſters gives a particular ſtamp to his wares. There is a large market on Tueſday for many commodities, but eſpecially for corn, which is bought up here for the whole Weſt Riding, Derbyſhire, and Nottinghamſhire. It has fairs on Tueſday after Trinity-Sunday, and November 28. In the new market place, erected by the duke of Norfolk, the ſhambles are built upon a moſt excellent plan, and ſtrongly enclоſed. There are ſeveral other new good buildings, ſuch as a large and elegant octagon chapel belonging to the hoſpital or almshouſes; likewiſe a good aſſembly-room and theatre. We muſt not omit the large ſteam engine, lately finiſhed, for the purpoſe of poliſhing and grinding the various ſorts of hardware. The pariſh being very large, as well as populous, Mary I. incorporated 12 of the chief inhabitants, and their ſucceſſors for ever, by the ſtyle of the *Twelve Capital Burgeſſes of Sheffield*, empowering them to elect and ordain three prieſts to aſſiſt the vicar, who were to be paid out of certain lands and rents which ſhe gave out of the crown; and ſince this ſettlement two more chapels have been built in two hamlets of this pariſh, which are ſerved by two of the aſſiſtants, while the third, in his turn, helps the vicar in his pariſh church. James I. founded a free grammar ſchool here, and appointed 13 ſchool burgeſſes to manage the revenue, and appoint the maſter and uſher. A new chapel was built lately by the contributions of the people of the town and of the neighbouring nobility and gentry. Water is conveyed by pipes into Sheffield, whoſe inhabitants pay but a moderate rent for it. In the neighbourhood there are ſome mines of alum. The remains of the Roman fortification between this town and Rotheram, which is ſix miles lower down the river, are ſtill viſible; and here is alſo the famous trench of five miles long, by ſome called *Devil's* or *Dane's Bank*, and by others *Kemp Bank* and *Temple's Bank*. W. Long. 1. 29. N. Lat. 53. 20.

Sheffield

Sheffield (John), duke of Buckinghamſhire, an eminent writer of the laſt and preſent century, of great perſonal bravery, and an able miniſter of ſtate, was born about 1650. He loſt his father at nine years of age; and his mother marrying Lord Oſſulſton, the care of his education was left entirely to a governor, who did not greatly improve him in his ſtudies. Finding that he was deficient in many parts

of

Sheffield, Sheffieldia.

of literature, he resolved to devote a certain number of hours every day to his studies; and thereby improved himself to the degree of learning he afterwards attained. Though possessed of a good estate, he did not abandon himself to pleasure and indolence, but entered a volunteer in the second Dutch war; and accordingly was in that famous naval engagement where the duke of York commanded as admiral: on which occasion his lordship behaved so gallantly, that he was appointed commander of the Royal Catharine. He afterward made a campaign in the French service under M. de Turenne. As Tangier was in danger of being taken by the Moors, he offered to head the forces which were sent to defend it: and accordingly was appointed to command them. He was then earl of Mulgrave, and one of the lords of the bedchamber to King Charles II. The Moors retired on the approach of his majesty's forces; and the result of the expedition was the blowing up of Tangier. He continued in several great posts during the short reign of King James II. till that unfortunate prince was dethroned. Lord Mulgrave, though he paid his respects to King William before he was advanced to the throne, yet did not accept of any post in the government till some years after. In the sixth year of William and Mary he was created marquis of Normanby in the county of Lincoln. He was one of the most active and zealous opposers of the bill which took away Sir John Fenwick's life; and exerted the utmost vigour in carrying through the Treason Bill, and the bill for Triennial Parliaments. He enjoyed some considerable posts under King William, and enjoyed much of his favour and confidence. In 1702 he was sworn lord privy-seal; and in the same year was appointed one of the commissioners to treat of an union between England and Scotland. In 1703 he was created duke of Normanby, and soon after duke of Buckinghamshire. In 1711 he was made steward of her majesty's household, and president of the council. During Queen Anne's reign he was but once out of employment; and then he voluntarily resigned, being attached to what were called the *Tory principles*. Her majesty offered to make him lord chancellor; but he declined the office. He was instrumental in the change of the ministry in 1710. A circumstance that reflects the highest honour on him is, the vigour with which he acted in favour of the unhappy Catalans, who afterward were so inhumanly sacrificed. He was survived by only one legitimate son (who died at Rome in 1735); but left several natural children. His worst enemies allow that he lived on very good terms with his last wife, natural daughter to King James II. the late duchess of Buckingham, a lady who always behaved with a dignity suitable to the daughter of a king. He died in 1721. He was admired by the poets of his age; by Dryden, Prior, and Garth. His Essay on Poetry was applauded by Addison, and his Rehearsal is still read with pleasure. His writings were splendidly printed in 1723, in two volumes 4to; and have since been reprinted in 1729, in two vols. 8vo. The first contains his poems on various subjects; the second, his prose works; which consist of historical memoirs, speeches in parliament, characters, dialogues, critical observations, essays, and letters. It may be proper to observe, that the edition of 1729 is castrated; some particulars relating to the Revolution in that of 1723 having given offence.

SHEFFIELDIA, in botany; a genus of plants belonging to the class of pentandria, and to the order of monogynia. The corolla is bell-shaped; the filaments are 10, of which every second is barren. The capsule consists of one cell, which has four valves. There is only one species, the *repens*.

Sheik Shell.

SHEIK, in the oriental customs, the person who has the care of the mosques in Egypt; his duty is the same as that of the imams at Constantinople. There are more or fewer of these to every mosque, according to its size or revenue. One of these is head over the rest, and answers to a parish-priest with us; and has under him, in large mosques, the readers, and people who cry out to go to prayers; but in small mosques the sheik is obliged to do all this himself. In such it is their business to open the mosque, to cry to prayers, and to begin their short devotions at the head of the congregation, who stand rank and file in great order, and make all their motions together. Every Friday the sheik makes a harangue to his congregation.

Sheik-Bellet, the name of an officer in the Oriental nations. In Egypt the sheik-bellet is the head of a city, and is appointed by the pacha. The business of this officer is to take care that no innovations be made which may be prejudicial to the porte, and that they send no orders which may hurt the liberties of the people. But all his authority depends on his credit and interest, not his office: for the government of Egypt is of such a kind, that often the people of the least power by their posts have the greatest influence: and a caia of the janizaries or Arabs, and sometimes one of their meanest officers, and oda-basha, finds means, by his parts and abilities, to govern all things.

SHEILDS. See Shields.

SHEKEL, the name of a weight and coin current among the ancient Jews. Dr Arbuthnot makes the weight of the shekel equal to 9 pennyweights 2¼ grains troy weight; and the value equal to 2s. 3½d. sterling. The golden shekel was worth 1l. 16s. 6d.

SHELDRAKE, in ornithology. See Anas.

SHELF, among miners, the same with what they otherwise call *fast ground* or *fast country*; being that part of the internal structure of the earth which they find lying even and in an orderly manner, and evidently retaining its primitive form and situation.

SHELL, in natural history, a hard, and, as it were, stony covering, with which certain animals are defended, and thence called *shell-fish*.

I

The singular regularity, beauty, and delicacy in the structure of the shells of animals, and the variety and brilliancy in the colouring of many of their, at the same time that they strike the attention of the most incurious observers, have at all times excited philosophers to inquire into and detect, if possible, the causes and manner of their formation. But the attempts of naturalists, ancient and modern, to discover this process, have constantly proved unsuccessful. M. de Reaumur hitherto appears alone to have given a plausible account, at least, of the formation of the shell of the garden-snail in particular, founded on a course of very ingenious experiments, related in the Paris Memoirs*. He there endeavours to show, that this substance is produced merely by the perspirable matter of the animal condensing and afterwards hardening on its surface, and accordingly taking the figure of its body, which has performed the office of a mould to it; in short, that the shell of a snail, and, as he supposed, of all other animals possessed

Formation of shells.

* See *Mem. de l'Acad. année* 1709, p. 475. *Traité de Hollande*, in 12mo.

Shell. ſelled of ſhells, was only the product of a viſcous tranſudation from the body of the animal, containing earthy particles united by mere juxtapoſition. This hypotheſis, however, is liable to very great and unſurmountable difficulties, if we apply it to the formation of ſome of the moſt common ſhells: for how, according to this ſyſtem, it may be aſked, can the oyſter, for inſtance, conſidered ſimply as a mould, form to itſelf a covering ſo much exceeding its own body in dimenſions?

2 Are compoſed of an earthy and an animal ſubſtance.

M. Heriſſant, in the Memoirs of the Academy of Sciences for 1766, has diſcovered the ſtructure of ſhells to be organical. In the numerous experiments that he made on an immenſe number, and a very great varicty, of animal ſhells, he conſtantly found that they were compoſed of two diſtinct ſubſtances; one of which is a cretaceous or earthy matter; and the other appeared, from many experiments made upon it by burning, diſtillation, and otherwiſe, to be evidently of an animal nature. Theſe two ſubſtances he dexterouſly ſeparated from each other by a very eaſy chemical analyſis; by the gentle operation of which they were exhibited diſtinctly to view, without any material alteration from the action of the ſolvent, or inſtrument employed for that purpoſe. On an entire ſhell or a fragment of one, contained in a glaſs veſſel, he poured a ſufficient quantity of the nitrous acid, conſiderably diluted either with water or ſpirit of wine. After the liquor has diſſolved all the earthy part of the ſhell (which may be collected after precipitation by a fixed or volatile alkali), there remains floating in it a ſoft ſubſtance, conſiſting of innumerable membranes of a retiform appearance, and diſpoſed, in different ſhells, in a variety of poſitions, which conſtitutes the animal part of it. This, as it has not been effected by the ſolvent, retains the exact figure of the ſhell; and, on being viewed through a microſcope, exhibits ſatisfactory proofs of a vaſcular and organical ſtructure. He ſhows that this membranous ſubſtance is an appendix to the body of the animal, or a continuation of the tendinous fibres that compoſe the ligaments by which it is fixed to its ſhell; and that this laſt owes its hardneſs to the earthy particles conveyed through the veſſels of the animal, which fix themſelves into, and incruſt, as it were, the meſhes formed by the reticular filaments of which this membranous ſubſtance is compoſed. In the ſhell called *porcelain*, in particular, the delicacy of theſe membranes was ſo great, that he was obliged to put it into ſpirit of wine, to which he had the patience to add a ſingle drop of ſpirit of nitre day by day, for the ſpace of two months; leſt the air generated, or let looſe by the action of the acid on the earthy ſubſtance, ſhould tear the compages of its fine membraneous ſtructure into ſhatters; as it certainly would have done in a more haſty and leſs gentle diſſolution. The delicate reticulated film, left after this operation, had all the tenuity of a ſpider's web; and accordingly he does not attempt to delineate its organization. In other ſhells he employed even five or ſix months in demonſtrating the complicated membraneous ſtructure of this animal ſubſtance by this kind of chemical anatomy. In general, however, the proceſs does not require much time.

3 Their membranous ſtructure produces great variety of colours.

Of the many ſingular configurations and appearances of the membranous part of different ſhells, which are deſcribed in this memoir, and are delineated in ſeveral well executed plates, we ſhall mention only, as a ſpecimen, the curious membraneous ſtructure obſerved in the laminæ of mother-of-pearl, and other ſhells of the ſame kind, after having been expoſed to the operation of the author's ſolvent. Beſide the great variety of fixed or permanent colours with which he found the animal filaments of theſe ſhells to be adorned, it is known, that the ſhell itſelf preſents to the view a ſucceſſion of rich and changeable colours, the production of which he eaſily explains from the configurations of their membranes. Nature, he obſerves, always magnificent in her deſigns, but ſingularly frugal in the execution of them, produces theſe brilliant decorations at a very ſmall expence. The membraneous ſubſtance above mentioned is plaited and rumpled, as it were, in ſuch a manner, that its exterior laminæ, incruſted with their earthy and ſemi-tranſparent matter form an infinite number of little priſms, placed in all kinds of directions, which refract the rays of light, and produce all the changes of colour obſervable in theſe ſhells. Shell.

With reſpect to the figures and colours of ſhells, it is obſerved, that river ſhells have not ſo agreeable or diverſified a colour as the land and ſea ſhells; but the variety in the figure, colours, and other characters of ſea ſhells, is almoſt infinite. The number of diſtinct ſpecies we find in the cabinets of the curious is very great; and doubtleſs the deep bottoms of the ſea, and the ſhores yet unexplored contain multitudes ſtill unknown to us. Even the ſame ſpecies differ in ſome degree in almoſt every individual; ſo that it is rare to find any two ſhells which are alike in all reſpects.

4 Whence the moſt beautiful ſhells are obtained.

This wonderful variety, however, is not all the produce of one ſea or one country; the different parts of the world afford us their different deputies. Bonani obſerves, that the moſt beautiful ſhells we are acquainted with come from the Eaſt Indies and from the Red ſea. This is in ſome degree countenanced by what is found to this day; and from the general obſervations of the curious, it ſeems, that the ſun, by the great heat that it gives to the countries near the line, exalts the colours of the ſhells produced there, and gives them a luſtre and brilliancy that thoſe of colder climates always want: and it may be, that the waters of thoſe vaſt ſeas, which are not ſubject to be weakened by freſh rivers, give a nouriſhment to the fiſh, that may add to the brilliancy of their ſhells.

5 Shells found in Aſia.

The ſhores of Aſia furniſh us with the pearl-oyſters and ſcallops in great perfection. About Amboyna are found the moſt beautiful ſpecimens of the cabbage-ſhell, the arroſair, the ducal mantle, and coral oyſters, or echinated oyſters. Here alſo are found a great variety of extremely beautiful muſcles, tellinæ, and volutæ; ſome fine buccinums, and the ſhell called the *Ethiopian crown*, in its greateſt perfection. The dolia, the murices, and the caſſandræ, are alſo found on theſe coaſts in great beauty. Many elegant ſnail and ſcrew-ſhells are alſo brought from thence; and finally, the ſerapion and ſpider ſhells. The Maldive and Philippine iſlands, Bengal, and the coaſt of Malabar, abound with the moſt elegant of all the ſpecies of ſnails, and furniſh many other kinds of ſhells in great abundance and perfection. China abounds in the fineſt ſpecies of of porcelain ſhells, and has alſo a great variety of beautiful ſnails. Japan furniſhes us with all the thicker and and larger bivalves; and the iſle of Cyprus is famous above all other parts of the world for the beauty and variety of the patella or limpet found there.

America

Shells.

America affords many very elegant ſhells, but neither in ſo great abundance nor beauty as the ſhores of Aſia. Panama is famous for the cylinders or rhombi, and we have beſide, from the ſame place, ſome good porcelains, and a very fine ſpecies of *dolium*, or *concha globoſa*, called from this place the *Panama purple ſhell*. One of the moſt beautiful of the cylinders is alſo known among our naturaliſts under the name of the *Panama ſhell*. About Braſil, and in the gulf of Mexico, there are found murices and dolia of extreme beauty; and alſo a great variety of porcelains, purpuræ, pectens, neritæ, bucardiæ or heart-ſhells, and elegant limpets. The iſle of Cayenne affords one of the moſt beautiful of the buccinum kind, and the Midas ear is found principally about this place. Jamaica and the iſland of Barbadoes have their ſhores covered with porcelains, chamæ, and buccina; and at St Domingo there are found almoſt all the ſame ſpecies of ſhells that we have from the Eaſt Indies; only they are leſs beautiful, and the colours more pale and dead. The pearl-oyſter is found alſo on this coaſt, but ſmaller than in the Perſian gulf. At Martinico there are found in general the ſame ſhells as at St Domingo, but yet leſs beautiful. About Canada are found the violet chamæ, and the lakes of that country abound with muſcles of a very elegant pale blue and pale red colours. Some ſpecies of theſe are remarkably light and thin; others are very thick and heavy. The Great Bank of Newfoundland is very barren in ſhells: the principal kind found there are muſcles of ſeveral ſpecies, ſome of which are of conſiderable beauty. About Carthagena there are many mother-of-pearl ſhells, but they are not of ſo brilliant colours as thoſe of the Perſian gulf. The iſland of Magellan, at the ſouthern point of America, furniſhes us with a very remarkable ſpecies of muſcle called by its name; and ſeveral very elegant ſpecies of limpets are found there, particularly the pyramidal.

6 In America.

7 In Africa.

In Africa, on the coaſt of Guinea, there is a prodigious quantity of that ſmall ſpecies of porcelain which is uſed there as money; and there is another ſpecies of porcelain on the ſame coaſt which is all over white; the women make bracelets of theſe, and the people of the Levant adorn their hair with them. The coaſt of Zanguebar is very rich in ſhells; we find there a vaſt variety of the large porcelains, many of them of great beauty; and the *nux maris* or ſea-nut is very frequent there. Beſide theſe, and many other ſhells, there are found on this coaſt all the ſpecies of nautili, many of which are very beautiful. The Canary iſles abound with a vaſt variety of the murices, and ſome other good ſhells; and we have from Madeira great variety of the echini or ſea-eggs different from thoſe of the European ſeas. Several ſpecies of muſcles are alſo common there, and the auris marina is nowhere more abundant. The Red ſea is beyond all other parts of the world abundant in ſhells, ſcarce any kind is wanting there; but what we principally have from thence are the purpuræ, porcelains, and echini marini.

8 In ſome iſlands of the Mediterranean and the coaſts ſurrounding it.

The Mediterranean and Northern ocean contain a great variety of ſhells, and many of very remarkable elegance and beauty; they are upon the whole, however, greatly inferior to thoſe of the Eaſt Indies. The Mediterranean abounds much more in ſhells than the ocean. The gulf of Tarentum affords great variety of purpuræ, of porcelains, nautili, and elegant oyſters; the coaſts of Naples and Sardinia afford alſo the ſame, and with them a vaſt number of the ſpecies of all the known ſpecies. The iſland of Sicily is famous for a very elegant kind of oyſter which is white all over; pinnæ marinæ and porcelains are alſo found in great plenty there, with tellinæ and chamæ of many ſpecies, and a great variety of other beautiful ſhells. Corſica is famous, beyond all other places, for vaſt quantities of the pinnæ marinæ: and many other very beautiful ſhells are found there. (Liſter, Hiſt. Conchyl.) About Syracuſe are found the gondola ſhell, the alated murex, and a great variety of elegant ſnails, with ſome of the dolia and neritæ. The Adriatic ſea, or gulf of Venice, is leſs furniſhed with ſhells than almoſt any of the ſeas thereabout. Muſcles and oyſters of ſeveral ſpecies are however found there, and ſome of the cordiform or heart-ſhells; there are alſo ſome tellinæ. About Ancona there are found vaſt numbers of the pholades buried in ſtone; and the aures marinæ are particularly frequent about Puzzoli. (*Bonani, Recreat. Ment. et Ocul*).

Shells.

9 On the coaſt of France.

The ports of Marſeilles, Toulon, and Antibes, are full of pinnæ marinæ, muſcles, tellinæ, and chamæ. The coaſts of Bretagne afford great numbers of the conchæ anatiferæ and pouſſepieds; they are found on old rotten boards, on ſea ſubſtances, and among cluſters of ſponges. The other ports of France, as Rochelle, Dunkirk, Breſt, St Maloes, and others, furniſh oyſters excellent for the table, but of the common kind, and of no beauty in their ſhells; great numbers of muſcles are alſo found there; and the common tellinæ, the onion-peel oyſters, the ſolens, and conchæ anatiferæ, are alſo frequent there. At Granville, in Lower Normandy, there are found very beautiful pectens, and ſome of the cordiform or heart-ſhells.

10 Of Britain.

Our own Engliſh coaſts are not the leaſt fruitful in ſhells, tho' they do not produce ſuch elegantly painted ones as the Indies. About Plymouth are found oyſters, muſcles, and ſolens, in great abundance; and there, and on moſt of our other ſhores, are numbers of the aures marinæ and dentalia, with pectens, which are excellent food; and many elegant ſpecies of the chamæ and tellinæ are fiſhed up in the ſea about Scarborough and other places. Ireland affords us great numbers of muſcles, and ſome very elegant ſcallop ſhells in great abundance, and the pholades are frequent on moſt of our ſhores. We have alſo great variety of the buccina and cochleæ, ſome volutæ; and, on the Guernſey coaſt, a peculiarly beautiful ſnail, called thence the *Guernſey ſnail*.

11 Of Spain and Portugal, &c.

The coaſts of Spain and Portugal afford much the ſame ſpecies of ſhells with the Eaſt Indies, but they are of much fainter colours, and greatly inferior in beauty. There are, according to Tavernier and others, ſome rivers in Bavaria in which there are found pearls of a fine water. About Cadiz there are found very large pinnæ marinæ, and ſome fine buccina. The iſles of Majorca and Minorca afford a great variety of extremely elegant ſhells. The pinnæ marinæ are alſo very numerous there, and their ſilk is wrought into gloves, ſtockings, and other things. The Baltic affords a great many beautiful ſpecies, but particularly an orange-coloured pecten, or ſcallop-ſhell, which is not found in any other part of the world.

12 Freſh water ſhells.

The freſh water ſhells are found much more frequently, and in much greater plenty than the ſea-ter kinds; there is ſcarce a pond, a ditch, or a river of freſh water in any part of the world in which there

Shells. are not found vaſt numbers of theſe ſhells with the fiſh living in them. All theſe ſhells are ſmall, and they are of very little beauty, being uſually of a plain grayiſh or browniſh colour. Our ditches afford us chamæ, buccina, neritæ, and ſome patellæ; but the Nile, and ſome other rivers, furniſhed the ancients with a ſpecies of tellina which was large and eatable, and ſo much ſuperior to the common ſea tellina in flavour, that it is commonly known by the name of *tellina regia*, "the royal tellina." We have a ſmall ſpecies of buccinum common in our freſh waters, which is very elegant, and always has its operculum in the manner of the larger buccina; a ſmall kind of muſcle is alſo very common, which is ſo extremely thin and tender, that it can hardly be handled without breaking to pieces. The large freſh water muſcle, commonly called in England the *horſe muſcle*, is too well known to need a deſcription; and the ſize ſufficiently diſtinguiſhes it from all other freſh water ſhells.

In collecting ſhells, it is moſt adviſable, whenever it can be done, to get thoſe which have in them the living animals; becauſe we ſhall thus obtain the natural hiſtory of the animals, and the ſhells themſelves in their natural beauty, and the full glow of their colours. Shells ſhould be alſo procured from the deeper parts of their reſorts, and immediately after ſtorms on the ſea beaches and ſhores; becauſe, by being much expoſed to the ſun, their colours fade, and they are liable to other accidents that injure them. In order to kill the fiſh that inhabits them, Mr Da Coſta adviſes to give them a quick dip in boiling water, and when they are cooled, to lay them in cold water till they are cleaned; and in this operation they ſhould not be touched with aquafortis, or any other acid, nor expoſed to the heat of the fire and ſun.

13 Art of poliſhing ſhells.

The art of poliſhing ſhells arrived but lately at its preſent ſtate of perfection; and as the love of ſea ſhells is become ſo common among us, it may not be diſagreeable to the reader to find ſome inſtructions in executing ſo pleaſing a method of adding to their natural beauty, the rules for which are at preſent ſo little known, though the effect of them be ſo much eſteemed.

Among the immenſe variety of ſhells which we are acquainted with, ſome are taken up out of the ſea, or found on its ſhores in all their perfection and beauty; their colours being all ſpread by nature upon the ſurface, and their natural poliſh ſuperior to any thing that art could give. Where nature is in herſelf thus perfect, it were madneſs to attempt to add any thing to her charms: but in others, where the beauties are latent and covered with a coarſer outer ſkin, art is to be called in; and the outer veil being taken off, all the internal beauties appear.

Among the ſhells which are found naturally poliſhed are the porcelains, or cowries; the caſſanders; the dolia, or conchæ globoſæ, or tuns; ſome buccina, the volutes, and the cylinders, or olives, or, as they are generally though improperly called, the *rhombi*; excepting only two or three, as the tiara, the plumb, and the butter-tub rhombus, where there is an unpromiſing film on the ſurface, hiding a very great ſhare of beauty within. Though the generality of the ſhells of theſe genera are taken out of the ſea in all their beauty, and in their utmoſt natural poliſh, there are ſeveral other genera, in which all or moſt of the ſpecies are taken up naturally rough and foul, and covered with an epidermis, or coarſe outer ſkin, which is in many rough and downy or hairy. Shells. The tellinæ, the muſcles, the cochleæ, and many others, are of this kind. The more nice collectors, as naturaliſts, inſiſt upon having all their ſhells in their native and genuine appearance, as they are found when living at ſea; but the ladies, who make collections, hate the diſagreeable outſides, and will have all ſuch poliſhed. It would be very adviſable, however, for both kinds of collectors to have the ſame ſhells in different ſpecimens both rough and poliſhed: the naturaliſt would by this means, beſides knowing the outſide of the ſhell, be better acquainted with its internal characters than he otherwiſe could be, and the lady would have a pleaſure in comparing the beauties of the ſhell, in its wrought ſtate, to its coarſe appearance as nature gives it. How many elegancies in this part of the creation muſt be wholly loſt to us, if it were not for the aſſiſtance of an art of this kind! Many ſhells in their native ſtate are like rough diamonds; and we can form no juſt idea of their beauties till they have been poliſhed and wrought into form.

Though the art of poliſhing ſhells is a very valuable one, yet it is very dangerous to the ſhells; for without the utmoſt care, the means uſed to poliſh and beautify a ſhell often wholly deſtroy it. When a ſhell is to be poliſhed, the firſt thing to be examined is whether it have naturally a ſmooth ſurface, or be covered with tubercles or prominences.

A ſhell which has a ſmooth ſurface, and a natural dull poliſh, need only be rubbed with the hand, or with a piece of chamoy leather, with ſome tripoli, or fine rotten ſtone, and will become of a perfectly bright and fine poliſh. Emery is not to be uſed on this occaſion, becauſe it wears away too much of the ſhell. This operation requires the hand of an experienced perſon, that knows how ſuperficial the work muſt be, and where he is to ſtop; for in many of theſe ſhells the lines are only on the ſurface, and the wearing away ever ſo little of the ſhell defaces them. A ſhell that is rough, foul, and cruſty, or covered with a tartareous coat, muſt be left a whole day ſteeping in hot water: when it has imbibed a large quantity of this, it is to be rubbed with rough emery on a ſtick, or with a blade of a knife, in order to get off the coat. After this, it may be dipped in diluted aquafortis, ſpirit of ſalt, or any other acid; and after remaining a few moments in it, be again plunged into common water. This will add greatly to the ſpeed of the work. After this it is to be well rubbed with linen cloths, impregnated with common ſoap; and when by theſe ſeveral means it is made perfectly clean, the poliſhing is to be finiſhed with fine emery and a hair-bruſh. If after this the ſhell when dry appears not to have ſo good a poliſh as was deſired, it muſt be rubbed over with a ſolution of gum arabic; and this will add greatly to its gloſs, without doing it the ſmalleſt injury. The gum-water muſt not be too thick, and then it gives no ſenſible coat, only heightening the colours. The white of an egg anſwers this purpoſe alſo very well; but it is ſubject to turn yellow. If the ſhell has an epidermis, which will by no means admit the poliſhing of it, it is to be dipped ſeveral times in diluted aquafortis, that this may be eaten off; and then the ſhell is to be poliſhed in the uſual way with putty, fine emery, or tripoli, on the hair of a fine bruſh. When it is only a pellicle that hides the colours, the ſhells muſt be ſteeped in hot water, and after that the

ſkin

Shells. ſkin worked off by degrees with an old file. This is the caſe with ſeveral of the cylinders, which have not the natural poliſh of the reſt.

When a ſhell is covered with a thick and fatty epidermis, as is the caſe with ſeveral of the muſcles and tellinæ; in this caſe aquafortis will do no ſervice, as it will not touch the ſkin: then a rough bruſh and coarſe emery are to be uſed; and if this does not ſucceed, ſeal-ſkin, or, as the workmen call it, *fiſh-ſkin* and *pumice-ſtone*, are to be employed.

When a ſhell has a thick cruſt, which will not give way to any of theſe means, the only way left is to plunge it ſeveral times into ſtrong aquafortis, till the ſtubborn cruſt is wholly eroded. The limpets, auris marina, the helmet-ſhells, and ſeveral other ſpecies of this kind, muſt have this ſort of management; but as the deſign is to ſhow the hidden beauties under the cruſt, and not to deſtroy the natural beauty and poliſh of the inſide of the ſhell, the aquafortis muſt be uſed in this manner: A long piece of wax muſt be provided, and one end of it made perfectly to cover the whole mouth of the ſhell; the other end will then ſerve as a handle, and the mouth being ſtopped by the wax, the liquor cannot get in to the inſide to ſpoil it; then there muſt be placed on a table a veſſel full of aquafortis, and another full of common water.

The ſhell is to be plunged into the aquafortis; and after remaining a few minutes in it, is to be taken out, and plunged into the common water. The progreſs the aquafortis makes in eroding the ſurface is thus to be carefully obſerved every time it is taken out; the point of the ſhell, and any other tender parts, are to be covered with wax, to prevent the aquafortis from eating them away; and if there be any worm holes, they alſo muſt be ſtopped up with wax, otherwiſe the aquafortis would ſoon eat through in thoſe places. When the repeated dippings into the aquafortis ſhow that the coat is ſufficiently eaten away, then the ſhell is to be wrought carefully with fine emery and a bruſh; and when it is poliſhed as high as can be by this means, it muſt be wiped clean, and rubbed over with gum water or the white of an egg. In this ſort of work the operator muſt always have the caution to wear gloves; otherwiſe the leaſt touch of the aquafortis will burn the fingers, and turn them yellow; and often, if it is not regarded, will eat off the ſkin and the nails.

Theſe are the methods to be uſed with ſhells which require but a moderate quantity of the ſurface to be taken off; but there are others which require to have a larger quantity taken off, and to be uncovered deeper: this is called entirely ſealing a ſhell. This is done by means of a horizontal wheel of lead or tin, impregnated with rough emery; and the ſhell is wrought down in the ſame manner in which ſtones are wrought by the lapidary. Nothing is more difficult, however, than the performing this work with nicety: very often ſhells are cut down too far by it, and wholly ſpoiled; and to avoid this, a coarſe vein muſt be often left ſtanding in ſome place, and taken down afterwards with the file, when the cutting it down at the wheel would have ſpoiled the adjacent parts.

After the ſhell is thus cut down to a proper degree, it is to be poliſhed with fine emery, tripoli, or rotten ſtone, with a wooden wheel turned by the ſame machine as the leaden one, or by the common method of working with the hand with the ſame ingredients. When a ſhell is full of tubercles, or protuberances, which muſt be preſerved, it is then impoſſible to uſe the wheel: and if the common way of dipping into aquafortis be attempted, the tubercles being harder than the reſt of the ſhell, will be eat through before the reſt is ſufficiently ſealed, and the ſhell will be ſpoiled. In this caſe, induſtry and patience are the only means of effecting a poliſh. A camel's-hair pencil muſt be dipped in aquafortis; and with this the intermediate parts of the ſhell muſt be wetted, leaving the protuberances dry: this is to be often repeated; and after a few moments the ſhell is always to be plunged into water to ſtop the eroſion of the acid, which would otherwiſe eat too deep, and deſtroy the beauty of the ſhell. When this has ſufficiently taken off the foulneſs of the ſhell, it is to be poliſhed with emery of the fineſt kind, or with tripoli, by means of a ſmall ſtick, or the common poliſhing ſtone uſed by the goldſmiths may be uſed. Shells.

This is a very tedious and troubleſome thing, eſpecially when the echinated oyſters and murices, and ſome other ſuch ſhells, are to be wrought: and what is worſt of all is, that when all this labour has been employed, the buſineſs is not well done; for there ſtill remain ſeveral places which could not be reached by any inſtrument, ſo that the ſhell muſt neceſſarily be rubbed over with gum water or the white of an egg afterwards, in order to bring out the colours and give a gloſs; in ſome caſes it is even neceſſary to give a coat of varniſh.

14 Some ſhells are ſo much diſguiſed by poliſhing as not to be known; ſuch as

Theſe are the means uſed by artiſts to brighten the colours and add to the beauty of ſhells; and the changes produced by poliſhing in this manner are ſo great, that the ſhell can ſcarcely be known afterwards to be the ſame it was; and hence we hear of new ſhells in the cabinets of collectors, which have no real exiſtence as ſeparate ſpecies, but are ſhells well known, diſguiſed by poliſhing. To caution the reader againſt errors of this kind, it may be proper to add the moſt remarkable ſpecies thus uſually altered.

15 the onyx-ſhell,

The onyx-ſhell or volute, called by us the *purple* or *violet-tip*, which in its natural ſtate is of a ſimple pale brown, when it is wrought ſlightly, or poliſhed with juſt the ſuperficies taken off, is of a fine bright yellow; and when it is eaten away deeper, it appears of a fine milk white, with the lower part bluiſh: it is in this ſtate that it is called the *onyx-ſhell;* and it is preſerved in many cabinets in its rough ſtate, and in its yellow appearance, as different ſpecies of ſhells.

16 violet ſhells,

The *violet ſhell*, ſo common among the curious, is a ſpecies of porcelain, or common cowry, which does not appear in that elegance till it has been poliſhed; and the common auris marina ſhows itſelf in two or three different forms, as it is more or leſs deeply wrought. In its rough ſtate it is duſky and coarſe, of a pale brown on the outſide, and pearly within; when it is eaten down a little way below the ſurface, it ſhows variegations of black and green; and when ſtill farther eroded, it appears of a fine pearly hue within and without.

17 nautilus.

The *nautilus*, when it is poliſhed down, appears all over of a fine pearly colour; but when it is eaten away but to a ſmall depth, it appears of a fine yellowiſh colour with duſky hairs. The burgau, when entirely cleared of its coat, is of the moſt beautiful pearl co-

Shells. lour; but when but ſlightly eroded, it appears of a variegated mixture of green and red; whence it has been called the *parroquet ſhell*. The common helmet ſhell, when wrought, is of the colour of the fineſt agate; and the muſcles, in general, though very plain ſhells in their common appearance, become very beautiful when poliſhed, and ſhow large veins of the moſt elegant colours. The Perſian ſhell, in its natural ſtate, is all over white, and covered with tubercles; but when it has been ground down on a wheel, and poliſhed, it appears of a gray colour, with ſpots and veins of a very bright and highly poliſhed white. The limpets, in general, become very different, when poliſhed, moſt of them ſhowing very elegant colours; among theſe the tortoiſe-ſhell limpet is the principal; it does not appear at all of that colour or tranſparence till it has been wrought.

18 Junquil-chama. That elegant ſpecies of ſhell called the *junquil-chama*, which has deceived ſo many judges of theſe things into an opinion of its being a new ſpecies, is only a white chama with a reticulated ſurface; but when this is poliſhed, it loſes at once its reticular work and its colour, and becomes perfectly ſmooth, and of a fine bright yellow. The violet-coloured chama of New England, when worked down and poliſhed, is of a fine milk white, with a great number of blue veins, diſpoſed like the variegations in agates.

19 The aſſes-ear ſhell. The *aſſes-ear ſhell*, when poliſhed after working it down with the file, becomes extremely gloſſy, and obtains a fine roſe colour all about the mouth. Theſe are ſome of the moſt frequent among an endleſs variety of changes wrought on ſhells by poliſhing: and we find there are many of the very greateſt beauties of this part of the creation which muſt have been loſt but for this method of ſearching deep in the ſubſtance of the ſhell for them.

20 Dutch method of poliſhing ſhells. The Dutch are very fond of ſhells, and are very nice in their manner of working them: they are under no reſtraint, however, in their works; but uſe the moſt violent methods, ſo as often to deſtroy all the beauty of the ſhell. They file them down on all ſides, and often take them to the wheel, when it muſt deſtroy the very characters of the ſpecies. Nor do they ſtop at this: but, determined to have beauty at any rate, they are for improving upon nature, and frequently add ſome lines and colours with a pencil, afterwards covering them with a fine coat of varniſh, ſo that they ſeem the natural lineations of the ſhell: the Dutch cabinets are by theſe means made very beautiful, but they are by no means to be regarded as inſtructors in natural hiſtory. There are ſome artificers of this nation who have a way of covering ſhells all over with a different tinge from that which nature gives them; and the curious are often enticed by theſe tricks to purchaſe them for new ſpecies.

There is another kind of work beſtowed on certain ſpecies of ſhells, particularly the nautilus; namely, the engraving on it lines and circles, and figures of ſtars, and other things. This is too obvious a work of art to ſuffer any one to ſuppoſe it natural. Buonani has figured ſeveral of theſe wrought ſhells at the end of his work; but this was applying his labour to very little purpoſe; the ſhells are ſpoiled as objects of natural hiſtory by it, and the engraving is ſeldom worth any thing.—They are principally done in the Eaſt Indies.

Shells are ſubject to ſeveral imperfections; ſome of which are natural and others accidental. The natural defects are the effect of age, or ſickneſs in the fiſh. The greateſt miſchief happens to ſhells by the fiſh dying in them. The curious in theſe things pretend to be always able to diſtinguiſh a ſhell taken up with the fiſh alive from one found on the ſhores: they call the firſt a *living*, the ſecond a *dead* ſhell; and ſay that the colours are always much fainter in the dead ſhells. When the ſhells have lain long dead on the ſhores, they are ſubject to many injuries, of which the being eaten by ſea worms is not the leaſt: age renders the fineſt ſhells livid or dead in their colours. Shells

21 Imperfections of ſhells natural and accidental.

Beſides the imperfections ariſing from age and ſickneſs in the fiſh, ſhells are ſubject to other deformities, ſuch as morbid cavities, or protuberances, in parts where there ſhould be none. When the ſhell is valuable, theſe faults may be hid, and much added to the beauty of the ſpecimen, without at all injuring it as an object of natural hiſtory, which ſhould always be the great end of collecting theſe things. The cavities may be filled up with maſtic diſſolved in ſpirit of wine, or with iſinglaſs: theſe ſubſtances muſt be either coloured to the tinge of the ſhell, or elſe a pencil dipped in water colours muſt finiſh them up to the reſemblance of the reſt; and then the whole ſhell being rubbed over with gum water, or with the white of an egg, ſcarce any eye can perceive the artifice: the ſame ſubſtances may alſo be uſed to repair the battered edge of a ſhell, provided the pieces chipped off be not too large. And when the excreſcences of a ſhell are faulty, they are to be taken down with a fine file. If the lip of a ſhell be ſo battered that it will not admit of repairing by any cement, the whole muſt be filed down or ground on the wheel till it become even.

Foſſil SHELLS. Thoſe found buried at great depths in the earth.

Of theſe ſome are found remaining almoſt entirely in their native ſtate, but others are variouſly altered by being impregnated with particles of ſtone and of other foſſils; in the place of others there is found mere ſtone or ſpar, or ſome other native mineral body, expreſſing all the lineaments in the moſt exact manner, as having been formed wholly from them, the ſhell having been firſt depoſited in ſome ſolid matrix, and thence diſſolved by very ſlow degrees, and this matter left in its place, on the cavities of ſtone and other ſolid ſubſtances, out of which ſhells had been diſſolved and waſhed away, being afterwards filled up leſs ſlowly with theſe different ſubſtances, whether ſpar or whatever elſe: theſe ſubſtances, ſo filling the cavities, can neceſſarily be of no other form than that of the ſhell, to the abſence of which the cavity was owing, though all the nicer lineaments may not be ſo exactly expreſſed. Beſides theſe, we have alſo in many places maſſes of ſtone formed within various ſhells; and theſe having been received into the cavities of the ſhells while they were perfectly fluid, and having therefore nicely filled all their cavities, muſt retain the perfect figures of the internal part of the ſhell, when the ſhell itſelf ſhould be worn away or periſhed from their outſide. The various ſpecies we find of theſe are, in many genera, as numerous as the known recent ones; and as we have in our own iſland not only the ſhells of our own ſhores, but thoſe of many other very diſtant ones, ſo we have alſo

Shell. also many ſpecies, and thoſe in great numbers, which are in their recent ſtate, the inhabitants of other yet unknown or unſearched ſeas and ſhores. The cockles, muſcles, oyſters, and the other common bivalves of our own ſeas, are very abundant: but we have alſo an amazing number of the nautilus kind, particularly of the nautilus græcorum, which though a ſhell not found living in our own or any neighbouring ſeas, yet is found buried in all our clay-pits about London and elſewhere; and the moſt frequent of all foſſil ſhells in ſome of our countries are the conchæ anomiæ, which yet we know not of in any part of the world in their recent ſtate. Of this ſort alſo are the cornua ammonis and the gryphitæ, with ſeveral of the echinitæ and others.

The exact ſimilitude of the known ſhells, recent and foſſil, in their ſeveral kinds, will by no means ſuffer us to believe that theſe, though not yet known to us in their living ſtate, are, as ſome have idly thought, a ſort of *luſus naturæ*. It is certain, that of the many known ſhores, very few, not even thoſe of our own iſland, have been yet carefully ſearched for the ſhell-fiſh that inhabit them; and as we ſee in the nautilus græcorum an inſtance of ſhells being brought from very diſtant parts of the world to be buried here, we cannot wonder that yet unknown ſhores, or the unknown bottoms of deep ſeas, ſhould have furniſhed us with many unknown ſhell-fiſh, which may have been brought with the reſt; whether that were at the time of the general deluge, or the effect of any other cataſtrophe of a like kind, or by whatever other means, to be left in the yet unhardened matter of our ſtony and clayey ſtrata.

Shells, in gunnery, are hollow iron balls to throw out of mortars or howitzers, with a fuſe-hole of about an inch diameter, to load them with powder, and to receive the fuſe. The bottom, or part oppoſite to the fuſe, is made thicker than the reſt, that the fuſe may fall uppermoſt. But in ſmall elevations this does not always happen, nor indeed is it neceſſary; for, let the ſhell fall as it will, the fuſe ſets fire to the powder within, which burſts the ſhell, and cauſes great devaſtation. The ſhells had much better be of an equal thickneſs; for then they burſt into more pieces.

Meſſage Shells, are nothing more than howitz-ſhells, in the inſide of which a letter or other papers are put; the fuſe hole is ſtopped up with wood or cork, and the ſhells are fired out of a royal or howitz, either into a garriſon or camp. It is ſuppoſed, that the perſon to whom the letter is ſent knows the time, and accordingly appoints a guard to look out for its arrival.

Shell-Fiſh. Theſe animals are in general oviparous, very few inſtances having been found of ſuch as are viviparous. Among the oviparous kinds, anatomiſts have found that ſome ſpecies are of different ſexes, in the different individuals of the ſame ſpecies; but others are hermaphrodites, every one being in itſelf both male and female. In both caſes their increaſe is very numerous, and ſcarce inferior to that of plants, or of the moſt fruitful of the inſect claſs. The eggs are very ſmall, and are hung together in a ſort of cluſters by means of a glutinous humour, which is always placed about them, and is of the nature of the gelly of frog's ſpawn. By means of this, they are not only kept together in the parcel, but the whole cluſter is faſtened to the rocks, ſhells, or other ſolid ſubſtances; and thus they are preſerved from being driven on ſhore by the waves, and left where they cannot ſucceed. See Testacea.

Shell-Gold. See Gold.

Sheltie || Shenſtone. SHELTIE, a ſmall but ſtrong kind of horſe, ſo called from Shetland, or Zetland, where they are produced.

SHELVES, in ſea language, a general name given to any dangerous ſhallows, ſand banks, or rocks, lying immediately under the ſurface of the water, ſo as to intercept any ſhip in her paſſage, and endanger her deſtruction.

SHENAN. See *Dyeing of Leather*, Vol. IX. p. 750, foot note.

SHENSTONE (William), an admired Engliſh poet, the eldeſt ſon of a plain country gentleman, who farmed his own eſtate in Shropſhire, was born in November 1714. He learned to read of an old dame, whom his poem of the "School-miſtreſs" has delivered to poſterity; and ſoon received ſuch delight from books, that he was always calling for new entertainment, and expected that, when any of the family went to market, a new book ſhould be brought him, which, when it came, was in fondneſs carried to bed, and laid by him. It is ſaid, that when his requeſt had been neglected, his mother wrapped up a piece of wood of the ſame form, and pacified him for the night. As he grew older, he went for a while to the grammar ſchool in Hales Owen, and was placed afterwards with Mr Crumpton, an eminent ſchoolmaſter at Solihul, where he diſtinguiſhed himſelf by the quickneſs of his progreſs. When he was young (June 1724), he was deprived of his father; and ſoon after (Auguſt 1726) of his grandfather; and was, with his brother, who died afterwards unmarried, left to the care of his grandmother, who managed the eſtate. From ſchool he was ſent, in 1732, to Pembroke college in Oxford, a ſociety which for half a century has been eminent for Engliſh poetry and elegant literature. Here it appears that he found delight and advantage; for he continued his name there ten years, though he took no degree. After the firſt four years he put on the civilian's gown, but without ſhowing any intention to engage in the profeſſion. About the time when he went to Oxford, the death of his grandmother devolved his affairs to the care of the reverend Mr Dolman, of Brome, in Staffordſhire, whoſe attention he always mentioned with gratitude. —At Oxford he applied to Engliſh poetry; and, in 1737, publiſhed a ſmall Miſcellany, without his name. He then for a time wandered about, to acquaint himſelf with life, and was ſometimes at London, ſometimes at Bath, or any place of public reſort; but he did not forget his poetry. He publiſhed, in 1740, his "Judgment of Hercules," addreſſed to Mr Lyttleton, whoſe intereſt he ſupported with great warmth at an election; this was two years afterwards followed by the "School-miſtreſs." Mr Dolman, to whoſe care he was indebted for his eaſe and leiſure, died in 1745, and the care of his fortune now fell upon himſelf. He tried to eſcape it a while, and lived at his houſe with his tenants, who were diſtantly related; but, finding that imperfect poſſeſſion inconvenient, he took the whole eſtate into his own hands, an event which rather improved its beauty than increaſed its produce. Now began his delight in rural pleaſures, and his paſſion of rural elegance; but in time his expences occaſioned

Shenſtone
Sherbet.

occaſioned clamours that overpowered the lamb's bleat and the linnet's ſong, and his groves were haunted by beings very different from fawns and fairies. He ſpent his eſtate in adorning it, and his death was probably haſtened by his anxieties. He was a lamp that ſpent its oil in blazing. It is ſaid, that if he had lived a little longer, he would have been aſſiſted by a penſion; ſuch bounty could not have been more properly beſtowed, but that it was ever aſked is not certain; it is too certain that it was never enjoyed.—He died at the Leaſowes, of a putrid fever, about five on Friday morning, Feb. 11. 1763; and was buried by the ſide of his brother, in the churchyard of Hales-Owen.

In his private opinions, our author adhered to no particular ſect, and hated all religious diſputes. Tenderneſs, in every ſenſe of the word, was his peculiar characteriſtic; and his friends, domeſtics, and poor neighbours, daily experienced the effects of his benevolence. This virtue he carried to an exceſs that ſeemed to border upon weakneſs; yet if any of his friends treated him ungenerouſly, he was not eaſily reconciled. On ſuch occaſions, however, he uſed to ſay, "I never will be a revengeful enemy: but I cannot, it is not in my nature, to be half a friend." He was no economiſt; for the generoſity of his temper prevented his paying a proper regard to the uſe of money: he exceeded therefore the bounds of his paternal fortune. But, if we conſider the perfect paradiſe into which he had converted his eſtate, the hoſpitality with which he lived, his charities to the indigent, and all out of an eſtate that did not exceed 300l. a-year, one ſhould rather wonder that he left any thing behind him, than blame his want of economy: he yet left more than ſufficient to pay all his debts, and by his will appropriated his whole eſtate to that purpoſe. Though he had a high opinion of many of the fair ſex, he forbore to marry. A paſſion he entertained in his youth was with difficulty ſurmounted. The lady was the ſubject of that admirable paſtoral, in four parts, which has been ſo univerſally and ſo juſtly admired, and which, one would have thought, muſt have ſoftened the proudeſt and moſt obdurate heart. His works have been publiſhed by Mr Dodſley, in 3 vols. 8vo. The firſt volume contains his poetical works, which are particularly diſtinguiſhed by an amiable elegance and beautiful ſimplicity; the ſecond volume contains his proſe works; the third his letters, &c. *Biographical Dictionary.*

SHEPPEY, an iſland at the mouth of the river Medway, about 20 miles in circumference. It is ſeparated from the main land by a narrow channel, and has a fertile ſoil, which feeds great flocks of ſheep. The borough-town of Queenborough is ſeated thereon; beſides which it has ſeveral villages.

SHERARDIA, in botany: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The calyx is ſmall, quadridentate; the corolla monopetalous, long, and funnel-ſhaped. The two ſeeds are naked, and crowned with the calyx. There are three ſpecies, viz. 1. Arvenſis; 2. Muralis; 3. Fruticoſa.

SHERBET, or SHERBIT, a compound drink, firſt brought into England from Turkey and Perſia, conſiſting of water, lemon-juice, and ſugar, in which are diſſolved perfumed cakes made of excellent Damaſcus fruit, containing an infuſion of ſome drops of roſe water. Another kind of it is made of violets, honey, juice of raiſins, &c.

Sheridan.

SHERIDAN (Thomas), D.D. the intimate friend of Dean Swift, is ſaid by Shield, in Cibber's "Lives of the Poets," to have been born about 1684, in the county of Cavan, where, according to the ſame authority, his parents lived in no very elevated ſtate. They are deſcribed as being unable to afford their ſon the advantages of a liberal education; but he, being obſerved to give early indications of genius, attracted the notice of a friend to his family, who ſent him to the college of Dublin, and contributed towards his ſupport while he remained there. He afterwards entered into orders, and ſet up a ſchool in Dublin, which long maintained a very high degree of reputation, as well for the attention beſtowed on the morals of the ſcholars as for their proficiency in literature. So great was the eſtimation in which this ſeminary was held, that it is aſſerted to have produced in ſome years the ſum of 1000l. It does not appear that he had any conſiderable preferment; but his intimacy with Swift, in 1725, procured for him a living in the ſouth of Ireland worth about 150l. a-year, which he went to take poſſeſſion of, and, by an act of inadvertence, deſtroyed all his future expectations of riſing in the church; for being at Corke on the 1ſt of Auguſt, the anniverſary of King George's birth-day, he preached a ſermon, which had for its text, "Sufficient for the day is the evil thereof." On this being known, he was ſtruck out of the liſt of chaplains to the lord lieutenant, and forbidden the caſtle.

This living Dr Sheridan afterwards changed for that of Dunboyne, which, by the knavery of the farmers, and power of the gentlemen in the neighbourhood, fell ſo low as 80l. *per annum*. He gave it up for the free ſchool of Cavan, where he might have lived well in ſo cheap a country on 80l. a-year ſalary, beſides his ſcholars; but the air being, as he ſaid, too moiſt and unwholeſome, and being diſguſted with ſome perſons who lived there, he ſold the ſchool for about 400l.; and having ſoon ſpent the money, he fell into bad health, and died Sept. 10. 1738, in his 55th year.

Lord Corke has given the following character of him: "Dr Sheridan was a ſchool-maſter, and in many inſtances perfectly well adapted for that ſtation. He was deeply verſed in the Greek and Roman languages, and in their cuſtoms and antiquities. He had that kind of good nature which abſence of mind, indolence of body, and careleſſneſs of fortune, produce; and although not over ſtrict in his own conduct, yet he took care of the morality of his ſcholars, whom he ſent to the univerſity remarkably well founded in all kinds of claſſical learning, and not ill inſtructed in the ſocial duties of life. He was ſlovenly, indigent, and cheerful. He knew books much better than men; and he knew the value of money leaſt of all. In this ſituation, and with this diſpoſition, Swift faſtened upon him as upon a prey with which he intended to regale himſelf whenever his appetite ſhould prompt him." His Lordſhip then mentions the event of the unlucky ſermon, and adds; "This ill-ſtarred, good-natured, improvident man, returned to Dublin, unhinged from all favour at court, and even baniſhed from the caſtle. But ſtill he remained a punſter, a quibbler, a fiddler, and a wit. Not a

eridan, heriff.

day paſſed without a rebus, an anagram, or a madrigal. His pen and his fiddleſtick were in continual motion; and yet to little or no purpoſe, if we may give credit to the following verſes, which ſhall ſerve as the concluſion of his poetical character.

"With muſic and poetry equally bleſs'd,
"A bard thus Apollo moſt humbly addreſs'd;
"Great author of poetry, muſic, and light!
"Inſtructed by thee, I both fiddle and write;
"Yet unheeded I ſcrape, or I ſcribble all day,
"My tunes are neglected, my verſe flung away.
"Thy ſubſtitute here, Vice-Apollo diſdains
"To vouch for my numbers, or liſt to my ſtrains.
"Thy manual ſign he refuſes to put
"To the airs I produce from the pen or the gut:
"Be thou then propitious, great Phœbus, and grant
"Relief, or reward, to my merit or want.
"Tho' the Dean and Delany tranſcendently ſhine,
"O! brighten one ſolo or ſonnet of mine:
"Make one work immortal, 'tis all I requeſt.
"Apollo look'd pleas'd, and reſolving to jeſt,
"Replied—Honeſt friend, I've conſider'd your caſe,
"Nor diſlike your unmeaning and innocent face.
"Your petition I grant, the boon is not great,
"Your works ſhall continue, and here's the receipt,
"On rondeaus hereafter your fiddle-ſtrings ſpend,
"Write verſes in circles, they never ſhall end."

"One of the volumes of Swift's miſcellanies conſiſts almoſt entirely of letters between him and the Dean. He publiſhed a proſe tranſlation of Perſius; to which he added the beſt notes of former editors, together with many judicious ones of his own. This work was printed at London, 1739, in 12mo." *Biographical Dictionary.*

SHERIDAN (Mrs Frances), wife to Thomas Sheridan, M. A. was born in Ireland about the year 1724, but deſcended from a good Engliſh family which had removed thither. Her maiden name was Chamberlaine, and ſhe was grand-daughter of Sir Oliver Chamberlaine. The firſt literary performance by which ſhe diſtinguiſhed herſelf was a little pamphlet at the time of a violent party-diſpute relative to the theatre, in which Mr Sheridan had newly embarked his fortune. So well-timed a work exciting the attention of Mr Sheridan, he by an accident diſcovered his fair patroneſs, to whom he was ſoon afterwards married. She was a perſon of the moſt amiable character in every relation of life, with the moſt engaging manners. After lingering ſome years in a very weak ſtate of health, ſhe died at Blois, in the ſouth of France, in the year 1767. Her "Sydney Biddulph" may be ranked with the firſt productions of that claſs in ours or in any other language. She alſo wrote a little romance in one volume called *Nourjahad*, in which there is a great deal of imagination productive of an admirable moral. And ſhe was the authoreſs of two comedies, "The Diſcovery" and "The Dupe."

ckſtone's mmenta-, Vol. I. 339.

SHERIFF, an officer, in each county in England, nominated by the king, inveſted with a judicial and miniſterial power, and who takes place of every nobleman in the county during the time of his office.

The ſheriff is an office of very great antiquity in this kingdom, his name being derived from two Saxon words, ſignifying the *reeve*, *bailiff*, or *officer* of the ſhire. He is called in Latin *vice-comes*, as being the deputy of the earl or *comes*, to whom the cuſtody of the ſhire is ſaid to have been committed at the firſt diviſion of this kingdom into counties. But the earls, in proceſs of time, by reaſon of their high employments and attendance on the king's perſon, not being able to tranſact the buſineſs of the county, were delivered of that burden; reſerving to themſelves the honour, but the labour was laid on the ſheriff. So that now the ſheriff does all the king's buſineſs in the county; and tho' he be ſtill called *vice-comes*, yet he is entirely independent of, and not ſubject to, the earl; the king by his letters patent, committing *cuſtodiam comitatus* to the ſheriff, and to him alone. Sheriff.

Sheriffs were formerly choſen by the inhabitants of the ſeveral counties. In confirmation of which it was ordained, by ſtatute 28 Edw. I. c. 8. that the people ſhould have an election of ſheriffs in every ſhire where the ſhrievalty is not of inheritance. For anciently in ſome counties the ſheriffs were hereditary; as we apprehend they were in Scotland till the ſtatute 20 Geo. II. c. 43; and ſtill continue in the county of Weſtmorland to this day; the city of London having alſo the inheritance of the ſhrievalty of Middleſex veſted in their body by charter. The reaſon of theſe popular elections is aſſigned in the ſame ſtatute, c. 13. "that the commons might chooſe ſuch as would not be a burden to them." And herein appears plainly a ſtrong trace of the democratical part of our conſtitution; in which form of government it is an indiſpenſable requiſite, that the people ſhould chooſe their own magiſtrates. This election was in all probability not abſolutely veſted in the commons, but required the royal approbation. For in the Gothic conſtitution, the judges of their county-courts (which office is executed by the ſheriff) were elected by the people, but confirmed by the king: and the form of their election was thus managed; the people, or *incolæ territorii*, choſe twelve electors, and they nominated three perſons, *ex quibus rex unam confirmabat*. But with us in England, theſe popular elections, growing tumultuous, were put an end to by the ſtatute 9 Edw. II. ſt. 2. which enacted, that the ſheriffs ſhould from thenceforth be aſſigned by the chancellor, treaſurer, and the judges; as being perſons in whom the ſame truſt might with confidence be repoſed. By ſtatutes 14 Edw. III. c. 7. 23 Hen. VI. c. 8. and 21 Hen. VIII. c. 20. the chancellor, treaſurer, preſident of the king's council, chief juſtices, and chief baron, are to make this election; and that on the morrow of All Souls, in the exchequer. And the king's letters patent, appointing the new ſheriffs, uſed commonly to bear date the ſixth day of November. The ſtatute of Cambridge, 12 Ric. II. c. 2. ordains, that the chancellor, treaſurer, keeper of the privy ſeal, ſteward of the king's houſe, the king's chamberlain, clerk of the rolls, the juſtices of the one bench and the other, barons of the exchequer, and all other that ſhall be called to ordain, name, or make juſtices of the peace, ſheriffs, and other officers of the king, ſhall be ſworn to act indifferently, and to name no man that ſueth to be put in office, but ſuch only as they ſhall judge to be the beſt and moſt ſufficient. And the cuſtom now is (and has been at leaſt ever ſince the time of Forteſcue, who was chief juſtice and chancellor to Henry the Sixth), that all the judges, together with the other great officers, meet in the exchequer chamber on the morrow of All Souls yearly, (which day is now altered to the morrow

of

Sheriff. of St Martin by the laſt act for abbreviating Michaelmas term), and then and there propoſe three perſons to the king, who afterwards appoints one of them to be ſheriff. This cuſtom of the twelve judges propoſing three perſons ſeems borrowed from the Gothic conſtitution before-mentioned: with this difference, that among the Goths the 12 nominors were firſt elected by the people themſelves. And this uſage of ours, at its firſt introduction, there is reaſon to believe, was founded upon ſome ſtatute, though not now to be found among our printed laws; firſt, becauſe it is materially different from the direction of all the ſtatutes before mentioned; which it is hard to conceive that the judges would have countenanced by their concurrence, or that Forteſcue would have inſerted in his book, unleſs by the authority of ſome ſtatute; and alſo, becauſe a ſtatute is expreſsly referred to in the record, which Sir Edward Coke tells us he tranſcribed from the council-book of 3d March, 34 Hen. VI. and which is in ſubſtance as follows: The king had of his own authority appointed a man ſheriff of Lincolnſhire, which office he refuſed to take upon him; whereupon the opinions of the judges were taken, what ſhould be done in this behalf. And the two chief juſtices, Sir John Forteſcue and Sir John Priſot, delivered the unanimous opinion of them all: "that the king did an error when he made a perſon ſheriff that was not choſen and preſented to him according to the ſtatute; that the perſon refuſing was liable to no fine for diſobedience, as if he had been one of the three perſons choſen according to the tenor of the ſtatute; that they would adviſe the king to have recourſe to the three perſons that were choſen according to the ſtatute, or that ſome other thrifty man be entreated to occupy the office for this year; and that, the next year, to eſchew ſuch inconveniences, the order of the ſtatute in this behalf made be obſerved." But, notwithſtanding this unanimous reſolution of all the judges of England, thus entered in the council-book, and the ſtatute 34 and 35 Hen. VIII. c. 26. § 61. which expreſsly recognizes this to be the law of the land, ſome of our writers have affirmed, that the king, by his prerogative, may name whom he pleaſes to be ſheriff, whether choſen by the judges or not. This is grounded on a very particular caſe in the fifth year of Queen Elizabeth, when, by reaſon of the plague, there was no Michaelmas term kept at Weſtminſter; ſo that the judges could not meet there *in craſtino animarum* to nominate the ſheriffs: whereupon the queen named them herſelf, without ſuch previous aſſembly, appointing for the moſt part one of two remaining in the laſt year's liſt. And this caſe, thus circumſtanced, is the only authority in our books for the making theſe extraordinary ſheriffs. It is true, the reporter adds, that it was held that the queen by her prerogative might make a ſheriff without the election of the judges, *non obſtante aliquo ſtatuto in contrarium*; but the doctrine of *non obſtante*, which ſets the prerogative above the laws, was effectually demoliſhed by the bill of rights at the Revolution, and abdicated Weſtminſter-hall when King James abdicated the kingdom. However, it muſt be acknowledged, that the practice of occaſionally naming what are called *pocket ſheriffs*, by the ſole authority of the crown, hath uniformly continued to the reign of his preſent majeſty; in which, it is believed, few (if any) inſtances have occurred.

Sheriffs, by virtue of ſeveral old ſtatutes, are to continue in their office no longer than one year; and yet it hath been ſaid that a ſheriff may be appointed *durante bene placito*, or during the king's pleaſure; and ſo is the form of the royal writ. Therefore, till a new ſheriff be named, his office cannot be determined, unleſs by his own death, or the demiſe of the king; in which laſt caſe it was uſual for the ſucceſſor to ſend a new writ to the old ſheriff; but now, by ſtatute 1 Anne ſt. 1. c. 8. all officers appointed by the preceding king may hold their offices for ſix months after the king's demiſe, unleſs ſooner diſplaced by the ſucceſſor. We may farther obſerve, that by ſtatute 1 Rich. II. c. 11. no man that has ſerved the office of ſheriff for one year can be compelled to ſerve the ſame again within three years after. Sheriff

We ſhall find it is of the utmoſt importance to have the ſheriff appointed according to law, when we conſider his power and duty. Theſe are either as a judge, as the keeper of the king's peace, as a miniſterial officer of the ſuperior courts of juſtice, or as the king's bailiff.

In his judicial capacity he is to hear and determine all cauſes of 40 ſhillings value and under, in his county-court: and he has alſo a judicial power in divers other civil caſes. He is likewiſe to decide the elections of knights of the ſhire, (ſubject to the controul of the Houſe of Commons), of coroners, and of verderors; to judge of the qualification of voters, and to return ſuch as he ſhall determine to be duly elected.

As the keepers of the king's peace, both by common law and ſpecial commiſſion, he is the firſt man in the county, and ſuperior in rank to any nobleman therein, during his office. He may apprehend, and commit to priſon, all perſons who break the peace, or attempt to break it; and may bind any one in a recognizance to keep the king's peace. He may, and is bound, *ex officio*, to purſue and take all traitors, murderers, felons, and other miſdoers, and commit them to gaol for ſafe cuſtody. He is alſo to defend his county againſt any of the king's enemies when they come into the land; and for this purpoſe, as well as for keeping the peace and purſuing felons, he may command all the people of his county to attend him; which is called the *poſſe comitatus*, or power of the county; which ſummons, every perſon above 15 years old, and under the degree of a peer, is bound to attend upon warning, under pain of fine and impriſonment. But though the ſheriff is thus the principal conſervator of the peace in his county, yet, by the expreſs directions of the great charter, he, together with the conſtable, coroner, and certain other officers of the king, are forbidden to hold any pleas of the crown, or, in other words, to try any criminal offence. For it would be highly unbecoming, that the executioners of juſtice ſhould be alſo the judges; ſhould impoſe, as well as levy, fines and amercements; ſhould one day condemn a man to death, and perſonally execute him the next. Neither may he act as an ordinary juſtice of the peace during the time of his office; for this would be equally inconſiſtent, he being in many reſpects the ſervant of the juſtices.

In his miniſterial capacity, the ſheriff is bound to execute all proceſs iſſuing from the king's courts of juſtice. In the commencement of civil cauſes, he is to ſerve the writ, to arreſt, and to take bail; when the cauſe comes to trial, he muſt ſummon and return the jury; when it is determined, he muſt ſee the judgment

Sheriff, Sherlock.

of the court carried into execution. In criminal matters, he alſo arreſts and impriſons, he returns the jury, he has the cuſtody of the delinquent, and he executes the ſentence of the court, tho' it extend to death itſelf.

As the king's bailiff, it is his buſineſs to preſerve the rights of the king within his bailiwick; for ſo his county is frequently called in the writs: a word introduced by the princes of the Norman line; in imitation of the French, whoſe territory is divided into bailiwicks, as that of England into counties. He muſt ſeize to the king's uſe all lands devolved to the crown by attainder or eſcheat; muſt levy all fines and forfeitures, muſt ſeize and keep all waifs, wrecks, eſtrays, and the like, unleſs they be granted to ſome ſubject; and muſt alſo collect the king's rents within his bailiwick, if commanded by proceſs from the exchequer.

To execute theſe various offices, the ſheriff has under him many inferior officers; an under ſheriff, bailiffs, and gaolers, who muſt neither buy, ſell, nor farm their offices, on forfeiture of 500l.

The under ſheriff uſually performs all the duties of the office; a very few only excepted, where the perſonal preſence of the high ſheriff is neceſſary. But no under ſheriff ſhall abide in his office above one year; and if he does, by ſtatute 23 Hen. VI. c. 8. he forfeits 200l. a very large penalty in thoſe early days. And no under ſheriff or ſheriff's officer ſhall practiſe as an attorney during the time he continues in ſuch office: for this would be a great inlet to partiality and oppreſſion. But theſe ſalutary regulations are ſhamefully evaded, by practiſing in the names of other attorneys, and putting in ſham deputies by way of nominal under ſheriffs: by reaſon of which, ſays Dalton, the under ſheriffs and bailiffs do grow ſo cunning in their ſeveral places, that they are able to deceive, and it may well be feared that many of them do deceive, both the king, the high ſheriff, and the county.

Sheriff, in Scotland. See Law, Part III. ſect. 3.

SHERLOCK (William), a learned Engliſh divine in the 17th century, was born in 1641, and educated at Eaton ſchool, where he diſtinguiſhed himſelf by the vigour of his genius and his application to ſtudy. Thence he was removed to Cambridge, where he took his degrees. In 1669 he became rector of the pariſh of St George, Botolph lane, in London; and in 1681 was collated to the prebend of Pancras, in the cathedral of St Paul's. He was likewiſe choſen maſter of the Temple, and had the rectory of Therfield in Hertfordſhire. After the Revolution he was ſuſpended from his preferment, for refuſing the oaths to King William and Queen Mary; but at laſt he took them, and publicly juſtified what he had done. In 1691 he was inſtalled dean of St Paul's. His Vindication of the Doctrine of the Trinity engaged him in a warm controverſy with Dr South and others. Biſhop Burnet tells us, he was "a clear, a polite, and a ſtrong writer; but apt to aſſume too much to himſelf, and to treat his adverſaries with contempt." He died in 1707. His works are very numerous; among theſe are, 1. A Diſcourſe concerning the Knowledge of Jeſus Chriſt, againſt Dr Owen. 2. Several pieces againſt the Papiſts, the Socinians, and Diſſenters. 3. A practical Treatiſe on Death, which is much admired. 4. A practical Diſcourſe on Providence. 5. A practical Diſcourſe on future Judgment; and many other works.

Sherlock Sherriffe.

SHERLOCK (Dr Thomas), biſhop of London, was the ſon of the preceding Dr William Sherlock, and was born in 1678. He was educated in Catharine hall, Cambridge, where he took his degrees, and of which he became maſter: he was made maſter of the Temple very young, on the reſignation of his father; and it is remarkable, that this maſterſhip was held by father and ſon ſucceſſively for more than 70 years. He was at the head of the oppoſition againſt Dr Hoadley biſhop of Bangor; during which conteſt he publiſhed a great number of pieces. He attacked the famous Collins's "Grounds and Reaſons of the Chriſtian Religion," in a courſe of ſix ſermons, preached at the Temple church, which he entitled "The Uſe and Intent of Prophecy in the ſeveral Ages of the World." In 1728, Dr Sherlock was promoted to the biſhopric of Bangor; and was tranſlated to Saliſbury in 1734. In 1747 he refuſed the archbiſhopric of Canterbury, on account of his ill ſtate of health; but recovering in a good degree, accepted the ſee of London the following year. On occaſion of the earthquakes in 1750, he publiſhed an excellent Paſtoral Letter to the clergy and inhabitants of London and Weſtminſter: of which it is ſaid there were printed in 4to, 5000; in 8vo, 20,000; and in 12mo, about 30,000; beſide pirated editions, of which not leſs than 50,000 were ſuppoſed to have been ſold. Under the weak ſtate of body in which he lay for ſeveral years, he reviſed and publiſhed 4 vols. of Sermons in 8vo, which are particularly admired for their ingenuity and elegance. He died in 1762, and by report worth 150,000l. "His learning," ſays Dr Nicholls, "was very extenſive: God had given him a great and an underſtanding mind, a quick comprehenſion, and a ſolid judgment. Theſe advantages of nature he improved by much induſtry and application. His ſkill in the civil and canon law was very conſiderable; to which he had added ſuch a knowledge of the common law of England as few clergymen attain to. This it was that gave him that influence in all cauſes where the church was concerned; as knowing preciſely what it had to claim from its conſtitutions and canons, and what from the common law of the land." Dr Nicholls then mentions his conſtant and exemplary piety, his warm and fervent zeal in preaching the duties and maintaining the doctrines of Chriſtianity, and his large and diffuſive munificence and charity; particularly by his having given large ſums of money to the corporation of clergymen's ſons, to ſeveral of the hoſpitals, and to the ſociety for propagating the goſpel in foreign parts: alſo his bequeathing to Catharine hall in Cambridge, the place of his education, his valuable library of books, and his donations for the founding a librarian's place and a ſcholarſhip, to the amount of ſeveral thouſand pounds.

SHERRIFFE of Mecca, the title of the deſcendants of Mahomet by Haſſan Ibn Ali. Theſe are divided into ſeveral branches, of which the family of Ali Bunemi, conſiſting at leaſt of three hundred individuals enjoy the ſole right to the throne of Mecca. The Ali Bunemi are, again, ſubdivided into two ſubordinate branches, Darii Sajid, and Darii Barkad; of whom ſometimes the one, ſometimes the other, have given ſovereigns to Mecca and Medina, when theſe were ſeparate ſtates.

Not only is the Turkiſh ſultan indifferent about the order of ſucceſſion in this family, but he ſeems even to

Sherriffe. foment the diſſenſions which ariſe among them, and favours the ſtrongeſt, merely that he may weaken them all. As the order of ſucceſſion is not determinately fixed, and the ſherriffes may all aſpire alike to the ſovereign power, this uncertainty of right, aided by the intrigues of the Turkiſh officers, occaſions frequent revolutions. The grand ſherriffe is ſeldom able to maintain himſelf on the throne; and it ſtill ſeldomer happens that his reign is not diſturbed by the revolt of his neareſt relations. There have been inſtances of a nephew ſucceeding his uncle, an uncle ſucceeding his nephew; and ſometimes of a perſon, from a remote branch, coming in the room of the reigning prince of the ancient houſe.

When Niebuhr was in Arabia, in 1763, the reigning Sherriffe Meſad had ſat fourteen years on the throne, and, during all that period, had been continually at war with the neighbouring Arabs, and with his own neareſt relations ſometimes. A few years before, the pacha of Syria had depoſed him, and raiſed his younger brother to the ſovereign dignity in his ſtead. But after the departure of the caravan, Jafar, the new ſherriffe, not being able to maintain himſelf on the throne, was obliged to reſign the ſovereignty again to Meſad. Achmet, the ſecond brother of the ſherriffe, who was much beloved by the Arabs, threatened to attack Mecca while Niebuhr was at Jidda. Our traveller was ſoon after informed of the termination of the quarrel, and of Achmet's return to Mecca, where he continued to live peaceably in a private character.

Theſe examples ſhow that the Muſſulmans obſerve not the law which forbids them to bear arms againſt their holy places. An Egyptian bey even preſumed, a few years ſince, to plant ſome ſmall cannons within the compaſs of the Kaba, upon a ſmall tower, from which he fired over that ſacred manſion, upon the palace of Sherriffe Meſad, with whom he was at variance.

The dominions of the ſherriffe comprehend the cities of Mecca, Medina, Jambo, Taaif, Sadie, Ghunfude, Hali, and thirteen others leſs conſiderable, all ſituated in Hedjas. Near Taif is the lofty mountain of Gazvan, which, according to Arabian authors, is covered with ſnow in the midſt of ſummer. As theſe dominions are neither opulent nor extenſive, the revenue of their ſovereign cannot be conſiderable.

He finds a rich reſource, however, in the impoſts levied on pilgrims, and in the gratuities offered him by Muſſulman monarchs. Every pilgrim pays a tax of from ten to a hundred crowns, in proportion to his ability. The Great Mogul remits annually ſixty thouſand roupees to the ſherriffe, by an aſſignment upon the government of Surat. Indeed, ſince the Engliſh made themſelves maſters of this city, and the territory belonging to it, the nabob of Surat has no longer been able to pay the ſum. The ſherriffe once demanded it of the Engliſh, as the poſſeſſors of Surat; and, till they ſhould ſatisfy him, forbade their captains to leave the port of Jidda. But the Engliſh diſregarding this prohibition, the ſherriffe complained to the Ottoman Porte, and they communicated his complaints to the Engliſh ambaſſador. He at the ſame time opened a negotiation with the nominal nabob, who reſides in Surat. But theſe ſteps proved all fruitleſs: and the ſovereign of Mecca ſeems not likely to be ever more benefited by the contribution from India. Sherriffe.

The power of the ſherriffe extends not to ſpiritual matters; theſe are entirely managed by the heads of the clergy, of different ſects, who are reſident at Mecca. Rigid Muſſulmans, ſuch as the Turks, are not very favourable in their ſentiments of the ſherriffes, but ſuſpect their orthodoxy, and look upon them as ſecretly attached to the tolerant ſect of the Zeidi.

SHETLAND, the name of certain iſlands belonging to Scotland, and lying to the northward of Orkney. There are many convincing proofs that theſe iſlands were very early inhabited by the Picts, or rather by thoſe nations who were the original poſſeſſors of the Orkneys; and at the time of the total deſtruction of thoſe nations, if any credit be due to tradition, their woods were entirely ruined (A). It is highly probable that the people in Shetland, as well as in the Orkneys, flouriſhed under their own princes dependent upon the crown of Norway; yet this ſeems to have been rather through what they acquired by fiſhing and commerce, than by the cultivation of their lands. It may alſo be reaſonably preſumed, that they grew thinner of inhabitants after they were annexed to the crown of Scotland; and it is likely that they revived again, chiefly by the very great and extenſive improvements which the Dutch made in the herring fiſhery upon their coaſts, and the trade that the crews of their buſſes, then very numerous, carried on with the inhabitants, neceſſarily reſulting from their want of proviſions and other conveniences, which in thoſe days could not be very conſiderable.

There are many reaſons which may be aſſigned why theſe iſlands, though part of our dominions, have not hitherto been better known to us. They were commonly placed two degrees too far to the north in all the old maps, in order to make them agree with Ptolemy's deſcription of Thule, which he aſſerted to be in the latitude of 63 degrees; which we find urged by Camden as a reaſon why Thule muſt be one of the Shetland iſles, to which Speed alſo agrees, though from their being thus wrong placed he could not find room for them in his maps. Another, and that no light cauſe, was the many falſe, fabulous, and impertinent relations publiſhed concerning them (B), as if they were countries inhoſpitable and uninhabitable; and laſtly, the indolence, or rather indifference, of the natives, who, contenting themſelves with thoſe neceſſaries and conveniences procured by their intercourſe with other nations, and conceiving

(A) The tradition is, that this was done by the Scots when they deſtroyed the Picts; but is more probably referred to the Norwegians rooting out the original poſſeſſors of Shetland.

(B) They repreſented the climate as intenſely cold; the ſoil as compoſed of crags and quagmire, ſo barren as to be incapable of bearing corn; to ſupply which, the people, after drying fiſh bones, powdered them, then kneaded and baked them for bread. The larger fiſh bones were ſaid to be all the fuel they had. Yet, in ſo dreary a country, and in ſuch miſerable circumſtances, they were acknowledged to be very long lived, cheerful, and contented.

Shetland. ceiving themſelves neglected by the mother country, have ſeldom troubled her with their applications.

There are few countries that have gone by more names than theſe iſlands; they were called in Icelandic, *Hialtlandia*, from *hialt*, the "hilt of a ſword;" this might be poſſibly corrupted into *Hetland*, *Hitland*, or *Hethland*, though ſome tell us this ſignifies a "high land." They have been likewiſe, and are ſtill in ſome maps, called *Zetland* and *Zeatland*, in reference, as has been ſuppoſed, to their ſituation. By the Danes, and by the natives, they are ſtyled *Tealtaland;* and notwithſtanding the oddneſs of the orthography, this differs very little, if at all, from their manner of pronouncing Zeatland, out of which pronunciation grew the modern names of *Shetland* and *Shotland*.

The iſlands of *Shetland*, as we commonly call them, are well ſituated for trade. The neareſt continent to them is Norway; the port of Bergen lying 44 leagues eaſt, whereas they lie 46 leagues north north-eaſt from Buchanneſs; eaſt north-eaſt from Sanda, one of the Orkneys, about 16 or 18 leagues; ſix or ſeven leagues north-eaſt from Fair iſle; 58 leagues eaſt from the Ferro iſles; and at nearly the ſame diſtance north-eaſt from Lewis. The ſouthern promontory of the Main-land, called *Sumburgh Head*, lies in 59 degrees and 59 minutes of north latitude; and the northern extremity of Unſt, the moſt remote of them all, in the latitude of 61 degrees 15 minutes. The meridian of London paſſes through this laſt iſland, which lies about 2 degrees 30 minutes weſt from Paris, and about 5 degrees 15 minutes eaſt from the meridian of Cape Lizard. According to Gifford's "Hiſtorical Deſcription of Zetland," the inhabited iſlands are 33, of which the principal is ſtyled *Main Land*, and extends in length from north to ſouth about 60 miles, and is in ſome places 20 broad, though in others not more than two.

It is impoſſible to ſpeak with preciſion; but, according to the beſt computation which we have been able to form, the Shetland iſles contain near three times as much land as the Orkneys: they are conſidered alſo as equal in ſize to the iſland of Madeira; and not inferior to the provinces of Utrecht, Zealand, and all the reſt of the Dutch iſlands taken together; but of climate and ſoil they have not much to boaſt. The longeſt day in the iſland of Unſt is 19 hours 15 minutes, and of conſequence the ſhorteſt day 4 hours and 45 minutes. The ſpring is very late, the ſummer very ſhort; the autumn alſo is of no long duration, dark, foggy, and rainy; the winter ſets in about November, and laſts till April, and ſometimes till May. They have frequently in that ſeaſon ſtorms of thunder, much rain, but little froſt or ſnow. High winds are indeed very frequent and very troubleſome, yet they ſeldom produce any terrible effects. The aurora borealis is as common here as in any of the northern countries. In the winter ſeaſon the ſea ſwells and rages in ſuch a manner, that for five or ſix months their ports are inacceſſible, and of courſe the people during that ſpace have no correſpondence with the reſt of the world.

The ſoil in the interior part of the Main-land, for the moſt part, is mountainous, mooriſh, and boggy, yet not to ſuch a degree as to render the country utterly impaſſable; for many of the roads here, and in ſome of the northern iſles, are as good as any other natural roads, and the people travel them frequently on all occaſions. Near the coaſt there are ſometimes for miles together flat pleaſant ſpots, very fertile both in paſture and corn. The mountains produce large crops of very nutritive graſs in the ſummer; and they cut conſiderable quantities of hay, with which they feed their cattle in the winter. They might with a little attention bring more of their country into cultivation: but the people are ſo much addicted to their fiſhery, and feel ſo little neceſſity of having recourſe to this method for ſubſiſtence, that they are content, how ſtrange ſoever that may ſeem to us, to let four parts in five of their land remain in a ſtate of nature. Shetland

They want not conſiderable quantities of marl in different iſlands, though they uſe but little; hitherto there has been no chalk found; limeſtone and freeſtone there are in the ſouthern parts of the Main-land in great quantities, and alſo in the neighbouring iſlands, particularly Fetlar; and conſiderable quantities of ſlate, very good in its kind. No mines have been hitherto wrought, though there are in many places viſible appearances of ſeveral kinds of metal. Some ſolid pieces of ſilver, it is ſaid, have been turned up by the plough. In ſome of the ſmaller iſles there are ſtrong appearances of iron; but, through the want of proper experiments being made, there is, in this reſpect at leaſt, hitherto nothing certain. Their meadows are encloſed with dikes, and produce very good graſs. The little corn they grow is chiefly barley, with ſome oats; though even in the northern extremity of Unſt the little land which they have is remarkable for its fertility. The hills abound with medicinal herbs: and their kitchen gardens thrive as well, and produce as good greens and roots, as any in Britain. Of late years, and ſince this has been attended to, ſome gentlemen have had even greater ſucceſs than they expected in the cultivating of tulips, roſes, and many other flowers. They have no trees, and hardly any ſhrubs except juniper, yet they have a tradition that their country was formerly overgrown with woods; and it ſeems to be a confirmation of this, that the roots of timber trees have been, and are ſtill, dug up at a great depth; and that in ſome, and thoſe too inacceſſible, places, the mountain aſh is ſtill found growing wild. That this defect, viz. the want of wood at preſent, does not ariſe entirely from the ſoil or climate, appears from ſeveral late experiments; ſome gentlemen having raiſed aſh, maple, horſe cheſnuts, &c. in their gardens. Though the inhabitants are without either wood or coals, they are very well ſupplied with fuel, having great plenty of heath and peat. The black cattle in this country are in general of a larger ſort than in Orkney, which is owing to their having more extenſive paſtures; a clear proof that ſtill farther improvements might be made in reſpect to ſize. Their horſes are ſmall, but ſtrong, ſtout, and well ſhaped, live very hardy, and to a great age. They have likewiſe a breed of ſmall ſwine, the fleſh of which, when fat, is eſteemed very delicious. They have no goats, hares, or foxes; and in general no wild or venomous creatures of any kind except rats in ſome few iſlands. They have no moor-fowl, which is the more remarkable, as there are everywhere immenſe quantities of heath; but there are many ſorts of wild and water fowl, particularly the dunter-gooſe, clack-gooſe, ſolan-gooſe, ſwans, Shetland

Shetland. ducks, teal, whaps, foifts, lyres, kittiwaiks, maws, plovers, cormorants, &c. There is likewiſe the ember gooſe, which is ſaid to hatch her egg under her wing. Eagles and hawks, as alſo ravens, crows, mews, &c. abound here.

All theſe iſlands are well watered; for there are everywhere excellent ſprings, ſome of them mineral and medicinal. They have indeed no rivers; but many pleaſant rills or rivulets, which they call *burns*, of different ſizes; in ſome of the largeſt they have admirable trouts, ſome of which are 15 and even of 20 pounds weight. They have likewiſe many freſh water lakes, well ſtored with trout and eels, and in moſt of them there are alſo large and fine flounders; in ſome very excellent cod. Theſe freſh water lakes, if the country was better peopled, and the common people more at their eaſe, are certainly capable of great improvements. The ſea coaſts of the main land of Shetland, in a ſtraight line, are 55 leagues; and therefore there cannot be a country conceived more proper for eſtabliſhing an extenſive fiſhery. What the inhabitants have been hitherto able to do, their natural advantages conſidered, does not deſerve that name, notwithſtanding they export large quantities of cod, tuſk, ling, and ſkate, inſomuch that the bounty allowed by acts of parliament amounts from 1400l. to 2000l. annually. They have, beſides, haddocks, whitings, turbot, and a variety of other fiſh. In many of the inlets there are prodigious quantities of excellent oyſters, lobſters, muſcles, cockles, and other ſhell fiſh. As to amphibious creatures, they have multitudes of otters and ſeals; add to theſe, that amber, ambergris, and other ſpoils of the ocean are frequently found upon the coaſts.

The inhabitants are a ſtout, well-made, comely people; the lower ſort of a ſwarthy complexion. The gentry are allowed, by all who have converſed with them, to be moſt of them polite, ſhrewd, ſenſible, lively, active, and intelligent perſons; and theſe, to the number of 100 families, have very handſome, ſtrong, well-built houſes, neatly furniſhed; their tables well ſerved, poliſhed in their manners, and exceedingly hoſpitable and civil to ſtrangers. Thoſe of an inferior rank are hardy, robuſt, and laborious people, who, generally ſpeaking, get their bread by fiſhing in all weathers in their yawls, which are little bigger than Graveſend wherries; live hardily, and in the ſummer ſeaſon moſtly on fiſh; their drink, which, in reference to the Britiſh dominions, is peculiar to the country, is called *bland*, and is a ſort of butter-milk, long kept, and very ſour. Many live to great ages, though not ſo long as in former times. In reſpect, however, to the bulk of the inhabitants, from the poorneſs of living, from the nature of it, and from the drinking great quantities of corn ſpirits of the very worſt ſort, multitudes are afflicted with an inveterate ſcurvy; from which thoſe in better circumſtances are entirely free, and enjoy as good health as in any other country in Europe. As they have no great turn to agriculture, and are perſuaded that their country is not fit for it, they do not (though probably they might) raiſe corn enough to ſupport them for more than two-thirds of the year. But they are much more ſucceſsful in their paſture grounds, which are kept well incloſed, in good order, and, together with their commons ſupply them plentifully with beef and mutton. They pay their rents generally in butter at Lammas, and in money at Martinmas. As to manufactures, they make a ſtrong coarſe cloth for their own uſe, as alſo linen. They make likewiſe of their own wool very fine ſtockings. They export, beſides the different kinds of fiſh already mentioned, ſome herrings, a conſiderable quantity of butter and train oil, otter and ſeal ſkins, and no inconſiderable quantity of the fine ſtockings juſt mentioned. Their chief trade is to Leith, London, Hamburgh, Spain, and to the Straits. They import timbers, deals, and ſome of their beſt oats, from Norway; corn and flour from the Orkneys, and from North Britain; ſpirits and ſome other things from Hamburgh; cloths and better ſort of linen from Leith; grocery, houſehold furniture, and other neceſſaries from London. The ſuperior duties to the earl of Morton are generally let in farm; and are paid by the people in butter, oil, and money. The remains of the old Norwegian conſtitution are ſtill viſible in the diviſion of their lands; and they have ſome udulmen or freeholders amongſt them. But the Scots laws, cuſtoms, manners, dreſs, and language, prevail; and they have a ſheriff, and other magiſtrates for the adminiſtration of juſtice, as well as a cuſtomhouſe, with a proper number of officers. In reference to their eccleſiaſtical concerns, they have a preſbytery, 12 miniſters, and an itinerant for Foula, Fair iſland, and the Skerries. Each of theſe miniſters has a ſtipend of between 40 and 50 pounds, beſides a houſe and a glebe free from taxes. The number of ſouls in theſe iſlands may be about 20,000.

Shew-bread, Shield.

SHEW-BREAD, the loaves of bread which the prieſt of the week put every Sabbath day upon the golden table in the ſanctuary, before the Lord, in the temple of the Jews. They were 12 in number, and were offered to God in the name of the 12 tribes of Iſrael. They were ſhaped like a brick, were ten palms long, and five broad, weighing about eight pounds each. They were unleavened, and made of fine flour by the Levites. The prieſts ſet them on the table in two rows, ſix in a row, and put frankincenſe upon them to preſerve them from moulding. They were changed every Sabbath, and the old ones belonged to the prieſt upon duty. Of this bread none but the prieſts might eat, except in caſes of neceſſity. It was called the *bread of faces*, becauſe the table of the ſhew bread being almoſt overagainſt the ark of the covenant, the loaves might be ſaid to be ſet before the face of God. The original table was carried away to Babylon, but a new one was made for the ſecond temple. It was of wood overlaid with gold. This, with the candleſtick and ſome other ſpoils, was carried by Titus to Rome.

SHIELD, an ancient weapon of defence, in form of a light buckler, borne on the arm to ſend off lances, darts, &c. The form of the ſhield is repreſented by the eſcutcheon in coats of arms. The ſhield was that part of the ancient armour on which the perſons of diſtinction in the field of battle always had their arms painted; and moſt of the words uſed at this time to expreſs the ſpace that holds the arms of families are derived from the Latin name for a ſhield, *ſcutum*. The French *eſcu* and *eſcuſſion*, and the Engliſh word *eſcutcheon*, or, as we commonly ſpeak it, *ſcutcheon*, are evidently from this origin: and the Italian *ſcudo* ſignifies both the ſhield of arms and that uſed in war. The Latin name *clypeus*, for the ſame thing, ſeems alſo to be derived from the

Shield. the Greek word γλυφις, *to engrave*; and it had this name from the ſeveral figures engraved on it, as marks of diſtinction of the perſon who wore it.

The ſhield in war, among the Greeks and Romans, was not only uſeful in the defence of the body, but it was alſo a token, or badge of honour, to the wearer; and he who returned from battle without it was always treated with infamy afterwards. People have at all times thought this honourable piece of the armour the propereſt place to engrave, or figure on the ſigns of dignity of the poſſeſſor of it; and hence, when arms came to be painted for families in aftertimes, the heralds always choſe to repreſent them upon the figure of a ſhield, but with ſeveral exterior additions and ornaments; as the helmet, ſupporters, and the reſt.

The form of the ſhield has not only been found different in various nations, but even the people of the ſame nation, at different times, have varied its form extremely; and among ſeveral people there have been ſhields of ſeveral forms and ſizes in uſe, at the ſame period of time, and ſuited to different occaſions. The moſt ancient and univerſal form of ſhields, in the earlier ages, ſeems to have been the triangular. This we ſee inſtances of in all the monuments and gems of antiquity: our own moſt early monuments ſhow it to have been the moſt antique ſhape alſo with us, and the heralds have found it the moſt convenient for their purpoſes, when they had any odd number of figures to repreſent; as if three, then two in the broad bottom part, and one in the narrow upper end, it held them very well; or if five, they ſtood as conveniently, as three below, and two above. The other form of a ſhield, now univerſally uſed, is ſquare, rounded, and pointed at the bottom: this is taken from the figure of the Samnitic ſhield uſed by the Romans, and ſince copied very generally by the Engliſh, French, and Germans.

The Spaniards and Portugueſe have the like general form of ſhields, but they are round at the bottom without the point; and the Germans, beſide the Samnite ſhield, have two others pretty much in uſe: Theſe are, 1. The bulging ſhield, diſtinguiſhed by its ſwelling or bulging out at the flanks; and, 2. The indented ſhield, or ſhield chancree, which has a number of notches and indentings all round its ſides. The uſe of the ancient ſhield of this form was, that the notches ſerved to reſt the lance upon, that it might be firm while it gave the thruſt; but this form being leſs proper for the receiving armorial figures, the two former have been much more uſed in the heraldry of that nation.

Beſide this different form of the ſhields in heraldry, we find them alſo often diſtinguiſhed by their different poſitions, ſome of them ſtanding erect, and others ſlanting various ways, and in different degrees; this the heralds expreſs by the word *pendant*, "hanging," they ſeeming to be hung up not by the centre, but by the right or left corner. The French call theſe *ecu pendant*, and the common antique triangular ones *ecu ancien*. The Italians call this *ſcuto pendente*; and the reaſon given for exhibiting the ſhield in theſe figures in heraldry is, that in the ancient tilts and tournaments, they who were to juſt at theſe military exerciſes, were obliged to hang up their ſhields with their armories, or coats of arms on them, out at the windows and balconies of the houſes near the place; or upon trees, pavilions, or the barriers of the ground, if the exerciſe was to be performed in the field. Shield ‖ Shields.

Thoſe who were to fight on foot, according to Columbier, had their ſhields hung up by the right corner, and thoſe who were to fight on horſeback had theirs hung up by the left. This poſition of the ſhields in heraldry is called *couché* by ſome writers, though by the generality *pendant*.

It was very frequent in all parts of Europe, in arms given between the 11th and 14th centuries; but it is to be obſerved, that the hanging by the left corner, as it was the token of the owner's being to fight on horſeback, ſo it was eſteemed the moſt honourable and noble ſituation; and all the pendant ſhields of the ſons of the royal family of Scotland and England, and of our nobility at that time, are thus hanging from the left corner. The hanging from this corner was a token of the owner's being of noble birth, and having fought in the tournaments before; but no ſovereign ever had a ſhield pendant any way, but always erect, as they never formally entered the liſts of the tournament.

The Italians generally have their ſhields of arms of an oval form; this ſeems to be done in imitation of thoſe of the popes and other dignified clergy: but their herald Petro Sancto ſeems to regret the uſe of this figure of the ſhield, as an innovation brought in by the painters and engravers as moſt convenient for holding the figures, but derogatory to the honour of the poſſeſſor, as not repreſenting either antiquity or honours won in war, but rather the honours of ſome citizen or perſon of learning. Some have carried it ſo far as to ſay, that thoſe who either have no ancient title to nobility, or have ſullied it by any unworthy action, cannot any longer wear their arms in ſhields properly figured, but were obliged to have them painted in an oval or round ſhield.

In Flanders, where this author lived, the round and oval ſhields are in the diſrepute he ſpeaks of; but in Italy, beſides the popes and dignified prelates, many of the firſt families of the laity have them.

The ſecular princes, in many other countries, alſo retain this form of the ſhield, as the moſt ancient and truly expreſſive of the Roman clypeus.

Shield, in heraldry, the eſcutcheon or field on which the bearings of coats of arms are placed. See Heraldry.

SHIELDRAKE, in ornithology. See Anas.

SHIELDS, North and South, two ſea-port towns, the one north of the Tyne in Northumberland, the other on the ſouth of the Tyne in the county of Durham. South Shields contains above 200 ſalt pans, and on both banks of the river are many convenient houſes for the entertainment of ſeamen and colliers, moſt of the Newcaſtle coal fleet having their ſtation here uſually till their coals are brought down in the barges and lighters from Newcaſtle. A very large Roman altar, of one entire ſtone, was found ſome years ago near this place, and put into the hands of the learned Dr Liſter, who, in his account of it ſent to the Royal Society, ſays it was erected to Marcus Aurelius Antoninus Caracalla, when he took upon him the command of the empire and the whole army (after his father's death at York), for his ſafe return from his ſucceſsful expedition againſt the Scots and Picts. W. Long. 1. 12. N. Lat. 55. 44.

SHIFTERS,

SHIFTERS, on board a man of war, certain men who are employed by the cooks to ſhift and change the water in which the fleſh or fiſh is put, and laid for ſome time, in order to fit it for the kettle.

SHIFTING A TACKLE, in ſea language, the act of removing the blocks of a tackle to a greater diſtance from each other, on the object to which they are applied, in order to give a greater ſcope or extent to their purchaſe. This operation is otherwiſe called *fleeting*. Shifting the helm denotes the alteration of its poſition, by puſhing it towards the oppoſite ſide of the ſhip. Shifting the voyal, ſignifies changing its poſition on the capſtern, from the right to the left, and *vice verſa*.

SHILLING, an Engliſh ſilver coin, equal to twelve pence, or the twentieth part of a pound.

Frcherus derives the Saxon *ſcilling*, whence our ſhilling, from a corruption of *ſiliqua*; proving the derivation by ſeveral texts of law, and, among others, by the 26th law, *De annuis legatis*. Skinner deduces it from the Saxon *ſcild*, "ſhield," by reaſon of the eſcutcheon of arms thereon.

Biſhop Hooper derives it from the Arabic *ſchecle*, ſignifying *a weight*; but others, with greater probability, deduce it from the Latin *ſicilicus*, which ſignified in that language *a quarter of an ounce*, or the 48th part of a Roman pound. In confirmation of this etymology it is alleged, that the ſhilling kept its original ſignification, and bore the ſame proportion to the Saxon pound as ſicilicus did to the Roman and the Greek, being exactly the 48th part of the Saxon pound; a diſcovery which we owe to M. Lambarde *.

Explicatio num et verborum in leg. Sax. ap. Libra.

However, the Saxon laws reckon the pound in the round number at 50 ſhillings, but they really coined out of it only 48; the value of the ſhilling was fivepence; but it was reduced to fourpence above a century before the Conqueſt; for ſeveral of the Saxon laws, made in Athelſtan's reign, oblige us to take this eſtimate. Thus it continued to the Norman times, as one of the Conqueror's laws ſufficiently aſcertains; and it ſeems to have been the common coin by which the Engliſh payments were adjuſted. After the Conqueſt, the French *ſolidus* of twelvepence, which was in uſe among the Normans, was called by the Engliſh name of ſhilling; and the Saxon ſhilling of fourpence took a Norman name, and was called the *groat*, or great coin, becauſe it was the largeſt Engliſh coin then known in England.

It has been the opinion of the biſhops Fleetwood and Gibſon, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and ſhillings, as well as by pence and farthings, had been in conſtant uſe even from the Saxon times, long before the Norman conqueſt, there never was ſuch a coin in England as either a pound or a mark, nor any ſhilling till the year 1504 or 1505, when a few ſilver ſhillings or twelve-pences were coined, which have long ſince been ſolely confined to the cabinets of collectors.

Mr Clarke combats this opinion, alleging that ſome coins mentioned by Mr Folkes, under Edward I. were probably Saxon ſhillings new minted, and that Archbiſhop Aelfric expreſsly ſays †, that the Saxons had three names for their money, viz. mancuſes, ſhillings, and pennies. He alſo urges the different value of the Saxon ſhilling at different times, and its uniform proportion to the pound, as an argument that their ſhilling was a coin; and the teſtimony of the Saxon goſpels, in which the words we have tranſlated *pieces of ſilver* is rendered *ſhillings*, which, he ſays, they would hardly have done, if there had been no ſuch coin as a ſhilling then in uſe. Accordingly the Saxons expreſſed their ſhilling in Latin by *ſiclus* and *argenteus*. He farther adds, that the Saxon ſhilling was never expreſſed by *ſolidus* till after the Norman ſettlement in England; and howſoever it altered during the long period that elapſed from the Conqueſt to the time of Henry VII. it was the moſt conſtant denomination of money in all payments, though it was then only a ſpecies of account, or the twentieth part of the pound ſterling: and when it was again revived as a coin, it leſſened gradually as the pound ſterling leſſened, from the 28th of Edward III. to the 43d of Elizabeth.

† *Gram. Saxon, p. 52.*

In the year 1560, there was a peculiar ſort of ſhilling ſtruck in Ireland, of the value of ninepence Engliſh, which paſſed in Ireland for twelvepence. The motto on the reverſe was, *poſui Deum adjutorem meum*. Eighty-two of theſe ſhillings, according to Malynes, went to the pound; they therefore weighed 20 grains, one-fourth each, which is ſomewhat heavier in proportion than the Engliſh ſhilling of that time, 62 whereof went to the pound, each weighing 92 grains ſeven-eighths; and the Iriſh ſhilling being valued at the Tower at ninepence Engliſh, that is, one-fourth part leſs than the Engliſh ſhilling, it ſhould therefore proportionably weigh one-fourth part leſs, and its full weight be ſomewhat more than 62 grains; but ſome of them found at this time, though much worn, weighed 69 grains. In the year 1598, five different pieces of money of this kind were ſtruck in England for the ſervice of the kingdom of Ireland. Theſe were ſhillings to be current in Ireland at twelvepence each; half ſhillings to be current at ſixpence, and quarter ſhillings at threepence. Pennies and halfpennies were alſo ſtruck of the ſame kind, and ſent over for the payment of the army in Ireland. The money thus coined was of a very baſe mixture of copper and ſilver; and two years after there were more pieces of the ſame kinds ſtruck for the ſame ſervice, which were ſtill worſe; the former being three ounces of ſilver to nine ounces of copper; and theſe latter only two ounces eighteen pennyweights to nine ounces two pennyweights of the alloy.

The Dutch, Flemiſh, and Germans, have likewiſe their ſhilling, called *ſchelin*, *ſchilling*, *ſcalin*, &c. but theſe not being of the ſame weight or fineneſs with the Engliſh ſhilling, are not current at the ſame value. The Engliſh ſhilling is worth about 23 French ſols; thoſe of Holland and Germany about 11 ſols and a half; thoſe of Flanders about nine. The Dutch ſhillings are alſo called *ſols de gros*, becauſe equal to twelve gros. The Danes have copper ſhillings worth about one-fourth of a farthing ſterling.

SHILOH is a term famous among interpreters and commentators upon Scripture. It is found (Gen. xlix. 10.) to denote the Meſſiah. The patriarch Jacob foretels his coming in theſe words: "The ſceptre ſhall not depart from Judah, nor a lawgiver from between his feet, until Shiloh come; and unto him ſhall the gathering of the people be." The Hebrew text reads, עד כי יבא שלה, *until Shiloh come*. All Chriſtian commentators agree, that this word ought to be underſtood of the Meſſiah, or Jeſus Chriſt; but all are not agreed about

about its literal and grammatical ſignification. St Jerome, who tranſlates it by *Qui mittendus eſt*, manifeſtly reads *Shiloach* "ſent," inſtead of *Shiloh*. The Septuagint have it Εως αν ελθη τα αποκειμενα αυτω; or, Εως αν ελθη ω αποκειται, (as if they had read שלן inſtead of שלה), i. e. "Until the coming of him to whom it is reſerved:" or, "Till we ſee arrive that which is reſerved for him."

It muſt be owned, that the ſignification of the Hebrew word *Shiloh* is not well known. Some tranſlate, "the ſceptre ſhall not depart from Judah, till he comes to whom it belongs;" שלה or שלי inſtead of לי אלן Others, "till the birth of him who ſhall be born of a pacific;" or, "of proſperity," שלה *proſperatus eſt*. *Shalah* ſignifies, "to be in peace, to be in proſperity;" others, "till the birth of him who ſhall be born of a woman that ſhall conceive without the knowledge of a man," שול or שליא *ſecundina*, *fluxus*†; otherwiſe, "the ſceptre ſhall not depart from Judah, till its end, its ruin, till the downfal of the kingdom of the Jews," שאל or שלה *it has ceaſed, it has finiſhed* ‡. Some Rabbins have taken the name *Siloh* or *Shiloh*, as if it ſignified the city of this name in Paleſtine: "The ſceptre ſhall not be taken away from Judah till it comes to Shiloh; till it ſhall be taken from him to be given to Saul at Shiloh." But in what part of Scripture is it ſaid, that Saul was acknowledged as king or conſecrated at Shiloh? If we would underſtand it of Jeroboam the ſon of Nebat, the matter is ſtill as uncertain. The Scripture mentions no aſſembly at Shiloh that admitted him as king. A more modern author derives *Siloh* from שלה, *fatigare*, which ſometimes ſignifies *to be weary*, *to ſuffer*; "till his labours his ſufferings, his paſſion, ſhall happen."

But not to amuſe ourſelves about ſeeking out the grammatical ſignification of Shiloh, it is ſufficient for us to ſhow, that the ancient Jews are in this matter agreed with the Chriſtians: they acknowledge, that this word ſtands for the *Meſſiah the King*. It is thus that the paraphraſts Onkelos and Jonathan, that the ancient Hebrew commentaries upon Geneſis, and that the Talmudiſts themſelves, explain it. If Jeſus Chriſt and his apoſtles did not make uſe of this paſſage to prove the coming of the Meſſiah, it was becauſe then the completion of this prophecy was not ſufficiently manifeſt. The ſceptre ſtill continued among the Jews; they had ſtill kings of their own nation in the perſons of the Herods; but ſoon after the ſceptre was entirely taken away from them, and has never been reſtored to them ſince.

The conceited Jews ſeek in vain to put forced meanings upon this prophecy of Jacob; ſaying, for example, that the ſceptre intimates the dominion of ſtrangers, to which they have been in ſubjection, or the hope of ſeeing one day the ſceptre or ſupreme power ſettled again among themſelves. It is eaſy to perceive, that all this is contrived to deliver themſelves out of perplexity. In vain likewiſe they take refuge in certain princes of the captivity, whom they pretend to have ſubſiſted beyond the Euphrates, exerciſing an authority over their nation little differing from abſolute, and being of the race of David. This pretended ſucceſſion of princes is perfectly chimerical; and though at certain times they could ſhow a ſucceſſion, it continued but a ſhort time, and their authority was too obſcure, and too much limited, to be the object of a prophecy ſo remarkable as this was,

SHINGLES, in building, ſmall pieces of wood, or quartered oaken boards, ſawn to a certain ſcantling, or, as is more uſual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long. Ship.

Shingles are uſed inſtead of tiles or ſlates, eſpecially for churches and ſteeples; however, this covering is dear; yet, where tiles are very ſcarce, and a light covering is required, it is preferable to thatch; and where they are made of good oak, cleft, and not ſawed, and well ſeaſoned in water and the ſun, they make a ſure, light, and durable covering.

The building is firſt to be covered all over with boards, and the ſhingles nailed upon them.

SHIP, a general name for all large veſſels, particularly thoſe equipped with three maſts and a bowſprit; the maſts being compoſed of a lower-maſt, top-maſt, and top-gallant-maſt: each of theſe being provided with yards, ſails, &c. Ships, in general, are either employed for war or merchandiſe.

Ships of War are veſſels properly equipped with artillery, ammunition, and all the neceſſary martial weapons and inſtruments for attack or defence. They are diſtinguiſhed from each other by their ſeveral ranks or claſſes, called *rates*, as follows: Ships of the firſt rate mount from 100 guns to 110 guns and upwards; ſecond rate, from 90 to 98 guns; third rate, from 64 to 74 guns; fourth rate, from 50 to 60 guns; fifth rate, from 32 to 44 guns; and ſixth rates, from 20 to 28 guns. See the article RATE. Veſſels carrying leſs than 20 guns are denominated *ſloops*, *cutters*, *fire-ſhips*, and *bombs*. It has lately been propoſed to reduce the number of theſe rates, which would be a ſaving to the nation, and alſo productive of ſeveral material advantages.

In Plate CCCCL. is the repreſentation of a firſt rate, with rigging, &c. the ſeveral parts of which are as follow:

Parts of the hull.—A, The cathead; B, The fore-chain-wales, or chains; C, The main-chains; D, The mizen-chains; E, The entering port; F, The hawſe-holes; G, The poop-lanterns; H, The cheſs-tree; I, The head; K, The ſtern.

1, The bowſprit. 2, Yard and ſail. 3, Gammoning. 4, Manrop. 5, Bobſtay. 6, Spritſail-ſheets. 7, Pendants. 8, Braces and pendants. 9, Halliards. 10, Lifts. 11, Clue-lines. 12, Spritſail-horſes. 13, Buntlines. 14, Standing lifts. 15, Bowſprit-ſhroud. 16, Jib boom. 17, Jibſtay and ſail. 18, Halliards. 19, Sheets. 20, Horſes. 21, Jib-guy. 22, Spritſail-topſail yard. 23, Horſes. 24, Sheets. 25, Lifts. 26, Braces and pendants. 27, Cap of bowſprit. 28, Jack ſtaff. 29, Truck. 30, Jack flag.—31, *Fore-maſt*. 32, Runner and tackle. 33, Shrowds. 34, Laniards. 35, Stay and laniard. 36, Preventer-ſtay and laniard. 37, Woolding of the maſt. 38, Fore-yard and ſail. 39, Horſes. 40, Top. 41, Crowfoot. 42, Jeers. 43, Yard-tackles. 44, Lifts. 45, Braces and pendants. 46, Sheets. 47, Foretacks. 48, Bowlines and bridles. 49, Fore bunt-lines. 50, Fore leech-lines. 51, Preventer-brace. 52, Futtock-ſhrouds.—53, *Foretop-maſt*. 54, Shrouds and laniards. 55, Foretop-ſail yard and ſail. 56, Stay and ſail. 57, Runner. 58, Back-ſtays. 59, Halliards. 60, Lifts. 61, Braces and pendants. 62, Horſes. 63, Clew-lines. 64, Bowlines and bridles. 65, Reef-tackles. 66, Sheets. 67, Buntlines.

Ship. Buntlines. 68, Croſs-trees. 69, Cap. 70, Foretop-gallant-maſt. 71, Shrouds. 72, Yard and ſail. 73, Backſtays. 74, Stay. 75, Lifts. 76, Clew-lines. 77, Braces and pendants. 78, Bowlines and bridles. 79, Flag-ſtaff. 80, Truck. 81, Flag-ſtaff-ſtay. 82, Flag of the lord high admiral.—83, *Main-maſt*. 84, Shrouds. 85, Laniards. 86, Runner and tackle. 87, Futtock-ſhrouds. 88, Top-lantern. 89, Crank of ditto. 90, Stay. 91, Preventer ſtay. 92, Stay-tackles. 93, Woolding of the maſt. 94, Jeers. 95, Yard-tackles. 96, Lifts. 97, Braces and pendants. 98, Horſes. 99, Sheets. 100, Tacks. 101, Bowlines and bridles. 102, Crow-foot. 103, Cap. 104, Top. 105, Buntlines. 106, Leechlines. 107, Yard and ſail.—108, *Main-topmaſt*. 109, Shrouds and laniards. 110, Yard and ſail. 111, Futtock ſhrouds. 112, Backſtays. 113, Stay. 114, Stayſail and halliards. 115, Tye. 116, Halliards. 117, Lifts. 118, Clew-lines. 119, Braces and pendants. 120, Horſes. 121, Sheets. 122, Bowlines and Bridles. 123, Buntlines. 124, Reef-tackles. 125, Croſs trees. 126, Cap.—127, *Main-top-gallant-maſt*, 128, Shrouds and laniards. 129, Yard and ſail. 130, Backſtays. 131, Stay. 132, Stayſail and halliard, 133, Lifts. 134, Braces and pendants. 135, Bowlines and bridles. 136, Clew-lines. 137, Flagſtaff. 138, Truck. 139, Flagſtaff-ſtay. 140, Flag ſtandard.—141, *Mizen-Maſt*. 142, Shrouds and laniards. 143, Cap. 144, Yard and ſail. 145, Block for ſignal halliards. 146, Sheet. 147, Pendant lines. 148, Peck-brails. 149, Stayſail. 150, Stay. 151, Derrick and ſpan. 152, Top. 153, Croſs-jack yard. 154, Croſs-jack lifts. 155, Croſs-jack braces. 156, Croſs-jack ſlings.—157, *Mizen-top-maſt*. 158, Shrouds and laniards. 159, Yard and ſail. 160, Backſtays. 161, Stay. 162, Halliards. 163, Lifts. 164, Braces and pendants. 165, Bowlines and bridles. 166, Sheets. 167, Clew-lines. 168, Stayſail. 169, Croſs-trees. 170, Cap. 171, Flagſtaff. 172, Flagſtaff-ſtay. 173, Truck. 174, Flag, union. 175, Enſign-ſtaff. 176, Truck. 177, Enſign. 178, Stern ladder. 179, Bower cable.

Fig. 2. Plate CCCCLI. is a vertical longitudinal ſection of a firſt rate ſhip of war, with references to the principal parts; which are as follow:

A, Is the head, containing,—1, The ſtem; 2, The knee of the head or cutwater; 3, The lower and upper cheek; 4, The trail-board; 5, The figure; 6, The gratings; 7, The brackets; 8, The falſe ſtem; 9, The breaſt hooks; 10, The hauſe holes; 11. The bulkhead forward; 12, The cat-head: 13, The cat-hook; 14, Neceſſary ſeats; 15, The manger within board; 16, The bowſprit.

B, Upon the forecaſtle—17, The gratings; 18, The partners of the maſt; 19, The gunwale; 20, The belfry; 21, The funnel for ſmoke; 22, The gangway going off the forecaſtle; 23, The forecaſtle guns.

C, In the forecaſtle—24, The door of the bulkhead forward; 25, Officers cabins; 26, Staircaſe; 27, Foretop-ſail ſheet bits; 28, The beams; 29, The carlings.

D, The middle gun-deck forward—30, The fore-jeer bits; 31, The oven and furnace of copper; 32, The captain's cook-room; 33, the ladder or way to the forecaſtle.

E, The lower gun-deck forward—34, The knees fore and aft; 35, The ſpirketings, or the firſt ſtreak next to each deck, the next under the beams being called *clamps*; 36, The beams of the middle gun-deck fore and aft; 37, The carlings of the middle gun-deck fore and aft; 38, The fore bits; 39, The after or main bits; 40, The hatchway to the gunner's and boatſwain's ſtore-rooms; 41, The jeer capſtan.

F, The orlop—42, 43, 44, The gunner's, boatſwain's, and carpenter's ſtore-rooms; 45, The beams of the lower gun-deck; 46, 47, The pillars and the riders, fore and aft; 48, The bulkhead of the ſtore-rooms.

G, The hold—49, 50, 51, The foot-hook rider, the floor rider, and the ſtandard, fore and aft; 52, The pillars; 53, The ſtep of the foremaſt; 54, The kelſon, or falſe keel, and dead riſing; 55, The dead-wood.

H, At midſhips in the hold—56, The floor-timbers; 57, The keel; 58, The well; 59, The chain pump; 60, The ſtep of the mainmaſt; 61, 62, Beams and carlings of the orlop, fore and aft.

I, The orlop amidſhips—63, The cable tire; 64, The main hatchway.

K, The lower gun-deck amidſhips—65, The ladder leading up to the middle gun-deck; 66, The lower tire of ports.

L, The middle gun-deck amidſhip—67, The middle tire of ports; 68, The entering port; 69, The main jeer bits; 70, Twiſted pillars or ſtanchions; 71, the capſtan; 72, Gratings; 73, The ladder leading to the upper deck.

M, The upper gun-deck amidſhips—74, The main top-ſail-ſheet bits; 75, The upper partners of the mainmaſt; 76, The gallows on which ſpare topmaſts &c. are laid; 77, The foreſheet blocks; 78, The rennets; 79, The gunwale; 80, The upper gratings; 81, The drift brackets; 82, The pin-rail; 83, The capſtan pall.

N, Abaft the mainmaſt—84, The gangway off the quarterdeck; 85, The bulkhead of the coach; 86, The ſtaircaſe down to the middle gun-deck; 87, The beams of the upper deck; 88, The gratings about the main-maſt; 89, The coach or council-chamber; 90, The ſtaircaſe up to the quarterdeck.

O, The quarterdeck—91, The beams; 92, The carlings; 93, The partners of the mizenmaſt; 94, The gangway up to the poop; 95, The bulkhead of the cuddy.

P, The poop—96, The trumpeter's cabin; 97, The taffarel.

Q, The captain's cabin.

R, The cuddy, uſually divided for the maſter and ſecretary's officers.

S, the ſtate-room, out of which is made the bed-chamber and other conveniences for the commander in chief; 98, The entrance into the gallery; 99, The bulkhead of the great cabin; 100, The ſtern lights and after galleries.

T, The ward-room, allotted for the lieutenants and marine officers: 101, The lower gallery; 102, The ſteerage and bulkhead of the ward-room; 103, The whip-ſtaff, commanding the tiller; 104, The after ſtaircaſe leading down to the lower gun-deck.

V, Several officers cabins abaft the mainmaſt, where the ſoldiers generally keep guard.

W, The gun-room—105, The tiller commanding the rudder; 106, The rudder; 107, The ſtern-poſt; 108, The tiller-tranſom; 109, The ſeveral tranſoms, viz. 1, 2, 3, 4, 5; 110, The gun-room ports, or ſtern-chaſe; 111, The

SHIP.

A FIRST RATE SHIP of WAR with Rigging &c. at Anchor.

Ship. 111, The bread-room ſcuttle, out of the gun-room; 112, The main capſtan; 113, The pall of the capſtan; 114, The partner; 115, The bulkhead of the bread-room.

X, The bread-room.

Y, The ſteward's room, where all proviſions are weighed and ſerved out.

Z, The cockpit, where are ſubdiviſions for the purſer, the ſurgeon, and his mates.

AA, The platform or orlop, where proviſion is made for the wounded in the time of ſervice; 116, The hold abaft the main-maſt; 117, The ſtep of the mizen-maſt; 118, The kelſon, or falſe keel; 119, The dead wood, or riſing.

Ships of war are fitted out either at the expence of the ſtate or by individuals. Thoſe fitted out at the public expence are called *King's ſhips*, and are divided into *ſhips of the line*, *frigates*, *ſloops*, &c. For an account of each of theſe, ſee the reſpective articles. Ships of war fitted out by individuals are called *privateers*. See the article PRIVATEER.

Armed-SHIP. See *ARMED-Ship.*

Bomb-SHIP. See *BOMB-Veſſels.*

Double-SHIP. See *SHIP-Building.*

Fire-SHIP. See *FIRE-Ship.*

Hoſpital-SHIP, a veſſel fitted up to attend on a fleet of men of war, and receive their ſick or wounded; for which purpoſe her decks ſhould be high, and her ports ſufficiently large. Her cables ought alſo to run upon the upper deck, to the end that the beds or cradles may be more commodiouſly placed between decks, and admit a free paſſage of the air to diſperſe that which is offenſive or corrupted.

Merchant-SHIP, a veſſel employed in commerce to carry commodities of various ſorts from one port to another.

The largeſt merchant ſhips are thoſe employed by the different companies of merchants who trade to the Eaſt Indies. They are in general larger than our 40 gun ſhips; and are commonly mounted with 20 guns on their upper deck, which are nine pounders; and ſix on their quarter deck, which are ſix pounders.

Regiſter SHIP. See *REGISTER Ship.*

Store-SHIP, a veſſel employed to carry artillery or naval ſtores for the uſe of a fleet, fortreſs, or garriſon.

Tranſport-SHIP, is generally uſed to conduct troops from one place to another.

Beſides the different kinds of ſhips above-mentioned, which are denominated from the purpoſe for which they are employed, veſſels have alſo, in general, been named according to the different manner of rigging them. It would be an endleſs, and at the ſame time an unneceſſary taſk, to enumerate all the different kinds of veſſels with reſpect to their rigging; and therefore a few only are here taken notice of. Fig. 3. Plate CCCCLI. is a *ſhip* which would be converted into a *bark* by ſtripping the mizen-maſt of its yards and the ſails belonging to them. If each maſt, its correſponding topmaſt and topgallant maſt, inſtead of being compoſed of ſeparate pieces of wood, were all of one-continued piece, then this veſſel with very little alteration would be a *polacre*. Fig. 4. repreſents a *ſnow*; fig. 5. a *bilander*; fig. 6. a *brig*; fig. 7. a *ketch*; fig. 8. a *ſchooner*; fig. 9. a *ſloop*; fig. 10. a *xebec*; fig. 11. a *galliot*; fig. 12. a *dogger*; fig. 13. a *galley* under ſail; fig. 14. ditto.

Plate CCCCLII.

Ships are alſo ſometimes named according to the different modes of their conſtruction. Thus we ſay, a *cat*-built ſhip, &c. Ship.

To SHIP, is either uſed actively, as to embark any perſon or put any thing aboard ſhip: or paſſively, to receive any thing into a ſhip; as, "we ſhipped a heavy ſea at three o'clock in the morning."

To SHIP, alſo implies to fix any thing in its place; as, to ſhip the oars, that is, to put them in their rowlocks; to ſhip the ſwivel guns, is to fix them in their ſockets; to ſhip the handſpokes, &c.

Machine for drawing Bolts out of SHIPS, an inſtrument invented by Mr William Hill for this purpoſe. His account of which is as follows *.

* *Tranſactions of the Society for the Encouragement of Arts*, &c. Vol. X.

"Firſt, The uſe of this machine is to draw the kelſon and dead wood bolts out, and to draw the knee of the head bolts. Secondly, The heads of the kelſon bolts heretofore were all obliged to be driven through the kelſon floor timbers, and keel, to get them out: by this means the kelſon is often entirely deſtroyed, and the large hole the head makes materially wounds the floors; and frequently, when the bolt is much corroded, it ſcarfs, and the bolt comes out of the ſide of the keel.—Thirdly, The dead-wood bolts that are driven with two or three drifts, are ſeldom or never got out, by which means the dead-wood is condemned, when ſome of it is really ſerviceable.—Fourthly, In drawing the knee of the head-bolts, ſometimes the knee ſtarts off, and cannot be got to again, but furs up, and with this machine may be drawn in; for it has been proved to have more power in ſtarting a bolt than the maul."

Plate CCCCLIII

In fig. 1. "A, A, repreſent two ſtrong male ſcrews, working in female ſcrews near the extremities of the cheeks againſt plates of iron E, E. CC is the bolt to be drawn; which, being held between the chaps of the machine at D D, is, by turning the ſcrews by the lever B, forced upwards out of the wood or plank of the ſhip. F, F, are two dogs, with hooks at their lower extremities; which, being driven into the plank, ſerve to ſupport the machine till the chaps have got faſt hold of the bolt. At the upper part of theſe dogs are rings paſſing through holes in a collar, moveable near the heads of the ſcrews. Fig. 2. is a view of the upper ſide of the cheeks when joined together; *a*, *a*, the holes in which the ſcrews work; *b*, the chaps by which the bolts are drawn. Fig. 3. The under ſide of the cheek: *a*, *a*, the holes in which the ſcrews work; *b*, the chaps by which the bolts are drawn, and where the teeth that gripe the bolt are more diſtinctly ſhown. Fig. 4. One of the cheeks ſeparated from the other, the letters referring as in fig. 2. and 3.

This machine was tried in his majeſty's yard at Deptford, and was found of the greateſt utility.—"Firſt, It drew a bolt that was driven down ſo tight as only to go one inch in ſixteen blows with a double headed maul, and was well clenched below: the bolt drew the ring a conſiderable way into the wood, and wire-drew itſelf through, and left the ring behind. Secondly, It drew a bolt out of the Venus's dead-wood that could not be got out by the maul. That part of it which went through the keel was bent cloſe up to the lower part of the dead-wood, and the machine drew the bolt ſtraight, and drew it out with eaſe. It alſo drew a kelſon bolt out of the Stanley Weſt Indiaman, in Meſſrs Wells's yard, Deptford; which being a bolt of two drifts, could not be driven out.

Ship.

Management of SHIPS *at ſingle anchor*, is the method of taking care of a ſhip while riding at ſingle anchor in a tide-way, by preventing her from fouling her anchor, &c. The following rules for this purpoſe, with which we have been favoured by Mr Henry Taylor * of North Shields, will be found of the utmoſt conſequence.

Taylor's inſtructions to Young Mariners riding at ſingle anchor in moderate weather.

Riding, in a tide-way, with a freſh-of-wind, the ſhip ſhould have what is called *a ſhort* or *windward ſervice*, ſay 45 or 50 fathoms of cable, and always ſheered to windward (A), not always with the helm hard down, but more or leſs ſo according to the ſtrength or weakneſs of the tide. It is a known fact, that many ſhips ſheer their anchors home, drive on board of other ſhips, and on the ſands near which they rode, before it has been diſcovered that the anchor had been moved from the place where it was let go.

1 When the wind is croſs, or nearly croſs, off-ſhore, or in the oppoſite direction, ſhips will always back. This is done by the mizen-topſail, aſſiſted, if needful, by the mizen-ſtayſail; ſuch as have no mizen-topſail commonly uſe the main-topſail, or if it blows freſh, a top-gallantſail, or any ſuch ſail at the gaff.

In backing, a ſhip ſhould always wind with a taught cable, that it may be certain the anchor is drawn round. In caſe there is not a ſufficiency of wind for that purpoſe, the ſhip ſhould be hove apeak.

2 Riding with the wind afore the beam, the yards ſhould be braced forward; if abaft the beam, they are to be braced all aback.

3 If the wind is ſo far aft that the ſhip will not back (which ſhould not be attempted if, when the tide ceaſes, the ſhip forges ahead, and brings the buoy on the lee quarter), ſhe muſt be ſeat ahead; if the wind is far aft, and blows freſh, the utmoſt care and attention is neceſſary, as ſhips riding in this ſituation often break their ſheer, and come to windward of their anchors again. It ſhould be obſerved, that when the ſhip lies in this tickliſh ſituation, the after-yards muſt be braced forward, and the fore-yards the contrary way: ſhe will lie ſafe, as the buoy can be kept on the lee quarter, or ſuppoſe the helm is aport, as long as the buoy is on the larboard quarter. With the helm thus, and the wind right aft, or nearly ſo, the ſtarboard main and fore braces ſhould be hauled in. This ſuppoſes the main braces to lead forward.

4 When the ſhip begins to tend to leeward, and the buoy comes on the weather-quarter, the firſt thing to be done is to brace about the fore-yard; and when the wind comes near the beam, ſet the fore-ſtayſail, and keep it ſtanding until it ſhakes; then brace all the yards ſharp forward, eſpecially if it is likely to blow ſtrong.

Ship.

If lying in the aforeſaid poſition, and ſhe breaks her ſheer, brace about the main-yard immediately; if ſhe recovers and brings the buoy on the lee or larboard quarter, let the main-yard be again braced about; but if ſhe come to a ſheer the other way, by bringing the buoy on the other quarter, change the helm and brace the fore-yard to.

How to manage when the ſhip breaks her ſheer.

6 When a long ſervice is out, and the ſhip is likely to go to windward.

Riding leeward tide with more cable than the windward ſervice, and expecting the ſhip will go to windward of her anchor, begin as ſoon as the tide eaſes to ſhorten in the cable. This is often hard work; but it is neceſſary to be done, otherwiſe the anchor may be fouled by the great length of cable the ſhip has to draw round; but even if that could be done, the cable would be damaged againſt the bows or cut-water. It is to be obſerved, that when a ſhip rides windward-tide the cable ſhould be cackled from the ſhort ſervice towards the anchor, as far as will prevent the bare part touching the ſhip.

When the ſhip tends to windward and muſt be ſet ahead, hoiſt the fore-ſtayſail as ſoon as it will ſtand, and when the buoy comes on the lee-quarter, haul down the fore-ſtayſail, brace to the fore-yard, and put the helm a-lee; for till then the helm muſt be kept a-weather and the yards full.

7 How to manage in a ſtorm. When the ſhip rides leeward tide, and the wind increaſes, care ſhould be taken to give her more cable in time, otherwiſe the anchor may ſtart, and probably it will be troubleſome to get her brought up again; and this care is the more neceſſary when the ſhip rides in the hauſe of another ſhip. Previous to giving a long ſervice it is uſual to take a weather-bit, that is, a turn of the cable over the windlaſs end, ſo that in veering away the ſhip will be under command. The ſervice ought to be greaſed, which will prevent its chafing in the hauſe.

If the gale continues to increaſe, the topmaſts ſhould be ſtruck in time; but the fore-yard, ſhould ſeldom, if ever, be lowered down, that in caſe of parting the fore-ſail may be ready to ſet. At ſuch times there ſhould be more on deck than the common anchor-watch, that no accident may happen from inattention or falling aſleep.

In a tide-way a ſecond anchor ſhould never be let go but when abſolutely neceſſary; for a ſhip will ſometimes ride eaſier and ſafer, eſpecially if the ſea runs high, with a very long ſcope of cable and one anchor, than with leſs

---

(A) It has been thought by ſome theoriſts, that ſhips ſhould be ſheered to leeward of their anchors; but experience and the common practice of the beſt informed ſeamen are againſt that opinion: for it is found, that when a ſhip rides leeward tide and ſheered to windward, with the wind two or three points upon the bow, and blowing hard, in the interval between the ſqualls the ſheer will draw her towards the wind's eye; ſo that when the next ſquall comes, before ſhe be preſſed aſtream of her anchor, it is probable there will be a lull again, and the ſpring which the cable got by the ſheer will greatly eaſe it during the ſquall.

Every ſeaman knows that no ſhip without a rudder, or the helm left looſe, will wear; they always in ſuch ſituations fly to: this proves that the wind preſſing upon the quarter and the helm a-lee, a ſhip will be leſs liable to break her ſheer than when the helm is a-weather. Beſides, if the helm is a-lee when ſhe breaks her ſheer, it will be a-weather when the wind comes on the other quarter, as it ought to be until ſhe either ſwing to leeward, or bring the buoy on the other quarter. Now if the ſhip breaks her ſheer with the helm a-weather, it throws her head to the wind ſo ſuddenly as ſcarce to give time to brace the yards about, and very probably ſhe will fall over her anchor before the fore-ſtayſail can be got up.

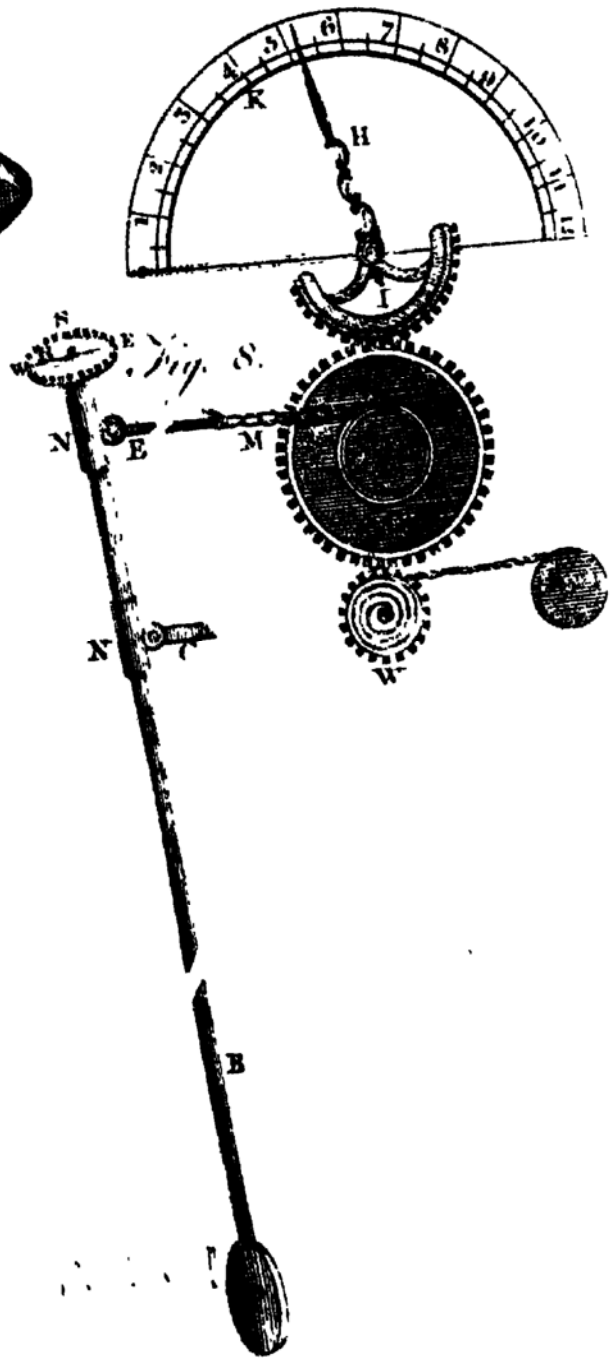
Fig. 8.



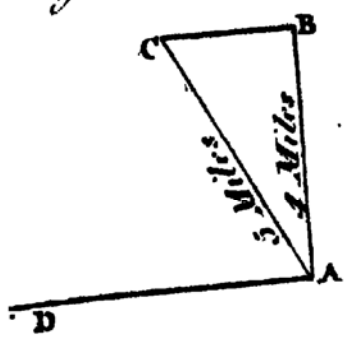


Fig. 9.

Ship. leſs length and two cables; however, it is adviſable, as a preventive, when ſhips have not room to drive, and the night is dark, to let fall a ſecond anchor under foot, with a range of cable along the deck. If this is not thought neceſſary to be done, the deep-ſea lead ſhould be thrown overboard, and the line frequently handled by the watch, that they may be aſſured ſhe rides faſt.

8 Caution reſpecting the anchor-watch.

If at any time the anchor-watch, preſuming on their own knowledge, ſhould wind the ſhip, or ſuffer her to break her ſheer without calling the mate, he ſhould immediately, or the very firſt opportunity, oblige the crew to heave the anchor in ſight; which will prevent the commiſſion of the like fault again; for beſides the ſhare of trouble the watch will have, the reſt of the crew will blame them for neglecting their duty.

9 The particular duty of the chief mate.

Prudent mates ſeldom lie a week in a road-ſtead without heaving their anchor in ſight; even though they have not the leaſt ſuſpicion of its being foul. There are other reaſons why the anchor ſhould be looked at; ſometimes the cable receives damage by ſweeping wrecks or anchors that have been loſt, or from rocks or ſtones; and it is often neceſſary to trip the anchor, in order to take a clearer birth, which ſhould be done as often as any ſhip brings up too near.

Method for the ſafe removal of ſuch Ships as have been driven on ſhore. For this purpoſe empty caſks are uſually employed to float off the veſſel, eſpecially if ſhe is ſmall, and at the ſame time near the port to which it is propoſed to conduct her. In other caſes, the following method adopted by Mr Bernard * will anſwer.

Philoſophical Tranſactions, Vol. LXX. Part I.

"On January 1. 1779 (ſays Mr Barnard), in a moſt dreadful ſtorm, the York Eaſt Indiaman, of eight hundred tons, homeward bound, with a pepper cargo, parted her cables in Margate roads, and was driven on ſhore, within one hundred feet of the head and thirty feet of the ſide of Margate pier, then drawing twenty-two feet ſix inches water, the flow of a good ſpring tide being only fourteen feet at that place.

"On the third of the ſame month I went down, as a ſhip-builder, to aſſiſt, as much as lay in my power, my worthy friend Sir Richard Hotham, to whom the ſhip belonged. I found her perfectly upright, and her ſheer (or ſide appearance) the ſame as when firſt built, but ſunk to the twelve feet water mark fore and aft in a bed of chalk mixed with a ſtiff blue clay, exactly the ſhape of her body below that draft of water; and from the rudder being torn from her as ſhe ſtruck coming on ſhore, and the violent agitation of the ſea after her being there, her ſtern was ſo greatly injured as to admit free acceſs thereto, which filled her for four days equal to the flow of the tide. Having fully informed myſelf of her ſituation and the flow of ſpring-tides, and being clearly of opinion ſhe might be again got off, I recommended, as the firſt neceſſary ſtep, the immediate diſcharge of the cargo; and, in the progreſs of that buſineſs, I found the tide always flowed to the ſame height on the ſhip; and when the cargo was half diſcharged, and I knew the remaining part ſhould not make her draw more than eighteen feet water, and while I was obſerving the water at twenty-two feet ſix inches by the ſhip's marks, ſhe inſtantly lifted to ſeventeen feet eight inches; the water and air being before excluded by her preſſure on the clay, and the atmoſphere acting upon her upper part equal to ſix hundred tons, which is the weight of water diſplaced at the difference of theſe two drafts of water. Ship.

"The moment the ſhip lifted, I diſcovered ſhe had received more damage than was at firſt apprehended, her leaks being ſuch as filled her from four to eighteen feet water in an hour and a half. As nothing effectual was to be expected from pumping, ſeveral ſcuttles or holes in the ſhip's ſide were made, and valves fixed thereto, to draw off the water at the loweſt ebb of the tide, to facilitate the diſcharge of the remaining part of the cargo; and, after many attempts, I ſucceeded in an external application of ſheep ſkins ſewed on a ſail and thruſt under the bottom, to ſtop the body of water from ruſhing ſo furiouſly into the ſhip. This buſineſs effected, moderate pumping enabled us to keep the ſhip to about ſix feet water at low water, and by a vigorous effort we could bring the ſhip ſo light as (when the cargo ſhould be all diſcharged) to be eaſily removed into deeper water. But as the external application might be diſturbed by ſo doing, or totally removed by the agitation of the ſhip, it was abſolutely neceſſary to provide ſome permanent ſecurity for the lives of thoſe who were to navigate her to the river Thames. I then recommended as the cheapeſt, quickeſt, and moſt effectual plan, to lay a deck in the hold, as low as the water could be pumped to, framed ſo ſolidly and ſecurely, and caulked ſo tight, as to ſwim the ſhip independent of her own leaky bottom.

"Beams of fir timber twelve inches ſquare were placed in the hold under every lower deck beam in the ſhip, as low as the water would permit; theſe were in two pieces, for the conveniency of getting them down, and alſo for the better fixing them of an exact length, and well bolted together when in their places. Over theſe were laid long Dantzic deals of two inches and a half thick, well nailed and caulked. Againſt the ſhip's ſide, all fore and aft, was well nailed a piece of fir twelve inches broad and ſix inches thick on the lower and three inches on the upper edge, to prevent the deck from riſing at the ſide. Over the deck, at every beam, was laid a croſs piece of fir timber ſix inches deep and twelve inches broad, reaching from the pillar of the hold to the ſhip's ſide, on which the ſhores were to be placed to reſiſt the preſſure of the water beneath. On each of theſe, and againſt the lower deck beam, at equal diſtances from the ſide and middle of the ſhip, was placed an upright ſhore, ſix inches by twelve, the lower end let two inches into the croſs piece. From the foot of this ſhore to the ſhip's ſide, under the end of every lower deck beam, was placed a diagonal ſhore ſix inches by twelve, to eaſe the ſhip's deck of part of the ſtrain by throwing it on the ſide. An upright ſhore of three inches by twelve was placed from the end of every croſs piece to the lower deck beams at the ſide, and one of three inches by twelve on the midſhip end of every croſs piece to the lower deck beam, and nailed to the pillars in the hold. Two firm tight bulkheads or partitions were made as near the extremes of the ſhip as poſſible. The ceiling or inſide plank of the ſhip was very ſecurely caulked up to the lower deck, and the whole formed a complete ſhip with a flat bottom within ſide, to ſwim the outſide leaky one; and that bottom being depreſſed ſix feet below the external water, reſiſted the ſhip's weight above it equal to five hundred and eighty-one tons, and ſafely conveyed her to the dry dock at Deptford."

SHIP-BUILDING.

SHIP-BUILDING, or NAVAL ARCHITECTURE, is the art of conſtructing a ſhip ſo as to anſwer a particular purpoſe either of war or merchandiſe.

To whom the world is indebted for the invention of ſhips, is like all other things of equal antiquity, uncertain.

A very ſmall portion of art or contrivance was ſeen in the firſt ſhips: they were neither ſtrong nor durable; but conſiſted only of a few planks laid together, without beauty or ornament, and juſt ſo compacted as to keep out the water. In ſome places they were only the hulks or ſtocks of trees hollowed, and then conſiſted only of one piece of timber. Nor was wood alone applied to this uſe; but any other buoyant materials, as the Egyptian reed papyrus; or leather, of which the primitive ſhips were frequently compoſed; the bottom and ſides being extended on a frame of thin battens or ſcantlings, of flexible wood, or begirt with wickers, ſuch as we have frequently beheld amongſt the American ſavages. In this manner they were often navigated upon the rivers of Ethiopia, Egypt, and Sabean Arabia, even in later times. But in the firſt of them, we find no mention of any thing but leather or hides ſewed together. In a veſſel of this kind, Dardanus ſecured his retreat to the country afterwards called *Troas*, when he was compelled by a terrible deluge to forſake his former habitation of Samothrace. According to Virgil, Charon's infernal boat was of the ſame compoſition.

But as the other arts extended their influence, naval architecture likewiſe began to emerge from the gloom of ignorance and barbariſm; and as the ſhips of thoſe ages were increaſed in bulk, and better proportioned for commerce, the appearance of thoſe floating citadels of unuſual form, full of living men, flying with ſeemingly expanded wings over the ſurface of the untravelled ocean, ſtruck the ignorant people with terror and aſtoniſhment: and hence, as we are told by Ariſtophanes, aroſe the fable of Perſeus flying to the Gorgons, who was actually carried thither in a ſhip! Hence, in all probability, the famous ſtory of Triptolemus riding on a winged dragon is deduced, only becauſe he failed from Athens, in the time of a great dearth, to a more plentiful country, to ſupply the neceſſities of his people. The fiction of the flying horſe Pegaſus may be joined with theſe, who, as ſeveral mythologiſts report, was nothing but a ſhip with ſails, and thence ſaid to be the offſpring of Neptune the ſovereign of the ſea; nor does there appear any other foundation for the ſtories of griffins, or of ſhips tranſformed into birds and fiſhes, which we ſo often meet with in the ancient poets. So acceptable to the firſt ages of the world were inventions of this nature, that whoever made any improvements in navigation or naval architecture, building new ſhips better fitted for ſtrength or ſwiftneſs than thoſe uſed before, or rendered the old more commodious by additional contrivances, or diſcovered countries unknown to former travellers, were thought worthy of the greateſt honours, and often aſſociated into the number of their deified heroes. Hence we have in aſtronomy the ſigns of Aries and Taurus, which were no other than two ſhips: the former tranſported Phryxus from Greece to Colchos, and the latter Europa from Phœnicia to Crete. Argo, Pegaſus, and Perſeus, were likewiſe new ſhips of a different ſort from the former, which being greatly admired by the barbarous and uninſtructed people of thoſe times, were tranſlated amongſt the ſtars, in commemoration of their inventors, and metamorphoſed into conſtellations by the poets of their own and of ſucceeding ages. Hiſtory.

The chief parts, of which ſhips anciently conſiſted, were three, viz. the belly, the prow, and the ſtern: theſe were again compoſed of other ſmaller parts, which ſhall be briefly deſcribed in their order. In the deſcription, we chiefly follow Scheffer, who hath ſo copiouſly treated this ſubject, and with ſuch induſtry and learning collected whatever is neceſſary to illuſtrate it, that very little room is left for enlargement by thoſe who incline to purſue this inveſtigation.

1. In the belly, or middle part of the ſhip, there was τρόπις, *carina*, or the "keel," which was compoſed of wood: it was placed at the bottom of the ſhip, being deſigned to cut and glide through the waves, and therefore was not broad, but narrow and ſharp; whence it may be perceived that not all ſhips, but only the μακραι, which ſhips of war were called, whoſe bellies were ſtraight and of a ſmall circumference, were provided with keels, the reſt having uſually flat bottoms. Around the outſide of the keel were fixed pieces of wood, to prevent it from being damaged when the ſhip was firſt launched into the water, or afterwards ſtruck on any rocks; theſe were called χαλινοματα, in Latin *cunei*.

Next to the keel was φαλαις, the "pump-well, or well-room," within which was contained the αντλιον, or "pump;" through which water was conveyed out of the ſhip.

After this, there was δευτερα τροπις, or the "ſecond keel," ſomewhat reſembling what is now called the *kelſon*; it was placed beneath the pump, and called λισθιον, χαλκηνη, κλειτοποδιον: by ſome it is falſely ſuppoſed to be the ſame with φαλαις.

Above the pump was a hollow place, called by Herodotus κοιλη της νηος, by Pollux κυτος and γαστρα, becauſe large and capacious, after the form of a belly; by the Latins, *teſtudo*. This was formed by crooked ribs, with which it was ſurrounded, which were pieces of wood riſing from the keel upwards, and called by Heſychius νομεις, and by others, ἰσχοιλια, the belly of the ſhip being contained within them: in Latin, *coſtæ*; and in Engliſh, *timbers*. Upon theſe were placed certain planks, which Ariſtophanes calls ἑπτερυγιας, or ἑπτερυγιδα.

The πλευραι, *latera*, or "ſides" of the ſhip, encompaſſed all the former parts on both hands; theſe were compoſed of large rafters extended from prow to ſtern, and called ζωστηρες, and ζωμαπρατα, becauſe by them the whole fabric was begirt or ſurrounded.

In both theſe ſides the rowers had their places, called τοιχοι and ἑδωλια, in Latin *fori* and *tranſtra*, placed above one another; the loweſt was called θαλαμιαι, and thoſe that laboured therein θαλαμιοι; the middle ζυγιοι, and the men ζυγιοι; the uppermoſt θρανιοι, whence the rowers

History. rowers were termed θρανιται. In theſe apartments were ſpaces through which the rowers put their oars: theſe were ſometimes one continued vacuity from one end to the other, called τρωφηξ, but more uſually diſtinct holes, each of which was deſigned for a ſingle oar; theſe were ſtyled τρημαλια, τρυπηματα, as alſo οφθαλμοι, becauſe not unlike the eyes of living creatures. All of them were by a more general name termed ζυγωτα, from containing the oars; but ζυγωτιν ſeems to have been another thing, ſignifying the ſpaces between the banks of oars on each ſide, where the paſſengers appear to have been placed. On the top of all there was a paſſage or place to walk, called παρασος, and παρατηγνις, as joining to the θρανοι, or uppermoſt bank of oars.

2. Πρωρα, "the "prow or fore-deck," whence it is ſometimes called μετωπον, and commonly diſtinguiſhed by other metaphorical titles taken from human faces. In ſome ſhips there is mention of two prows, as alſo two ſterns: ſuch was Danaus's ſhip adorned by Minerva when he fled from Egypt. It was uſual to beautify the prow with gold and various ſorts of paint and colours; in the primitive times red was moſt in uſe; whence Homer's ſhips were commonly dignified with the titles of μιλτοπαρηοι, and φοινικοπαρηοι, or "red-faced;" the blue likewiſe, or ſky-colour, was frequently made uſe of, as bearing a near reſemblance to the colour of the ſea; whence we find ſhips called by Homer κυανοπρωροι, by Ariſtophanes κυανεμβολοι. Several other colours were alſo made uſe of; nor were they barely varniſhed over with them, but very often anneal'd by wax melted in the fire, ſo as neither the ſun, winds, nor water, were able to deface them. The art of doing this was called from the wax κηρογραφια, from the fire εγκαυστικη, which is deſcribed by Vitruvius, and mentioned in Ovid.

——— *Picta coloribus uſtis*
Cæruleam matrem concava puppis habet—

The painted ſhip with melted wax anneal'd
Had Tethys for its deity———

In theſe colours the various forms of gods, animals, plants, &c. were uſually drawn, which were likewiſe often added as ornaments to other parts of the ſhips, as plainly appears from the ancient monuments preſented to the world by Bayſius.

The ſides of the prow were termed πλευραι, or "wings," and παρηιαι, according to Scheffer, or rather παρειαι; for ſince the prow is commonly compared to a human face, it will naturally follow that the ſides ſhould be called *cheeks*. Theſe are now called *bows* by our mariners.

3. Πρυμνη, "the hind-deck or poop," ſometimes caleld ουρα, the "tail," becauſe the hindmoſt part of the ſhip: it was of figure more inclining to round than the prow, the extremity of which was ſharp, that it might cut the waters; it was alſo built higher than the prow, and was the place where the pilot ſat to ſteer; the outer-bending part of it was called στεγος, anſwering to our term *quarter*.

They had various ornaments of ſculpture on the prow; as helmets, animals, triumphal wreaths, &c.—The ſtern was more particularly adorned with wings, ſhields, &c. Sometimes a little maſt was erected thereon to hung ribbands of divers colours, which ſerved inſtead of a flag to diſtinguiſh the ſhip; and a weather-cock, to ſignify the part from whence the wind blew.

On the extremity of the prow was placed a round piece of wood, called the πλυγις, from its bending; and ſometimes οφθαλμος, the "eye" of the ſhip, becauſe fixed in the fore-deck; on this was inſcribed the name of the ſhip, which was uſually taken from the figure painted on the flag. Hence comes the frequent mention of ſhips called *Pegaſi*, *Scyllæ*, *bulls*, *rams*, *tigers*, &c. which the poets took the liberty to repreſent as living creatures that tranſported their riders from one country to another.

The whole fabric being completed, it was fortified with pitch, and ſometimes a mixture of roſin, to ſecure the wood from the waters; whence it comes that Homer's ſhips are everywhere mentioned with the epithet of μελαιναι, or "black." The firſt that made uſe of pitch were the inhabitants of Phæacia, ſince called Corfica; ſometimes wax was employed in the ſame uſe; whence Ovid,

Cærulea ceratas accipit unda rates.

The azure waves receive the waxed ſhips.

After all, the ſhip being bedecked with garlands and flowers, the mariners alſo adorned with crowns, ſhe was launched into the ſea with loud acclamations and other expreſſions of joy; and being purified by a prieſt with a lighted torch, an egg and brimſtone, or after ſome other manner, was conſecrated to the god whoſe image ſhe bore.

The ſhips of war of the ancients were diſtinguiſhed from other kinds of veſſels by various turrets and acceſſions of building, ſome to defend their own ſoldiers, and others to annoy the enemy; and from one another, in latter ages, by ſeveral degrees or ranks of oars, the moſt uſual number of which was four or five, which appear not to have been arranged, as ſome imagine, on the ſame level in different parts of the ſhip; nor yet, as others have ſuppoſed, directly above one another's heads; but their ſeats being placed one behind another, aſcended gradually, like ſtairs. Ptolemy Philopater, urged by a vain-glorious deſire of exceeding all the world beſides in naval architecture, is ſaid to have farther enlarged the number of banks to 40; and the ſhip being otherwiſe in equal proportion, this raiſed her to ſuch an enormous bulk, that ſhe appeared at a diſtance like a floating mountain or iſland; and, upon a nearer view like a prodigious caſtle on the ocean. She was 280 cubits long, 38 broad, and 48 high (each cubit being 1 Engliſh foot 5$\frac{1}{2}$ inches), and carried 400 rowers, 400 ſailors, and 3000 ſoldiers. Another which the ſame prince made to ſail on the Nile, we are told, was half a ſtadium long. Yet theſe were nothing in compariſon of Hiero's ſhip, built under the direction of Archimedes; on the ſtructure whereof Moſchion wrote a whole volume. There was wood enough employed in it to make 50 galleys; it had all the variety of apartments of a palace; ſuch as banqueting rooms, galleries, gardens, fiſh ponds, ſtables, mills, baths, and a temple to Venus. The floors of the middle apartment were all inlaid, and repreſented in various colours the ſtories of Homer's Iliad. The ceilings, windows, and all other parts, were finiſhed with wonderful art, and embelliſhed with all kinds of ornaments. In the uppermoſt apartment there was a ſpacious gymnaſium, or place for exerciſe, and water was conveyed to the garden by pipes,

ſome

History. ſome of hardened clay, and others of lead. The floors of the temple of Venus were inlaid with agates and other precious ſtones; the inſide lined with cypreſs wood; the windows adorned with ivory, paintings, and ſmall ſtatues. There was likewiſe a library. This veſſel was adorned on all ſides with fine paintings. It had 20 benches of oars, and was encompaſſed with an iron rampart, eight towers, with walls and bulwarks, furniſhed with machines of war, particularly one which threw a ſtone of 300 pounds, or a dart 12 cubits long, the ſpace of half a mile, with many other particulars related by Athenæus. Caligula likewiſe built a veſſel adorned with jewels in the poop, with ſails of many colours, and furniſhed with large porticoes, bagnios, and banqueting-rooms, beſides rows of vines, and fruit-trees of various kinds. But theſe, and all ſuch monſtrous fabrics, ſerved only for ſhow and oſtentation, being rendered by their vaſt bulk unwieldy and unfit for ſervice. Athenæus informs us, the common names they were known by, were *Cyclades* or *Ætana*, i. e. "iſlands, or mountains," to which they ſeemed nearly equal in bigneſs; conſiſting, as ſome report, of as many materials as would have compoſed 50 triremes, or ſhips of three banks.

The veſſels employed by the northern nations appear to have been ſtill more imperfect than thoſe of the Romans; for a law was enacted in the reign of the emperor Honorius, 24th September, A. D. 418, inflicting capital puniſhment on any who ſhould inſtruct the barbarians in the art of ſhip-building; a proof at once of the great eſtimation in which this ſcience was then held, and of the ignorance of the barbarians with regard to it.

The fleet of Richard I. of England, when he weighed anchor for the holy war from Meſſina, in Sicily, where he had paſſed the winter, A. D. 1190-1, is ſaid to have conſiſted of 150 great ſhips and 53 galleys, beſides barks, tartans, &c. What kinds of ſhips theſe were is not mentioned. To the cruſades, however pernicious in other reſpects, this ſcience ſeems to owe ſome improvements; and to this particular one we are indebted for Richard's marine code, commonly called the *Laws of Oleron*, from the name of a ſmall iſland on the coaſt of France, where he compoſed them, and which moſt of the nations in Europe have made the baſis of their maritime regulations. Thoſe ſhips, if they merit the name of ſhips, were probably very ſmall, as we find that ſo long after as the time of Edward I. anno 1304, 40 men were deemed ſufficient to man the beſt and largeſt veſſels in England; and that Edward the Third, anno 1335, ordained the mayor and ſheriffs of London to "take up all ſhips in their port, and all other ports in the kingdom, of the burden of 40 tons and upwards, and to furniſh the ſame with armed men and other neceſſaries of war, againſt the Scots his enemies, confederated with certain perſons of foreign nations. Edward the Third's fleet before Calais, anno 1347, conſiſting of 738 Engliſh ſhips, carrying 14,956 mariners, being on an average but 20 men to each ſhip; 15 ſhips and 459 mariners, from Bayonne in Guienne, being 30 men to each ſhip; 7 ſhips and 184 men from Spain, which is 26 men to each ſhip; one from Ireland, carrying 25 men; 14 from Flanders, with 133 men being ſcarcely 10 men to each ſhip; and one from Guelderland, with 24 mariners. Fifteen of theſe were called the king's own ſhips, manned with 419 mariners, being ſomewhat over 27 to each ſhip.

Fœdera, Vol. II. p. 943.

Ib. Vol. IV. p. 664.

Hiſtorians repreſent the veſſels of Venice and Genoa as the largeſt and the beſt about this time, but they were ſoon exceeded in ſize by the Spaniſh veſſels called *carricks*, ſome of which carried cannon; and theſe again were exceeded by the veſſels built by the northern people, particularly thoſe belonging to the Hanſe towns.—In the 14th century, the Hanſeatics were the ſovereigns of the northern ſeas, as well without as within the Baltic; and their ſhips were ſo large, that foreign princes often hired them in their wars. According to Hakluyt, an Engliſh ſhip from Newcaſtle, of 200 tons burden, was ſeized in the Baltic by thoſe of Wiſmar and Roſtock, anno 1394: and another Engliſh veſſel of the ſame burden was violently ſeized in the port of Liſbon, anno 1412.

Fœdera, Vol. VIII. p. 727.

Soon after ſhips of a much larger ſize were conſtructed. It is mentioned that a very large ſhip was built, anno 1449, by John Taverner of Hull; and in the year 1455, King Henry VI. at the requeſt of Charles king of Sweden, granted a licenſe for a Swediſh ſhip of the burden of a thouſand tons or under, laden with merchandiſe, and having 120 perſons on board, to come to the ports of England, there to diſpoſe of their lading, and to relade back with Engliſh merchandiſe, paying the uſual cuſtoms. The inſcription on the tomb of William Canning, an eminent merchant, who had been five times mayor of Briſtol, in Ratcliff-church at Briſtol, anno 1474, mentions his having forfeited the king's peace, for which he was condemned to pay 300 merks; in lieu of which ſum, King Edward IV. took of him 2470 tons of ſhipping, amongſt which there was one ſhip of 900 tons burden, another of 500 tons, and one of 400 tons, the reſt being ſmaller.

Ib. Vol. XI p. 258.

Ib. Vol. XI p. 364.

In the year 1506, King James IV. of Scotland built the largeſt ſhip which had hitherto been ſeen, but which was loſt in her way to France in the year 1512, owing probably to a defective conſtruction, and the unſkilfulneſs of the crew in managing ſo large a ſhip.—About this time a very large ſhip was likewiſe built in France. In the fleet fitted out by Henry VII. anno 1512, there was one ſhip, the Regent, of 1000 tons burden, one of 500, and three of 400 each. A ſhip ſtill larger than the Regent was built ſoon after, called *Henri Grace de Dieu!* In the year 1522 the firſt voyage round the globe was finiſhed.

The Engliſh naval hiſtorians think that ſhips carried cannon on their upper decks only, and had not gunports before the year 1545: and it is certain that many of the largeſt ſhips in former times were fitted out from harbours, where ſhips of a moderate ſize now would not have water enough to float them. In 1575 the whole of the royal navy did not exceed 24 ſhips, and the number of merchant ſhips belonging to England amounted to no more than 135 veſſels above 100 tons, and 656 between 40 and 100 tons. At Queen Elizabeth's death, anno 1603, there were not above four merchant ſhips in England of 400 ton burden each.—The largeſt of Queen Elizabeth's ſhips of war was 1000 tons burden, carrying but 340 men, and 40 guns, and

Monſon's Naval Tracts, p. 294.

the

History. the ſmalleſt 600 tons, carrying 150 men and 30 guns. Smaller veſſels were occaſionally hired by her from private owners.

In the memorable ſea-fight of Lepanto between the Turks and Chriſtians, *anno* 1571, no veſſels were employed but galleys; and it would appear from the carcaſes of ſome of them, which are ſtill preſerved in the arſenal at Venice, that even theſe were not ſo large or ſo well conſtructed as thoſe of our times. The Invincible Armada, as Spaniſh vanity ſtyled it, once the terror and admiration of nations, in the pompous and exaggerated deſcriptions of which the Spaniſh authors of thoſe times dwelt with ſo much apparent pleaſure, conſiſted of 130 ſhips, near 100 of which were the ſtatelieſt that had yet been ſeen on the ocean. The largeſt of theſe, however, would be no more than a third rate veſſel in our navy, and they were ſo ill conſtructed, that they would neither move eaſily, ſail near the wind, nor be properly worked in tempeſtuous weather. The whole of the naval force collected by Queen Elizabeth to oppoſe this formidable fleet, including hired veſſels tenders, ſtore-ſhips, &c. amounted to no more than 143.

Ship-building began now to make a conſiderable progreſs in Britain. Both war and trade required an increaſe of ſhipping; ſo that, in the year 1670, the annual charge of the navy was reported to be 500,000l.; and in 1678 the navy conſiſted of 83 ſhips, of which 58 were of the line. At this time the exports amounted to ten millions *per annum*; and the balance of trade was two millions. In 1689 there were 173 ſhips, great and ſmall, in the royal navy, and it has been conſtantly increaſing; ſo that in 1761 the ſhips in the navy amounted to 372, of which 129 were of the line; and in the beginning of the year 1795, the total amount was above 430.

3 ps of com- n form ud de- tive,

As ſhips of the common conſtruction are found to be very defective in many particulars, various methods have therefore from time to time been propoſed to remove ſome of the bad qualities they poſſeſſed. As it would be an endleſs taſk to enumerate the different inventions for this purpoſe, therefore a few of them only will be mentioned.

4 l im- vements roſed.

In 1663 Sir William Petty conſtructed a double ſhip, or rather a ſingle ſhip with a double bottom, which was found to ſail conſiderably faſter than any of the ſhips with which it had an opportunity of being tried. Her firſt voyage was from Dublin to Holyhead; and in her return "ſhe turned into that narrow harbour againſt wind and tide, among rocks and ſhips, with ſuch dexterity as many ancient ſeamen confeſſed they had never ſeen the like." This veſſel with 70 more were loſt in a dreadful tempeſt.

5 uble s in- duced Sir Wil- m Petty, *ropean agazine* Auguſt 82

This ſubject was again revived by Mr Gordon, in his Principles of Naval Architecture, printed at Aberdeen anno 1784; where, having delivered his ſentiments on the conſtruction of large maſts, he ſays: "Theſe experiments likewiſe point out to us methods by which two veſſels may be laterally connected together, though at a conſiderable diſtance from each other, in a manner ſufficiently ſtrong, with very little increaſe of weight or expence of materials, and without expoſing much ſurface to the action or influence of the wind or the waves, or obſtructing their motion in any conſiderable degree, and conſequently without being much oppoſed by them on that account under any circumſtances; and if veſſels are judiciouſly conſtructed with a view to ſuch a junction, it would be no eaſy matter to enumerate all the advantages that may be obtained by this means." He then enumerates the advantages that double veſſels would have over thoſe of the common conſtruction. Soon after double ſhips were actually built by Mr Miller of Dalſwinton.

7 and lately conſtructed by Mr Miller. *Principles of Naval Architecture*, p. 76.

Another plan was propoſed by Mr Gordon to make a ſhip ſail faſt, draw little water, and to keep a good wind. For this purpoſe, "the bottom (he ſays) ſhould be formed quite flat, and the ſides made to riſe perpendicular from it, without any curvature; which would not only render her more ſteady, as being more oppoſed to the water in rolling, but likewiſe more convenient for ſtowage, &c. while the ſimplicity of the form would contribute greatly to the caſe and expedition with which ſhe might be fabricated. Though diminiſhing the draught of water is, *cæteris paribus*, undoubtedly the moſt effectual method of augmenting the velocity with which veſſels go before the wind; yet, as it proportionally diminiſhes their hold of the water, it renders them extremely liable to be driven to leeward, and altogether incapable of keeping a good wind. This defect may, however, be remedied, in a ſimple and effectual manner, by proportionally augmenting the depth of keel, or, as ſo large a keel would be inconvenient on many accounts, proportionally increaſing their number; as, in place of adding a keel eight feet deep to a veſſel drawing ſix feet water, to affix to different parts of her flat bottom, which would be well adapted for receiving them, ſix different keels of two feet deep each at equal diſtances from each other, with proper intervals between; which will be found equally effectual for preventing theſe pernicious effects. Four ſuch, indeed, would have anſwered the purpoſe as well as the eight feet keel, were it not for the ſuperior preſſure or reſiſtance of the lower water (A).

8 Draught of water propoſed to be diminiſhed in order to obtain velocity, &c.

9 Inconvenience of this plan remedied by augmenting the depth of the keel,

11 or by increaſing the number of keels.

Thus then it appears, that a veſſel drawing eight feet water only, keels and all, may be made to keep as good a wind, or be as little liable to be driven to leeward, as the ſharpeſt built veſſel of the ſame length drawing 14, nay 20 or upwards, if a few more keels are added, at the ſame time that ſhe would be little more reſiſted in moving in the line of the keels than a veſſel drawing ſix feet water only. Theſe keels, beſides, would ſtrengthen the veſſel conſiderably, would render her more ſteady, and leſs liable to be overſet, and thereby enable

(A) This is frequently repeated on the authority of Mr Gordon and others. Theory ſays otherwiſe; and the experiments of Sir Iſaac Newton ſhow in the moſt unexceptionable manner, that the reſiſtance of a ball deſcending through the water is the ſame at all depths; nay, the heaping up of the water on the bow, occaſioning a hydroſtatical preſſure in addition to the real reſiſtance, will make the whole oppoſition to an equal ſurface, but of greater horizontal dimenſions, greater, becauſe it bears a greater proportion to the reſiſtance.

enable her to carry more sail; and Mr Gordon then enumerates the several advantages that a ship of this construction will possess.

This plan has lately been put into execution by Captain Schank, with this difference only, that instead of the keels being fixed as proposed by Mr Gordon, Captain Schank constructed them so as to slide down to a certain depth below the bottom, or to be drawn up within the ship as occasion might require.

Captain Schank having communicated his plans to the Navy Board, two vessels were in consequence ordered to be built of 13 tons each, and similar in dimensions, one on the old construction, and the other flat-bottomed, with sliding keels. In 1790 a comparative trial in presence of the commissioners of the navy was made on the river Thames, each having the same quantity of sail; and although the vessel on the old construction had leeboards, a greater quantity of ballast, and two Thames pilots aboard, yet Captain Schank's vessel with three sliding keels beat the other vessel, to the astonishment of all present, one half of the whole distance sailed; and no doubt she would have beat her much more had she been furnished with a Thames pilot.

This trial gave so much satisfaction, that a king's cutter of 120 tons was immediately ordered to be built on the same construction, and Captain Schank was requested to superintend its building. This vessel was launched at Plymouth in 1791, and named the *Trial*. The length of this vessel is 66 feet, breadth 21 feet, and depth of the hold seven feet: her bottom is quite flat, and draws only six feet water, with all her guns, stores, &c. whereas all other vessels of her tonnage on the old construction draw 14 feet; so that she can go with safety into almost any harbour or creek. She has three sliding keels enclosed in a case or well; they are each 14 feet in length; the fore and the after keels are three feet broad each, and the middle keel is six feet broad. The keels are moveable by means of a winch, and may be let down seven feet below the real keel; and they work equally well in a storm as in still water. Her hold is divided into several compartments, all water tight, and so contrived, that should even a plank or two start at sea in different parts of the vessel, she may be navigated with the greatest security to any place. If she should be driven on shore in a gale of wind, she will not soon become a wreck, as her keels will be driven up into their cases, and the ship being flat-bottomed, will not be easily overset; and being able to go into such shallow water, the crew may all be easily saved. By means of her sliding keels she is kept steady in the greatest gale; she is quite easy in a great sea, does not strain in the least, and never takes in water on her deck; and when at anchor, she rides more upright and even than any other ship can do: she sails very fast either before or upon a wind; no vessel she has ever been in company with, of equal size, has been able, upon many trials, to beat her in sailing; and yet her sails seem too small.

It has also been proposed to construct vessels of other materials than wood; and lately a vessel was built whose bottom, instead of being plank, was copper.

Book I. *Containing the Method of delineating the several Sections of a Ship.*

Properties of Ships.

Chap. I. *Of the Properties of Ships.*

15 General principles of ship-building.

A ship ought to be constructed so as to answer the particular purpose for which she is intended. It would be an easy matter to determine the form of a ship intended to sail by means of oars; but, when sails are used, a ship is then acted upon by two elements, the wind and water: and therefore it is much more difficult than is commonly imagined to ascertain the form of a ship so as to answer in an unfavourable as well as a favourable wind; the ship at the same time having a cargo of a certain weight and magnitude.

16 Properties that a ship must possess to be a good sailer.

Every ship ought to sail well, but particularly when the wind is upon the beam; for this purpose a considerable length in proportion to the breadth is necessary, and the plane of resistance should be the least possible. The main frame should also be placed in a proper situation; but according to the experiments of Mr Chapman *, its plane is variable with the velocity of the ship: the mean place of the main frame has, however, been generally estimated to be about one-twelfth of the length of the keel before the middle. Without a sufficient degree of stability a ship will not be able to carry a press of sail: a great breadth in proportion to the length and low upper works will augment the stability. The following particulars being attended to, the above property will be gained, and the ship will also steer well. The wing transom should be carried pretty high; the fashion pieces well formed, and not full below the load water line: the lower part of the stem to be a portion of a circle, and to have a considerable rake; the sternpost to be nearly perpendicular to the keel; and all the upper works kept as low as possible.

* *Traité de la construction des Vaisseaux*, p. 40.

17 To make a ship keep a good wind,

Many ships from construction are liable to make much leeway. This may in a great measure be avoided by giving the ship a long keel, little breadth, and a considerable depth in the hold: whence the bow will meet with little resistance in comparison to the side, and therefore the ship will not fall much to the leeward.

18 and to sail smoothly without pitching hard.

Another very great retardation to the velocity of a ship is her pitching. The principal remedy for this is to increase the length of the keel and floor, to diminish the rising afore and abaft, and to construct the hull in such a manner that the contents of the fore body may be duly proportioned to the contents of the after body.

19 In ships of war the lower deck guns to be sufficiently high above the water.

In a ship of war the lower tier of guns ought to be of a sufficient height above the water, otherwise it will be impossible to work the lee-guns, when it blows hard. This property will be obtained by giving her a long floor timber, little rising, a full midship frame, light upper works, and the wing transom not too high: And in every ship the extreme breadth ought always to be higher afore and abaft than at midships.

20 Properties of a merchant ship

A merchant ship, besides being a fast sailer, ought to carry a considerable cargo in proportion to its length, to sail with little ballast, and to be navigated with few hands.

21 to take in a great cargo.

That a ship may take in a considerable cargo, it should

Properties of Ships.

should have a great breadth and depth in proportion to its length, a full bottom, and a long and flat floor. But a ship of this construction will neither sail fast, nor carry much sail.

If a ship be filled out much towards the line of floatation, together with low upper works, she will require little ballast: and that ship which is stiff from construction is much better adapted for sailing fast than one which, in order to carry the same quantity of canvas, is obliged to be loaded with a much greater weight: for the resistance is as the quantity of water to be removed, or nearly as the area of a transverse section of the immersed part of the body at the midship frame; and a body that is broad and shallow is much stiffer than one of the same capacity that is narrow and deep. "The advantages (says Mr Gordon) are numerous, important, and obvious. For it is evident, that by enlarging, perhaps doubling, the breadth of vessels, and forming their bottoms flat and well furnished with keels, they must, in the *first* place, become much steadier, roll little, if any, and be enabled to carry greatly more sail, and that in a better direction, at the same time that they would be in no danger of being dismasted or overset, unless the masts were of a most extraordinary height indeed. *Secondly*, They would have little or no occasion for ballast, and if any was used, could incur less danger from its shifting. *Thirdly*, That there would be much more room upon deck, as well as accommodation below; the breadth being so much increased without any diminution of the height above the load-water line. *Fourthly*, That they would deviate much less from the intended course, and penetrate the water much easier in the proper direction: for doubling the breadth, without any increase of weight, would diminish the depth or draught of water one-half; and though the extent of the directly opposing surface would be the same as before, yet the vessel in moving would meet with half the former resistance only: for so great is the difference between the pressure, force, or reaction, of the upper and the under water. *Fifthly*, That they would by this means be adapted for lying unsupported in docks and harbours when dry, be rendered capable of being navigated in shallow water, and of being benefited by all the advantages attending that very important circumstance; and it is particularly to be observed, that making vessels which may be navigated in shallow water, may, in many respects, justly be regarded as a matter of equal importance with increasing the number of harbours, and improving them, as having identically the same effects with regard to navigation; at the same time, that the benefits which would result from such circumstances are obtained by this means without either expence, trouble, or inconveniency: besides, it would not only enable vessels to enter many rivers, bays, and creeks, formerly inaccessible to ships of burden, but to proceed to such places as are most land-locked, where they can lie or ride most secure, and with least expence of men and ground tackle. As ships of war would carry their guns well by being so steady, there could be but little occasion for a high topside, or much height of hull above water; and as little or no ballast would be required, there would be no necessity, as in other vessels, for increasing their weight on that account, and thereby pressing them deeper into the water. These are very important circumstances, and would contribute much to improve the sailing of such vessels." From whence it appears, that there would be united, what has hitherto been deemed irreconcileable, the greatest possible stability, which is nearly as the area of a transverse section of the immersed part of the body at the midship frame: and a body that is broad and shallow is much stiffer than one of the same capacity that is narrow and deep. A ship of this construction may take in a considerable cargo in proportion to her size; but if deeply loaded will not sail fast, for then the area of a section of the immersed part at the midship frame will be very considerable; and as the sails of such a ship must necessarily be large, more hands will therefore be required.

24 and to be navigated with few hands. *Traité du Navire.*

The less the breadth of a ship, the fewer hands will be necessary to work her; as in that case the quantity of sail will be less, and the anchors also of less weight. We shall gain much (says M. Bouguer) by making the extreme breadth no more than the fifth or sixth part of the length, if, at the same time, we diminish the depth proportionally; and likewise this most surprising circumstance, that by diminishing these two dimensions, or by increasing the length, a ship may be made to go sometimes as fast as the wind.

25 Impossible to unite all these qualities in the same ship.

In order to obtain the preceding properties, very opposite rules must be followed; and hence it appears to be impossible to construct a ship so as to be possessed of them all. The body, however, must be so formed, that as many of these properties may be retained as possible, always observing to give the preference to those which are most required. If it is known what particular trade the ship is to be employed in, those qualities are then principally to be adhered to which are most essentially necessary for that employment.

26 Small ships inferior to large ones in point of sailing, &c.

It may easily be demonstrated that small ships will not have the same advantages as large ones of a similar form, when employed in the same trade: for a large ship will not only sail faster than a small one of a similar form, but will also require fewer hands to work her. Hence, in order that a small ship may possess the same advantages as a large one, the corresponding dimensions will not be proportional to each other. The reader will see in Chapman's *Architectura Navalis Mercatoria* ample tables of the several dimensions of ships, of different classes and sizes, deduced from theory combined with experiment. Tables of the dimensions of the principal ships of the British navy, and of other ships, are contained in the Ship-builder's Repository, and in Murray's Treatise on Ship-building.
